- ☑ Do NOT generate dusts. Dust clouds of the right proportions in air present a dangerous explosion hazard. Use a scoop or a vacuum equipped with a high efficiency particulate air filter (HEPA) to collect spills. Place materials in drum for recovery or disposal, as required.
- ☑ Ventilate area and remove ignition sources.
- ☑ Containers should be removed to safer area if it can be done without increasing the risk.
- ☑ It may be necessary to dispose of 1-naphthylamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS General Assessment

Accidents or mishaps involving 1-naphthylamine can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer" or "carcinogen" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered when planning or implementing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|---------------------------------|
| Characterization Aromatic Amine | RCRA Number U168 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Naphthylamine (beta) | Chemical Abstract Service (CAS) Number 91-59-8 | |
| DOT Hazard Class and Label Requirements Poison B; Poison | DOT Emergency Guide Code 55 | |
| DOT Identification Number UN 1650 | Molecular Formula C₁₀H₇NH₂ | |

Synonyms

2-Aminonaphthalene; β -naphthylamine; beta-naphthylamine.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|--|---|---|
| 2-Naphthylamine (derivation: From β -naphthol by heating in an autoclave with ammonium sulfite and ammonia). | PEL: Suspected Cancer Agent STEL: Not Applicable | REL: Possible Cancer Agent Reduce to Lowest Level | Not Applicable | TLV: Confirmed Human Carcinogen STEL: Not Applicable |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 583°F (306°C) | Specific Gravity (H ₂ O = 1) 1.06 |
| Vapor Pressure (mm Hg) 1 at 226°F (108°C) | Molecular Weight (atomic weight) 143.2 |
| Vapor Density (Air = 1) Not Found | Melting Point 232°F (111°C) |

Solubility

Miscible in water. Soluble in alcohol and ether.

Appearance and Odor

Odorless, white to red crystals with a faint, aromatic odor. Darkens to reddish purple color in air.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 315°F (157°C) closed cup | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Combustible Solid | Autoignition Temperature Not Determined |

Extinguishing Media

Use dry chemical, carbon dioxide, alcohol foam, or water (spray, mist or fog).

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Structural fire-fighting clothing is permeable and may not provide adequate protection. Wear self-contained breathing apparatus (SCBA) operated in positive pressure mode. Move fire-exposed containers from fire if it can be done without risk. Cool with water spray.

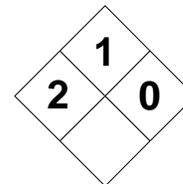

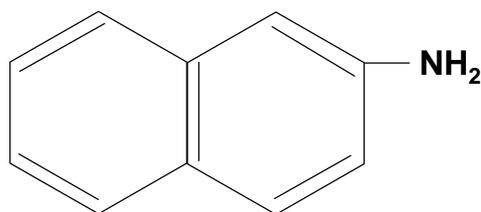

Unusual Fire and Explosion Hazards

Dusts can form extremely explosive mixtures if dispersed through the air in proper proportions and exposed to an ignition source.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|--|--|--|
| Stability | | Conditions to Avoid 2-Naphthylamine is stable at room temperature under normal conditions of handling and storage. Avoid the formation of dust clouds of 2-naphthylamine and prevent contact with ignition sources or oxidizers. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with nitrous acid. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of 2-naphthylamine is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Poisonous gases, including oxides of carbon (carbon monoxide) and oxides of nitrogen are produced when 2-naphthylamine is involved in a fire. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: Irritation of the nose, throat, and respiratory tract. Symptoms include cough, sneezing, tachycardia, hypertension, cyanosis, headache, fatigue, anorexia, vomiting, emaciation, and bladder problems causing hematuria (blood in urine), proteinuria (excessive proteins in urine), and bladder injury and/or cancer. ABSORPTION: Irritation of the skin and eyes. Absorbs through the skin to cause effects of inhalation and may lead to acute hemorrhagic cystitis, dyspnea, ataxia, dysuria, and hematuria. INGESTION: Gastrointestinal irritation and symptoms of absorption have been reported. | | | | |
| Carcinogenicity Confirmed Human Confirmed Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 1 | OSHA Regulated? 29 CFR 1910.1009 | Target Organs? Bladder and skin |
| Medical Conditions Generally Aggravated by Exposure May be especially harmful to persons with pre-existing bladder damage. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Call poison control center. Unless advised otherwise, give conscious person one or two glasses of milk or water to drink and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Wear SCBA respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Do not create dust cloud. Ventilate area of spill. Do NOT dry sweep. Use HEPA vacuum and deposit in sealed drums. | | | | |
| Preferred Waste Disposal Method Consider reclamation or recycling, if possible. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated location away from heat. Protect containers from physical damage. A regulated controlled area must be established per OSHA 29 CFR 1910.1009. | | | | |
| Other Precautions and Warnings Sources of ignition (open flame or smoking) are prohibited where 2-naphthylamine is used or stored. Metal containers should be used. Do NOT generate dust clouds or dusty conditions when working. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) This is a confirmed human carcinogen. Use a NIOSH-approved powered air-purifying respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Clothing (prevent skin contact) |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

2-NAPHTHYLAMINE

CAS: 91-59-8

**IDENTIFICATION AND TYPICAL USES**

2-Naphthylamine is a white or colorless crystalline solid with a faint, unpleasant, aromatic odor. It will darken to a reddish-purple when exposed to air. It is widely used in the manufacture of dyes and in rubber. Its use is currently curtailed because of its hazardous (carcinogenic) properties.

RISK ASSESSMENT: HEALTH**General Assessment**

2-Naphthylamine is a human poison by *inhalation*, *ingestion*, and *absorption* through intact skin. It is a severe health hazard due to its known carcinogenic properties. There is sufficient evidence that exposure leads to bladder cancer in humans. It also causes tumors in the kidney, liver, lungs, skin, and blood tissues in test animals. Its human teratogenicity and reproductive health risk are unknown.

Inhalation of the dusts, as well as skin absorption, causes irritation of the skin, eyes, nose, throat, and the mucous membranes lining the respiratory tract. There can be eczema, tachycardia (rapid heartbeat) hypertension (increased blood pressure) cough, sneezing, headache, fatigue, anorexia, painful diarrhea, loss of appetite with subsequent weight loss, low body temperature, cyanosis (blue discoloration of the skin, especially on face, hands, and feet due to oxygen deficiency), vomiting, and emaciation. There can also be serious bladder disorders, including hematuria (blood in urine) and proteinuria (excessive proteins in urine), as well as bladder damage (including cancer).

Ingestion can lead to symptoms of inhalation and absorption, as well as acute hemorrhagic cystitis, methemoglobinemia (causing hypoxia or inadequate supply of oxygen to tissues), and respiratory distress, dyspnea, ataxia, and dysuria (infrequent urination).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to 2-naphthylamine:

Skin: Irritation with rash and localized inflammation. Absorption through intact skin is likely on short exposures.

Eye: Severe irritation, pain, and inflammation.

Lung: Nose, throat, and respiratory tract irritation causing coughing, sneezing, and toxic systemic effects.

Other: Ingestion may cause hemorrhagic cystitis.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to 2-naphthylamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, 2-naphthylamine is suspected to cause cancer of the bladder. It may also cause tumors of the kidney, liver, lungs, skin, and blood tissues. Mutation data have also been recorded

Reproductive Hazard: According to information presented in the references, 2-naphthylamine has not been adequately tested for its ability to adversely affect reproduction

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with 2-naphthylamine. It is suspected to cause cancer of the bladder. Occupational poisoning occurs most commonly by all routes of exposure. Substitution with a non-cancer agent is recommended. However, if a less toxic material or compound cannot be substituted for 2-naphthylamine, then *engineering controls* are the most effective method of reducing exposures. The

best protection is to enclose operations and/or provide local exhaust ventilation at the site of 2-naphthylamine release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 2-naphthylamine. For the best protection, use an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or a supplied-air respirator operated in continuous flow, especially when high exposures to 2-naphthylamine are anticipated. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 2-naphthylamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 2-naphthylamine is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered:

- Complete blood count (CBC).
- Urinalysis to test for blood and protein levels in urine (establish baseline).

If symptoms should develop or overexposure is suspected, the following additional tests may be helpful:

- Complete blood count.
- Urinalysis (compare to baseline).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
- Wash thoroughly immediately after exposure to 2-naphthylamine and at the end of the work shift or before eating, drinking, or smoking.
- A regulated, marked controlled area must be established wherever 2-naphthylamine is used, handled or stored. Other requirements are established by OSHA (29 CFR 1910.1009).
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 2-naphthylamine should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 2-naphthylamine, emergency shower facilities should be provided.
- Workers whose clothing has been contaminated by 2-naphthylamine should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to 2-naphthylamine.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 2-naphthylamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

2-Naphthylamine is a combustible solid. It can present a dangerous explosion hazard if its dusts form a cloud and come into contact with an ignition source. It is also incompatible with oxidizing materials and contact can result in violent and explosive reactions. Caution is always required in handling, storage, transportation, and disposal of 2-naphthylamine. Emergency responders should be made aware of the pres-

ence of 2-naphthylamine at any emergency response situation.

2-Naphthylamine can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 2-naphthylamine.

Insufficient data are available to evaluate or predict the short-term effects of 2-naphthylamine to aquatic life, plants, birds, or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of 2-naphthylamine to aquatic life, plants, birds, or terrestrial animals.

💧 *Water Solubility*

2-Naphthylamine is nearly insoluble in water. Concentrations of less than 1 milligram will mix with a liter of water.

🕒 *Persistence in the Environment*

2-Naphthylamine is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 2-naphthylamine found in fish tissues is expected to be somewhat higher than the average concentration of 2-naphthylamine in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or

spill of 2-naphthylamine into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 2-naphthylamine should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 2-naphthylamine should contact the water table, aquifer, or navigable waterway, time is of the essence. It is practically insoluble and total containment and remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 2-naphthylamine.

If 2-naphthylamine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Do NOT generate dusts. Dust clouds of the right proportions in air present a dangerous explosion hazard. Use a scoop or a vacuum equipped with a high efficiency particulate air filter (HEPA) to collect spills. Place materials in drum for recovery or disposal, as required.
- ☑ Ventilate area and remove ignition sources.
- ☑ Containers should be removed to safer area if it can be done without increasing the risk.
- ☑ It may be necessary to dispose of 2-naphthylamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS *General Assessment*

Accidents or mishaps involving 2-naphthylamine can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer" or "carcinogen" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered when planning or implementing public relations policies.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and mucous membranes of the respiratory tract. Also stimulates and then depresses the central nervous system with dizziness, nausea, headache, anesthesia, euphoria, cardiac rhythm disruptions, respiratory arrest, and death. SKIN & EYES: Irritation with drying, cracking, redness, blistering (prolonged contact). May lead to contact dermatitis and secondary infection. INGESTION: May cause nausea, vomiting, headache, dizziness, gastrointestinal irritation; blurring of vision, gaseous tumors, and other effects of central nervous system depression. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 | Target Organs? Eyes, skin, respiratory sys., liver, CNS, kidneys. |
| Medical Conditions Generally Aggravated by Exposure None identified. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Do not induce vomiting due to possible aspiration of vomitus/chemical into the lungs which can cause chemical pneumonitis. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Wear SCBA respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Stop leak if it can be done without risk. Provide maximum explosion-proof ventilation. Absorb with vermiculite or other similar material and deposit in sealed containers. Use non-sparking tools during cleanup. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated location. Keep away from sources of heat. | | | | |
| Other Precautions and Warnings Sources of ignition (open flame or smoking) are prohibited where naptha is used or stored. Metal containers should be bonded and grounded during transfer operations. Bulk storage not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use an MSHA/NIOSH-approved organic vapor respirator, a powered air purifying respirator, or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Nitrile or Polyvinyl Alcohol Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron if Splash is Likely | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NAPTHA

Formula varies with grade

CAS: 8030-30-6

**IDENTIFICATION AND TYPICAL USES**

Naptha is a clear, light colored to colorless or reddish-brown, mobile, aromatic, volatile liquid with a characteristic odor. Naptha is a general term applied to refined, partly refined, or unrefined petroleum products and liquid products of natural gas, not less than 10% of which distill below 347°F (175°C) and not less than 95% of which distill below 464°F (240°C) when subjected to distillation in accordance with the Standard Method of Test for Distillation of Gasoline, Naptha, Kerosene, and Similar Petroleum Products (ASTM D86). It is used as a source (by various cracking processes) of gasoline, special naphthas, petroleum chemicals (especially ethylene).

RISK ASSESSMENT: HEALTH**General Assessment**

Naptha is considered mildly to moderately toxic by *inhalation* of its vapors or by *ingestion* of the liquid. Skin contact will also cause localized damage at site of contact. There are no data regarding its carcinogenic, teratogenic, or mutagenic properties in animals or humans.

Inhalation of the naptha vapors can cause irritation of the eyes, nose, throat, and respiratory tract mucosa. Systemic effects include cough, dyspnea, nausea, headache, respiratory arrest, and death. Naptha is also a central nervous system depressant causing euphoria, anesthesia, cardiac rhythm disruptions, dizziness, intoxication, stupor, drunkenness, cyanosis, and possible loss of consciousness. Chronic lung dysfunction may occur if naptha is aspirated into the lungs.

Skin contact may cause dermatitis resulting from the defatting of the skin's natural protective oily barrier. Eye contact can lead to permanent damage depending upon the length of exposure. There may be irritation of the conjunctiva with redness, swelling, tearing, and localized inflammation of eye tissues on short exposures.

Ingestion may cause nausea, vomiting, diarrhea, and abdominal pain. If aspirated into the lungs, there may also be hypoxia, infection, chemical pneumonitis, and the possible formation of gaseous tumors. Other possible effects include headaches, dizziness, gastrointestinal irritation, drunkenness, cyanosis, and symptoms of CNS depression similar to that caused by inhalation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to naptha:

- Skin:** Irritation with potential for redness, blistering, burning, and dermatitis.
- Eye:** Severe irritation, conjunctivitis, redness, possible pain, and visual disturbances.
- Lung:** Nose, throat, and respiratory tract irritation causing difficulty in breathing, coughing, congestion, and possible respiratory arrest.
- CNS:** Inebriation, dizziness, stupor, headaches, mental confusion, loss of consciousness, and possible cardiac arrhythmia abnormalities.
- Other:** Ingestion followed by vomiting may cause some of the chemical to be aspirated into the lungs which can lead to chemical pneumonitis and other serious effects.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to naptha and can last for months or even years:

Cancer Hazards: According to information presented in the references, naptha has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: There is no evidence in the references to indicate that exposure to naptha causes any adverse effects to reproduction.

Other Chronic Effects: There is no evidence of systemic poisoning resulting from long-term exposures. There may be chronic headache, loss of appetite, dizziness, sleepiness, indigestion, and nausea. Chronic lung dysfunction may occur if naphtha is aspirated into the lungs. Repeated skin contact causes blistering, drying, and lesions.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with or exposure to naphtha. Occupational exposures occur most commonly through inhalation. A less toxic material or compound should be used in place of naphtha whenever possible. If substitution cannot be done, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local explosion-proof exhaust ventilation at the site of naphtha release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around naphtha. An MSHA/NIOSH-approved air-purifying respirator with an organic vapor cartridge, a supplied-air respirator operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand are the appropriate methods of respiratory protection when exposure to naphtha is anticipated. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, nitrile or polyvinyl alcohol gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with naphtha.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where naphtha is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered:

- ☑ Lung function tests (establish baseline).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

- ☑ Lung function tests (compare to baseline).
- ☑ Evaluation for nervous system disorders.
- ☑ Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory disorders, smokers exposed to naphtha may experience symptoms more rapidly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible risk factors.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel have been trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to naphtha and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of naphtha should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to naphtha, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by naphtha should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to naphtha.
- ☑ Where possible, automatically transfer liquids containing naphtha from drums or other containers to process containers. Always practice ground-

ing and bonding techniques. Use non-sparking tools.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of naphtha. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Naphtha is a moderately flammable liquid. Because of its extremely low flash point and high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). Containers can explode when exposed to excessive heat. A boiling liquid expanding vapor explosion (BLEVE) may occur when tankers or rail cars are involved in or are parked near a fire. It is a dangerous fire hazard and moderate explosion hazard when exposed to heat or flame. It is incompatible with commonly encountered oxidizers. Caution is always required in handling, storage, transportation, and disposal of naphtha. Emergency responders should be made aware of the presence of naphtha at any emergency response situation.

Naphtha can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to naphtha.

Insufficient data are available to evaluate the short-term effects of naphtha to aquatic life, plants, birds, or land animals.

☞ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of naphtha to aquatic life, plants, birds, or terrestrial animals.

💧 *Water Solubility*

Naphtha is not soluble in water. Concentrations of 1 milligram will not mix with a liter of water.

⌚ *Persistence in the Environment*

Naphtha is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of naphtha found in fish tissues is expected to be about the same as the average concentration of naphtha in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of naphtha into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of naphtha should be segregated from other chemicals and materials to minimize the risk of cross-contamination. Facilities should be designed to meet maximum explosion-proof requirements.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If naphtha should contact the water table, aquifer, or navigable waterway, time is of the essence. It is not soluble and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of naphtha.

If naphtha is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Absorb liquids in vermiculite, sand, earth, or similar material and deposit in sealed drum. Use non-sparking tools during cleanup procedures.
- ☑ Ventilate area of spill or leak. Container should be removed to safer area if it can be done without increasing the risk.
- ☑ Use water spray to knock down vapors.
- ☑ It may be necessary to dispose of naphtha as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving naphtha can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|--|---|---|
| Neochromium (derivation: By reacting sulfuric acid with chromium hydroxide and subsequent crystallization. Typically hydrated with between 15 and 18 water molecules). | PEL (8 hour): 0.5 mg(Cr)/m³ STEL: Not Established | REL (10 hour): 0.5 mg(Cr)/m³ STEL: Not Established | 250 mg/m³ as Cr | TLV (8 hour): 0.5 mg(Cr)/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|-------------------------|--------------------------------------|---|--------------------------------|
| Boiling Point | 212°F (100°C) loses water | Specific Gravity (H ₂ O = 1) | 3.01 (anhydrous) |
| Vapor Pressure (mm Hg) | 0 at 69°F (20°C) for Chromium | Molecular Weight | 165.07 |
| Vapor Density (Air = 1) | Not Found | Melting Point | 153°F (67°C) Decomposes |

Solubility

Anhydrous form is insoluble in water and most acids. Soluble in alcohol.

Appearance and Odor

Hard, brittle, semi-gray, lustrous metal. It often appears as a powder.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|-----------------------|-------------------------------------|---|
| Flash Point (method used) | Not Applicable | Explosive Limits in Air % by Volume | LEL: Not Determined UEL: Not Determined |
| NFPA Classification | No Citation | Autoignition Temperature | Not Determined |

Extinguishing Media

Neochromium may burn, but does not readily ignite. Use agents suitable to surrounding fires.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Water may be ineffective if used directly on fires involving neochromium. Remain clear of smoke, water fallout and water runoff. Do not release runoff to sewers or waterways; contain for proper disposal.

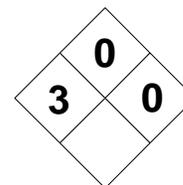

Unusual Fire and Explosion Hazards

None reported.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|--|---|--|
| Stability | | Conditions to Avoid Neochromium is stable in closed containers under routine conditions of handling and storage. Keep away from incompatible materials since violent and or explosive reactions can occur. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with strong oxidizers (such as chlorine, bromine, hydrogen peroxide, and fluorine), and most alkali materials. It is readily oxidized to chromic acid by hypochlorites, peroxides, or pressurized oxygen. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of neochromium is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, neochromium can emit highly toxic/poisonous fumes and gases including oxides of sulfur and chromium. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the respiratory system. Exposure to some chromium compounds can cause sores or "chrome holes" to appear in the nasal cavity. Respiratory irritation is primarily due to mechanical rather than chemical action. Overexposure to high concentrations of neochromium may cause delayed pulmonary edema (fluid in lungs), which can be fatal. SKIN & EYES: A minor irritant to the eyes and skin. May cause sensitization leading to itchy rash. INGESTION: Irritation of the gastrointestinal tract. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 (Chromium) | Target Organs? Respiratory system, skin, eyes. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, existing skin conditions or respiratory problems may be aggravated. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. <u>For inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. <u>If swallowed:</u> Provide breathing assistance if necessary. Never attempt to give a convulsing or unconscious person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area and protect from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where neochromium is used, handled, or stored. | | | | |
| Other Precautions and Warnings Personnel must be trained on the hazards of chromium compounds <i>before</i> being assigned to work in areas where neochromium is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At any exposure level, recommend using an MSHA/NIOSH-approved supplied-air respirator with a full facepiece, hood, or helmet operated in the continuous flow mode or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NEOCHROMIUMCrHO₅S

CAS: 64093-79-4

**IDENTIFICATION AND TYPICAL USES**

Neochromium appears as a peach-red to violet powder in anhydrous form, or as dark green, amorphous scales or crystals. It may also take the appearance of dark cubes. It is used in the textile industry for dyeing, printing, moth-proofing, and water-proofing. It is also used in metal treating and polishing, in the tanning of leather, in the manufacture of other chromium compounds, in the production of green varnishes, paints, inks, and glazes (for porcelain), and as a sensitizer in photographic processes.

RISK ASSESSMENT: HEALTH**General Assessment**

Neochromium is a questioned animal carcinogen. It is harmful to humans by *ingestion* with gastrointestinal effects. It can also be toxic by *inhalation*. The toxicity of chromium alloys and compounds varies significantly. Neochromium has not been shown to cause significant toxicity. However, human mutation data have been reported and, because the nature of its human carcinogenic properties is unknown, it should be handled with extreme caution. Exposure to the dusts of neochromium may cause dangerous lung irritation and possibly lead to disease, including pulmonary fibrosis and pneumoconiosis.

Occupational exposure to certain chromium(III) compounds can produce skin ulceration, dermatitis, perforation of the nasal septa, and lung damage. Overexposure to high concentrations of neochromium dusts can cause a dangerous buildup of fluids in the lungs (pulmonary edema), which is a medical emergency and can be fatal. Symptoms of cough, congestion, tightness in the chest, and difficulty breathing may be delayed up to 48 hours. This can create a false sense of security with regard to health exposure risk.

Inhalation of chromium fumes can cause "metal fume fever," which is a flu-like illness lasting up to 24

hours with characteristic symptoms of chills, aches, cough, and fever. It is not known if exposure to heated neochromium fumes will have this same effect.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to neochromium:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Neochromium particles can irritate the eyes.

Lung: Inhalation of neochromium will irritate the lungs and may cause a condition known as pulmonary edema (fluid in the lungs).

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to neochromium and can last for months or even years:

Cancer Hazards: Many chromium compounds are confirmed human carcinogens. They have been shown to cause cancer of the lung and throat in humans and test animals. It is not known if neochromium will cause cancer in humans. However, human mutation data have been reported and many scientists believe that exposure to such chemicals may pose a cancer risk in the long term.

Reproductive Hazard: According to information available in the references, there is no evidence to indicate that neochromium adversely affects reproduction.

Other Chronic Effects: Long-term exposures may cause skin sensitization characterized by a red, itchy rash resembling eczema. Once this develops, even small future exposure can cause symptoms to reappear. Very irritating substances may affect the lungs.

It is not known whether neochromium causes lung damage.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with neochromium. Because many related chromium compounds are known human carcinogens, prudent risk management dictates that neochromium be handled and treated with extreme caution. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around neochromium. The permissible exposure level (PEL) for chromium compounds is extremely low (0.5 mg/m^3) and difficult to accurately monitor. For any exposure level, recommend using a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece in pressure demand mode as the respiratory protection methods of choice. If a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with neochromium.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where neochromium is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the PEL or greater, or significant skin contact), the following medical tests are recommended:

- ☑ Lung function tests (these may be normal if person is not displaying symptoms at the time of the test).

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Consider urine chromium levels. Persons without workplace exposure usually have levels below 15 micrograms per liter of urine.
- ☑ Lung function tests (these may be normal if person is not displaying symptoms at the time of the test).
- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to neochromium may be more pronounced in smokers than in non-smokers. Prudent risk management requires proper consideration of *all* possible factors which may be responsible for the appearance of exposure symptoms in the workplace.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to neochromium and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of neochromium should be communicated to all exposed and potentially exposed workers.
- ☑ Where possible, automatically transfer neochromium from drums or other storage containers to process containers.
- ☑ Specific engineering controls are recommended by NIOSH for chromium and some information may be useful in controlling the risks of exposure to neochromium. Refer to NIOSH Criteria Documents: Occupational Exposure to Chromium. Publication Number 76-129.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of neochromium. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Neochromium will not readily ignite but can burn if involved in a fire. Finely divided powders may form explosive mixtures with air, especially in confined areas. It can be readily oxidized on exposure to hypochlorites, peroxides, and oxygen under high pressure and temperature. In a fire, neochromium will emit toxic and poisonous gases. It is also incompatible with strong oxidizers (such as chlorine, fluorine, bromine, and hydrogen peroxide), and many alkali metals (zinc, magnesium, and aluminum in acid solution). These characteristics require special consideration during any emergency situation involving a leak or spill of neochromium.

Neochromium can enter the environment through effluents from the metal plating industries, from municipal waste treatment plant discharges, or from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to neochromium.

Chromium is more toxic in soft water than in hard water. Neochromium has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of neochromium exposure to plants, birds or land animals.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Neochromium has high chronic toxicity to aquatic life. Insufficient data are available to evaluate the

long-term effects of neochromium exposure to plants, birds or land animals.

💧 Water Solubility

Water solubility of chromium and its salts ranges from low to high.

⌚ Persistence in the Environment

Neochromium is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of neochromium found in fish is expected to be somewhat higher than the average concentration of neochromium in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of neochromium should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage of neochromium should be avoided.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum or wet mop method to reduce dust during cleanup. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. If neochromium should contact the water table, aqui-

fer, or navigable waterway, time is of the essence. Chromium compounds may be moderately to highly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of neochromium.

If neochromium is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- ☑ It may be necessary to dispose of neochromium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving neochromium can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the terms "cancer" or "carcinogen" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered when drafting or implementing public relations policies.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with

specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Solubility

Very slightly soluble in water.

Appearance and Odor

Colorless, odorless, tasteless gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Combustible Gas | Autoignition Temperature Not Determined |

Extinguishing Media

Use extinguishing media suitable to surrounding fires. Neon itself will not ignite or support combustion.

Special Fire Fighting Procedures

Neon is inert and will not support combustion. However, it is recommended that self-contained breathing apparatus (SCBA) be worn. Contact with the liquid may cause frostbite. Heat will build pressure and may rupture closed storage containers. Keep fire-exposed containers cool with water spray.

Unusual Fire and Explosion Hazards

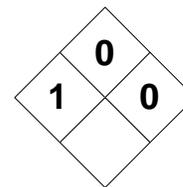

Neon cylinders may explode in the heat of fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|--|------------------------------|--|
| Stability | | Conditions to Avoid Neon is stable in closed cylinders under routine conditions of handling and storage. Keep away from heat and other gases. It can condense and solidify other gases. Use metal containers made for cryogenics. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Neon is a monatomic, chemically inactive, simple asphyxiant gas that is lighter than air. Some steels and other materials will become brittle in contact with the compressed gas or the refrigerated liquid. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of neon is not expected to occur. Prevent any accidental or uncontrollably rapid release of neon gas. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products None reported. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: An asphyxiant gas. Initial symptoms are those of oxygen starvation. Feeling of "air hunger," diminished mental alertness, headache, dullness, shortness of breath, and an impairment in muscle coordination. Continued exposures lead to faulty judgment, depression of senses, rapid fatigue, unconsciousness, convulsions, coma, and death. SKIN & EYES: Contact with the compressed gas or refrigerated liquid can cause frostbite and burns. INGESTION: Not likely since neon is a gas at normal working (room) temperatures. | | | | |
| Carcinogenicity No Evidence Human No Evidence Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, skin, eyes, CNS. |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures Eye contact (liquid): Immediately flush with large amounts of tepid water for 15 minutes (minimum), occasionally lifting eyelids; seek medical attention. Skin contact (liquid): Remove all contaminated clothing. Immediately flush area with large amounts of tepid water. Do NOT rub! Seek medical assistance. For inhalation: Remove the person from exposure. Emergency responders must be protected from inert atmospheres. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Treat frozen tissues and protect the airway. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. Ensure response personnel are properly protected with self-contained breathing apparatus (SCBA). | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dry, well-ventilated area away from heat, direct sunlight, or other hot areas (water lines, vent pipes). Ensure proper storage and handling precautions are in place whenever working with compressed gas cylinders. | | | | |
| Other Precautions and Warnings Containers may explode in fire or under conditions of extreme heat. Protect cylinders from physical damage. Use pressure relief on liquid containers. Periodically check vent valves for blockage (ice). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure limits have been established. Neon is a simple asphyxiant. Do NOT use cartridge-type respirators (ineffective for this type of gas). Use a powered supplied-air respirator or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious, Thermal Insulated Gloves | | Eye Protection Chemical Goggles and/or Face Mask | | Other Protective Clothing Protective Boots, Gauntlets, Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NEON

Ne

CAS: 7440-01-9

**IDENTIFICATION AND TYPICAL USES**

Neon is a colorless, odorless, and tasteless gas. It is an inert element of atomic number 10 of the noble gas group of the periodic system with three stable isotopes. It is used in luminescent electric tubes and photoelectric bulbs, in the electronic industry, in high-voltage indicators for high-tension power lines, in certain lasers, as an ingredient of gaseous fillers for anti-fog devices, in warning signals, in electrical current detectors, in lightning arresters and, as a liquid, in cryogenic research.

RISK ASSESSMENT: HEALTH**General Assessment**

Neon is a simple asphyxiant gas. As such, its primary route of entry into the body is through *inhalation*. While it does not pose a significant physiological effect (i.e., no systemic poisoning or toxicity), it can displace oxygen levels to below that which is necessary to sustain life. Skin contact with the liquid can be destructive to tissues due to the extremely cold temperatures but absorption is not a likely exposure route. Since neon usually exists as a gas at room temperatures, ingestion is not likely to occur either.

Inhalation of neon gas can cause headache, dullness, shortness of breath, and the symptoms of asphyxiation. These include rapid respiration and a feeling of "air hunger" or air starvation followed by a decrease in mental alertness, and impaired muscular coordination. If exposure continues, there can be nausea, vomiting, prostration, unconsciousness, coma, and death.

Skin or eye contact with the vapor poses no serious threat. The vapors have not been shown to cause any physiological response. However, if the liquid should contact either the skin or the eyes, there can be serious irritation, burns, tissue damage, and frostbite.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to neon:

- Skin:** Liquid threat only. Redness, pain, swelling, blisters, and severe frostbite.
- Eye:** Liquid threat only. Causes frostbite, redness, irritation, severe pain, and blurred vision.
- Lung:** Vapor is non-irritating and therefore poses no threat of damage to the lungs. However, in high concentrations, neon can lead to symptoms of asphyxiation and oxygen deprivation up to and including death.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to neon and can last for months or even years:

- Cancer Hazards:** According to information presented in the references, exposure to neon does not lead to carcinogenic effects (it is a simple asphyxiant).
- Reproductive Hazards:** There are no reports to support any claims of reproductive hazards.
- Other Chronic Effects:** None reported.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with neon. If another gas cannot be substituted for neon, then *engineering controls* are the most effective method of reducing exposures. The best protection is to separate operations and provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with neon. Air-purifying respirators

(e.g., the cartridge-type or gas masks) cannot be used with neon. These types of respirators only purify the air and can do nothing to protect in oxygen deficient atmospheres. A powered air-supplied respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber or leather apron should be worn. To prevent hand and skin exposures with the liquid, thermal insulated gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with neon.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where neon is used or stored.

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, consider installing automatic sensors that warn personnel of dropping oxygen levels and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Safety shower and eyewash stations should be readily available in work areas where neon is used or stored.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of neon should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Even though neon is a naturally occurring element that is present in the environment, the environment is at

risk of exposure during transportation, storage, disposal, or destruction of neon. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, may cause possible contamination of the surrounding environmental mediums (mostly air but, depending upon the nature of the spill, water and soil may be affected).

Neon is a non-flammable, non-combustible, non-explosive, and chemically inactive, inert gas. It presents no fire hazard. However, it can cause other gases to condense and solidify. It causes the condensation of oxygen from the air on non-insulated surfaces. Liquid oxygen is a fire hazard. Ice formation inside valves, vents, or critical components can be hazardous to equipment operation and to personnel. Also, because of its ability to displace oxygen, neon requires special consideration during any emergency involving a leak or release of neon gas or liquid especially in confined or enclosed spaces (such as sewers). Neon can enter the environment through industrial discharges, unchecked venting to air, or through spills of the liquid. Since liquids will most likely vaporize rapidly, water and soil contamination are possible but improbable.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to neon. Insufficient data are available on the short-term effects of neon on aquatic life, plants, birds, or land animals. However, as a relatively non-toxic, simple asphyxiant, it might be assumed that any acute ecological toxicity will be relatively low.

🌱* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the long-term effects of neon to aquatic life, plants, birds, or land animals. However, as a relatively non-toxic, simple asphyxiant, it might be assumed that any chronic ecological toxicity will be relatively low.

💧 *Water Solubility*

Neon is only slightly soluble in water. Concentrations of 1 milligram or less may mix with a liter of water. It is normally a gas at room temperature and pressure and solubility may not be a concern.

Persistence in the Environment

Neon is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually all of neon will eventually end up in the air.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Neon is not expected to accumulate in the edible tissues of fish.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of neon should be segregated from other gases to prevent cross-contamination or contact. Buildings designated for storage should be equipped with monitors that provide ample warning (audible and visual) of oxygen deficient atmospheres.

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures. If applicable contaminated soils should be removed for incineration and replaced with clean soil. When spills or leaks occur, it may be necessary to contact the local and/or state emergency response authorities. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of neon.

If neon is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.
- If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- Keep neon out of a confined space, such as a sewer, because of the possibility of creating an inert atmosphere.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving neon can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Work/Hygiene Practices Always wash hands thoroughly after working with nickel powders and dusts; never bring food, drink, or smoking materials into vicinity of nickel powders. | | | | |

NICKEL

Ni

CAS: 7440-02-0

**IDENTIFICATION AND TYPICAL USES**

Nickel is a malleable, silvery-white, hard, ductile metal. It is metallic element of atomic number 28, group VIII of the periodic table, atomic weight 58.70, with valance 2,4 and five stable isotopes. It is used in alloys (low-alloy steels, stainless steel, copper and brass, permanent magnets, and electrical resistance alloys). Also used in electroplated protective coatings, electroformed coatings, alkaline storage batteries, fuel cell electrodes, as a catalyst in the methanation of fuel gases and the hydrogenation of vegetable oils.

RISK ASSESSMENT: HEALTH**General Assessment**

Nickel is a severe human poison by *ingestion* and *inhalation* of its finely divided powders and dusts. Skin contact with the dusts of nickel may result in scratching ("nickel scratch") and scarring. Nickel is a confirmed carcinogen in animals causing lung and nasal tumors. Its carcinogenic potential in humans is considered highly suspect. Nickel has also been shown to cause teratogenic effects in test animals as well as mutations (genetic changes) under experimental conditions.

Inhalation of nickel dusts or fumes can cause severe inflammation and irritation of the upper respiratory tract with nonproductive cough, rapid breathing, dyspnea, and tightness in the chest. The fumes may cause metal fume fever with chills, high fever, and flu-like symptoms that can last up to 24 hours after exposure. There may also be asthma-like symptoms, inflammation of the lungs (noninfectious), conjunctivitis, nausea, vomiting, and abdominal pain.

Ingested nickel is poorly absorbed, and there appears to be no retention of nickel from nutritional sources in individuals with normal kidneys. Dusts of metallic nickel and nickel oxide are not significantly absorbed systemically, although fumes from welding

nickel are absorbed through the lungs, producing an increase in nickel levels in plasma and in urine. Symptoms of ingestion (large doses) may include nausea, vomiting, and diarrhea.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to nickel:

Skin: Irritation/scratching on contact with dusts. May cause "nickel itch" or, nickel dermatitis.

Eye: Irritation and scratching with possible progression to conjunctivitis.

Lung: Irritation of the nose, throat, and lungs on exposure to powders and dusts. The fumes can cause flu-like conditions ("metal fume fever").

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to nickel and can last for months or even years:

Cancer Hazards: According to information presented in the references, nickel is known to cause nasal sinus and lung cancer in animals. It is thought to be able to cause at least the same damage in humans. Mutation data have also been reported and many scientists believe that such chemicals cause a cancer risk in the long-term.

Reproductive Hazard: According to information presented in the references, exposure to nickel and its salts may damage a developing fetus.

Other Chronic Effects: Skin contact can cause allergy. Symptoms include burning, itching, redness and bumps, or other rash-like developments. The rash may spread to other areas and remain for weeks after the exposure has ended. Repeated inhalation exposure can cause chronic pulmonary irritation, chronic thickening of the mucous membranes of the nose, nasal sinusitis, anosmia (loss of the sense of smell), and per-

foration (holes) in the nasal septum. Lung allergy (asthma) occasionally develops with wheezing and/or tightness in the chest. Long-term exposure to the dusts or fumes may cause carcinoma of the paranasal sinuses, larynx, and lungs. Single high or repeated lower exposures may cause damage to the heart muscle, liver, and/or kidney.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with nickel. It is a confirmed carcinogen and human exposure must be avoided or controlled. *Engineering controls* are always the most effective method of reducing exposures. The best protection, especially when working with fine powders and dusts of nickel, is to enclose operations and/or provide explosion-proof, local exhaust ventilation at the site of powder/dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around nickel. A self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand is the best respiratory protection. However, for exposures near or over the 1 mg/m³ PEL for dusts, a respirator with a dust/mist/fume filter may suffice. If a full facepiece respirator is not available, then dust goggles or safety glasses with side shields attached should be worn to protect the eyes. To prevent hand and skin exposures, suitable gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nickel.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where nickel is used or stored. Before beginning work with nickel, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- ☑ Lung function tests (may be normal if person is not experiencing symptoms at the time of the test).
- ☑ Urinalysis or plasma (blood) tests for nickel. Normal nickel content in unexposed population should be less than 10 micrograms per liter.

If symptoms develop or overexposure is suspected, the following additional tests may be useful:

- ☑ Daily urine nickel monitoring for several days following last exposure. Persons with urine nickel over 100 micrograms per liter require medical attention.
- ☑ Consider chest X-ray after acute overexposure.
- ☑ Evaluation by a qualified allergist with special testing and careful consideration of exposure history (may help diagnose allergy).
- ☑ Liver and kidney function tests.

Also, because smoking can cause heart disease, emphysema, lung cancer, and other respiratory disorders, smokers who are exposed to nickel may experience symptoms more quickly and more pronounced than non-smokers under the same conditions of exposure. Persons who are allergic to nickel may also react to nickel-coated jewelry, watchbands, and, in some cases, prolonged contact with keys and coins.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site where nickel powder or dust is worked. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when working with nickel compounds.
- ☑ Wash thoroughly immediately after exposure to nickel and at the end of the work shift or before eating, drinking, or smoking. Clothing contaminated with nickel dusts or powders should not be taken home.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nickel should be communicated to all exposed workers.
- ☑ Specific engineering controls are recommended for nickel by NIOSH in Criteria Document: Inorganic Nickel (Publication Number 77-164).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of nickel. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of nickel

materials, especially the dusts and powders. Accidental contact with a variety of incompatible materials can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Nickel is considered a combustible solid. It is incompatible with oxidizing agents and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of nickel. Should nickel ever come into contact with incompatible substances such as oxidizers, ammonium nitrate, acids, or sulfur compounds either during use, transportation, or storage, the formation of highly explosive commodities is extremely possible.

Elemental nickel is one of the most common metals found in surface waters, occurring naturally due to the weathering of rocks. Other sources of nickel in the environment include the burning of coal and other fossil fuels and discharges from such industries as electroplating and smelting.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nickel.

Nickel and its compounds have high acute toxicity to aquatic life. The softer the water, the higher the toxicity. Insufficient data are available on the short-term effects of nickel exposure to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Nickel and its compounds have high chronic toxicity in aquatic life. The softer the water, the greater the toxicity. Insufficient data are available on the long-term effects of nickel to plants, birds, or land animals.

💧 *Water Solubility*

Nickel and its compounds have water solubilities ranging from extremely low (negligible) to relatively high.

⌚ *Persistence in the Environment*

Nickel is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nickel and its compounds found in fish tissues is expected to be somewhat higher than the average concentration of nickel in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in the contamination of the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nickel should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. When environmental contamination occurs, the local and/or state emergency response authorities may require notification. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nickel.

If nickel is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area of nickel powder spill or leak.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Do NOT dry sweep residues (generates dusts). Damp mop or use HEPA vacuum instead.
- ☑ It may be necessary to dispose of nickel as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nickel can present a significant threat to business operations. The loss or damage of equipment or facilities due to explosion or fire can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered whenever developing or implementing public relations policies.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

NICKEL AMMONIUM SULFATENiSO₄•(NH₄)₂SO₄•6H₂O

CAS: 15699-18-0

**IDENTIFICATION AND TYPICAL USES**

Nickel ammonium sulfate is a green, odorless, crystalline powder. It is used primarily as a nickel electrolyte for electroplating.

RISK ASSESSMENT: HEALTH***General Assessment***

Nickel ammonium sulfate is a severe human poison by *ingestion* and *inhalation* of its finely divided powders and dusts. Skin contact with the dusts of nickel salts may result in scratching ("nickel ammonium sulfate scratch") and scarring. Nickel ammonium sulfate is a confirmed carcinogen in animals causing lung and nasal tumors. Its carcinogenic potential in humans is considered highly suspect. Nickel compounds have also been shown to cause teratogenic effects in test animals as well as mutations (genetic changes) under experimental conditions. It is not known if the ammonium sulfate will have this effect, but caution is certainly warranted.

Inhalation of nickel ammonium sulfate dusts or fumes can cause severe inflammation and irritation of the upper respiratory tract with nonproductive cough, rapid breathing, dyspnea, and tightness in the chest. The fumes of nickel and its compounds may cause metal fume fever with chills, high fever, and flu-like symptoms that can last up to 24 hours after exposure. There may also be asthma-like symptoms, inflammation of the lungs (noninfectious), conjunctivitis, nausea, vomiting, and abdominal pain. Symptoms of pulmonary edema, such as cough and shortness of breath, may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk.

Ingested nickel is poorly absorbed, and there appears to be no retention of the metal from nutritional sources in individuals with normal kidneys. Dusts of metallic nickel and nickel oxide are not significantly absorbed systemically, although fumes from welding

nickel is absorbed through the lungs, producing an increase in nickel levels in plasma and in urine. Symptoms of ingestion (large doses) may include nausea, vomiting, and diarrhea.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to nickel ammonium sulfate:

- Skin: Irritation/scratching on contact with dusts. May cause "nickel itch" or nickel dermatitis.
- Eye: Irritation and scratching with possible progression to conjunctivitis.
- Lung: Irritation of the nose, throat, and lungs with the possible development of pulmonary edema. The fumes can cause flu-like conditions ("metal fume fever").

⚠ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to nickel ammonium sulfate and can last for months or even years:

Cancer Hazards: According to information presented in the references, nickel is known to cause nasal sinus and lung cancer in animals. It is thought to be able to cause at least the same damage in humans. Mutation data have also been reported and many scientists believe that such chemicals cause a cancer risk in the long-term. It is not known if the ammonium sulfate specifically will cause cancer. However, caution is warranted in use, handling, and storage.

Reproductive Hazard: According to information presented in the references, exposure to nickel and its salts may damage a developing fetus and reduce fertility in males and females.

Other Chronic Effects: Skin contact can cause allergy. Symptoms include burning, itching, redness and bumps, or other rash-like developments. The rash

may spread to other areas and remain for weeks after the exposure has ended. Repeated inhalation exposure can cause chronic pulmonary irritation, chronic thickening of the mucous membranes of the nose, nasal sinusitis, anosmia (loss of the sense of smell), and perforation (holes) in the nasal septum. Lung allergy (asthma) occasionally develops with wheezing and/or tightness in the chest. Long-term exposure to the dusts or fumes may cause carcinoma of the paranasal sinuses, larynx, and lungs. Single high or repeated lower exposures may cause damage to the heart muscle, liver, and/or kidney.

🕒 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with nickel ammonium sulfate. It is a confirmed animal carcinogen and human exposure must be avoided or controlled. *Engineering controls* are always the most effective method of reducing exposures. The best protection, especially when working with fine powders and dusts of nickel ammonium sulfate, is to enclose operations and/or provide explosion-proof, local exhaust ventilation at the site of powder/dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around nickel ammonium sulfate. A self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand is the best respiratory protection. However, for exposures near or over the 1 mg/m³ PEL for dusts, a respirator with a dust/mist/fume filter may suffice. If a full facepiece respirator is not available, then dust goggles or safety glasses with side shields attached should be worn to protect the eyes. To prevent hand and skin exposures, suitable gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nickel ammonium sulfate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where nickel ammonium sulfate is used or stored.

Before personnel beginning working with nickel ammonium sulfate, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended to assist in exposure management:

- ☑ Lung function tests (may be normal if person is not experiencing symptoms at the time of the test).
- ☑ Urinalysis or plasma (blood) tests for nickel. Normal nickel content in unexposed population should be less than 10 micrograms per liter.

If symptoms develop or overexposure is suspected, the following additional tests may be useful:

- ☑ Daily urine nickel monitoring for several days following last exposure. Persons with urine nickel over 100 micrograms per liter require medical attention.
- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- ☑ Evaluation by a qualified allergist with special testing and careful consideration of exposure history (may help diagnose allergy).
- ☑ Liver and kidney function tests.

Also, because smoking can cause heart disease, emphysema, lung cancer, and other respiratory disorders, smokers who are exposed to nickel ammonium sulfate may experience symptoms more quickly and more pronounced than non-smokers under the same conditions of exposure. Persons who are allergic to nickel ammonium sulfate may also react to nickel ammonium sulfate-coated jewelry, watchbands, and, in some cases, prolonged contact with keys and coins.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site where nickel ammonium sulfate powder or dust is worked. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when working with nickel ammonium sulfate compounds.
- ☑ Wash thoroughly immediately after exposure to nickel ammonium sulfate and at the end of the work shift or before eating, drinking, or smoking. Clothing contaminated with nickel ammonium sulfate dusts or powders should not be taken home.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nickel ammonium sulfate should be provided to all personnel.

mium sulfate should be communicated to all exposed and potentially exposed workers.

- ☑ Specific engineering controls are recommended for this chemical by NIOSH. Refer to NIOSH Criteria Document: Inorganic Nickel (Publication Number 77-164).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of nickel ammonium sulfate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of nickel ammonium sulfate materials, especially the dusts and powders. Accidental contact with a variety of incompatible materials can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Nickel ammonium sulfate is considered a combustible solid. It is incompatible with oxidizing agents and acids and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of nickel ammonium sulfate. Should nickel ammonium sulfate ever come into contact with incompatible substances such as oxidizers, ammonium nitrate, acids, or sulfur compounds either during use, transportation, or storage, the formation of highly explosive commodities is extremely possible.

Elemental nickel is one of the most common metals found in surface waters, occurring naturally due to the weathering of rocks. Other sources of nickel in the environment include the burning of coal and other fossil fuels and discharges from such industries as electroplating and smelting.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nickel ammonium sulfate.

Nickel and its compounds have high acute toxicity to aquatic life. The softer the water, the higher the toxicity. Insufficient data are available on the short-term effects of nickel exposure to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Nickel and its compounds have high chronic toxicity in aquatic life. The softer the water, the greater the toxicity. Insufficient data are available on the long-term effects of nickel ammonium sulfate to plants, birds, or land animals.

💧 *Water Solubility*

Nickel and its compounds have water solubilities ranging from extremely low (negligible) to relatively high (almost miscible).

🕒 *Persistence in the Environment*

Nickel is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nickel and its compounds found in fish tissues is expected to be somewhat higher than the average concentration of nickel in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in the contamination of the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nickel ammonium sulfate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous

materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. When environmental contamination occurs, the local and/or state emergency response authorities may require notification. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nickel ammonium sulfate. If nickel ammonium sulfate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area of nickel ammonium sulfate powder spill or leak.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Do NOT dry sweep residues (generates dusts). Damp mop or use HEPA vacuum instead.
- ☑ It may be necessary to dispose of nickel ammonium sulfate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nickel ammonium sulfate can present a significant threat to business operations. The loss or damage of equipment or facilities due to explosion or fire can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered whenever developing or implementing public relations policies.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in

the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Delayed pneumonitis with chest pain, extremely difficult breathing, rapid respiration, intense exhaustion, cyanosis, loss of consciousness, and death. Other symptoms include headache, vertigo, sweating, weakness, coughing, dyspnea, nausea, stomach pain, and vomiting. It may lead to cancer of the lungs and sinuses. SKIN & EYES: An irritant to the eyes and skin. Exposure may cause contact dermatitis. Absorption is possible, with symptoms similar to that of inhalation. Eye contact causes irritation. INGESTION: A poison with CNS and gastrointestinal effects with nausea and vomiting. | | | | |
| Carcinogenicity Suspected Human Confirmed Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 1 | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Lungs, sinus, reproductive system, CNS, skin. |
| Medical Conditions Generally Aggravated by Exposure Existing problems with the upper respiratory tract may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. <u>For inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. <u>If swallowed:</u> Unlikely, but possible. Contact poison control center for assistance. Never attempt to give a convulsing or unconscious person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Restrict those not involved in cleanup activities from area. Remove all ignition sources and provide explosion-proof ventilation if possible. Absorb spills using vermiculite or other similar material and place in sealed drums from disposal. Use non-sparking tools during cleanup operations. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area and protect from physical damage. Use external or detached storage facility. Keep fire, heat, and ignition sources away (including direct sunlight). Store cylinders upright and secure them properly (never secure around the neck of the cylinder). | | | | |
| Other Precautions and Warnings Bulk storage of nickel carbonyl is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure levels are low and difficult to accurately monitor. For the best protection, use a full facepiece supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in positive pressure or other continuous flow mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Suit or Clothing |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NICKEL CARBONYL

NiCO₄

CAS: 13463-39-3

IDENTIFICATION AND TYPICAL USES

Nickel carbonyl is a colorless to yellow liquid with a characteristic musty odor. It can also appear as a gas above 110°F (43°C). It is used in the production of high-purity nickel powder by the Mond process. Also used in continuous nickel coatings on steel and other metals.

RISK ASSESSMENT: HEALTH

General Assessment

Nickel carbonyl is a human poison by *inhalation* and by dermal *absorption*. While *ingestion* is an unlikely exposure route because nickel carbonyl will vaporize rapidly at ambient temperatures, it is still possible. Because it is lipid soluble, it can easily cross biological membranes (such as the lung alveolus, blood-brain barrier, and placenta barrier). It is a confirmed carcinogen in animals and is likely to cause the same effects in humans. Tumors of the lung and nasal cavity have been well documented in experimental animal studies. Human mutation data have also been reported and nickel carbonyl is an experimental teratogen causing damage to the developing fetus in test animals.

Inhalation of nickel carbonyl vapors causes depression of the central nervous system (CNS) with symptoms of somnolence, fever, headache, dizziness (vertigo), sweating, weakness, and nausea. Pulmonary effects include delayed pneumonitis, coughing, dyspnea, pain in or behind sternum, irritation, congestion and hemorrhage of the lungs, delayed pulmonary edema (fluid in the lungs), tachycardia (rapid pulse), cyanosis, increased body temperature, hyperpnea, stomach pain, and vomiting. Symptoms of pulmonary edema can be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk. There may also be liver or brain effects on exposure to nickel carbonyl vapors.

Skin contact is likely to cause localized irritation and redness with dermal absorption possible. If absorption occurs, the symptoms noted for inhalation are likely to follow. Mixed exposures (e.g., inhalation and absorption) can therefore be extremely dangerous.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to nickel carbonyl:

Skin: Irritation, rash, and possible contact dermatitis. Dermal absorption is possible.

Eye: Nickel carbonyl particles can irritate the eyes and may cause disturbances to visual acuity

Lung: Irritation of the vapors can irritate the nose, mouth, and throat. High levels can irritate the lungs, causing a buildup of fluid (pulmonary edema), which is a medical emergency and can be fatal.

CNS: Symptoms include vertigo, headache, somnolence, nausea, and vomiting.

●* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to nickel carbonyl and can last for months or even years:

Cancer Hazards: Nickel carbonyl is a probable human carcinogen. There is limited evidence in the references that exposure can cause lung and nasal sinus cancer in humans and it has been shown to cause lung cancer in test animals. Human mutation data have also been reported and many scientists believe that such chemicals pose a cancer risk in the long-term.

Reproductive Hazard: According to information available in the references, nickel carbonyl has been shown to cause teratogenic effects in animal studies.

Other Chronic Effects: Permanent lung damage may occur after a single high exposure or repeated exposures to low concentration of nickel carbonyl. Chronic exposure may lead to a skin allergy in some individuals. The allergy may begin as an itch followed by a rash or redness with small bumps. Once such an allergy develops, even the slightest future exposures can cause a reappearance. The rash may persist for weeks after the exposure has stopped with gradual improvement over time (3-4 weeks). High or repeated exposures may cause damage to the heart muscle, liver and/or kidney.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with nickel carbonyl since it is considered a probable human carcinogen by more than one recognized authority (the ACGIH, NIOSH, the NTP, and the IARC). Prudent risk management dictates that it be handled and treated as though it were a confirmed human carcinogen. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around nickel carbonyl. The permissible exposure limit (PEL) is extremely low and difficult to accurately monitor (0.001 ppm). For the best protection, use a supplied-air respirator equipped with a full facepiece and operated in positive pressure mode or an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nickel carbonyl. A regulated, controlled work area should be

established where nickel compounds are used, handled, or stored.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where nickel carbonyl is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the PEL or greater, or significant skin contact), the following medical tests are recommended:

- ☑ Lung function tests (may be normal if person is not experiencing symptoms at the time of the test).
- ☑ Urinalysis or plasma (blood) tests for nickel. Normal nickel content in unexposed population should be less than 10 micrograms per liter.

If symptoms develop or overexposure is suspected, the following additional tests may be useful:

- ☑ Daily urine nickel monitoring for several days following last exposure. Persons with urine nickel ammonium sulfate over 100 micrograms per liter require medical attention.
- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- ☑ Evaluation by a qualified allergist with special testing and careful consideration of exposure history (may help diagnose allergy).
- ☑ Liver and kidney function tests.

Also, because smoking can cause heart disease, emphysema, lung cancer, and other respiratory disorders, smokers who are exposed to nickel ammonium sulfate may experience symptoms more quickly and more pronounced than non-smokers under the same conditions of exposure. Persons who are allergic to nickel ammonium sulfate may also react to nickel ammonium sulfate-coated jewelry, watchbands, and, in some cases, prolonged contact with keys and coins.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that

personnel have been trained on its use, care, and maintenance.

- ☑ Wash thoroughly immediately after exposure to nickel carbonyl and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nickel carbonyl should be communicated to all exposed workers.
- ☑ Where possible, automatically transfer nickel carbonyl from drums or other storage containers to process containers.
- ☑ Specific engineering controls are recommended for nickel by NIOSH. Refer to NIOSH Criteria Document: Inorganic Nickel (Publication Number 77-164).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of nickel carbonyl. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Nickel carbonyl is considered an extremely flammable liquid. It is considered a Class IB flammable liquid per OSHA 29 CFR 1910.106. Its extremely low flash point and relatively low boiling point present an extremely dangerous fire and explosion hazard. It is also incompatible with acids and oxidizers and contact can cause fire or explosion. Its vapors are more than five times heavier than air. They can travel for long distances, settle in low-lying areas, and, if contact with an ignition source is made, there can be flashback to the chemical's source with resulting fire or explosion. The liquid can also explode when heated in closed containers. These characteristics require special consideration during any emergency situation involving a leak or spill of nickel carbonyl.

Nickel is one of the most common metals found in surface waters, due to the weathering of rocks. Other sources of nickel in the environment include the burning of coal and other fossil fuels and discharges from such industries as electroplating and smelting.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nickel ammonium sulfate.

Nickel and its compounds have high acute toxicity to aquatic life. The softer the water, the higher the toxicity. Insufficient data are available on the short-term effects of nickel exposure to plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Nickel and its compounds have high chronic toxicity in aquatic life. The softer the water, the greater the toxicity. Insufficient data are available on the long-term effects of nickel ammonium sulfate to plants, birds, or land animals.

◆ *Water Solubility*

Nickel and its compounds have water solubilities ranging from extremely low (negligible) to relatively high (almost miscible).

⌚ *Persistence in the Environment*

Nickel is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nickel and its compounds found in fish tissues is expected to be somewhat higher than the average concentration of nickel in the water from which the fish was taken.

🔹 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nickel compounds should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed and replaced with clean soil. If nickel carbonyl should contact the water table, aquifer, or navigable waterway, time is of the essence. It is nearly insoluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nickel carbonyl. If nickel carbonyl is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Absorb liquids using vermiculite or other similar material and deposit in sealed drums for disposal. Use non-sparking tools.
- ☑ It may be necessary to dispose of nickel carbonyl as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nickel carbonyl can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may

result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, hysteria, ignorance, and anxiety can run equally high. This must be considered when dealing with the public following an incident involving nickel carbonyl.

🔹 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Medical Conditions Generally Aggravated by Exposure Persons with existing dermatitis or asthma may react more quickly on exposure to nickel sulfate. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> If victim is conscious, give large amounts of water and induce vomiting. Never attempt to give a convulsing or unconscious person anything by mouth. Provide breathing assistance if necessary. Keep person at rest and quiet. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area. Keep away from incompatible materials and prevent physical damage to containers. | | | | |
| Other Precautions and Warnings Personnel must be trained on the hazards of nickel compounds <i>before</i> being assigned to areas where nickel is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) The PEL is low and difficult to monitor. Use a full facepiece respirator with high efficiency particulate air (HEPA) filter. For best protection, use a supplied-air respirator with a full facepiece, hood, or helmet or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NICKEL SULFATENiSO₄

CAS: 7786-81-4 (anhydrous)

**IDENTIFICATION AND TYPICAL USES**

Nickel sulfate can appear as yellow-green crystals (the anhydrous form), blue or emerald-green crystals (an aqueous form), or green cubic crystals (another aqueous form). It is used in the manufacture of nickel ammonium sulfate, nickel catalysts, in nickel plating, as a mordant in dyeing and printing textiles, in coatings, and in ceramics.

RISK ASSESSMENT: HEALTH***General Assessment***

Nickel sulfate is a human poison by *inhalation* and, to a lesser degree, by *ingestion* of its finely divided powders and dusts. Skin contact with the dusts of nickel sulfate may result in scratching ("nickel scratch") and scarring. Nickel and many of its salts are confirmed carcinogens in animals, causing lung and nasal tumors. Its carcinogenic potential in humans is considered highly suspect. Nickel has also been shown to cause teratogenic effects in test animals as well as mutations (genetic changes) under experimental conditions. Nickel sulfate may cause infertility in males.

Inhalation of nickel sulfate dusts can cause severe inflammation and irritation of the upper respiratory tract with nonproductive cough, rapid breathing, dyspnea, and tightness in the chest. Nickel fumes may cause metal fume fever with chills, high fever, and flu-like symptoms that can last up to 24 hours after exposure. There may also be asthma-like symptoms, inflammation of the lungs (noninfectious), conjunctivitis, nausea, vomiting, and abdominal pain.

Ingested nickel is poorly absorbed, and there appears to be no retention of nickel from nutritional sources in individuals with normal kidneys. Dusts of metallic nickel and nickel oxide are not significantly absorbed systemically, although fumes from welding nickel are absorbed through the lungs, producing an increase in nickel levels in plasma and in urine.

Symptoms of ingestion (large doses) may include nausea, vomiting, and diarrhea.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to nickel sulfate:

Skin: Irritation/scratching on contact with dusts. May cause "nickel itch" or nickel dermatitis.

Eye: Irritation and scratching with possible progression to conjunctivitis.

Lung: Irritation of the nose, throat, and lungs on exposure to powders and dusts. The fumes can cause flu-like conditions ("metal fume fever").

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to nickel sulfate and can last for months or even years:

Cancer Hazards: According to information presented in the references, nickel is known to cause nasal sinus and lung cancer in animals. It is thought to be able to cause at least the same damage in humans. Mutation data have been reported for nickel sulfate and many scientists believe that such chemicals cause a cancer risk in the long-term. It is not known if the sulfate in particular will cause cancer, but caution is warranted in this regard.

Reproductive Hazard: According to information presented in the references, exposure to nickel and its salts may damage a developing fetus and/or cause infertility in males.

Other Chronic Effects: Skin contact can cause allergy. Symptoms include burning, itching, redness and bumps, or other rash-like developments. The rash may spread to other areas and remain for weeks after the exposure has ended. Repeated inhalation exposure

can cause chronic pulmonary irritation, chronic thickening of the mucous membranes of the nose, nasal sinusitis, anosmia (loss of the sense of smell), and perforation (holes) in the nasal septum. Lung allergy (asthma) occasionally develops with wheezing and/or tightness in the chest. Long-term exposure to the dusts or fumes may cause carcinoma of the paranasal sinuses, larynx, and lungs. Single high or repeated lower exposures may cause damage to the heart muscle, liver, and/or kidney.

🔊 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with nickel sulfate. The specific nature of its carcinogenic potential is not clearly understood. However, nickel and many of its salts or confirmed carcinogens and human exposure must be avoided or controlled. *Engineering controls* are always the most effective method of reducing exposures. The best protection, especially when working with fine powders and dusts of nickel sulfate, is to enclose operations and/or provide local exhaust ventilation at the site of powder/dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around nickel sulfate. A self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand is the best respiratory protection. However, for exposures near or over the 1 mg/m³ PEL for dusts, a respirator with a dust/mist/fume filter may suffice. If a full facepiece respirator is not available, then dust goggles or safety glasses with side shields attached should be worn to protect the eyes. To prevent hand and skin exposures, suitable gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nickel.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where nickel is used or stored. Before beginning work with nickel, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- ☑ Urinalysis or plasma (blood) tests for nickel. Normal nickel content in unexposed population should be less than 10 micrograms per liter.
- If symptoms develop or overexposure is suspected, the following additional tests may be useful:
- ☑ Daily urine nickel monitoring for several days following last exposure. Persons with urine nickel over 100 micrograms per liter require medical attention.
 - ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
 - ☑ Evaluation by a qualified allergist with special testing and careful consideration of exposure history (may help diagnose allergy).
 - ☑ Liver and kidney function tests.
- Also, because smoking can cause heart disease, emphysema, lung cancer, and other respiratory disorders, smokers who are exposed to nickel may experience symptoms more quickly and more pronounced than non-smokers under the same conditions of exposure. Persons who are allergic to nickel may also react to nickel-coated jewelry, watchbands, and, in some cases, prolonged contact with keys and coins.
- Other methods to reduce exposure include:
- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
 - ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
 - ☑ Wash thoroughly immediately after exposure to nickel sulfate and at the end of the work shift or before eating, drinking, or smoking. Eyewash stations and safety showers should be readily available for emergency use.
 - ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nickel sulfate should be communicated to all exposed and potentially exposed workers.
 - ☑ Specific engineering controls are recommended for nickel by NIOSH. Refer to NIOSH Criteria
- ☑ Lung function tests (may be normal if person is not experiencing symptoms at the time of the test).

Document: Inorganic Nickel (Publication Number 77-164).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of nickel sulfate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Nickel sulfate is non-combustible. However, its powders may form explosive mixtures in air especially in confined areas. It is also incompatible with strong acids, such as hydrochloric, sulfuric, and nitric. It can react violently in contact with ordinary combustible materials such as wood or paper. These characteristics require special consideration during any emergency situation involving a leak or spill of nickel sulfate.

Nickel is a naturally occurring element in natural water aquifers. At low concentrations, it is an essential element for both plants and animals. At slightly higher concentrations, it is toxic to aquatic life. The toxicity of nickel and its compounds to aquatic life varies with the physical and chemical conditions of the water. Factors such as water hardness, alkalinity, and pH influence nickel toxicity.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nickel sulfate.

Nickel and its compounds have high acute toxicity to aquatic life. The softer the water, the higher the toxicity. Insufficient data are available on the short-term effects of nickel exposure to plants, birds, or land animals.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Nickel and its compounds have high chronic toxicity in aquatic life. The softer the water, the greater the toxicity. Insufficient data are available on the long-term effects of nickel to plants, birds, or land animals.

💧 Water Solubility

Nickel and its compounds have water solubilities ranging from extremely low (negligible) to relatively high (almost miscible). Nickel sulfate is moderately soluble in water.

🕒 Persistence in the Environment

Nickel is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nickel found in fish is expected to be somewhat higher than the average concentration of nickel sulfate in the water from which the fish was taken.

🛑 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If nickel sulfate should contact the water table, aquifer, or navigable waterway, time is of the essence. Nickel compounds, and especially nickel

sulfate, may be moderately to highly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nickel sulfate. If nickel sulfate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do NOT dry sweep (generates airborne dusts). Use a damp mop or a HEPA vacuum to collect residues.
- ☑ It may be necessary to dispose of nickel sulfate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nickel sulfate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, hysteria, ignorance, and anxiety can run equally high. This must be considered when dealing with the public following an incident involving nickel carbonyl.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate

plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards | | | | |
| INHALATION: Irritation of the respiratory tract with nausea and vomiting, salivation, abdominal pain, headache, dizziness, hearing and visual disturbances, confusion, weakness, loss of muscular coordination, paroxysmal atrial fibrillation, convulsions, sweating, dyspnea. | | | | |
| ABSORPTION: Nicotine can pass through unbroken skin to cause symptoms similar to that noted for inhalation. Irritates the conjunctiva of the eye. | | | | |
| INGESTION: Gastrointestinal tract irritation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? CNS, CVS, lungs, GI tract, reproductive sys. |
| Medical Conditions Generally Aggravated by Exposure Existing nervous system or heart disorders may be aggravated by exposure to nicotine. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention. Give victim one or two glasses of water or milk to drink as quickly as possible. Do NOT induce vomiting unless directed to do so. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Provide maximum explosion-proof ventilation. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Absorb spills in vermiculite and deposit in sealed drums. Use non-sparking tools. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Nicotine is a flammable liquid. Store to avoid contact with strong oxidizers, since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat. | | | | |
| Other Precautions and Warnings Sources of ignition (heat, flame, cigarettes, incompatibles) are prohibited where nicotine is used, handled, or stored. Bulk storage of nicotine is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure levels are relatively low (0.5 mg/m³). Use an MSHA/NIOSH-approved supplied-air respirator with full facepiece in continuous flow mode, or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Boots; Aprons; Gauntlets |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NICOTINE

CAS: 54-11-5

**IDENTIFICATION AND TYPICAL USES**

Nicotine is a pale yellow to dark brown oily, hygroscopic liquid with a slight fish-like odor when warm. It may initially appear as a thick water-white oil that turns brown on exposure to air. It is used as an insecticide (although such use may be restricted), as a fumigant, in tanning, and in medicine. It is also one of the principal constituents of tobacco. It occurs in dried leaves of *Nicotiana tabacum* and *Nicotiana rustica* to the extent of 2-8%.

RISK ASSESSMENT: HEALTH**General Assessment**

Nicotine is a highly toxic compound. It can enter the body through *inhalation* and skin *absorption*. Although unlikely in the industrial setting, *ingestion* is also a possible route of exposure. There is no information in the reference to indicate that nicotine specifically causes cancer in humans. However, mutation data have been reported and nicotine has been shown to cause adverse reproductive effects in humans, especially by ingestion.

Inhalation causes irritation of the respiratory tract. Systemic action by all routes of exposure primarily affects the central nervous system and cardiovascular system. Symptoms include stimulation of the neuromuscular junctions and nicotine receptors in the brain causing depression and paralysis of autonomic ganglia. Indications of such exposure may include headache, nausea, vomiting, salivation, muscular weakness, twitching, and convulsions, tremors, confusion, hallucinations, distorted perceptions with hearing and visual disturbances. Death can occur from respiratory failure. There may also be incoordination, paroxysmal atrial fibrillation, prostration, faintness, abdominal pains, circulatory disturbances, and death from cardiac

disturbances. "Nicotinism" (or poisoning by nicotine) is characterized by stimulation and subsequent depression of the central nervous system.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to nicotine (within hours or days):

Skin: Mild irritation in contact with the liquid. Nicotine is readily absorbed through intact skin.

Eye: Severe irritation of the conjunctiva with burning, itching, and watering. Direct contact with heated vapors can irritate the eyes.

Lung: Irritation of the bronchial tubes and other members of the respiratory tract. May cause headache, loss of appetite, nausea, vomiting, slowed reactions, and death from respiratory paralysis.

CNS: Stimulation and then depression of the central and autonomic nervous system causing salivation, nausea, vertigo, sweating, hearing and visual disturbances, tremors and convulsions, faintness, prostration, confusion, hallucinations, excitement, and possibly coma. Death can occur from respiratory paralysis.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to nicotine and can last for months or even years:

Cancer Hazards: According to information presented in the references, nicotine has not been adequately tested for its ability to cause cancer in test animals.

However, it is known to cause mutations (genetic changes) in living cells and many scientists believe that long-term exposure to such chemicals may pose a cancer risk in the long-term. The data on its human carcinogenicity are inconclusive.

Reproductive Hazard: According to the references, nicotine has been shown to cause teratogenic effects and adversely affect reproduction in test animals.

Other Chronic Effects: Chronic exposure to nicotine, especially from long-term smoking, may lead to circulatory disorders and tobacco toxicosis. There can be adverse effects to blood pressure and other cardiovascular system complications.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with nicotine. It is a questionable teratogen and mutagen. Its carcinogenic potential is not clearly understood. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around nicotine. Air-purifying respirators will provide protection for exposures above the PEL. However, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or a supplied-air respirator operated in continuous flow mode are the recommended respiratory protection methods of choice when working with a questioned carcinogen. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and a protective apron should also be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made. Skin contact must be prevented since nicotine can pass through intact skin quickly.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nicotine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where nicotine is used or stored.

Before beginning employment, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for personnel working with nicotine:

- ☑ Evaluation of nervous system function and performance to establish a baseline of response levels.
- ☑ Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Liver and kidney function tests.
- ☑ Evaluation of cardiovascular system functions with electrocardiogram (EKG) and other special testing.
- ☑ Lung function tests (compare to baseline).
- ☑ Nervous system evaluation by a qualified neurologist.
- ☑ Evaluation by a qualified allergist, including careful evaluation of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, lung cancer, high blood pressure, and other serious physical disorders, as well as cause an increase in nicotine content in the body, smokers exposed to nicotine in the workplace may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* possible exposure factors.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- ☑ Wash thoroughly immediately after exposure to nicotine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information

on the health and safety hazards of nicotine should be communicated to all exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to nicotine, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of nicotine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Nicotine is considered a Class IIIB combustible liquid. Its moderate flash point and relatively high boiling point present a serious fire hazard under normal or emergency response conditions. Also, because it is incompatible with many common oxidizers and acids, extreme caution is required in handling, storage, transportation, and disposal of nicotine. These characteristics also require special consideration during any emergency situation involving a leak or spill of nicotine liquid. Its vapors are heavier than air and can collect in low-lying areas. Should nicotine ever come into contact with incompatible substances (such as oxidizers) either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for nicotine waste is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

Nicotine can enter the environment from industrial and municipal plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nicotine.

Insufficient data are available to evaluate or predict the short-term effects of nicotine to aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of nicotine to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Nicotine is highly soluble in water. Concentrations of 1000 milligrams or more will mix with a liter of water.

🕒 *Persistence in the Environment*

Nicotine is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nicotine found in fish tissues is expected to be about the same as the average concentration of nicotine in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of nicotine into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nicotine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Personnel working in storage areas must be trained on the hazards of nicotine.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using

non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If nicotine should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nicotine. If nicotine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Absorb liquids using vermiculite or other material and deposit in sealed drums for disposal. Collect in safest manner possible using non-sparking tools. Nicotine can attack some rubber, plastics, and coatings. Brass, copper, or other soft metal tools may be required to prevent sparking.
- ☑ It may be necessary to dispose of nicotine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nicotine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the term "reproductive hazard" is used, public emotion, hysteria, and ignorance can run equally high. This should be carefully considered when drafting or implementing public relations policies.

🔊 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any safety, health or environ-

mental policies or procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

NITRIC ACID

CAS: 7697-37-2

**IDENTIFICATION AND TYPICAL USES**

Nitric acid is a transparent to clear or yellow fuming liquid. It can also appear as reddish-brown to orange-brown fumes. It has a suffocating odor. The liquid may darken to brown on aging and exposure to light. Fuming nitric acid is concentrated nitric acid that contains dissolved nitrogen dioxide. It is used in the manufacture of ammonium nitrate for fertilizer and explosives, in organic synthesis (for dyes, drugs, explosives, cellulose nitrate, and nitrate salts), in metallurgy, in photo-engraving, for etching steel, in ore flotation, in urethanes, in rubber chemicals, and in the reprocessing of spent nuclear fuel.

RISK ASSESSMENT: HEALTH**General Assessment**

Nitric acid is highly corrosive to the skin, eyes, digestive tract, and respiratory system (or any other tissue it contacts). It is a human poison by *ingestion* and is dangerously toxic by *inhalation*. There are no data in the references regarding any carcinogenic, mutagenic, or teratogenic effects on exposure to nitric acid. Its corrosive and irritating properties limit the possibility of long-term exposure since people cannot tolerate unprotected contact for even short periods of time.

Inhalation produces severe irritation of the eyes, nose, and respiratory tract with coughing, dyspnea (labored breathing), bronchitis, headache, and total body weakness. The vapors can cause laryngitis, pharyngitis, chemical bronchitis, pneumonitis, and delayed pulmonary edema which can be fatal. There may be tearing, nasal discharge, throat irritation, ulceration of the nasal septa and nose irritation, and nausea. Symptoms of pulmonary edema, such as chest pain, congestion, coughing, and weakness, may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk. There may also be depression of the central nervous system with

symptoms of giddiness, salivation, nausea, muscular weakness, and other unspecified symptoms.

Skin contact causes severe burning with possible vesiculation. Its extremely corrosive properties cause immediate burns, membrane ulceration, skin blistering, and local necrosis (tissue destruction) upon contact. Eye contact causes damage and the possibility of permanent blindness.

Ingestion is extremely dangerous, even life-threatening. It causes severe poisoning, throat swelling, convulsions, risk of stomach perforation, bloody vomiting, burning sensation on the mouth, acute tissue damage, diarrhea with pain, and possible coma.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to nitric acid:

Skin: Irritation/rash or burning feeling on contact with redness, blistering and vesiculation, and localized tissue destruction.

Eye: Severe irritation; may cause burns and damage with permanent blindness.

Lung: Severe irritation of the mucous membranes in the nose, throat, and lungs with delayed pulmonary edema (fluid in the lungs), which can be fatal.

CNS: Possible depression of the nervous system with symptoms of giddiness and irritability.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to nitric acid and can last for months or even years:

Cancer Hazards: According to information presented in the references, nitric acid has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, nitric acid has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Skin contact causes irritation and burns. There may be some lasting effects of chronic exposures such as sensitization. Once an individual becomes "sensitized," even the slightest future exposures can cause an allergic reaction. Repeated inhalation of very low concentrations may cause chronic bronchitis, chronic lung diseases, tooth erosion, and/or loss of appetite.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with nitric acid. It is extremely corrosive and moderately toxic to humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around nitric acid. A self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. For low concentrations (near or over the 2 ppm exposure limit), an acid gas cartridge respirator (equipped with a mist/vapor filter) is acceptable protection. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid-resistant gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nitric acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where nitric acid is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

- ☑ Lung function tests (look for chronic respiratory diseases).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).
- ☑ If nitric acid is ingested, contact poison control center. Unless advised otherwise and victim is conscious and alert, give 1-2 glasses of water or milk to dilute followed by milk of magnesia. Do NOT induce vomiting and do NOT administer sodium bicarbonate.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to nitric acid and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nitric acid should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of nitric acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Nitric acid is considered a non-combustible liquid. However, as an oxidizer, it can greatly accelerate the burning of ordinary combustible materials such as wood or paper. It is also extremely corrosive to many materials. It is incompatible with many materials, in-

cluding hydrogen sulfide, carbides, cyanides, and alkalis, and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of nitric acid. It will also corrode many common plastics, rubber, and coatings. Selection of response equipment (shovels, containers, and the like) must therefore be carefully considered. Should nitric acid ever come into contact with incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or explosive commodities is extremely possible.

Nitric acid can enter the environment mainly through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nitric acid.

Insufficient data are available on the short-term effects of nitric acid exposure to aquatic life, plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of nitric acid to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Nitric acid is highly soluble in water. Concentrations of over 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Nitric acid is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nitric acid found in fish tissues is expected to be somewhat lower than the average concentration of nitric acid in the water from which the fish was taken.

🔧 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nitric acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). It must be kept cool and in a well-ventilated location away from direct sunlight.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If nitric acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nitric acid. If nitric acid is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Neutralize remaining residue with soda ash or sodium bicarbonate. Do NOT flush to drains, sewers, or waterways. Use water spray to cool and knock-down vapors. Collect water for disposal.
- ☑ It may be necessary to dispose of nitric acid as a hazardous waste. The responsible state agency or

the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nitric acid can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Vapor Density (Air = 1) | 1.04 | Melting Point | -263°F (-164°C) |

Solubility

Slightly soluble in water (5%).

Appearance and Odor

Colorless gas with a sharp, sweet odor. Also appears with a deep blue color in liquid form. Shipped as a non-liquefied compressed gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---------------------------|---|
| Flash Point (method used) | Explosive Limits in Air % by Volume |
| Not Applicable | LEL: Not Applicable UEL: Not Applicable |
| NFPA Classification | Autoignition Temperature |
| Non-Flammable Gas | Not Applicable |

Extinguishing Media

Will not burn but will enhance the burning of other materials. Use agent suitable to surrounding fire.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Move container from fire area if it can be done without risk. Fight fire from maximum distance. Stay away from ends of tanks. Cool exposed containers with direct water spray.

Unusual Fire and Explosion Hazards

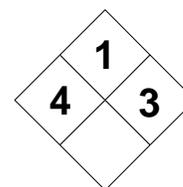

Containers may explode in fire. As an oxidizer, nitric oxide can greatly accelerate the burning of ordinary combustible materials such as wood and paper. Use extreme caution if nitric oxide is in or near a fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|---|--|--|
| Stability | | Conditions to Avoid Nitric oxide is normally stable in closed containers under routine conditions of handling and storage. It is highly reactive with many materials. Avoid contact with incompatibles, heat, and atmospheric oxygen. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with fluorine, combustible materials, ozone, chlorinated hydrocarbons, metals, carbon disulfide, chlorine monoxide, phosphine, perchloryl fluoride, and water (forms nitric acid). | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of nitric oxide is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, nitric oxide emits carbon monoxide and/or oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? |
| Health Hazards INHALATION: Severe irritation to the eyes, nose, throat, and lungs. Causes headache, nausea, vomiting, difficulty breathing, cyanosis, pulmonary edema (fluid in the lungs), depression of the CNS with drowsiness, weakness, loss of coordination, and convulsions. Also causes the development of methemoglobinemia affecting the transportation of oxygen by the blood. SKIN & EYES: A severe eye and skin irritant. Cold compressed gas temperatures may cause frostbite and associated tissue destruction. INGESTION: Unlikely since nitric oxide exists as a gas at normal room temperatures. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Skin, eyes, respiratory system, blood, CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, existing respiratory problems (bronchitis, asthma) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum). Skin contact: Wash with large amounts of water for a minimum of 15 minutes. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. Oxygen should be administered by trained medical personnel only. If swallowed: Not likely since nitric oxide is a gas. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA). Stop flow of gas. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. If gas cannot be stopped, remove leaking container to safe area outdoors and allow to empty. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed, insulated, steel containers or cylinders in a cool, well-ventilated area away from heat. Protect containers from physical damage. Regularly inspect for leaks, cracks, or faulty valves. | | | | |
| Other Precautions and Warnings Use external or detached storage. Ensure cylinders are stored upright and properly secured at all times. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use a NIOSH/MSHA-approved air purifying gas-cartridge respirator, or a supplied-air respirator, or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical Goggles and Face Mask | | Other Protective Clothing Protective Uniform or Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NITRIC OXIDE

NO

CAS: 10102-43-9

IDENTIFICATION AND TYPICAL USES

Nitric oxide appears as a colorless gas with a sharp and sweet odor. It may appear as a deep blue liquid at temperatures below -263°F (-164°C). It converts readily to toxic nitrogen dioxide and nitrogen tetroxide on contact with air. Nitric oxide is used as an intermediate in the manufacture of nitric acid, in the preparation of metal nitrosyls, in the bleaching of rayon, and in the manufacture of incandescent lamps.

RISK ASSESSMENT: HEALTH

General Assessment

Nitric oxide is a severe irritant to the eyes, nose, and throat. As a gas, it can primarily enter the body through *inhalation*. While skin absorption is not likely, skin contact can result in serious tissue damage as a direct result of the cold temperatures of the compressed gas or cryogenic liquid. Ingestion is not a probable route of exposure under most circumstances. There are no data regarding any carcinogenic, mutagenic, or teratogenic potential.

Inhalation of nitric oxide can cause severe irritation to the eyes, nose, throat, and respiratory system. Symptoms can be delayed for 1 to 5 hours and may include headache, nausea, vomiting, dyspnea (difficult breathing), diarrhea, cyanosis (bluish discoloration of the lips, fingers, and toes), methemoglobinemia, and possible CNS depression with drowsiness, weakness, loss of coordination, memory impairment, peripheral neuropathy, convulsions, coma, and death. Lung irritation can be quite severe and may lead to pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can be fatal. The symptoms of pulmonary edema can be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk.

Skin contact with compressed nitric oxide can cause characteristic burns due to frostbite. Eye contact causes irritation, watering, inflammation of the lids, burns to the cornea, and (possibly) severe lesions.

Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to nitric oxide:

Skin: Severe irritation with localized tissue damage and possible burns due to the cold temperature of the compressed gas.

Eye: Severe conjunctival irritation and possible damage to the cornea and loss of vision.

Lung: Severe irritation to respiratory tract causing shortness of breath and cough. High acute exposures can be fatal due to a buildup of fluid in the lungs (pulmonary edema).

CNS: Possible depression of the central nervous system causing a variety of toxic effects including loss of coordination and consciousness.

Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to nitric oxide and can last for months or even years:

Cancer Hazards: According to information presented in the references, nitric oxide has not been adequately tested for its ability to cause cancer in test animals. Animal mutation data have been reported and many scientists believe that such chemicals may pose a cancer risk in the long-term.

Reproductive Hazard: According to the references, nitric oxide has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Long-term exposures to low concentrations may result in the gradual corrosion of teeth enamel, chronic headache, and chronic cough or bronchitis.

☉ **Recommended Risk-Reduction Measures**

Nitric oxide is, by itself, a very toxic substance. On exposure to air, it can rapidly convert to the even more toxic nitrogen dioxide and nitrogen tetroxide. Personnel should therefore avoid direct contact with nitric oxide. If a less toxic material or compound cannot be substituted for nitric oxide, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of nitric oxide release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around nitric oxide. The exposure level of 25 ppm (8-hour TWA) may lead personnel to believe that they are not being exposed to dangerous levels. However, prudent risk management requires proper consideration and implementation of an appropriate respiratory protection program (per OSHA 29 CFR 1910.134). While a gas-cartridge air purifying respirator will certainly suffice, the best protection is obtained using an MSHA/NIOSH-approved supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, polyvinylchloride gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nitric oxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where nitric oxide is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical test is recommended:

- Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following may be useful:

- Repeat lung function tests (compare to baseline).
- Consider chest X-ray after acute exposure (may be negative if taken immediately following exposure due to delayed development of pulmonary edema).
- Examination and evaluation of the nervous system functions by a qualified neurologist.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other respiratory ailments, any exposure to nitric oxide can result in quicker and more devastating symptoms. Smokers should therefore avoid unprotected contact with this chemical. Prudent risk management requires proper consideration of *all* possible factors that may be causing the appearance of exposure symptoms among workers.

Other methods to reduce exposure include:

- Always ensure that proper protective clothing is worn when using chemical substances, and that personnel are trained on its use, care, and maintenance.
- Wash thoroughly immediately after exposure to nitric oxide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nitric oxide should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to compressed nitric oxide gas, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by nitric oxide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to chemical substances such as nitric oxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is always at risk of exposure during transportation, storage, disposal, or destruction of nitric oxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. As a gas, it primarily affects the air. However, depending upon the nature and conditions of the release, accidental spills, large or small, can result in contamination of the other surrounding environmental mediums (water and soil).

Nitric oxide is non-flammable gas. However, as an oxidizer it can greatly accelerate the burning of ordinary combustible materials such as wood and paper. This is especially true when nitric oxide is heated. Also, on exposure to air, it will release nitrogen dioxide and nitrogen tetroxide which are both extremely toxic and very powerful oxidizers. It is incompatible with many fuels and hydrocarbons, as well as other common gases such as carbon monoxide, ozone, and phosphine. Caution is always required in handling, storage, transportation, and disposal of nitric oxide. Emergency responders should be made aware of the presence of nitric oxide at any emergency response situation.

Nitric oxide may enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nitric oxide. Insufficient data are available to evaluate or predict the acute (short-term) effects of nitric oxide on aquatic life, plants, birds, or land animals.

☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the chronic (long-term) effects of nitric oxide on aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Nitric oxide is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Nitric oxide is slightly persistent in the aquatic environment, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. As a gas, virtually 100% of nitric oxide will eventually end up in the air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nitric oxide found in fish tissues is expected to be somewhat lower than the average concentration of nitric oxide in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of nitric oxide into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nitric oxide should be segregated from other chemicals to minimize the risk of cross-contamination. Nitric oxide must be stored to avoid contact with incompatible materials since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If nitric oxide should contact the water table, aquifer, or navigable waterway, time is of the essence. Because it is slightly soluble in water, total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nitric oxide.

If nitric oxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Absorb spilled liquids with vermiculite or a similar material and deposit in sealed drum for disposal.
- ☑ Ventilate area of spill or leak.
- ☑ Remove ignition sources from the area.
- ☑ If source if leak is a cylinder, attempt to stop flow. If this cannot be done or cylinder is damaged, remove to safe place outdoors and allow to vent until empty.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nitric oxide can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. If <u>swallowed:</u> Unless advised otherwise, give 2 tablespoons Ipecac (adult dose) and 1-2 glasses of water. Induce vomiting. Seek medical attention immediately. NOTE: Alcohol ingestion in a heated environment may increase individual susceptibility. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or other non-reactive material and deposit in sealed drum. Ventilate area of spill or leak. For dry spills, collect for reuse or disposal. Do NOT dry sweep. Use water spray to knock-down vapors (for solution spills) and wet mop residue of dry spills. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Store in detached facility away from main plant or facility. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where nitrobenzene is used, handled, or stored. Heat may cause solids to liquefy and containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL is low and difficult to monitor. For exposures above the PEL, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NITROBENZENE

CAS: 98-95-3

**IDENTIFICATION AND TYPICAL USES**

Nitrobenzene is a clear, colorless to pale yellow oily liquid or, it can appear as a bright yellow crystalline solid. It has a distinctive odor of almond oil. It is used in the manufacture of aniline, as a solvent for cellulose ethers, for modifying esterification of cellulose acetate, as an ingredient in metal polishes and shoe polishes, and in the manufacture of benzidine, quinoline, azobenzene, and other chemicals.

RISK ASSESSMENT: HEALTH***General Assessment***

Nitrobenzene is a human poison. It can enter the body through all routes of exposure (*inhalation, ingestion, and skin absorption*). While there are no data on its carcinogenic abilities in humans or animals, it is known to cause mutations (genetic changes) in experimental tests. It is also a known animal teratogen and can cause adverse reproductive effects.

Inhalation can cause irritation to the respiratory system and associated mucosa. Symptoms include headaches, dizziness, vomiting, nausea, anemia, anoxia, dyspnea, rapid pulse, irritation of the eyes, coma, and possibly death. It also results in the formation of methemoglobin (a pigment similar to hemoglobin that is unable to perform the normal oxygenation process). This may be indicated by the development of cyanosis (blue discoloration of the fingers, toes, lips, and facial skin due to the lack of oxygen in the blood). There may also be deleterious effects on the central nervous system (CNS) and cardiovascular system (CVS) following high exposures.

Skin contact can produce the same systemic systems as inhalation as a result of the chemical's ability to pass readily through intact skin. There may also be localized irritation with the appearance of small blisters, redness, and/or swelling. Eye contact with the

liquid solution or dusts can cause irritation, redness and swelling of the eyelids, painful sensitivity to light, and can cause severe eye damage and possible loss of vision if not removed immediately from contact with the eye.

Ingestion of nitrobenzene can also cause systemic effects similar to those of inhalation. There can also be painful irritation of the mouth and stomach, stomach cramps, and diarrhea. A bitter almond taste or burning sensation in the mouth, dry throat, and thirst can occur.

Alcohol consumption, some medications, exposure to sunlight, or hot baths can aggravate and enhance symptoms.

Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to nitrobenzene:

Skin: Irritation and possible blistering. It will pass through unbroken skin to cause toxic systemic effects, including weakness, nausea, collapse, and even death.

Eye: Severe irritation with damage and possible damage to or loss of vision.

Lung: Irritation to the respiratory tract and associated mucosa. Can cause weakness, nausea, confusion, collapse, coma, and death (respiratory failure).

CNS: A CNS depressant causing weakness, confusion, vertigo, mood changes and other personality changes, nausea, collapse.

CVS: Causes adverse effects on the function of the cardiovascular system. It forms methemoglobin which interferes with the blood's ability to effectively transport oxygen to the cells. This can lead to serious, life-threatening illness.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to nitrobenzene and can last for months or even years:

Cancer Hazards: According to information presented in the references, nitrobenzene has not been adequately tested for its ability to cause cancer in test animals. Some studies have suggested that exposure to nitrobenzene causes mutations (genetic changes in living cells). Many scientists believe that such chemicals may pose a cancer risk in the long-term. There is no evidence that nitrobenzene causes cancer.

Reproductive Hazard: According to information presented in the references, nitrobenzene has been shown to be a teratogen in experimental tests and it may also have the ability to adversely affect reproduction in animals.

Other Chronic Effects: Long-term exposure may produce a reversible anemia.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with nitrobenzene. It is an extremely toxic skin and eye irritant with the ability to enter the body through all routes of exposure. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around nitrobenzene. The exposure level is low (1 ppm) and difficult to monitor. For exposures above the PEL, use an MSHA/NIOSH-approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust/mist pre-filter. Better protection is obtained using a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, protective gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nitrobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where nitrobenzene is used or stored.

Before beginning employment with nitrobenzene and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- ☑ Kidney and liver function tests.
- ☑ Complete blood count with methemoglobin levels.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney and liver function tests.
- ☑ Monitor methemoglobin levels hourly for at least 24 hours until definite decline is noticed..
- ☑ Consider possible reactions caused by alcohol consumption and/or medications.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Physicians should note that symptoms may be delayed, so victim should be kept under observation. The methemoglobin concentration should be determined at regular intervals until indications of full reduction to hemoglobin occur.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to nitrobenzene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of nitrobenzene should be communicated to all exposed and potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to nitrobenzene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of nitrobenzene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of nitrobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Nitrobenzene is normally considered a combustible liquid, but it can also appear in mixed solutions of flammable liquids. In solid form, its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with many common reducing agents, caustics, and some reactive metals (such as zinc and tin). Contact with either can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of nitrobenzene. Should nitrobenzene ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Nitrobenzene may enter the environment through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nitrobenzene.

Nitrobenzene appears to have high acute toxicity to aquatic life. Insufficient data are available to

evaluate the short-term effects of nitrobenzene exposure to plants, birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of nitrobenzene to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Nitrobenzene is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Nitrobenzene is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nitrobenzene found in fish tissue is expected to be somewhat higher than the average concentration of nitrobenzene in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nitrobenzene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for

storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If nitrobenzene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nitrobenzene. If nitrobenzene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet mop spill area to collect residue.
- It may be necessary to dispose of nitrobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nitrobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the term "reproductive hazard" is used, public

emotion, hysteria, and ignorance can run equally high. This should be a consideration during the development of public relation policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

NITROETHANE

CAS: 79-24-3

**IDENTIFICATION AND TYPICAL USES**

Nitroethane is a colorless, oily liquid with a mild, fruity odor. It is used as a solvent for nitrocellulose, cellulose acetate, cellulose acetopropionate, cellulose acetobutyrate, vinyl alkyd, and many other resins, waxes, fats, and dyestuffs. Also used in propellant research and as a fuel additive.

RISK ASSESSMENT: HEALTH**General Assessment**

Nitroethane is moderately toxic by *ingestion* and *inhalation*. It is also a skin irritant, but dermal *absorption* has not been reported. There are no indications of any carcinogenic, mutagenic, or teratogenic effects following exposure.

Inhalation causes irritation of the mucosa of the eyes, nose, throat, and respiratory tract. Systemic effects have not been observed in humans. However, animal studies indicate a possibility for the development of pulmonary rales and edema (fluid in the lungs) which is a medical emergency. Symptoms of cough, congestion, labored breathing, and pain in the chest may be delayed up to 48 hours which may give a false sense of security with regard to health exposure risk. There may also be liver and kidney injury and, at high concentrations, narcosis. Severe exposure in humans is expected to cause similar effects. Nitroethane may also cause the formation of methemoglobin which can significantly interfere with the blood's ability to properly transport oxygen.

Skin contact causes mild to severe irritation and, if allowed to remain in contact for prolonged periods, either directly or in chemical-soaked clothing, there can be reddening and smarting at the site of contact. Eye contact can cause irritation and tearing.

Ingestion may result in irritation of the mouth and stomach, nausea, and vomiting.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to nitroethane:

Skin: Irritation with redness and smarting at the site of contact.

Eye: Irritation and inflammation with a possibility of damage to visual acuity.

Lung: Irritation of the mucosa of the nose, throat, and respiratory tract. May lead to delayed pulmonary edema which can be fatal.

CNS: Unspecified effects associated with depression of the central nervous system.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to nitroethane and can last for months or even years:

Cancer Hazards: According to information presented in the references, nitroethane has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: Long-term exposure can lead to dermatitis.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with nitroethane. If another chemical cannot be substituted for a nitroethane, then *engineering controls* are the most effective

Risk Management for Hazardous Chemicals

method of reducing exposures. The best protection is to separate operations and provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using equipment with explosion-proof designs and ensuring all metal containers and tools are electrically grounded and bonded can further reduce the potential for injury or damage. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with nitroethane. For exposures over the 8-hour PEL (100 ppm), an air-purifying chemical cartridge respirator equipped with an organic vapor cartridge may provide adequate protection. However, best protection is obtained using a powered air-supplied respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures with the liquid, thermal gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nitroethane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where nitroethane is used or stored.

If overexposure is suspected or symptoms develop, the following medical tests are recommended:

- Lung function tests.
- Liver and kidney function tests.
- Methemoglobin level monitoring.
- Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Other methods to reduce exposure to chemicals include:

- Where possible, consider installing automatic sensors that warn personnel of dropping oxygen levels and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation

or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to nitroethane and at the end of the work shift or before eating, drinking, or smoking.
- Safety shower and eyewash stations should be readily available in work areas where nitroethane is used or stored.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nitroethane should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT***General Assessment***

The environment is at risk of exposure during transportation, storage, disposal, or destruction of nitroethane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Nitroethane is a Class IC flammable liquid per OSHA 29 CFR 1910.106. It can present an extremely flammable and highly explosive hazard. Also, since it can react violently in the presence of oxidizers, acids, and hydrocarbons, nitroethane requires special consideration during any emergency involving a leak or release of nitroethane gas or liquid.

Nitroethane can enter the environment through industrial discharges or through spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nitroethane. Insufficient data are available on the short-term effects of nitroethane on aquatic life, plants, birds, or land animals.

☪ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first ex-

Risk Management for Hazardous Chemicals

posure(s) to toxic chemicals. Insufficient data are available to evaluate the long-term effects of nitroethane to aquatic life, plants, birds, or land animals.

◆ *Water Solubility*

Nitroethane is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Nitroethane is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nitroethane found in the edible tissues of fish is expected to be somewhat lower than the average concentration found in the water from which the fish was taken.

🔒 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nitroethane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. When spills or leaks occur, it may be necessary to contact the local and/or state emergency response authorities. A comprehensive emergency response or

disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nitroethane. If nitroethane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids using vermiculite, dry earth, or other material and place in sealed containers for disposal. For small spills, cover liquid with soda ash, place in an open bucket of water, and let stand for two hours. Neutralize with hydrogen chloride and flush to drain with flooding water.
- ☑ Keep nitroethane out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- ☑ It may be necessary to dispose of nitroethane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nitroethane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Solubility

Very slightly soluble in water; insoluble in liquid ammonia and alcohol.

Appearance and Odor

Colorless, odorless, tasteless gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: Not Applicable UEL: Not Applicable |
| NFPA Classification Non-Flammable Gas | Autoignition Temperature Not Applicable |

Extinguishing Media

Use extinguishing media suitable to surrounding fires. Nitrogen will not ignite.

Special Fire Fighting Procedures

Fire can produce toxic vapors and gases: wear full protective clothing and self-contained breathing apparatus (SCBA). Contact with the liquid may cause frostbite. Heat will build pressure and may rupture closed storage containers. Keep fire-exposed containers cool with water spray. Pipes containing liquid nitrogen can condense oxygen from the air, which is a fire hazard.

Unusual Fire and Explosion Hazards

Nitrogen cylinders may explode in the heat of fire.

SECTION V - REACTIVITY DATA

| | | |
|---------------------------------|----------------------------|--|
| Stability | | Conditions to Avoid Nitrogen is stable in closed cylinders under routine conditions of handling and storage. Keep away from heat and other gases. It can condense and solidify other gases. Use metal containers made for cryogenics. |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Nitrogen is a simple asphyxiant gas that is lighter than air. It can react violently with lithium, neodymium, titanium, and zirconium. Also incompatible with hydrogen gas and magnesium powder + ignition source. |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of nitrogen is not expected to occur. Liquid nitrogen will attack some rubber and plastics, making them brittle. |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Forms cyanides when heated in the presence of alkalis or barium oxide. No other hazardous products of decomposition have been noted. |

SECTION VI - HEALTH HAZARD DATA

| | | | |
|-----------------------------------|-------------------------|--------------------|------------|
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? | Ingestion? |
|-----------------------------------|-------------------------|--------------------|------------|

Health Hazards

INHALATION: An asphyxiant gas. Initial symptoms are those of oxygen starvation. Feeling of “air hunger,” diminished mental alertness, headache, dullness, shortness of breath, and an impairment in muscle coordination. Continued exposures lead to faulty judgment, depression of senses, rapid fatigue, unconsciousness, convulsions, coma, and death.

SKIN & EYES: Contact with the compressed gas or refrigerated liquid can cause frostbite and burns.

INGESTION: Not likely since nitrogen is a gas at normal working (room) temperatures.

| | | | | |
|---|-------------|---------------------------|-----------------|---|
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| No Evidence Human No Evidence Animal | No | No | No | Respiratory system; skin; eyes, CNS. |

Medical Conditions Generally Aggravated by Exposure

None Reported.

Emergency and First-aid Procedures

Eye contact (liquid): Immediately flush with large amounts of tepid water for 15 minutes (minimum), occasionally lifting eyelids; seek medical attention. **Skin contact (liquid):** Remove all contaminated clothing. Immediately flush area with large amounts of tepid water. Do NOT rub! Seek medical assistance. For **inhalation:** Remove the person from exposure. Emergency responders must be protected from inert atmospheres. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If **swallowed:** Treat frozen tissues and protect the airway. Seek medical attention immediately.

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled

Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. Ensure response personnel are properly protected with self-contained breathing apparatus (SCBA).

Preferred Waste Disposal Method

No citation.

Precautions to be Taken in Handling and Storage

Store in tightly closed containers in a cool, dry, well-ventilated area away from heat, direct sunlight, or other hot areas (water lines, vent pipes). Ensure proper storage and handling precautions are in place whenever working with compressed gas cylinders.

Other Precautions and Warnings

Containers may explode in fire or under conditions of extreme heat. Protect cylinders from physical damage. Use pressure relief on liquid containers. Periodically check vent valves for blockage (ice).

SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT

Respiratory Protection (*specify type*)

No exposure limits have been established. Nitrogen is a simple asphyxiant. Do NOT use cartridge-type respirators (ineffective for this type of gas). Use a powered supplied-air respirator or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode.

Ventilation

Local exhaust or general mechanical systems recommended.

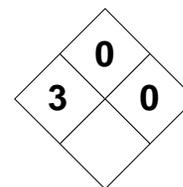

| | | |
|--|--|--|
| Protective Gloves Impervious, Thermal Insulated Gloves | Eye Protection Chemical Goggles and/or Face Mask | Other Protective Clothing Protective Boots, Gauntlets, Apron |
|--|--|--|

Work/Hygiene Practices

Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals.

NITROGENN₂

CAS: 7727-37-0

**IDENTIFICATION AND TYPICAL USES**

Nitrogen is a colorless, odorless, and tasteless gas. It is used in the production of ammonia, acrylonitrile, nitrates, cyanamide, cyanides, nitrides, in the manufacture of explosives, as an inert gas for purging, as an inert blanket gas, and for exerting gaseous pressures on systems and components. Also used in the electric and electronic industries, in food refrigeration and for freeze drying, for pressurizing liquid propellants, in quick-freezing foods, for chilling aluminum in foundries, for cryogenic preservation, as a food antioxidant, as a source of pressure in oil wells, for inflating tires, and as a major component of fertilizer mixtures.

RISK ASSESSMENT: HEALTH**General Assessment**

Nitrogen is a simple asphyxiant gas. As such, its primary route of entry into the body is through *inhalation*. While it does not pose a significant physiological effect (i.e., no systemic poisoning or toxicity), it can displace oxygen levels to below that which is necessary to sustain life. Skin contact with the liquid can be destructive to tissues due to the extremely cold temperatures but absorption is not a likely exposure route. Since nitrogen usually exists as a gas at room temperatures, ingestion is not likely to occur either.

Inhalation of nitrogen gas can cause headache, dullness, shortness of breath, and the symptoms of asphyxiation. These include rapid respiration and a feeling of "air hunger" or air starvation followed by a decrease in mental alertness, and impaired muscular coordination. If exposure continues, there can be nausea, vomiting, prostration, unconsciousness, coma, and death.

Skin or eye contact with the vapor poses no serious threat. The vapors have not been shown to cause any physiological response. However, if the liquid should contact either the skin or the eyes, there can be serious irritation, burns, tissue damage, and frostbite.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to nitrogen:

- Skin:** Liquid threat only. Redness, pain, swelling, blisters, and severe frostbite.
- Eye:** Liquid threat only. Causes frostbite, redness, irritation, severe pain, and blurred vision.
- Lung:** Vapor is non-irritating and therefore poses no threat of damage to the lungs. However, in high concentrations, nitrogen can lead to symptoms of asphyxiation and oxygen deprivation up to and including death.

⚙ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to nitrogen and can last for months or even years:

- Cancer Hazards:** According to information presented in the references, exposure to nitrogen does not lead to carcinogenic effects (it is a simple asphyxiant).
- Reproductive Hazards:** There are no reports to support any claims of reproductive hazards.
- Other Chronic Effects:** None reported.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with nitrogen. If another gas cannot be substituted for a nitrogen, then *engineering controls* are the most effective method of reducing exposures. The best protection is to separate operations and provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than

the controls mentioned above, but is still advisable whenever working with nitrogen. Air-purifying respirators (e.g., the cartridge-type or gas masks) *cannot* be used with nitrogen. These types of respirators only purify the air and can do nothing to protect in oxygen-deficient atmospheres. A powered air-supplied respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber or leather apron should be worn. To prevent hand and skin exposures with the liquid, thermal insulated gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nitrogen.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where nitrogen is used or stored.

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, consider installing automatic sensors that warn personnel of dropping oxygen levels and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use, care, and maintenance.
- ☑ Safety shower and eyewash stations should be readily available in work areas where nitrogen is used or stored.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nitrogen should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of nitrogen. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and/or possible contamination of the surrounding environmental mediums (mostly air but, depending upon the nature of the spill, water and soil may be affected).

Nitrogen is a non-flammable, non-combustible, non-explosive, and chemically inactive, inert gas. It presents no fire hazard. However, it can cause other gases to condense and solidify. It causes the condensation of oxygen from the air on non-insulated surfaces. Liquid oxygen is a fire hazard. Ice formation inside valves, vents, or critical components can be hazardous to equipment operation and to personnel. Also, because of its ability to displace oxygen, nitrogen requires special consideration during any emergency involving a leak or release of nitrogen gas or liquid especially in confined or enclosed spaces (such as sewers).

Nitrogen can enter the environment through industrial discharges, unchecked venting to air, or through spills of the liquid. Since liquids will most likely vaporize rapidly, water and soil contamination are possible but improbable.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nitrogen.

Insufficient data are available on the short-term effects of nitrogen on aquatic life, plants, birds, or land animals. However, as a relatively non-toxic, simple asphyxiant, it might be assumed that any acute ecological toxicity will be relatively low.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of nitrogen to aquatic life, plants, birds, or land animals. However, as a relatively non-toxic,

simple asphyxiant, it might be assumed that any chronic ecological toxicity will be relatively low.

◆ **Water Solubility**

Nitrogen is only slightly soluble in water. Concentrations of 1 milligram or less may mix with a liter of water. It is normally a gas at room temperature and pressure and solubility may not be a concern.

⌚ **Persistence in the Environment**

Nitrogen is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually all of nitrogen will eventually end up in the air.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Nitrogen is not expected to accumulate in the edible tissues of fish.

🛡️ **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nitrogen should be segregated from other gases to prevent cross-contamination or contact. Buildings designated for storage should be equipped with monitors that provide ample warning (audible and visual) of oxygen-deficient atmospheres.

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures. If applicable, contaminated soils should be removed for incineration and replaced with clean soil. When spills or leaks occur, it may be necessary to contact the local and/or state emergency response authorities. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any op-

erations involving the use, transportation, storage, or disposal of nitrogen. If nitrogen is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep nitrogen out of a confined space, such as a sewer, because of the possibility of creating an inert atmosphere.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nitrogen can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Corrosive to wet steel; reacts with alkalis to form nitrates and nitrites; decomposes in water to form nitric acid and nitric oxide; incompatible with metals, ammonia, acetic anhydride, hydrocarbons, combustibles. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of nitrogen dioxide is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, nitrogen dioxide emits other toxic oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? X |
| Health Hazards INHALATION: Severe irritation to the eyes, nose, throat, and lungs. Causes headache, nausea, vomiting, difficulty breathing, cyanosis, pulmonary edema (fluid in the lungs), depression of the CNS with drowsiness, weakness, loss of coordination, and convulsions. Also causes the development of frothy sputum. Loud wheezing, rapid heartbeat, possible fever, and chills. SKIN & EYES: A severe eye and skin irritant. Sudden bursts of the compressed liquid may cause frost-bite and associated tissue destruction. Skin and eye contact can cause burns. INGESTION: Unlikely, but possible. May cause burns to the mouth and throat. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 Target Organs? Skin, eyes, respiratory system, CVS. |
| Medical Conditions Generally Aggravated by Exposure Chronic respiratory problems (bronchitis, asthma) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum). Skin contact: Wash with large amounts of water for a minimum of 15 minutes. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. Oxygen should be administered by trained medical personnel only. If swallowed: Not likely since nitrogen dioxide is a gas above 70°F (21°C). Do NOT induce vomiting. Contact poison control center for assistance. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA). Stop flow of gas. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. If gas cannot be stopped, remove leaking container to safe area outdoors and allow to empty. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed, insulated, steel containers or cylinders in a cool, well-ventilated area away from heat. Protect containers from physical damage. Regularly inspect for leaks, cracks, or faulty valves. | | | | |
| Other Precautions and Warnings Use external or detached storage. Ensure cylinders are stored upright and properly secured at all times. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use a NIOSH/MSHA-approved air-purifying gas-cartridge respirator, or a supplied-air respirator, or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical Goggles and Face Mask | | Other Protective Clothing Protective Uniform or Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NITROGEN DIOXIDENO₂

CAS: 10102-44-0

**IDENTIFICATION AND TYPICAL USES**

Nitrogen dioxide appears as a yellowish-brown liquid or reddish-brown gas (above 70°F) with a pungent, acrid odor. It can also appear in solid form (below 15°F) and is structurally found as N₂O₄ (nitrogen tetroxide). Nitrogen dioxide and nitrogen tetroxide are always found together at normal environmental temperatures; dinitrogen tetroxide, nitrogen peroxide, and nitrogen tetroxide are used as synonyms for nitrogen dioxide. It is used in the production of nitric acid, as a nitrating agent, an oxidizing agent, as a catalyst, as an oxidizer for rocket fuels, and as a polymerization inhibitor for acrylates.

RISK ASSESSMENT: HEALTH***General Assessment***

Nitrogen dioxide is a severe irritant to the eyes, nose, and throat. As a gas, it can primarily enter the body through *inhalation*. While skin absorption is not likely, skin contact can result in serious tissue damage as a direct result of the cold temperatures of the compressed gas or cryogenic liquid. Ingestion is not a probable route of exposure under most circumstances. There are no data regarding any carcinogenic potential. However, it is an experimental teratogen and mutation data have also been reported.

Inhalation of nitrogen dioxide can cause severe irritation to the eyes, nose, throat, and respiratory system. Symptoms can be delayed for 1 to 5 hours and may include headache, nausea, vomiting, dyspnea (difficult breathing), diarrhea, cyanosis (bluish discoloration of the lips, fingers, and toes), and possible CNS depression with drowsiness, weakness, loss of coordination, memory impairment, peripheral neuropathy, convulsions, coma, and death. Lung irritation can be quite severe and may lead to pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can be fatal. The symptoms of pulmonary

edema can be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk. There can be cough, frothy sputum, and increased difficulty in breathing, loud wheezing, a rapid heartbeat (tachypnea), and increased respiration rate.

Skin contact with compressed liquid nitrogen dioxide can cause characteristic burns due to frostbite. Eye contact causes irritation, watering, inflammation of the lids, burns to the cornea, and (possibly) severe lesions.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to nitrogen dioxide:

- Skin: Severe irritation with localized tissue damage and possible burns due to the cold temperature of the compressed gas.
- Eye: Severe conjunctival irritation and possible damage to the cornea and loss of vision.
- Lung: Severe irritation to respiratory tract causing shortness of breath and cough. High acute exposures can be fatal due to a buildup of fluid in the lungs (pulmonary edema).
- CNS: Possible depression of the central nervous system causing a variety of toxic effects including loss of coordination and consciousness.

☠ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to nitrogen dioxide and can last for months or even years:

Cancer Hazards: According to information presented in the references, nitrogen dioxide has not been adequately tested for its ability to cause cancer in test animals. Animal mutation data have been reported

and many scientists believe that such chemicals may pose a cancer risk in the long-term.

Reproductive Hazard: According to the references, nitrogen dioxide has been shown to cause teratogenic effects in test animals and may adversely affect reproduction as well.

Other Chronic Effects: Long-term exposures to low concentrations may result in chronic pulmonary fibrosis leading to severe obstruction of the bronchioles. There may also be a yellow-brown staining of the skin and teeth resulting from repeated exposures. This is probably due to the formation of nitric acid.

🕒 **Recommended Risk-Reduction Measures**

Nitrogen dioxide is a very toxic substance. Personnel should therefore avoid direct contact with nitrogen dioxide. If a less toxic material or compound cannot be substituted for nitrogen dioxide, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of nitrogen dioxide release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around nitrogen dioxide. The 15-minute short-term exposure level of 1 ppm is relatively low and extremely difficult to monitor. Prudent risk management requires proper consideration and implementation of an appropriate respiratory protection program (per OSHA 29 CFR 1910.134). While a gas-cartridge air-purifying respirator will certainly suffice, the best protection is obtained using an MSHA/NIOSH-approved supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, impervious polyvinyl chloride or polyethylene gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nitrogen dioxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where nitrogen dioxide is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical test is recommended:

- ☑ Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Repeat lung function tests (compare to baseline).
- ☑ Consider chest X-ray after acute exposure (may be negative if taken immediately following exposure due to delayed development of pulmonary edema).
- ☑ Examination and evaluation of the nervous system functions by a qualified neurologist.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other respiratory ailments, any exposure to nitrogen dioxide can result in quicker and more devastating symptoms. Smokers should therefore avoid unprotected contact with this chemical. Prudent risk management requires proper consideration of *all* possible factors that may be causing the appearance of exposure symptoms among workers.

Other methods to reduce exposure include:

- ☑ Always ensure that proper protective clothing is worn when using chemical substances, and that personnel are trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to nitrogen dioxide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nitrogen dioxide should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to compressed nitrogen dioxide gas, emergency shower facilities should also be provided.

- ☑ Workers whose clothing has been contaminated by nitrogen dioxide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to chemical substances such as nitrogen dioxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is always at some risk of exposure during transportation, storage, disposal, or destruction of nitrogen dioxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. As a gas, it primarily affects the air. However, depending upon the nature and conditions of the release, accidental spills, large or small, can result in contamination of the other surrounding environmental mediums (water and soil).

Nitrogen dioxide can appear as a non-combustible gas or non-combustible liquid. However, as an oxidizer it can greatly accelerate the burning of ordinary combustible materials such as wood and paper. This is especially true when nitrogen dioxide is heated. It is incompatible with many fuels and chlorinated hydrocarbons. It can also react with other common substances such as carbon disulfide and ammonia. When in contact with water, it reacts to form nitric acid. Caution is always required in handling, storage, transportation, and disposal of nitrogen dioxide. Emergency responders should be made aware of the presence of nitrogen dioxide at any emergency response situation.

Nitrogen dioxide may enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nitrogen dioxide.

Insufficient data are available to evaluate or predict the acute (short-term) effects of nitrogen dioxide on aquatic life, plants, birds, or land animals. However, it is known that nitrogen dioxide will react in water to form nitric acid which may have slight acute toxicity to aquatic life.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the chronic (long-term) effects of nitrogen dioxide on aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Nitrogen dioxide reacts in water to form nitric acid. It is moderately soluble with decomposition complete over a relatively short period of time.

⌚ *Persistence in the Environment*

Nitrogen dioxide will decompose to nitric acid in the aquatic environment which may be slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. As a gas, virtually 100% of nitrogen dioxide will eventually end up in the air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nitrogen dioxide found in fish tissues is expected to be somewhat lower than the average concentration of nitrogen dioxide in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of nitrogen dioxide into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nitrogen dioxide should be segregated from other chemicals to minimize the risk of cross-contamination. Nitrogen dioxide must be stored to

avoid contact with incompatible materials since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If nitrogen dioxide should contact the water table, aquifer, or navigable waterway, time is of the essence. Because it will decompose to nitric acid in water, total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nitrogen dioxide.

If nitrogen dioxide is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- Absorb spilled liquids with vermiculite or a similar material and deposit in sealed drum for disposal.
- Ventilate area of spill or leak.
- Remove ignition sources from the area.
- It may be necessary to dispose of nitrogen dioxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nitrogen dioxide can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Synonyms

Nitrogen fluoride; trifluorammine; trifluorammonia; perfluorammonia.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|--|---|--|
| Nitrogen trifluoride: (derivation: By electrolysis of ammonium acid fluoride or low-temperature reaction of nitrogen and fluorine in the presence of electrical discharge). 1 ppm = 2.95 mg/m³ | PEL (8-hour): 10 ppm 29 mg/m³ STEL: Not Established | REL (10-hour): 10 ppm 29 mg/m³ STEL: Not Established | 1000 ppm | TLV: 10 ppm 29 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point -200°F (-129°C) | Specific Gravity (H ₂ O = 1) 2.46 (Gas) |
| Vapor Pressure (atmospheres) >1 at 68°F (20°C) | Molecular Weight (atomic weight) 71.0 |
| Vapor Density (Air = 1) 1.537 at -200°F (-129°C) | Freezing Point -340°F (-206°C) |

Solubility

Very slightly soluble in cold water.

Appearance and Odor

Colorless gas with a slight moldy odor. Usually shipped as a non-liquefied compressed gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: Not Applicable UEL: Not Applicable |
| NFPA Classification Non-Flammable Gas | Autoignition Temperature Not Applicable |

Extinguishing Media

Will not burn but will enhance the burning of other materials. Use agent suitable to surrounding fire, except for water (water, heat, and nitrogen trifluoride may cause an explosion). Do NOT use Halon 130.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and (SCBA). Move container from fire area if it can be done without risk. Cool exposed containers with direct water spray (do NOT allow water to get inside containers. Do NOT release runoff from control measures to sewers and waterways.

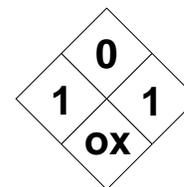

Unusual Fire and Explosion Hazards

Containers may explode in fire. Fight fire from a distance or with unmanned hose holders, if possible. Stay away from ends of tanks. Use extreme caution if nitrogen trifluoride is in or near a fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|---|--|--|---|
| Stability | | Conditions to Avoid Nitrogen trifluoride is normally stable in closed containers under routine conditions of handling and storage, but can explode under pressure. Avoid contact with incompatibles, heat, and organic materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible ammonia, carbon monoxide, methane, hydrogen sulfide, diborane, tetrafluorohydrazine, hydrogen, ethylene, chlorine dioxide, charcoal, oil, grease, and oxidizable materials. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of nitrogen trifluoride is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, nitrogen trifluoride emits highly toxic fluorine fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin/eye)? | Ingestion? | |
| Health Hazards INHALATION: The gas causes the development of methemoglobinemia which can significantly impair the blood's ability to transport oxygen to the cells, causing a lack of oxygenated tissues. This may cause symptoms such as cyanosis, dizziness, weakness, and severe headache. It may also lead to hemolysis, anemia, and altered kidney functions. SKIN & EYES: A severe eye and skin irritant. Sudden bursts of the compressed liquid may cause frost-bite and associated tissue destruction. Skin and eye contact can cause burns. INGESTION: Unlikely, but possible. May cause burns to the mouth and throat. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Blood, liver, kidneys, central nervous system. |
| Medical Conditions Generally Aggravated by Exposure Chronic respiratory problems (bronchitis, asthma) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum). Skin contact: Wash with large amounts of tepid water for a minimum of 15 minutes. Do NOT use dry heat or rub the affected area. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Not likely since nitrogen trifluoride is a gas above 70°F (21°C). Do NOT induce vomiting. Contact poison control center for assistance. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA). Stop flow of gas. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. If gas cannot be stopped, remove leaking container to safe area outdoors and allow to empty. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed, insulated, steel containers or cylinders in a cool, well-ventilated area away from heat. Protect containers from physical damage. Regularly inspect for leaks, cracks, or faulty valves. | | | | |
| Other Precautions and Warnings Use external or detached storage. Ensure cylinders are stored upright and properly secured at all times. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use a NIOSH/MSHA-approved air-purifying gas-cartridge respirator, or a supplied-air respirator, or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | Eye Protection Chemical Goggles and Face Mask | Other Protective Clothing Protective Uniform or Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NITROGEN TRIFLUORIDENF₃

CAS: 7783-54-2

**IDENTIFICATION AND TYPICAL USES**

Nitrogen trifluoride is a colorless gas with a slight, moldy odor. It is normally shipped as a non-liquefied compressed gas. It is used as an oxidizing agent in high energy fuels or for chemical synthesis, and as a dry etchant gas.

RISK ASSESSMENT: HEALTH***General Assessment***

Nitrogen trifluoride is a severe irritant to the eyes, nose, and throat. As a gas, it can primarily enter the body through *inhalation*. While skin absorption is not likely, skin contact can result in serious tissue damage as a direct result of the cold temperatures of the compressed gas or cryogenic liquid. Ingestion is not a probable route of exposure under most circumstances. There are no data regarding any carcinogenic, mutagenic, or teratogenic potential on long-term exposure.

Inhalation of nitrogen trifluoride can cause severe irritation to the eyes, nose, and throat. The primary systemic effect of exposure to nitrogen trifluoride vapors is the development of methemoglobinemia which can significantly interfere with the blood's ability to transport oxygen to the body's cells. This causes a lack of oxygenated blood in the tissues. Symptoms include cyanosis with blue lips, nose, ears, fingers, toes, and facial skin due to this lack of oxygen. There can also be dizziness, weakness, severe headache, hemolysis (damage) of the red blood cells, leading to anemia and possible alterations in kidney function.

Skin contact with compressed liquid nitrogen trifluoride can cause characteristic burns due to frostbite. Eye contact causes irritation, watering, inflammation of the lids, burns to the cornea, and (possibly) severe lesions.

Human exposure data are limited. However, animal studies indicate that the fluoride ion is not released

from nitrogen trifluoride during the metabolic process which may indicate a possibility of fluoride buildup over time and may result in the mottling of teeth and in unspecified skeletal changes.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to nitrogen trifluoride:

Skin: Severe irritation with localized tissue damage and possible burns due to the cold temperature of the compressed gas.

Eye: Conjunctival irritation and possible damage to the cornea and loss of vision.

Lung: Irritation to respiratory tract causing shortness of breath and cough. The gas causes the development of methemoglobin which significantly impairs the blood's ability to effectively transport oxygen. This can lead to anemia and cyanosis.

⚙️ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to nitrogen trifluoride and can last for months or even years:

Cancer Hazards: According to information presented in the references, nitrogen trifluoride has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the references, nitrogen trifluoride has not been tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Long-term exposures to low concentrations may result in damage to tooth enamel and could lead to unspecified skeletal changes.

🛡️ *Recommended Risk-Reduction Measures*

Nitrogen trifluoride is a very toxic substance. Personnel should avoid direct contact with nitrogen trifluoride. If a less toxic material or compound cannot be substituted for nitrogen trifluoride, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of nitrogen trifluoride release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around nitrogen trifluoride. The permissible exposure limit of 10 ppm (8-hour TWA) can be reached relatively quickly, even under normal operating conditions. Prudent risk management requires proper consideration and implementation of an appropriate respiratory protection program (per OSHA 29 CFR 1910.134). While a gas-cartridge air-purifying respirator will certainly suffice for low or transient exposures over the PEL, the best protection is obtained using an MSHA/NIOSH-approved supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nitrogen trifluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where nitrogen trifluoride is used or stored.

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Complete blood count (CBC) with tests for electrolytes and arterial blood gases.
- ☑ Monitor methemoglobin levels. Methylene blue therapy may be indicated if levels exceed 60%.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, smoking not only

causes heart disease, lung cancer, emphysema, and other respiratory ailments, it also decreases the blood's ability to effectively transport oxygen by increasing the carboxyhemoglobin content of the blood. Therefore, smokers exposed to nitrogen trifluoride may experience symptoms more rapidly than non-smokers under the same conditions of exposure. Smokers should therefore avoid unprotected contact with this chemical. Prudent risk management requires proper consideration of *all* possible factors that may be causing the appearance of exposure symptoms among workers.

Other methods to reduce exposure include:

- ☑ Always ensure that proper protective clothing is worn when using chemical substances, and that personnel are trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to nitrogen trifluoride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nitrogen trifluoride should be communicated to exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to compressed nitrogen trifluoride gas, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by nitrogen trifluoride should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to chemical substances such as nitrogen trifluoride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is always at some risk of exposure during transportation, storage, disposal, or destruction of nitrogen trifluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. As a gas, it primarily affects the air. However, depending upon the nature and conditions of the release, accidental spills, large or small, can result in contamina-

tion of the other surrounding environmental mediums (water and soil).

Nitrogen trifluoride is a non-flammable gas. However, as an oxidizer it can greatly accelerate the burning of ordinary combustible materials such as wood and paper. It can also react explosively in contact with a number of commonly encountered materials, including oil, grease, oxidizable materials, ammonia, carbon monoxide, methane, and even water. In contact with water or water vapor, reactions may be violent and explosive. Caution is always required in handling, storage, transportation, and disposal of nitrogen trifluoride. Emergency responders should be made aware of the presence of nitrogen trifluoride at any emergency response situation.

Nitrogen trifluoride may enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nitrogen trifluoride.

Insufficient data are available to evaluate or predict the acute (short-term) effects of nitrogen trifluoride on aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the chronic (long-term) effects of nitrogen trifluoride on aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Nitrogen trifluoride is slightly soluble in water. Concentrations of 1 to 100 milligrams may mix with a liter of water (there may be a violent reaction, depending upon the concentration of nitrogen trifluoride present).

🕒 *Persistence in the Environment*

Nitrogen trifluoride will react with water in the aquatic environment and therefore may be only slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

As a gas, virtually 100% of nitrogen trifluoride will eventually end up in the air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nitrogen trifluoride found in fish tissues is expected to be somewhat lower than the average concentration of nitrogen trifluoride in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of nitrogen trifluoride into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nitrogen trifluoride should be segregated from other chemicals to minimize the risk of cross-contamination. Nitrogen trifluoride must be stored to avoid contact with incompatible materials since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat. If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If nitrogen trifluoride should contact the water table, aquifer, or navigable waterway, time is of the essence. Because it will decompose to nitric acid in water, total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nitrogen trifluoride.

If nitrogen trifluoride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.

- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of nitrogen trifluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nitrogen trifluoride can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| NFPA Classification Explosive Liquid | Autoignition Temperature 518°F (270°C) |

Extinguishing Media

Water spray has proven effective in fighting propellant fires involving nitroglycerin.

Special Fire Fighting Procedures

Poisonous gases are emitted during fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Remain clear of smoke, water fallout and water runoff. Move containers from fire area if it can be done without risk. Cool exposed containers. Fight fire from distance, if possible.

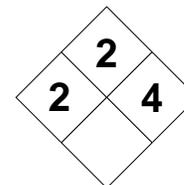

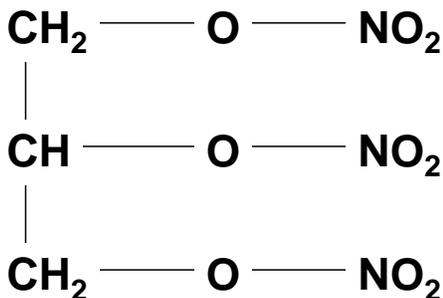

Unusual Fire and Explosion Hazards

Nitroglycerin is a highly explosive, shock-sensitive compound. Containers may explode in fire due to buildup of pressure. Spontaneous detonation occurs between 356°F and 424°F (180°C and 218°C).

| SECTION V - REACTIVITY DATA | | | | |
|---|--|--|--|--|
| Stability | | Conditions to Avoid Nitroglycerin is a shock-sensitive, friction-sensitive, and impact-sensitive compound. Avoid contact or exposure to heat and incompatible materials. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Incompatible with heat, ozone (explodes), shock, and acids. Also sensitive to ultraviolet radiation. Nitroglycerin is an OSHA Class A Explosive per 29 CFR 1910.109. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of nitroglycerin may occur with simple impact, friction, or shock. Polymerization is explosively violent. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products At high temperatures, nitroglycerin emits toxic oxides of nitrogen. However, the detonation products are relatively harmless and include carbon dioxide, water vapor, nitrogen, and oxygen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? |
| Health Hazards INHALATION: Symptoms include headache, nausea, vomiting, abdominal pain, lightheadedness, tremor, dyspnea, paralysis, and convulsions. High exposures can lead to methemoglobinemia, a condition which interferes with the blood's oxygen-carrying ability causing cyanosis. ABSORPTION: May cause mild irritation to the eyes and skin. INGESTION: A fatal poison by ingestion. Initial symptoms are the same as that for inhalation. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? CNS, blood, skin, CVS |
| Medical Conditions Generally Aggravated by Exposure Existing heart conditions (including hypertension), nervous disorders, and skin problems. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes; seek medical attention. Skin contact: Remove all contaminated clothing. Immediately flood area with water for 15 minutes. Then wash affected areas with soap and water. Inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility, if required. If swallowed: Contact poison control center. Rinse victim's mouth with water. Unless advised otherwise by poison control center and victim is conscious and alert, give 2-3 glasses of water to drink to dilute and then induce vomiting repeatedly until vomitus is clear. Never give anything by mouth to an unconscious or convulsing person. Never try to make an unconscious or convulsing person vomit. Seek medical attention immediately. Keep victim warm and at rest. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all sources of ignition and ventilate area. Restrict those not involved in cleanup from entering area. Do NOT touch or disturb spilled materials. Notify appropriately trained response personnel. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, dry, well-ventilated area away from heat and incompatibles. All metal containers should be grounded and bonded. Drums should be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. | | | | |
| Other Precautions and Warnings Use non-sparking tools and equipment and provide explosion-proof ventilation in storage areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use an MSHA/NIOSH-approved self-contained breathing apparatus in positive pressure mode or a supplied-air respirator operated in continuous flow or other positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Rubber (test for adequacy) | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron, Boots (avoid skin contact) | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NITROGLYCERIN

CAS: 55-63-0

**IDENTIFICATION AND TYPICAL USES**

Nitroglycerin is a colorless to pale-yellow, viscous liquid with a sweet taste. It can also appear as a solid at temperatures below 56°F (13°C). It is used primarily in the manufacture of high explosives, especially flashless propellant powder (with nitrocellulose), and as a chemical intermediate. It is often mixed with ethylene glycol dinitrate. Nitroglycerin is also used in pharmaceuticals, primarily in the formulation of cardiovascular medications.

RISK ASSESSMENT: HEALTH**General Assessment**

Nitroglycerin is an extremely toxic material and human poison. It can enter the body through *inhalation* of its vapors. It will also easily pass through intact skin (*absorption*) and can be *ingested* to cause toxic systemic effects. In fact, ingestion of even a small amount (1.5 to 2.0 grams) may be fatal to humans. Nitroglycerin is an experimental teratogen and a questioned carcinogen in test animals. Mutation data have also been reported for this compound.

Inhalation of nitroglycerin causes headache, nausea, vomiting, abdominal pain, tremor, dyspnea, paralysis, convulsions, lightheadedness, and the development of methemoglobinemia which interferes with the blood's ability to transport oxygen to the cells. Symptoms include anemia and cyanosis. Inhalation of the vapors can also affect blood pressure levels causing an abnormal decrease in systolic and diastolic pressures. After repeated exposures, a tolerance may develop. Angina (chest pains) and even heart attacks can occur if exposure is stopped suddenly.

Skin contact can cause minor, localized irritation as well as toxic systemic effects similar to that of in-

halation due to nitroglycerin's ability to pass through unbroken skin with relative ease.

Ingestion of even small amounts are acutely poisonous and can cause death in humans.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to nitroglycerin:

Skin: Local irritation at contact site.

Eye: Irritation and possible inflammation.

Lung: Irritation of the nose, throat, and respiratory tract. The vapors cause more damage systemically, as a result of their action on the nervous system, rather than locally to the respiratory tract members themselves.

CNS: Extreme depression affecting many other normal functions of anatomical systems.

CVS: Causes heart rhythm disturbances and adversely affects blood pressure and other cardiovascular responses.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to nitroglycerin and can last for months or even years:

Cancer Hazards: According to information presented in the references, nitroglycerin has been shown to cause cancer in limited animal studies. However, the data are conflicting and inconclusive in this regard. Mutation data have been reported and many scientists believe that exposure to mutagenic substances may present a cancer hazard in the long-term. Additional

study is required before any determinations can be made in this regard for nitroglycerin.

Reproductive Hazard: Nitroglycerin has been shown to cause teratogenic and adverse reproductive effects in laboratory experiments. It is not known if it will have this effect in humans exposed to nitroglycerin.

Other Chronic Effects: Long-term exposure may result in a tolerance to nitroglycerin with no noticeable symptoms. If personnel are removed from exposure for a short period (such as a weekend or vacation), serious and severe exposure symptoms may develop on their return to work where nitroglycerin exposure occurs. Sudden cessation of exposure may cause chest pains and possible heart attack in some individuals. Repeated exposures can cause chronic skin irritation.

🔗 **Recommended Risk-Reduction Measures**

Nitroglycerin presents a serious health hazard risk. Personnel should avoid direct contact with nitroglycerin. If a less toxic material or compound cannot be substituted for nitroglycerin, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of nitroglycerin release. While not always operationally possible, isolating operations involving nitroglycerin manufacturing or use can also reduce exposure. Personnel must follow proper industrial hygiene and good housekeeping work practices. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around nitroglycerin. The short-term exposure level (STEL) is relatively low and difficult to accurately monitor (0.1 mg/m^3). For the best protection, an MSHA or NIOSH-approved powered air-supplied respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode are recommended. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. Skin contact must not occur. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nitroglycerin.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where nitroglycerin is used or stored.

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- ☑ Electrocardiogram (EKG), if chest discomfort is felt.
- ☑ Blood methemoglobin level monitoring.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and other respiratory problems, personnel who smoke may show symptoms of exposure much quicker and more pronounced than those who do not. Prudent risk management requires careful consideration of *all* possible and potential exposure risk factors to ensure proper implementation of control measures and management of the exposure risk.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in the proper use, care, and maintenance of their protective equipment.
- ☑ Wash thoroughly immediately after exposure to nitroglycerin and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nitroglycerin should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to nitroglycerin, emergency shower facilities should also be provided in the immediate work area.
- ☑ Workers whose clothing has been contaminated by nitroglycerin should change into clean clothes *before* leaving work. Contaminated work clothing should never be worn home where family

members can be contaminated. The clothing should be laundered only by individuals who have been informed of the hazards of exposure to nitroglycerin.

- ☑ Specific engineering controls are recommended for this chemical by NIOSH. Refer to NIOSH Criteria Document: Occupational Exposure to Nitroglycerin and Ethylene Glycol Dinitrate (Publication Number 78-187).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of nitroglycerin. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where nitroglycerin contacts incompatible commodities can result in violent and even explosive reactions (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Nitroglycerin is considered an explosive liquid. It is shock-sensitive, impact-sensitive, and friction-sensitive. It can easily detonate on exposure to heat or incompatible materials. Contact with ozone or even ultraviolet radiation may cause an explosive reaction. Therefore, extreme caution is required in handling, storage, transportation, and disposal of nitroglycerin. Its characteristics also require special consideration during any emergency situation involving a leak or spill of nitroglycerin.

Nitroglycerin may enter the environment through industrial discharges, from dynamite operations, and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nitroglycerin.

Nitroglycerin has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of nitroglycerin to plants, land animals, and birds.

☠ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility,

and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Nitroglycerin has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of nitroglycerin to plants, birds, and land animals.

💧 Water Solubility

Nitroglycerin is highly soluble in water. Concentrations of 1000 milligrams and even more will readily mix with a liter of water.

⌚ Persistence in the Environment

Nitroglycerin is slightly persistent in the water, with a half-life between and 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Approximately 99.8% of nitroglycerin will eventually end up in the water. The remainder will end up in equal amounts in terrestrial soils and aquatic sediments.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nitroglycerin found in fish tissues is expected to be somewhat higher than the average concentration of nitroglycerin in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nitroglycerin should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Storage facilities should be equipped with the proper fire protection equipment (sprinklers, alarms, extinguishers). To prevent static sparks, all equipment and containers used in shipping, receiving, or transferring should be electrically

grounded and bounded. Facilities should be equipped with maximum explosion-proof ventilation.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Spilled materials should not be touched or disturbed until professionally trained responders arrive. Contaminated soils should be removed for incineration and replaced with clean soils. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. If nitroglycerin should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is highly soluble in water and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nitroglycerin. If nitroglycerin is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area or leak or spill.
- Do NOT touch or disturb spilled nitroglycerin. Evacuate area and wait arrival of professionally trained response personnel.
- It may be necessary to dispose of nitroglycerin as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nitroglycerin can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or

"reproductive hazard" are used, public hysteria, ignorance, and anxiety can run equally high. This must be carefully considered when drafting or implementing public relations policies.

🔗 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Nitroetan.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|---|---|--|
| Nitromethane (derivation: By reaction methane or propane with nitric acid under pressure). 1 ppm = 2.54 mg/m³ | PEL: 100 ppm 250 mg/m³ STEL: Not Established | REL: Not Established STEL: Not Established | 750 ppm | TLV: 100 ppm 250 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 213°F (101°C) | Specific Gravity (H ₂ O = 1) 1.14 |
| Vapor Pressure (mm Hg) 27.8 at 68°F (20°C) | Molecular Weight 61.0 |
| Vapor Density (Air = 1) 2.11 | Freezing Point -20°F (-29°C) |

Solubility

Slightly soluble in water (10%). Soluble in alcohol, acetone, ether, and dimethylformamide.

Appearance and Odor

Colorless, oily liquid with disagreeable odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) 95°F (35°C) closed cup | Explosive Limits in Air % by Volume LEL: 7.3% UEL: Not Determined |
| NFPA Classification Class IC Flammable Liquid | Autoignition Temperature 785°F (418°C) |

Extinguishing Media

Use carbon dioxide, water spray, or alcohol-resistant foam.

Special Fire Fighting Procedures

Nitromethane is a highly flammable, very dangerous fire and explosion hazard. Poisonous gases are evolved from fire. Wear a self-contained breathing apparatus (SCBA) with full facepiece. Move containers from fire area if it can be done without risk or cool fire-exposed containers with water spray.

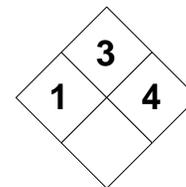

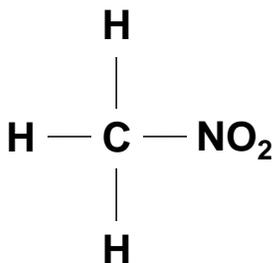

Unusual Fire and Explosion Hazards

Containers may explode in fire. Boiling liquid expanding vapor explosion (BLEVE) is likely. Immediately withdraw if rising sound is heard coming from venting device. Vapors are heavier than air and can travel for great distances to an ignition source and flashback to cause fire or explosion.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|--|---|
| Stability | | Conditions to Avoid Nitromethane is shock-sensitive and thermally unstable. High pressures and contamination by other materials contribute to its instability. Avoid contact with heat, sparks, flame, and incompatible materials. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Nitromethane is reactive in contact with acetone, amines, strong acids, alkalis, oxidizers, hydrocarbons, and other combustible materials. Slowly corrodes steel and copper when wet. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of nitromethane is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products If involved in fire, nitromethane can produce toxic nitrogen oxides and irritating fumes and smoke. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation to the eyes, nose, throat, and respiratory tract. Animal studies have shown a potential for the development of pulmonary edema (fluid in the lungs), injury to the liver, kidney, and narcosis. There may be bronchitis, anuria, and increases in methemoglobin levels in the blood. SKIN & EYES: Skin contact causes irritation and may cause reddening and smarting if it remains in contact for extended period of time. Eye contact can cause tearing and irritation. INGESTION: Causes irritation of the mouth and stomach, nausea, and vomiting. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1010.1000 Table Z-1 | Target Organs? Skin, eyes, CNS, liver, respiratory tract. |
| Medical Conditions Generally Aggravated by Exposure Possible skin disorders may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Immediately flush with large amounts of water for 15 minutes (minimum), occasionally lifting eyelids; seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. Observe 48 hours for lung effects. If <u>swallowed:</u> Contact poison control center. Unless directed otherwise, give a conscious person 1 to 2 glasses of water, then induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Ventilate area. Restrict entry into the area. Absorb liquids with vermiculite and place in sealed containers for disposal. Use non-sparking tools during cleanup operations. | | | | |
| Preferred Waste Disposal Method Dilute with fuel oil and atomize in proper combustion chamber. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible materials or in the presence of heat since violent reactions or explosions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area. | | | | |
| Other Precautions and Warnings Bulk storage of nitromethane is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures over the 8-hour PEL of 100 ppm, use an MSHA/NIOSH-approved air-purifying respirator with organic vapor cartridge. Otherwise, use a powered supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical Goggles and/or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

NITROMETHANE

CAS: 75-52-5

**IDENTIFICATION AND TYPICAL USES**

Nitromethane is a colorless, oily liquid with a mild, fruity odor. It is used as a solvent for cellulose compounds, polymers, waxes, and fats. It is also used in rocket and racing car fuel, in chemical synthesis, in explosive mixtures, and in the coating industry.

RISK ASSESSMENT: HEALTH**General Assessment**

Nitromethane is moderately toxic by *ingestion* and *inhalation*. It is also a skin irritant, but dermal absorption has not been reported. There are no indications of any carcinogenic, mutagenic, or teratogenic effects following exposure.

Inhalation causes irritation of the mucosa of the eyes, nose, throat, and respiratory tract. Systemic effects have not been observed in humans. However, animal studies indicate a possibility for the development of pulmonary edema (fluid in the lungs) which is a medical emergency. Symptoms of cough, congestion, labored breathing, and pain in the chest may be delayed up to 48 hours which may give a false sense of security with regard to health exposure risk. There may also be liver injury and, at high concentrations, narcosis. Severe exposure in humans is expected to cause similar effects. Nitromethane may also cause the formation of methemoglobin which can significantly interfere with the blood's ability to properly transport oxygen. Other symptoms of exposure by inhalation may include anorexia, nausea, vomiting, anuria, and diarrhea.

Skin contact causes mild to severe irritation and, if allowed to remain in contact for prolonged periods, either directly or in chemical-soaked clothing, there can be reddening and smarting at the site of contact. Eye contact can cause irritation and tearing.

Ingestion may result in irritation of the mouth and stomach, nausea, and vomiting.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to nitromethane:

Skin: Irritation with redness and smarting at the site of contact.

Eye: Irritation and inflammation with a possibility for damage to visual acuity.

Lung: Irritation of the mucosa of the nose, throat, and respiratory tract. May lead to delayed pulmonary edema which can be fatal.

CNS: Unspecified effects associated with depression of the central nervous system.

☹ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to nitromethane and can last for months or even years:

Cancer Hazards: According to information presented in the references, nitromethane has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: Long-term exposure can lead to dermatitis.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with nitromethane. If another chemical cannot be substituted for a nitromethane, then *engineering controls* are the most effective method of reducing exposures. The

best protection is to separate operations and provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using equipment with explosion-proof designs and ensuring all metal containers and tools are electrically grounded and bonded can further reduce the potential for injury or damage. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with nitromethane. For exposures over the 8-hour PEL (100 ppm), an air-purifying chemical cartridge respirator equipped with an organic vapor cartridge may provide adequate protection. However, best protection is obtained using a powered air-supplied respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures with the liquid, thermal gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with nitromethane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where nitromethane is used or stored.

If overexposure is suspected or symptoms develop, the following medical tests are recommended:

- ☑ Lung function tests.
- ☑ Liver and kidney function tests.
- ☑ Methemoglobin level monitoring.
- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, consider installing automatic sensors that warn personnel of dropping oxygen levels and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation

or enclosure is not used, respiratory protection should be mandatory.

- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to nitromethane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Safety shower and eyewash stations should be readily available in work areas where nitromethane is used or stored.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of nitromethane should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of nitromethane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Nitromethane is a Class IC flammable liquid per OSHA 29 CFR 1910.106. It can present an extremely flammable and highly explosive hazard. Also, since it can react violently in the presence of oxidizers, acids, and hydrocarbons, nitromethane requires special consideration during any emergency involving a leak or release of nitromethane gas or liquid.

Nitromethane can enter the environment through industrial discharges or through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to nitromethane.

Insufficient data are available on the short-term effects of nitromethane on aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of nitromethane to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Nitromethane is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Nitromethane is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of nitromethane found in the edible tissues of fish is expected to be somewhat lower than the average concentration found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of nitromethane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by

those trained in proper containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. When spills or leaks occur, it may be necessary to contact the local and/or state emergency response authorities. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of nitromethane. If nitromethane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Absorb liquids using vermiculite, dry earth, or other material and place in sealed containers for disposal. For small spills, cover liquid with soda ash, place in an open bucket of water, and let stand for two hours. Neutralize with hydrogen chloride and flush to drain with flooding water.
- ☑ Keep nitromethane out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- ☑ It may be necessary to dispose of nitromethane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving nitromethane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety

and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| NFPA Classification Non-Combustible Solid | | | | Autoignition Temperature Not Applicable | | | |
| Extinguishing Media Use extinguishing agent suitable to surrounding area. Octachloronaphthalene is non-combustible. | | | | | | | |
| Special Fire Fighting Procedures Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Structural fire fighting clothing is permeable and may not provide adequate protection against octachloronaphthalene. Remove containers from fire if it can be done without risk. | | | | | | | |
| Unusual Fire and Explosion Hazards Octachloronaphthalene is non-combustible but can present a significant explosion hazard if it comes into contact with incompatible materials. The vapors are much heavier than air and can collect in low areas to displace oxygen. | | | | | | | |

| SECTION V - REACTIVITY DATA | | | | |
|---|---|---|--|---|
| Stability | | Conditions to Avoid Octachloronaphthalene is normally stable under routine conditions of storage and handling. Avoid contact with heat and incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with strong oxidizers (fluorine, bromine, chlorine), and oxidizing agents. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of octachloronaphthalene is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, octachloronaphthalene can emit carbon monoxide, toxic chloride fumes, and acrid, irritating smoke. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Irritation of the respiratory tract, headache, nausea, and vomiting. There is also risk of liver injury, jaundice, and blood disorders. | | | | |
| ABSORPTION: Coal tar derivatives may absorb through unbroken skin. Irritation with burning, itching, and the development of an acne-like rash. Irritates the conjunctiva of the eye. | | | | |
| INGESTION: Gastrointestinal tract irritation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Skin and liver |
| Medical Conditions Generally Aggravated by Exposure Diseases of the skin and/or liver may be aggravated upon exposure to octachloronaphthalene. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For red or blistered skin, contact physician. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Contact poison control center or seek medical attention immediately. Do NOT induce vomiting unless directed to do so. Never attempt to give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by applicable environmental regulations. | | | | |
| Preferred Waste Disposal Method Incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Octachloronaphthalene is a non-combustible solid. Store to avoid contact with strong oxidizers, since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area. | | | | |
| Other Precautions and Warnings Personnel assigned to areas where octachloronaphthalene is used, handled, or stored must be trained on its hazards <i>before</i> being assigned to such areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use an MSHA/NIOSH-approved air-purifying respirator with a dust/mist pre-filter and organic vapor cartridge. For best protection, use a supplied-air respirator with full facepiece in continuous flow mode, or use a self-contained breathing apparatus with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Boots; Aprons; Gauntlets | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

OCTACHLORONAPHTHALENEC₁₀Cl₈

CAS: 2234-13-1

**IDENTIFICATION AND TYPICAL USES**

Octachloronaphthalene is a waxy, pale-yellow solid with an aromatic odor. It is used in fireproofing and waterproofing in cable insulation and as a lubricant additive.

RISK ASSESSMENT: HEALTH**General Assessment**

There are very little data available on the toxicity of this chemical in humans or animals. However, based upon data that does exist for other lower chlorinated naphthalenes, it might be assumed that octachloronaphthalene is a human poison by *ingestion*, *inhalation* and by dermal *absorption*. It is irritating to the skin and, on prolonged contact, may cause the development of an acne-like rash. There are no data on its carcinogenic, mutagenic, or teratogenic effects of exposure to octachloronaphthalene.

Inhalation of octachloronaphthalene vapors may lead to serious and, in the case of overexposure, possibly fatal liver damage. Symptoms include jaundice (yellow discoloration of the skin and eyes).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to octachloronaphthalene (within hours or days):

Skin: Irritation with burning, itching, and the development of an acne-like rash at the site of chemical contact.

Eye: Severe irritation of the conjunctiva with burning, itching, and watering.

Lung: May cause mild irritation of the respiratory tract and associated mucosa.

Other: May cause serious or even fatal liver damage on acute overexposure.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after repeated exposures to octachloronaphthalene and can last for months or even years:

Cancer Hazards: According to information presented in the references, octachloronaphthalene has not been adequately tested for its ability to cause cancer in test animals. Other similar naphthalene compounds have been shown to be carcinogenic in the long-term.

Reproductive Hazard: According to the references, octachloronaphthalene has not adequately tested for its ability to adversely affect reproduction. Other similar naphthalene compounds have been shown to be teratogenic in the long-term.

Other Chronic Effects: Continuous exposures to octachloronaphthalene may lead to an increased incidence of liver dysfunction and may actually cause irreversible damage.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with octachloronaphthalene. The exact nature of its toxicity is not clearly understood or documented in the references. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemi-

cal release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around octachloronaphthalene. Air-purifying respirators will provide protection for exposures above the PEL. However, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or a supplied-air respirator operated in continuous flow mode are the recommended respiratory protection methods of choice when working with this material. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and a protective apron should also be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with octachloronaphthalene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where octachloronaphthalene is used or stored.

Before beginning employment, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for personnel working with octachloronaphthalene:

- Liver function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following may be useful:

- Liver function tests.
- Evaluation by a qualified allergist, including careful evaluation of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to octachloronaphthalene and at the end of the work shift or before eating, drinking, or smoking. Avoid contact with direct sunlight.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of octachloronaphthalene should be communicated to all exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to octachloronaphthalene, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of octachloronaphthalene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Octachloronaphthalene is considered a non-combustible solid. However, because it is incompatible with many commonly encountered oxidizers (chlorine, bromine, fluorine), extreme caution is required in handling, storage, transportation, and disposal of octachloronaphthalene. These characteristics also require special consideration during any emergency situation involving a leak or spill of octachloronaphthalene. Even as a solid, it has a considerably high vapor pressure. Vapors are heavier than air and can collect in low lying areas to displace oxygen. Should octachloronaphthalene ever come into contact with incompatible substances (such as oxidizers) either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for octachloronaphthalene waste is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

Octachloronaphthalene can enter the environment from industrial and municipal plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to octachloronaphthalene.

Octachloronaphthalene has slight acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of octachloronaphthalene to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Octachloronaphthalene has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of octachloronaphthalene to plants, birds, or land animals.

💧 *Water Solubility*

Octachloronaphthalene is nearly insoluble in water. Concentrations of 1 milligram or less may mix with a liter of water.

⌚ *Persistence in the Environment*

Octachloronaphthalene is moderately persistent in water, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 51.7% of octachloronaphthalene will eventually end up in terrestrial soils; approximately 48.2% will end up in aquatic sediments; and the remainder will end up in suspended solids.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of octachloronaphthalene found in fish tissues is expected to be considerably higher

than the average concentration of octachloronaphthalene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of octachloronaphthalene into the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of octachloronaphthalene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Personnel working in storage areas must be trained on the hazards of octachloronaphthalene.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If octachloronaphthalene should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of octachloronaphthalene. If octachloronaphthalene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Do NOT dry sweep. Use vacuum equipped with a HEPA filter instead. Damp mop residue.
- ☑ It may be necessary to dispose of octachloronaphthalene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS *General Assessment*

Accidents or mishaps involving octachloronaphthalene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any safety, health or environmental policies or procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Vapors are poisonous. Causes irritation of the respiratory system mucosa and depression of the central nervous system (CNS). High concentrations even for short periods may lead to fatal pulmonary edema (fluid in the lungs). Intoxicating and anesthetic effects. SKIN & EYES: Irritation with drying, cracking, redness, blistering (prolonged contact). May lead to contact dermatitis and secondary infection. INGESTION: May cause nausea, vomiting, headache, dizziness, gastrointestinal irritation, blurring of vision, and other effects of central nervous system depression. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, respiratory system, CNS. |
| Medical Conditions Generally Aggravated by Exposure None identified. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 48 hours for lung effects. If swallowed: Seek medical attention immediately. Do not induce vomiting due to possible aspiration of vomitus/chemical into the lungs. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Wear SCBA respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Stop leak if it can be done without risk. Provide maximum explosion-proof ventilation. Absorb with vermiculite or other similar material and deposit in sealed containers. Use non-sparking tools during cleanup. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated location. Keep away from sources of heat. | | | | |
| Other Precautions and Warnings Sources of ignition (open flame or smoking), are prohibited where octane is used or stored. Metal containers should be bonded and grounded during transfer operations. Bulk storage not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use a MSHA/NIOSH-approved air-purifying organic vapor respirator, a powered air purifying respirator, or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron if Splash is Likely | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

OCTANE

CAS: 111-65-9

**IDENTIFICATION AND TYPICAL USES**

Octane is a clear, colorless liquid with a mild, gasoline-like odor. It is used as a solvent, in organic synthesis, in calibrations, and in azeotropic distillations.

RISK ASSESSMENT: HEALTH**General Assessment**

Octane is considered moderately toxic by *inhalation* of its vapors or by *ingestion* of the liquid. Skin contact will also cause localized irritation at the site of contact, but dermal absorption has not been reported. When large quantities are in contact with skin for extended periods, blisters may develop. There are no reports of any carcinogenic, mutagenic, or teratogenic effects. The toxic properties of octane are expected to be at least similar to those of other paraffinic hydrocarbons.

Inhalation of the octane vapors can cause mild to severe irritation of the eyes, nose, throat, and respiratory tract mucosa. Systemic effects include cough, conjunctiva irritation, flushing of the face, headaches, and blurred vision. High concentrations even for short periods can cause potentially fatal pulmonary edema (fluid in the lungs). Symptoms of coughing, wheezing, congestion, tightness in chest, and dyspnea may be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk. Inhalation can also lead to depression of the central nervous system (CNS) with symptoms of intoxication, hallucination, mental confusion, staggering gait or stupor, slurred speech, loss of consciousness and possible convulsions.

Skin contact may cause dermatitis with local blistering and rash. Eye contact can cause irritation of the conjunctiva with redness, swelling, tearing, and localized inflammation of eye tissues. Ingestion may cause nausea, vomiting, headaches, dizziness, gastrointestinal irritation, and symptoms of CNS depression simi-

lar to those caused by inhalation. If vomiting occurs, aspiration of the liquid into the lungs can cause choking, difficulty breathing or shortness of breath (dyspnea), tachypnea (rapid respiration), tachycardia (rapid heartbeat), fever, bronchitis, and pneumonitis.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to octane:

Skin: Irritation with potential for redness, blistering, irritation, rash, and possible dermatitis.

Eye: Severe irritation, conjunctivitis, redness, and possible pain.

Lung: Nose, throat, and respiratory tract irritation causing difficulty in breathing, possible pulmonary edema on high exposure (a medical emergency) which can be fatal.

CNS: Inebriation, dizziness, stupor, hallucinations, slurred speech, mental confusion, loss of consciousness, and possible convulsions.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to octane and can last for months or even years:

Cancer Hazards: According to information presented in the references, octane has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: There is no evidence in the references to indicate that exposure to octane causes any adverse effects to reproduction.

Other Chronic Effects: Chronic inhalation of octane vapors can cause loss of appetite, nausea, weight loss, insomnia, hyperesthesia, motor weakness, muscular degeneration, diminished tendon reflexes, and loss of

coordination. Repeated skin contact causes dermatitis in some individuals.

U Recommended Risk-Reduction Measures

Personnel should avoid direct contact with or exposure to octane. Occupational poisoning occurs most commonly by inhalation. Substitution is not usually an option with octane since its use is quite specific. However, a less toxic material or compound should be used in place of octane whenever possible. If substitution cannot be done, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of octane release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around octane. A MSHA/NIOSH-approved air-purifying respirator with an organic vapor cartridge, a supplied-air respirator operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand are the appropriate methods of respiratory protection when exposure to octane is anticipated. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures protective gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with octane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where octane is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered:

- Lung function tests (establish baseline).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

- Lung function tests (compare to baseline).
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after

exposure due to delayed development of pulmonary edema).

- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory disorders, smokers exposed to octane may experience symptoms more rapidly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible risk factors.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel have been trained on its use, care, and maintenance.
- Wash thoroughly immediately after exposure to octane and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of octane should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to octane, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by octane should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to octane.
- Where possible, automatically transfer liquids containing octane from drums or other containers to process containers. Always ground and bond all containers and use non-sparking tools.

RISK ASSESSMENT: ENVIRONMENT *General Assessment*

The environment is at risk of exposure during transportation, storage, disposal, or destruction of octane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Octane is a moderately flammable liquid. Because of its extremely low flash point and high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). It is a dangerous fire hazard and moderate explosion hazard when exposed to heat or flame. It is incompatible with commonly encountered oxidizers and some acids (such as nitric). Caution is always required in handling, storage, transportation, and disposal of octane. Emergency responders should be made aware of the presence of octane at any emergency response situation.

Octane can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to octane.

Octane has high acute toxicity to aquatic life. It can cause death in plants and roots and membrane damage in leaves of various agricultural crops. Insufficient data are available to evaluate the short-term effects of octane on birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Octane has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of octane to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Octane is not soluble in water. Concentrations of 1 milligram will not mix with a liter of water.

🕒 *Persistence in the Environment*

Octane is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical

to be degraded. About 99.5% of octane will eventually end up in air; the rest will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of octane found in fish tissues is expected to be somewhat higher than the average concentration of octane in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of octane into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of octane should be segregated from other chemicals and materials to minimize the risk of cross-contamination. Facilities should be designed to meet explosion-proof requirements.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If octane should contact the water table, aquifer, or navigable waterway, time is of the essence. It is not soluble and total remediation may be possible. Octane will normally float on the water's surface making reclamation easier if response actions are prompt. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of octane.

If octane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.

- ☑ Absorb liquids in vermiculite, sand, earth, or similar material and deposit in sealed drum. Use non-sparking tools during cleanup procedures.
- ☑ Remove all ignition sources. Ventilate area of spill or leak. Container should be removed to safer area if it can be done without increasing the risk.
- ☑ Use water spray to knock down vapors.
- ☑ It may be necessary to dispose of octane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving octane can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

OLEIC ACID

CAS: 112-80-1

**IDENTIFICATION AND TYPICAL USES**

Oleic acid is a pale-yellow to red oily liquid with a characteristic fatty-acid odor. It is used as a soap base, in the manufacture of oleates, in ointments, cosmetics, in polishing compounds, in lubricants, for ore flotation, as an intermediate, in certain surface coatings, and as a food-grade additive.

RISK ASSESSMENT: HEALTH***General Assessment***

Exposure to oleic acid is possible through *inhalation* of its vapors and, although not common, by *ingestion*. The data in the references are limited regarding its specific toxicity. However, mutation data have been reported in test animals and its carcinogenic potential is considered questionable in some references.

Inhalation of oleic acid vapors may cause irritation of the eyes, nose, throat, and mucous membranes of the upper respiratory tract. Bronchial tube irritation may also occur with progression to bronchitis if exposures continue.

Skin and eye contact can result in mild to moderate irritation. If allowed to remain in contact with the eye for prolonged periods, corneal abrasions may occur. Ingestion may cause systemic poisoning with abdominal cramps and possible nausea and vomiting.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to oleic acid:

Skin: Irritation/rash or burning feeling on contact.

Eye: Mild irritation; may cause burns and damage.

Lung: Irritation of the nose, throat, and lungs following exposure.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to oleic acid and can last for months or even years:

Cancer Hazards: According to information presented in the references, oleic acid has not been adequately tested for its ability to cause cancer in animals. Mutation data have been reported and some scientists believe that long-term exposure to mutagens may pose a cancer risk. There is no indication that exposure to oleic acid will have this effect. Additional research is required.

Reproductive Hazard: There are no data in the references to indicate that exposure to oleic acid will have adverse effects on the reproductive process in animals or humans.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with oleic acid. The exact nature of its toxicity is not clearly understood in the references. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around oleic acid. No exposure levels have been established for oleic acid. This does not mean that exposure is without health risk. Prudent risk management may require a conservative approach to respiratory protection until further data are known about oleic acid. For transient exposures, an air-purifying respirator equipped with an acid cartridge, a HEPA filter, and a dust/mist pre-filter may suffice. Greater protection is obtained using a supplied-air respirator or a self-contained breathing apparatus (SCBA)

with full facepiece operated in pressure demand or other positive pressure mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash/dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with oleic acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where oleic acid is used or stored. Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to oleic acid and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of oleic acid should be communicated to all exposed or potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of oleic acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Oleic acid is considered a non-combustible solid. It may be corrosive, especially when mixed in solution. It is incompatible with potassium chlorite and contact can cause violent reactions, including fire or

explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of oleic acid.

Oleic acid can enter the environment mainly through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to oleic acid.

Insufficient data are available to evaluate or predict the short-term effects of oleic acid exposure to aquatic life, birds, plants, or land animals.

☞ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of oleic acid exposure to aquatic life, birds, plants, or land animals.

💧 *Water Solubility*

Oleic acid is not soluble in water. Concentrations of less than 1 milligram may not mix with a liter of water.

⌚ *Persistence in the Environment*

Oleic acid is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

There is no information in the references on the expected bioaccumulation of oleic acid in the edible tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or

spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of oleic acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If oleic acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is not soluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of oleic acid. If oleic acid is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources and ventilate area of spill.
- Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Use non-sparking tools, such as plastic shovels, rubber implements, or tools made of soft metals (e.g., brass or copper) during cleanup operations.
- It may be necessary to dispose of oleic acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving oleic acid can present a significant threat to business operations. The loss or

damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer" or "carcinogen" are used, public emotion, ignorance, anxiety, and hysteria can run equally high. This must be carefully considered whenever drafting or implementing public relations policies.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|--------------------------------|
| Characterization Acid, Mineral | RCRA Number None | EPA Class Not Listed |
| DOT Proper Shipping Name Oleum; Sulfuric Acid, ≥30% free sulfur trioxide | Chemical Abstract Service (CAS) Number 8014-95-7 | |
| DOT Hazard Class and Label Requirements Corrosive Material; Corrosive and Poison | DOT Emergency Guide Code 44 | |
| DOT Identification Number UN 1831 | Chemical Formula H₂SO₄•SO₃ | |

Synonyms

Disulphuric acid; dithionic acid; fuming sulfuric acid; pyrosulfuric acid; elixir of vitriol; oil of vitriol.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| Oleum (derivation: Sulfur trioxide is first produced by the contact process and is then absorbed in concentrated sulfuric acid). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Established | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point Not Found | Specific Gravity (H ₂ O = 1) Not Found |
| Vapor Pressure (mm Hg) Not Found | Molecular Weight 178.14 |
| Vapor Density (Air = 1) Not Found | Melting Point Not Found |

Solubility

Miscible in water with violent reaction.

Appearance and Odor

Viscous, fuming, opaque or slightly yellow-brown liquid (depending on purity) with a sharp, penetrating, characteristic odor. Odor Threshold = 3 mg/m³ in most individuals.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Non-Combustible | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Combustible Liquid | Autoignition Temperature Not Applicable |

Extinguishing Media

Reacts with water producing heat and toxic fumes. Use dry chemical or carbon dioxide.

Special Fire Fighting Procedures

Poisonous gases are released in fire. Wear full protective clothing and (SCBA). Use water spray to flush and dilute a spill, to disperse vapors, and to keep fire-exposed containers cool. Do NOT direct solid stream of water at oleum. Do not release runoff from fire control measure to sewers or streams.

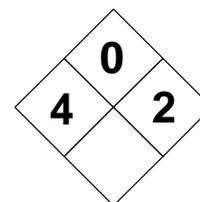

Unusual Fire and Explosion Hazards

A non-combustible liquid that increases the burning of combustible materials. Containers may explode in fire. Releases toxic and corrosive sulfur oxides when involved in fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|---|------------------------------|---|
| Stability | | Conditions to Avoid Oleum is normally stable in closed containers under routine conditions of handling and storage. It is extremely hygroscopic and will fume vigorously in moist air. Keep dry and away from sources of heat. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Alkalines, reducing agents, carbides, chlorates, fulminates, nitrates, picrates, metals, acetic acid, acetic anhydride, acetonitrile, acrolein, acrylic acid, alcohols, ethers, ketones, oxidizing agents, and many others. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of oleum is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, oleum can emit highly toxic/poisonous gases and fumes, including toxic oxides of sulfur. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Vapors cause irritation to the upper respiratory tract with coughing, dyspnea, headache, bronchitis, weakness, tearing, nasal discharge, nausea, chemical bronchitis, pulmonary edema (fluid in the lungs), and possible CNS effects. SKIN & EYES: Eye contact causes blindness and tissue damage. Skin contact causes burns, blistering, local necroses, and membrane ulceration. Burns may be 2nd or 3rd degree. INGESTION: Corrosion of the mucosa of the mouth, throat, and esophagus with stomach discomfort and pain, nausea, intense thirst, vomiting, circulatory collapse, clammy skin, weak and rapid pulse, shallow respiration, scanty urine, circulatory shock and subsequent death. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory tract; eyes; skin; mucosa. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma) may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If swallowed: Seek medical attention, contact poison control center. Give 1-2 glasses of water to drink. Do NOT induce vomiting (aspiration hazard). Never give anything by mouth to an unconscious person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other material, neutralize with soda ash, collect and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Oleum is a powerful oxidizer that can greatly accelerate the burning of oxidizable materials. Store in tightly closed containers in cool, dry, well-ventilated area away from heat. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where oleum is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use half-mask respirator with acid cartridge for low or transient exposures (cartridge should be designed to protect against acid vapor or mist). For higher exposures, use a supplied-air respirator or a self-contained breathing apparatus operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Acid resistant synthetic rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

OLEUM

CAS: 8014-95-7

**IDENTIFICATION AND TYPICAL USES**

Oleum is a heavy, oily (viscous), opaque or yellow-brown fuming liquid with a sharp, characteristic, penetrating odor. It is used as a chemical intermediate for linear alkylbenzene sulfonate surfactants and dyes; as a chemical agent in the manufacture of nitrocellulose and caprolactum and in petroleum refining. It is also used in the production of fertilizers, explosives, other acids, parchment paper, and glue. It is a drying agent for chlorine and nitric acid. It is used as a laboratory reagent, and in the pickling of metal.

RISK ASSESSMENT: HEALTH***General Assessment***

Oleum is highly corrosive to the skin, eyes, digestive tract, and respiratory system (or any other tissue it contacts). It is a human poison by *ingestion* and is dangerously toxic by *inhalation*. There are no data in the references regarding any carcinogenic, mutagenic, or teratogenic effects on exposure to oleum. Its corrosive and irritating properties limit the possibility of long-term exposure since people cannot tolerate unprotected contact for even short periods of time.

Inhalation produces severe irritation of the eyes, nose, and respiratory tract with coughing, stomach pains, intense thirst, dyspnea (labored breathing), bronchitis, headache, clammy skin, weak and rapid pulse, scanty urine, and total body weakness. The vapors can cause laryngitis, pharyngitis, chemical bronchitis, pneumonitis, and delayed pulmonary edema which can be fatal. There may be tearing, nasal discharge, throat irritation, ulceration of the nasal septa and nose irritation, and nausea. Symptoms of pulmonary edema, such as chest pain, congestion, coughing, and weakness, may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk. There may also be depression of the central nervous system with symptoms of giddiness, salivation, nausea, muscular weakness, and other un-

specified symptoms. There may be total circulatory system collapse, shock, and death.

Skin contact causes severe burning with possible vesiculation. Its extremely corrosive properties cause immediate burns, membrane ulceration, skin blistering, 2nd and 3rd degree burns, and local necrosis (tissue destruction) upon contact. Eye contact causes damage and the possibility of permanent blindness.

Ingestion is extremely dangerous, even life-threatening. It causes severe poisoning, esophageal burns, throat swelling, convulsions, risk of stomach perforation, bloody vomiting, burning sensation on the mouth, acute tissue damage, diarrhea with pain, and possible coma.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to oleum:

Skin: Irritation/rash or burning feeling on contact with redness, blistering and vesiculation, localized tissue destruction, and deep 2nd or 3rd degree burns.

Eye: Severe irritation; may cause burns and damage with permanent blindness.

Lung: Severe irritation of the mucous membranes in the nose, throat, and lungs with delayed pulmonary edema (fluid in the lungs), which can be fatal.

CNS: Possible depression of the nervous system with symptoms of giddiness, nausea, vomiting, and irritability.

●☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to oleum and can last for months or even years:

Cancer Hazards: According to information presented in the references, oleum has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, oleum has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated skin contact with dilute solutions causes dermatitis. Chronic exposure may also cause changes in pulmonary function leading to chronic bronchitis, gastritis, stomatitis, erosion of dental enamel, conjunctivitis, increased propensity for respiratory tract infections, and possible respiratory tract cancer.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with oleum. It is extremely corrosive and highly toxic to humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around oleum. No exposure levels have been established for oleum. This does not mean that exposure is without health risk. For low concentrations, an acid gas cartridge respirator (equipped with a mist/vapor filter) may provide acceptable protection. However, a self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with oleum.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and

other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where oleum is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

- ☑ Lung function tests (look for chronic respiratory diseases).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
- ☑ Wash thoroughly immediately after exposure to oleum and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of oleum should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of oleum. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Oleum is considered a non-combustible liquid. However, as an oxidizer, it can greatly accelerate the burning of ordinary combustible materials such as

wood or paper. It is also extremely corrosive to many materials. It is incompatible with many materials, including hydrogen sulfide, carbides, cyanides, and alkalis, and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of oleum. Selection of response equipment (shovels, containers, and the like) must therefore be carefully considered. Should oleum ever come into contact with incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or explosive commodities is extremely possible.

Oleum can enter the environment mainly through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to oleum.

Insufficient data are available on the short-term effects of oleum exposure to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of oleum to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Oleum is highly soluble in water and will react violently. Concentrations of over 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Oleum is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become con-

centrated in the tissues and internal organs of animals as well as humans.

The concentration of oleum found in fish tissues is expected to be somewhat lower than the average concentration of oleum in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of oleum should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). It must be kept cool and in a well-ventilated location away from direct sunlight.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If oleum should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of oleum. If oleum is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Neutralize remaining residue with soda ash or sodium bicarbonate. Do NOT flush to drains, sewers, or waterways. Use water spray to cool and knock down vapors. Collect water for disposal.

- ☑ It may be necessary to dispose of oleum as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving oleum can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. If rash develops, seek medical attention. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Provide breathing assistance if necessary. Never attempt to give a convulsing or unconscious person anything by mouth. Seek medical attention immediately. Contact poison control center for assistance. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts and friction). Carefully use a vacuum equipped with a high efficiency particulate air (HEPA) filter. Exercise extreme caution, osmium can self-ignite or explode in air or if heated. Use only non-sparking tools. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area and protect from physical damage. Sources of heat or ignition are prohibited where osmium is used, handled, or stored. | | | | |
| Other Precautions and Warnings Avoid generating dusty conditions in storage areas. Mechanically ground and bond all containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels have been established. As a minimum, use a full facepiece respirator with a high efficiency particulate air (HEPA) filter. For high or prolonged exposures, use a full facepiece supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

OSMIUM

Os

CAS: 7440-04-2

**IDENTIFICATION AND TYPICAL USES**

Osmium is a lustrous, bluish-white, extremely hard and dense metal of the platinum group. It has no odor. It is metallic element of atomic number 76, group VIII of the periodic table, atomic weight 190.2, valences 2, 3, 4, 6, 8 with seven stable isotopes. It is used as a hardener for iridium and platinum, in pen points, instrument pivots, and as a catalyst.

RISK ASSESSMENT: HEALTH***General Assessment***

Osmium is a human poison by an unspecified route. The exposure routes are *inhalation* (primarily) and possibly *ingestion*. However, since it is not significantly soluble in water, it is not absorbed efficiently by ingestion. There are no data on its carcinogenic, mutagenic, and teratogenic capabilities.

Inhalation of osmium dusts and powders will cause irritation of the nose, throat, respiratory tract, and associated mucous membranes. It has been shown to cause asthma-like conditions with shortness of breath, labored breathing, respiratory irritation, wheezing, persistent conjunctivitis, coughing, and tightness in the chest. Skin contact results in surface irritation and may lead to dermatitis, localized ulceration, and discoloration (green or black) of the skin's surface at the site of contact. The powders can irritate the eyes. Ingestion causes unspecified gastrointestinal effects.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to osmium:

Skin: Irritation, rash, and possible contact dermatitis, ulceration, and discoloration of the skin's surface at the area of contact.

Eye: Osmium particles can irritate the eyes and may cause damage to vision if not quickly removed.

Lung: Irritation of the dusts and fumes can irritate the nose, mouth, throat, lungs, and mucosa of the respiratory tract.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to osmium and can last for months or even years:

Cancer Hazards: According to information presented in the references, osmium has not been shown to cause cancer in test animals.

Reproductive Hazard: According to information available in the references, osmium has not been tested for its ability to adversely affect reproduction in humans.

Other Chronic Effects: Possible kidney damage and skin allergy on long-term exposure to osmium.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with osmium. The exact nature of its human toxicity is not clearly understood in the references. If the specific osmium compound in question is unknown, adequate risk management dictates that it be handled and treated as though it posed as serious risk to human health. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around osmium. No exposure levels

have been established for osmium. This does not mean that exposure is without risk to human health. As a minimum, an MSHA/NIOSH-approved respirator with a high efficiency particulate air (HEPA) filter is recommended. For high exposures, or exposures to unknown levels (as in an emergency), use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with osmium.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where osmium is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the PEL or greater, or significant skin contact), the following medical tests are recommended:

- ☑ Lung function tests.
- ☑ Chest X-ray.

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Kidney and lung function tests.
- ☑ Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to osmium may be more pronounced in smokers than in non-smokers. Prudent risk management requires proper consideration of *all* possible factors that may be causing exposure symptoms in the workplace.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are adequately trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to osmium and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of osmium should be communicated to all potentially exposed workers.
- ☑ Where possible, automatically transfer osmium from drums or other storage containers to process containers. Avoid contact with air and do not generate airborne dusts.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of osmium. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Osmium powder can explode spontaneously in air. It will ignite and is potentially explosive in contact with heat, friction, and sparks. When heated in the presence of fluorine, it can react violently. It may explode on contact with chlorine trichloride or oxygen difluoride. These characteristics require special consideration during any emergency situation involving a leak or spill of osmium. Osmium can occur in the environment as a natural element in certain ores in the earth's crust. It can also enter the environment through industrial and municipal discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after ani-

mals or plants are exposed to osmium. Insufficient data are available to evaluate the short-term effects of osmium to aquatic life, plants, birds, or land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the long-term effects of osmium exposure to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Elemental osmium and most of its compounds are insoluble in water. Concentrations of less than 1 milligram will not mix with a liter water.

⌚ *Persistence in the Environment*

Osmium and its compounds are highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of osmium found in fish is expected to be at least equal to the average concentration of osmium in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of osmium should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Tasks which can generate dusty conditions must be avoided. Storage facilities should be designed with proper fire suppression and

protection equipment. Containers must be protected from exposure to heat and from physical damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum method to reduce dust during cleanup. Do not dry sweep (generates airborne dusts and friction). *Carefully* and *slowly* use a vacuum equipped with a high efficiency particulate air (HEPA) filter, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed and replaced with clean soil. If osmium should contact the water table, aquifer, or navigable waterway, time is of the essence. Osmium is not soluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of osmium. If osmium is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- ☑ It may be necessary to dispose of osmium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving osmium can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

OSMIUM TETROXIDEOsO₄

CAS: 20816-12-0

**IDENTIFICATION AND TYPICAL USES**

Osmium tetroxide is a colorless, crystalline solid or a pale-yellow mass with an unpleasant, acrid, chlorine-like odor. It is a liquid at temperatures above 105°F (40.5°C). It is used as a catalyst in chemical reactions, in photography, and as a fat stain in pathological laboratories (for microscopic staining).

RISK ASSESSMENT: HEALTH***General Assessment***

Osmium tetroxide is a human poison by an unspecified route. The exposure routes are *inhalation* (primarily) and possibly (but unlikely) *ingestion*. Skin contact can cause localized effects but dermal absorption has not been reported. There are no data on its carcinogenic, mutagenic, and teratogenic capabilities.

Inhalation of osmium tetroxide dusts and powders will cause irritation of the nose, throat, respiratory tract, and associated mucous membranes. It has been shown to cause asthma-like conditions with shortness of breath, labored breathing, respiratory irritation, wheezing, persistent conjunctivitis, coughing, tracheitis, bronchitis, tightness in the chest, and pulmonary edema (fluid in the lungs), which can be fatal. Symptoms of pulmonary edema can be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk.

Skin contact results in surface irritation and may lead to dermatitis, localized ulceration, and discoloration (green or black) of the skin's surface at the site of contact. The powder can irritate the eyes. Ingestion causes unspecified gastrointestinal effects.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to osmium tetroxide:

Skin: Irritation, rash, and possible contact dermatitis, ulceration, and discoloration of the skin's surface at the area of contact.

Eye: Osmium tetroxide particles can irritate the eyes and may cause damage to vision if not quickly removed. High concentrations cause corneal damage and blindness.

Lung: Irritation of the dusts and fumes can irritate the nose, mouth, throat, lungs, and mucosa of the respiratory tract. Pulmonary edema may occur on high exposure.

☠ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to osmium tetroxide and can last for months or even years:

Cancer Hazards: According to information presented in the references, osmium tetroxide has not been shown to cause cancer in test animals.

Reproductive Hazard: According to information available in the references, osmium tetroxide has not been tested for its ability to adversely affect reproduction in humans.

Other Chronic Effects: Possible kidney damage and skin allergy on long-term exposure to osmium tetroxide. Chronic exposure may also cause broncho pneumonia, sterile lung abscess, and gangrene.

☠ *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with osmium tetroxide. The exact nature of its human toxicity is not clearly understood in the references. Adequate risk management dictates that it be handled and treated as though it posed as serious risk to human health. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemi-

cal release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around osmium tetroxide. Exposure levels are low (0.0002 ppm) and extremely difficult to monitor. As a minimum, an MSHA/NIOSH-approved respirator with a high efficiency particulate air (HEPA) filter is recommended. For high exposures, or exposures to unknown levels (as in an emergency), use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with osmium tetroxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where osmium tetroxide is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the PEL or greater, or significant skin contact), the following medical tests are recommended:

Lung function tests.

Complete eye examination.

If symptoms develop or overexposure is suspected, the following may also be useful:

Kidney (with urinalysis) and lung function tests.

Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with a medical examination.

Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to osmium tetroxide may be more pronounced in smokers than in non-smokers. Prudent risk management requires proper consideration of *all* possible factors that may be causing exposure symptoms in the workplace.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances and that personnel are adequately trained on its use, care, and maintenance.

Wash thoroughly immediately after exposure to osmium tetroxide and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of osmium tetroxide should be communicated to all exposed workers.

Where possible, automatically transfer osmium tetroxide from drums or other storage containers to process containers. Avoid contact with air and do not generate airborne dusts.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of osmium tetroxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Osmium tetroxide powder can emit highly toxic and poisonous fumes when heated. Even though it is non-combustible in solid form, it is highly flammable as a dust and can form explosive mixtures in air. It will ignite and is potentially explosive in contact with heat, friction, and sparks. When heated in the pres-

ence of fluorine, it can react violently. It may explode on contact with chlorine trichloride or oxygen difluoride. These characteristics require special consideration during any emergency situation involving a leak or spill of osmium tetroxide.

Osmium can occur in the environment as a natural element in certain ores in the earth's crust. It can also enter the environment through industrial and municipal discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to osmium tetroxide.

Insufficient data are available to evaluate the short-term effects of osmium tetroxide to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of osmium tetroxide exposure to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Osmium tetroxide is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Osmium tetroxide is quite soluble in the aquatic environment. It is an oxidizing agent and is readily reduced by organic matter. Consequently, it is not likely to be highly persistent as osmium tetroxide. Some of the osmium compounds formed may be persistent in the environment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Osmium tetroxide will probably not accumulate in aquatic organisms or aquatic ecosystems, but osmium might accumulate in both. The concentration of osmium found in fish is expected to be at least equal to the average concentration of osmium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of osmium tetroxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Tasks which can generate dusty conditions must be avoided. Storage facilities should be designed with proper fire suppression and protection equipment. Containers must be protected from exposure to heat and from physical damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum method to reduce dust during cleanup. Do not dry sweep (generates airborne dusts and friction). *Carefully* and *slowly* use a vacuum equipped with a high efficiency particulate air (HEPA) filter, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed and replaced with clean soil. If osmium tetroxide should contact the water table, aquifer, or navigable waterway, time is of the essence. Osmium tetroxide is highly soluble in water and, therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of osmium tetroxide.

If osmium tetroxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.

- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- ☑ It may be necessary to dispose of osmium tetroxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving osmium tetroxide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention; contact poison control center. Do NOT induce vomiting. Give 1-2 glasses of milk. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Personnel must wear protective clothing. Collect solid materials using scoop or carefully vacuum with a HEPA vacuum and place in sealed containers for disposal. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Oxalic acid is a combustible solid. Avoid contact with strong oxidizers such as chlorine since violent reactions occur. Store in tightly closed containers in cool, well-ventilated area away from heat. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where oxalic acid is used, handled, or stored. Detached facility storage is preferred. Electrically ground and bond all containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use half-mask respirator with acid cartridge for low or transient exposures (cartridge should be designed to protect against acid dusts or mists). For higher exposures, use a supplied-air respirator or a self-contained breathing apparatus operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. Use maximum explosion-proof design. | | | | |
| Protective Gloves Acid resistant natural rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Natural Rubber or Neoprene Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

OXALIC ACID

CAS: 144-62-7

**IDENTIFICATION AND TYPICAL USES**

Oxalic acid is a colorless, odorless powder or granular solid. The anhydrous form is an odorless, white solid. It also occurs naturally in many plants (wood sorrel, rhubarb, and spinach). It is the metabolite product of many molds. It is used in indigo dyeing, calico printing, removal of paints, rust, and ink stains, in metal polishing, bleaching leather, and manufacture of oxalates. It is also used as an analytical reagent and as a reducing agent in organic synthesis.

RISK ASSESSMENT: HEALTH***General Assessment***

Oxalic acid is a strong poison. Exposure to oxalic acid is possible through *inhalation* of its vapors and by *ingestion*. It can also be *absorbed* through the body through skin contact, preceded by tissue destruction at the site of contact. There are no reports on its carcinogenic, mutagenic, or teratogenic properties.

Inhalation produces severe irritation of the eyes, nose, and respiratory tract with coughing, dyspnea (labored breathing), gastrointestinal disturbances, albuminuria, gradual weight loss, increasing weakness and nervous system disorders, ulceration of the mucosa of the nose and throat, epistaxis, headache, irritation, and nervousness. There may be tearing, nasal discharge, throat irritation, nausea, and vomiting.

Skin contact causes severe burning with possible vesiculation. Its extremely corrosive properties cause immediate burns, membrane ulceration, skin blistering, and local necrosis (tissue destruction) upon contact. Skin sensitization and dermatitis may also occur. Eye contact causes damage and the possibility of permanent corneal scarring.

Ingestion is extremely dangerous, even life-threatening. It causes severe poisoning, corrosion of the mouth, esophagus, and stomach, bloody vomiting,

salivation, burning and abdominal pain, collapse, convulsions, kidney damage, acute tissue damage, diarrhea with pain, shock, breathing difficulties, circulatory collapse, and death.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to oxalic acid:

Skin: Irritation/rash or burning feeling on contact with redness, blistering and vesiculation, and localized tissue destruction.

Eye: Severe irritation; may cause burns and damage with permanent corneal scarring.

Lung: Severe irritation of the mucous membranes in the nose, throat, and lungs following exposure.

CNS: Inconclusive (possible nervousness, irritation, and weight loss).

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to oxalic acid and can last for months or even years:

Cancer Hazards: According to information presented in the references, oxalic acid has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, oxalic acid has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Skin contact causes irritation and burns. There may be some lasting effects of chronic exposures such as sensitization and/or dermatitis. Once an individual becomes "sensitized," even

the slightest future exposures can cause an allergic reaction.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with oxalic acid. It is extremely corrosive and highly toxic to humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around oxalic acid. A self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. For low concentrations (near the 1 mg/m³ exposure limit), an acid gas cartridge respirator (equipped with a mist/vapor filter) is acceptable protection. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be used. Natural rubber, neoprene, or polyvinyl chloride are acceptable materials.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with oxalic acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where oxalic acid is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

- ☑ Lung function tests (look for chronic respiratory diseases).
- ☑ Kidney function tests.

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- ☑ Wash thoroughly immediately after exposure to oxalic acid and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of oxalic acid should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of oxalic acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Oxalic acid is considered a combustible solid. It is also extremely corrosive to many materials. It is incompatible with oxidizing agents and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of oxalic acid. Should oxalic acid ever come into contact with incompatible substances such as oxidizers, alkalis, chlorites, or silver compounds either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible. Oxalic acid can enter the environment mainly through industrial discharges or spills.

☠ **Acute Ecological Effects**

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to oxalic acid.

Insufficient data are available on the short-term effects of oxalic acid exposure to aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available on the long-term effects of oxalic acid to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Oxalic acid is highly soluble in water. Concentrations of over 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Oxalic acid is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of oxalic acid found in fish tissues is expected to be about the same as the average concentration of oxalic acid in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of oxalic acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If oxalic acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of oxalic acid.

If oxalic acid is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Use non-sparking tools to cleanup area.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Collect solid materials using a vacuum equipped with a high-efficiency particulate air (HEPA) filter. Do NOT dry sweep (generates airborne dusts). Damp mop residues and flush area with water. Do NOT flush to drains, sewers, or waterways. Collect water for disposal.
- ☑ It may be necessary to dispose of oxalic acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving oxalic acid can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety

or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| | | LEL: Not Determined | UEL: Not Determined |
| NFPA Classification | Non-Flammable Gas | Autoignition Temperature | |
| | | Not Determined | |

Extinguishing Media

Use agents suitable to surrounding fire. Oxygen difluoride does not burn but is a powerful oxidizer.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Also, use a water spray to keep fire-exposed containers cool. Keep water from contacting oxygen difluoride directly since it will react slowly to form hydrofluoric acid. Poisonous gases are produced in fire.

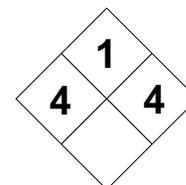

Unusual Fire and Explosion Hazards

Oxygen difluoride is a dangerous explosion hazard. Firefighters should avoid contact with vapors produced during fire. In the presence of water, moist air, or combustible gases (carbon monoxide, hydrogen, methane), oxygen difluoride can produce spark-sensitive mixtures.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|--|--|---|
| Stability | | Conditions to Avoid Oxygen difluoride is normally NOT stable unless it is handled and stored with extreme care to avoid contact with incompatible materials (including water and moist air). It is extremely reactive. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Oxygen difluoride is incompatible with combustible materials (wood, paper, oil, gases), oxidizers (bromine, chlorine), iodine, platinum, metal oxides, moist air, hydrogen, sulfide, hydrocarbons, water. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of oxygen difluoride is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, oxygen difluoride emits highly toxic/poisonous gases, including hydrogen fluoride gas and oxides of fluorine. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: Vapors cause irritation to the upper respiratory tract with coughing, dyspnea, headache, congestion, fever, myalgia (muscle pain), elevated lymphocyte count, bone changes (due to action of fluoride ion), congestion, CNS effects, and/or delayed pulmonary edema. SKIN & EYES: Skin contact with compressed gas can cause severe, painful burns. Eye contact causes burning, watering, redness, corneal ulceration, blurred vision, and possible blindness. INGESTION: Not likely (oxygen difluoride is a gas at room temperature). | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Do not allow victims to rub their eyes. Skin contact: Remove all contaminated clothing. Wash area with water for a minimum of 15 minutes then use soap and water and wash again. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 48 hours for lung effects. If swallowed: Not likely. It is normally a gas. Even as a pressurized liquid it rapidly evaporates at room temperature. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area (avoid vapors). Shut off flow of gas if possible. Provide maximum explosion-proof ventilation of the area of spill and remove all ignition sources (hydrogen gas may be present). Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers upright in cool, dry, well-ventilated area away from heat and moisture. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where oxygen difluoride is used, handled, or stored. Detached facility storage is preferred. Prevent damage to containers. Use non-sparking tools around containers. Electrically ground and bond all containers and equipment. Do not drag or slide containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure levels are relatively low. Recommend using a supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

OXYGEN DIFLUORIDEOF₂

CAS: 7783-41-7

**IDENTIFICATION AND TYPICAL USES**

Oxygen difluoride is a colorless gas or a yellow-brown liquid (under pressure) with a peculiar, foul odor. It is normally shipped as a non-liquefied compressed gas. It is primarily used as an oxidizer for rocket propellants.

RISK ASSESSMENT: HEALTH***General Assessment***

As a gas, oxygen difluoride is a deadly human poison by *inhalation*. It is more poisonous than fluorine. Inhalation of just a few breaths may be fatal. It can cause serious burns on skin contact with the compressed gas, but dermal absorption has not been reported. Ingestion is not probable since oxygen difluoride exists as a gas at room temperatures. Even the compressed liquid vaporizes so rapidly that ingestion is not likely to occur. It is highly caustic and, therefore, an extremely corrosive and destructive compound. There are no reports of any carcinogenic, teratogenic, reproductive, or mutagenic effects resulting from exposure to oxygen difluoride.

Inhalation severely dehydrates tissues and causes destructive corrosive damage to the nose, throat, and mucosa of the upper respiratory tract. There can be coughing, dyspnea (labored breathing), lachrymation, and nausea. Severe exposures may cause pulmonary edema (fluid in the lungs). The development of pulmonary edema can be delayed up to 48 hours after exposure, thereby creating a false sense of security with regard to health exposure risk.

Skin contact with the compressed gas or liquid causes severe burning due to oxygen difluoride's intense corrosive action on human tissue. The liquid may continue to burn and destroy skin tissues long after the exposure if it is not properly removed. Because of the fluoride ion's affinity for calcium, burns may be bone-deep in some instances. The extremely corrosive properties of oxygen difluoride can cause

immediate stinging, burning, redness, swelling, membrane ulceration, painful skin blistering, and local necrosis (tissue destruction) upon contact. Eye contact causes immediate stinging and watering with tissue damage and the possibility of corneal damage. There will be redness and swelling of the lids, intense pain, and tissue destruction. Loss of vision is likely.

Ingestion is extremely rare under normal operating conditions. However, if liquid solutions are accidentally swallowed, there can be severe burns to the lips, mouth, throat, and stomach. If vomiting occurs and the liquid is aspirated into the lungs, the corrosive action on the lung tissues can be fatal.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to oxygen difluoride:

Skin: Irritation/rash or burning feeling on contact with redness, blistering, localized tissue destruction, and deep, painful burns.

Eye: Severe irritation; may cause burns and damage with permanent loss of vision.

Lung: Severe irritation of the mucous membranes in the nose, throat, and lungs following exposure. Pulmonary edema is likely to occur within 48 hours of exposure.

CNS: Unspecified adverse action on the central nervous system.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to oxygen difluoride and can last for months or even years:

Cancer Hazards: According to information presented in the references, oxygen difluoride has not been adequately tested for its ability to cause cancer in laboratory test animals. Additional research is required in

this regard. Its acute toxic action is so harmful that long-term effects have not been well-documented.

Reproductive Hazard: According to information presented in the references, oxygen difluoride has not been shown to cause teratogenic or other adverse reproductive effects in test animals.

Other Chronic Effects: None reported.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with oxygen difluoride. It is extremely corrosive and highly poisonous to humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around oxygen difluoride. The exposure level is extremely low (0.05 ppm) and difficult to accurately monitor. While an air-purifying chemical cartridge respirator or gas mask may suffice for low or infrequent exposures, the best protection is obtained using a self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, protective gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with oxygen difluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where oxygen difluoride is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

- Lung function tests (establish baseline).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

- Lung function tests (compare to baseline).
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, because smoking can cause heart disease, emphysema, lung cancer, and other respiratory disorders, smokers exposed to oxygen difluoride may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* possible exposure factors.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use, care, and maintenance.
- Wash thoroughly immediately after exposure to oxygen difluoride and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of oxygen difluoride should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of oxygen difluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and especially air).

Oxygen difluoride is considered a non-flammable gas. However, it is a powerful oxidizer and extremely corrosive to many materials. It is incompatible with water or steam and will liberate hydrofluoric acid and explosive hydrogen gas and heat on contact. It is incompatible with most metal oxides, combustible materials (wood, paper) and combustible gases (carbon monoxide, hydrogen, methane), chlorine, bromine, iodine, platinum, hydrogen sulfide, and hydrocarbons. These characteristics require special consideration during any emergency situation involving a leak or spill of oxygen difluoride. Should oxygen difluoride ever come into contact with any of these incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Oxygen difluoride can enter the environment mainly industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to oxygen difluoride.

Insufficient data are available to evaluate or predict the short-term effects of oxygen difluoride exposure to aquatic life, plants, birds, or land animals.

☞ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of oxygen difluoride to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Oxygen difluoride is slightly soluble in water, but reacts slowly to form hydrofluoric acid which is highly soluble in water. Concentrations of over 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Oxygen difluoride is slightly persistent in the aquatic environment, with a half-life of less than 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Small quantities of such chemicals as oxygen difluoride may be neutralized by the alkalinity in aquatic systems, but larger quantities can lower the pH for extended periods of time. The concentration of oxygen difluoride found in the edible tissues of most aquatic species that are consumed by humans is expected to be about the same as the average concentration in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of oxygen difluoride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Containers should be protected against physical damage and stored away from direct sunlight or other heat sources. Cylinders must be stored upright and secured properly. They should never be rolled or dragged. Because oxygen difluoride will corrode and/or react with many materials, selection of storage containers requires proper consideration.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils (solution spills) should be removed for incineration and replaced with clean soil. If oxygen difluoride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in water and, therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, stor-

age, or disposal of oxygen difluoride. If oxygen difluoride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and provide maximum explosion-proof ventilation.
- ☑ Shut off gas leak, if possible. If leak is from a cylinder and it cannot be turned off, remove cylinder to safe area (outdoors) and allow to vent. Take care to avoid contact with the vapors or any escaping compressed liquids. Be aware of the possibility that hydrogen gas may be in the area (explosion hazard).
- ☑ It may be necessary to dispose of oxygen difluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving oxygen difluoride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Triatomic oxygen.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|---|---|---|
| Ozone (derivation: Occurs in the atmosphere from UV light action on oxygen at high altitudes, and by lightning action on air. Also occurs in automobile engines and by electrolysis of alkaline perchlorate solutions. Derived by the passage of air or oxygen between electrodes at high voltage). 1 ppm = 2.00 mg/m³ | PEL: 0.1 ppm 0.2 mg/m³ STEL (15-min): 0.3 ppm 0.6 mg/m³ | REL (ceiling): 0.1 ppm 0.2 mg/m³ STEL: Not Applicable | 5 ppm | TLV (ceiling): 0.1 ppm 0.2 mg/m³ STEL: Not Applicable |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point -169°F (-111°C) | Specific Gravity (H ₂ O = 1) 1.66 (Gas) |
| Vapor Pressure (atmospheres) >1 at 68°F (20°C) | Molecular Weight 54.0 |
| Vapor Density (Air = 1) 1.655 | Melting Point -315°F (-193°C) |

Solubility
Very slightly soluble (0.001%). Soluble in alkaline solvents.
Appearance and Odor
Normally a colorless to blue gas with a very pungent odor. Can appear as a dark blue liquid at -169 to -315°F (-111 to -193°C), or bluish-black crystals below -315°F (-193°C). Odor Threshold = 0.25ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

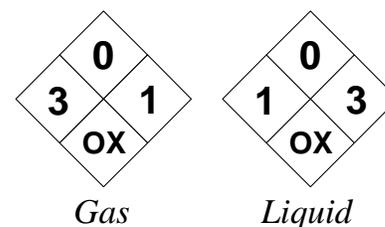

| | |
|--|--|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Flammable Gas | Autoignition Temperature Not Determined |

Extinguishing Media
Use agents suitable to surrounding fire. Ozone does not burn but is a powerful oxidizer.
Special Fire Fighting Procedures
Wear full protective clothing and self-contained breathing apparatus (SCBA). Also, use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire.
Unusual Fire and Explosion Hazards
Ozone is a dangerous explosion hazard. The liquid and solid form can explode violently when shocked or exposed to heat or fire. Containers may explode in fire. Decomposition of ozone into oxygen can increase the burning rate of fires.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|---|--|--|
| Stability | | Conditions to Avoid Ozone is unstable at normal temperatures and readily decomposes to biatomic oxygen. Its liquid and solid forms can explode when shocked, exposed to heat or flame, or by contact with incompatible materials. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Incompatible with rubber and reacts with non-saturated organic compounds to produce ozonides which are unstable. Incompatible with acetylene, alkenes, alkyl metals, benzene, aniline, and bromine. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ozone is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, ozone emits oxygen which can greatly accelerate the intensity of fire. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and upper respiratory tract with coughing, dyspnea, visual disturbances, lachrymation, headache, decreased pulse rate and blood pressure, loss of coordination, chest pains, fatigue, possible hemorrhage, and pulmonary edema which can be fatal. There may be blood and chromosomal changes. SKIN & EYES: Skin or eye contact with compressed gas can cause severe, painful burns (frostbite). INGESTION: Not likely (ozone is a gas at room temperature). | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Do not allow victims to rub their eyes. Skin contact: Remove all contaminated clothing. Wash area with water for a minimum of 15 minutes then use soap and water and wash again. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 48 hours for lung effects. If swallowed: Not likely. It is normally a gas. DOCTOR: Detection of serum lactate dehydrogenase may indicate lung permeability due to ozone. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area (avoid vapors). Shut off flow of gas if possible. If not, remove cylinder to safe location (outdoors) and allow to vent until empty. Stay upwind of spill area. Remove all ignition sources. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers upright in cool, dry, well-ventilated area away from heat and moisture. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where ozone is used, handled, or stored. Detached facility storage is preferred. Prevent damage to containers. Refrigerated storage area is recommended. Do not drag or slide containers. Electrically ground and bond all equipment. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure levels are relatively low. Recommend using a supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

OZONEO₃

CAS: 10028-15-6

**IDENTIFICATION AND TYPICAL USES**

Ozone is normally a colorless to blue gas with a pungent odor. It can also appear as a dark blue liquid at temperatures of -169° to -315°F (-112° to -193°C) or a bluish-black crystalline solid below -315°F (-193°C). In every case, ozone typically has a very pungent, irritating odor. It is used in the purification of drinking water, in industrial waste treatment, for deodorizing air and sewage gases, in bleaching waxes, oils, wet paper, and textiles, in the production of peroxides, and bactericides. It is also an oxidizing agent in several chemical processes (acids, aldehydes, ketones from unsaturated fatty acids), in steroid hormones, in the removal of chlorine from nitric acid, and in the oxidation of phenols and cyanides.

RISK ASSESSMENT: HEALTH**General Assessment**

As a gas, ozone is a toxic human poison by *inhalation*. It is more poisonous than fluorine. Inhalation of ozone at relatively low concentrations can cause death in a short period of time. Its destructive action is very similar to that caused by inhalation of radioactive particulates. It is only slightly water soluble and, therefore, it is not easily soluble in the mucosa along the respiratory tract but passes directly to the smallest components of the lungs (alveoli and bronchioles) to cause destructive damage. It can cause serious burns on skin contact with the compressed gas, but dermal absorption has not been reported. Ingestion is not probable since ozone exists as a gas at room temperatures. Even the compressed liquid vaporizes so rapidly that ingestion is not likely to occur. It is highly caustic and, therefore, an extremely corrosive and destructive compound. There are no reports of any carcinogenic, teratogenic, reproductive, or mutagenic effects resulting from exposure to ozone.

Inhalation can cause nose, throat, and respiratory tract irritation with coughing, difficulty in breathing, lachrymation, headache, decreased pulse rate and blood pressure, loss of coordination, chest pain and soreness, and fatigue. Severe exposures may cause hemorrhage and/or pulmonary edema (fluid in the lungs) which can be fatal. The development of pulmonary edema can be delayed up to 48 hours after exposure, thereby creating a false sense of security with regard to health exposure risk. Experimental studies with human tissues and animals have shown blood changes (alterations in shape of red blood cells thereby increasing the possibility of hemolysis), chromosomal changes, and adverse reproductive effects. Cell membrane damage may also occur and tissue death in the lungs is possible.

Skin contact with the compressed gas or liquid causes severe burning due to ozone's intense corrosive action on human tissue. The extremely corrosive properties of ozone can cause immediate stinging, burning, redness, swelling, membrane ulceration, painful skin blistering, and local necrosis (tissue destruction) upon contact. Eye contact causes immediate stinging and watering with tissue damage and the possibility of corneal damage. There will be redness and swelling of the lids, intense pain, and tissue destruction. Loss of vision is likely.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ozone:

Skin: Irritation/rash or burning feeling on contact with redness, blistering, localized tissue destruction, and deep, painful burns.

Eye: Severe irritation; may cause burns and damage with permanent loss of vision.

Lung: Severe irritation of the mucous membranes in the nose, throat, and lungs following exposure.

Pulmonary edema is likely to occur within 48 hours of exposure.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to ozone and can last for months or even years:

Cancer Hazards: According to information presented in the references, ozone has not been adequately tested for its ability to cause cancer in laboratory test animals. Additional research is required in this regard.

Reproductive Hazard: According to information presented in the references, ozone has not been shown to cause teratogenic or other adverse reproductive effects in test animals.

Other Chronic Effects: Repeated exposure may cause breathing disorders through respiratory tract scarring or premature aging similar to that caused by continued exposure to ionizing radiation.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ozone. It is extremely corrosive and highly toxic to humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ozone. The exposure level is extremely low (0.1 ppm) and difficult to accurately monitor. Exposure to relatively low concentrations of ozone gas can cause death in a short period of time. While an air-purifying chemical cartridge respirator or gas mask may suffice for low or infrequent exposures, the best protection is obtained using a self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, protective gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ozone.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ozone is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

- ☑ Lung function tests (establish baseline).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

- ☑ Lung function tests (compare to baseline).
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- ☑ Blood level monitoring for lactate dehydrogenase. Increased levels may indicate lung permeability due to ozone. Persistent hypoxia may require endotracheal intubation.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, because smoking can cause heart disease, emphysema, lung cancer, and other respiratory disorders, smokers exposed to ozone may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* possible exposure factors.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to ozone and at the end of the work shift or before eating, drinking, or smoking.

- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ozone should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at serious risk of exposure during transportation, storage, disposal, or destruction of ozone. Ozone appears to contribute to the formation of photochemical smog. While stratospheric ozone (above approximately 56,000 feet or 17 kilometers) is essential to prevent harmful levels of the sun's ultraviolet radiation from reaching the Earth's surface, ozone concentrations in the lower atmosphere (the troposphere) near the Earth's surface can be extremely harmful to humans. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and especially air).

Ozone is considered a non-flammable gas. However, it is a powerful oxidizer and extremely corrosive to many materials. It is incompatible with many commonly encountered materials including acetylene, alkylmetals, antimony, aromatic compounds (benzene, aniline), oxidizable materials (both organic and inorganic), other oxidizers (bromine, fluorine), nitrogen, nitrogen oxide, nitrogen trichloride, fluoroethylene, liquid hydrogen, silica gel, cryogenic ethylene, and all reducing materials and agents. These characteristics require special consideration during any emergency situation involving a leak or spill of ozone. Should ozone ever come into contact with any of these incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Although it does occur naturally, ozone can also enter the environment as a by-product of internal combustion engines, by electronic irradiation of air, and by industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ozone.

Insufficient data are available to evaluate or predict the short-term effects of ozone exposure to aquatic life, plants, birds, or land animals.

☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of ozone to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ozone is very slightly soluble in cold water. Concentrations of 10 milligrams or less will mix with a liter of water.

⌚ *Persistence in the Environment*

Ozone is slightly persistent in the aquatic environment, with a half-life of less than 2 and 20 days. It is highly persistent in the atmosphere with a half-life in air of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ozone found in the edible tissues of most aquatic species that are consumed by humans is expected to be about the same as the average concentration of ozone in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ozone to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ozone should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Containers should be protected against physical damage and stored away from direct sunlight or other heat sources. Cylinders must be stored upright and secured properly. They should never be rolled or dragged.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils (solution spills) should be removed for incineration and replaced with clean soil. If ozone should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in water and, therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ozone. If ozone is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources and ventilate area.
- Shut off gas leak, if possible. If leak is from a cylinder and it cannot be turned off, remove cylinder to safe area (outdoors) and allow to vent. Take care to avoid contact with the vapors or any escaping compressed liquids.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ozone can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Also, public awareness of the word

"ozone" has increased dramatically in recent years. Even if the exact nature of its properties is unknown, people may still become emotionally charged at the mere mention of the chemical's name. This must be carefully considered when drafting or implementing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

PARAFFIN WAX

CAS: 8002-74-2

**IDENTIFICATION AND TYPICAL USES**

Paraffin wax appears as a white to slightly yellow, or colorless translucent tasteless, odorless, solid consisting of a mixture of solid hydrocarbons of high molecular weight (e.g., $C_{36}H_{74}$). It has a great number of uses. It is found in candles and it is used as a paper coating and protective sealant for food products and beverages. It is also used in glass-cleaning preparations; in the carpet-laying industry (hot melt carpet backing to join together carpet pieces); as a biodegradable mulch (hot melt-coated paper); for impregnating match heads; in lubricants; in the manufacture of crayons; in some surgical techniques; in stoppers for acid bottles; in electrical insulation; as a component in some floor polishes; in cosmetics; in the photography industry; as an anti-frothing agent in sugar refining; for packing tobacco products; for protecting rubber products from drying and cracking (due to exposure to the sun); and as a chewing gum base.

RISK ASSESSMENT: HEALTH***General Assessment***

Paraffin wax fumes are harmful to humans primarily by *inhalation*. There are no reports of dermal absorption; however, skin contact with the wax can cause a variety of reactions especially in the long-term. If the wax should be hot or molten, then burns and blistering are also likely. Ingestion has not been reported as a likely exposure route. There are some reports in the references (Lewis 1992) that exposure to paraffin over the course of many years may cause cancer. There are no reports of any teratogenic or mutagenic effects.

Human systemic effects by inhalation include mild irritation of the eyes, nose, and throat. There may be some degree of discomfort and possible nausea.

Repeated skin contact may cause chronic dermatitis, the development of wax boils, pimples, blackheads, and other chronic skin disorders. The hot or

molten wax can cause serious burns to the eyes and skin.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to paraffin wax:

Skin: Irritation and, if the wax is hot, redness, blistering, and burning.

Eye: Severe irritation; pain and permanent damage possible if the wax is hot or molten.

Lung: Nose, throat, and respiratory tract irritation causing mild discomfort and nausea.

⚙️ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to paraffin wax and can last for months or even years:

Cancer Hazards: Paraffin wax is a known suspected carcinogen in some test animals. There are reports of scrotum cancer developing in humans exposed to paraffin wax for periods of 10 years or more. Also, a skin lesion known as paraffinoma has been linked to the use of paraffin in some cosmetics.

Reproductive Hazard: According to information presented in the references, paraffin wax has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged or repeated skin contact can cause the development of chronic dermatitis, folliculitis (inflammation of the hair follicles), melanoderma (abnormal skin pigmentation), hyperkeratoses (thickening of the skin), and possible sensitization in some individuals.

🛡️ *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with paraffin wax. Occupational exposures occur most commonly by inhalation. If a less toxic material or compound cannot be substituted for paraffin wax, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of paraffin wax release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around paraffin wax. A MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or a powered air-supplied respirator in continuous flow mode are the recommended methods of respiratory protection when exposure to paraffin wax is anticipated. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with paraffin wax.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where paraffin wax is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered:

- Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to paraffin wax and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of paraffin wax should be communicated to all exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to paraffin wax, emergency shower facilities should be provided.
- Workers whose clothing has been contaminated by paraffin wax should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to paraffin wax.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of paraffin wax. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Paraffin wax is a moderately flammable liquid. Because of its low flash point and high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). It is a dangerous fire hazard and moderate explosion hazard when exposed to heat or flame. Caution is always required in handling, storage, transportation, and disposal of paraffin wax. Emergency responders should be made aware of the presence of paraffin wax at any emergency response situation.

Paraffin wax can enter the environment from industrial effluents and from spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to paraffin wax.

Insufficient data are available to evaluate or predict the short-term effects of paraffin wax on aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of paraffin wax on aquatic life, plants, birds, or terrestrial animals.

💧 *Water Solubility*

Paraffin wax is insoluble. Concentrations of less than 1 milligram will not mix with a liter of water.

🕒 *Persistence in the Environment*

Paraffin wax is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Paraffin wax will eventually end up in aquatic and terrestrial sediments in approximately even proportions.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Paraffin wax is not expected to accumulate in the edible tissues of fish that are normally consumed by humans.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of paraffin wax into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of paraffin wax should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed and replaced with clean soil. If paraffin wax should contact the water table, aquifer, or navigable waterway, time is of the essence. It is not soluble and total remediation may be possible. The local and/or state emergency response authorities should be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of paraffin wax.

If paraffin wax is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Allow molten wax to cool and solidify before cleanup operations begin. Collect materials using non-sparking tools and place in suitable drums or containers for reclamation or disposal.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources from area.
- ☑ It may be necessary to dispose of paraffin wax as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving paraffin wax can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness (leukemia), injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer" or "carcinogen" are used, public emotion, anxiety, hysteria, and ignorance can all run equally high. This must be carefully considered whenever drafting or implementing public relations policies.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|--|---|---|
| Parathion: (derivation: From sodium ethylate, thiophosphoryl chloride, and sodium <i>p</i> -nitrophenate). 1 ppm = 12.11 mg/m³ | PEL (8-hour): 0.1 mg/m³ (skin) STEL: Not Established | REL (10-hour): 0.05 mg/m³ (skin) STEL: Not Established | 10 mg/m³ | TLV: 0.1 mg/m³ (skin) STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 707°F (375°C) | Specific Gravity (H ₂ O = 1) 1.27 |
| Vapor Pressure (mm Hg) 3.78 x 10⁻⁵ at 68°F (20°C) | Molecular Weight 291.3 |
| Vapor Density (Air = 1) 10.0 | Melting Point 43°F (6°C) |

Solubility

Slightly soluble in water (0.001%). Soluble in alcohols, esters, ethers, chloroform, ketones, aromatic hydrocarbons, and animal and vegetable oils. Nearly insoluble in petroleum ether and kerosene.

Appearance and Odor

Pale-yellow to dark-brown liquid with a garlic-like odor. Odor Threshold = 0.47 mg/m³.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 392°F (200°C) opened cup | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Class IIIB Combustible Liquid | Autoignition Temperature Not Determined |

Extinguishing Media

Use dry chemical, carbon dioxide, water spray, fog, or standard foam.

Special Fire Fighting Procedures

Poisonous gases are produced in fire; wear full protective clothing and self-contained breathing apparatus (SCBA). If possible, fight fire from a distance and avoid smoke (consider down-wind conditions). Move containers from fire area if it can be done safely and without risk.

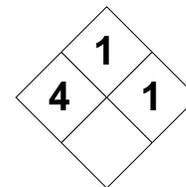

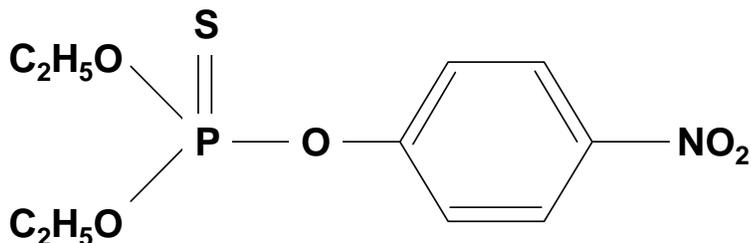

Unusual Fire and Explosion Hazards

Containers may explode when exposed to heat of a fire. Use water spray to cool fire-exposed containers that cannot be moved from fire area. Evacuate non-essential personnel 2000 feet from fire area.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|---|--|---|
| Stability | | Conditions to Avoid Parathion is kept stable in aqueous solution of distilled water in acid solution. Avoid contact with incompatible materials. Keep away from heat and flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with strong oxidizers, alkaline materials, and endrin. It will also attack some forms of rubber, plastics, and coatings. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of parathion will not occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Acrid and irritated gases and fumes are produced when parathion is involved in fire, including oxides of nitrogen, phosphorus, and sulfur. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Labored or difficult breathing, tightness in chest, wheezing, coughing, rales, increased respiration, headache, runny nose, and excessive bronchial secretions. There may also be laryngeal spasms, excessive salivation, respiratory distress, cyanosis, pulmonary edema (fluid in lungs), visual disturbances, tearing, blurring, nausea and vomiting, pain in the stomach, and CNS effects such as giddiness, dizziness, weakness, slow heart-beat, arrhythmia, loss of coordination, slurred speech, confusion, disorientation with drowsiness, hypertension, convulsions, coma, and death (respiratory paralysis). | | | | |
| ABSORPTION: Irritation to the skin and eyes. May absorb to cause toxic systemic effects, including sweating twitching and many of the symptoms noted for inhalation. Sensitization and dermatitis may occur at high exposures. Extremely irritating to the eyes. | | | | |
| INGESTION: Causes many of the same symptoms noted for inhalation and absorption. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, CNS, CVS, blood. |
| Medical Conditions Generally Aggravated by Exposure Glaucoma, cardiovascular disorders, hepatic and renal diseases, and CNS disorders. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water followed by a 95% ethanol wash and then a second soap and water rinse. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 48 hours for lung effects. If swallowed: Contact poison control center. Give 1-2 glasses of water. Unless advised otherwise, do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Do not use plastic or rubber tools during cleanup since parathion can attack such materials. | | | | |
| Preferred Waste Disposal Method | | | | |
| Mix in flammable solvent and burn in chemical incinerator equipped with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store in tightly closed containers in a cool, well-ventilated, moisture-free area. | | | | |
| Other Precautions and Warnings | | | | |
| Keep away from rubber and plastic materials. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For best protection, use a supplied-air respirator with full facepiece operated in pressure demand mode or a SCBA with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Teflon or Saranex Material | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Whole Body Protection | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

PARATHION

CAS: 56-38-2

**IDENTIFICATION AND TYPICAL USES**

Parathion is a pale-yellow to dark-brown liquid with a faint, garlic-like odor. It can also appear as a solid at temperatures below 43°F (6°C). It is a pesticide whose general use is now subject to restrictions in the United States. It is used as an insecticide for wheat and nuts and as an acaricide.

RISK ASSESSMENT: HEALTH***General Assessment***

Parathion is toxic to humans by *inhalation*, *dermal absorption*, and *ingestion*. It is a questionable carcinogen with human mutation data also reported. It is also an experimental teratogen with positive evidence of reproductive effects in animals. It is not easily removed from the surface of the skin and eye contact with the liquid can be fatal due to the chemical's rapid absorption through the eye.

Inhalation of parathion vapors will cause a tightness in the chest, wheezing, increased pulmonary secretions, bluish color in the skin, small pupils (miosis), an aching feeling in and behind the eyes, blurred vision, lachrymation (tearing), runny nose, headache, and watering mouth. It can lead to pulmonary edema (fluid in the lungs) which can be fatal. Symptoms may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk. There may be laryngeal spasms, respiratory distress, bradycardia (reduced heartbeat), tachycardia (fast heartbeat), and other cardiac disturbances (arrhythmia, complete heart block). It will also cause systemic effects with action on the central nervous system. This action can include weakness, general twitching and paralysis, dizziness, confusion, staggering gait, slurred speech, sweating, incontinence, convulsions, stopped breathing, coma, and death. This compound is also an

inhibitor of cholinesterase, a blood enzyme that is essential to the proper functioning of the muscles.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to parathion:

Skin: Irritation and possible inflammation. May absorb through unbroken skin to cause toxic systemic effects, including ocular disturbances, respiratory impairment, and CNS effects.

Eye: One drop of parathion in the eye can be life-threatening. It is easily absorbed through the cornea and conjunctiva.

Lung: Irritation of the mucosa of the nose, throat, and upper respiratory tract. Effects are more systemic than localized, with action on the blood, central nervous system, and (possibly) the cardiovascular system. Direct lung effects include pulmonary edema (fluid in the lungs) which can also be fatal.

CNS: A depressant, causing headache, blurred vision, giddiness, nervousness, and other systemic effects up to and including death from respiratory paralysis or cardiac disturbances.

Other: Ingestion of parathion will result in loss of appetite, nausea, vomiting, abdominal cramps, and diarrhea with 2 hours of exposure.

☠ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to parathion and can last for months or even years:

Cancer Hazards: According to the information presented in the references, parathion has been shown to

cause cancer in test animals. It has been shown to cause mutations (genetic changes) in humans and may pose a cancer risk as well.

Reproductive Hazard: According to the information presented in the references, parathion may damage the developing fetus in humans since it has been shown to be fetotoxic in animals.

Other Chronic Effects: Chronic exposure to parathion has not been sufficiently studied. However, there is some indication that long-term exposure or frequent high exposures may inhibit the essential enzyme cholinesterase. Individuals may become more susceptible to parathion's toxic effects following long-term exposure. Parathion binds irreversibly to cholinesterase causing its depletion. This action is apparently the reason for the increased susceptibility in chronic exposure. Symptoms include headache, vertigo, loss of memory and appetite, insomnia, disorientation, muscular twitching and trembling, and other CNS effects. Parathion is partially converted in the body to paraoxon, an active cholinesterase inhibitor. It may also cause dermal sensitization as well as dermatitis in some people.

🔹 **Recommended Risk-Reduction Measures**

Parathion is more toxic to humans than most other anticholinesterase agents. Less toxic substances should always be sought as a first step towards risk reduction. If a less toxic chemical cannot be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. These controls certainly may not be practical or applicable when using parathion as an insecticide, especially outdoors. However, during manufacture, transportation, or storage, these engineering controls may be effective in reducing exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around parathion. The exposure level for this compound is relatively low and may be difficult to measure and even more difficult to protect against. At low or infrequent exposures, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist pre-filter may suffice. However, for maximum exposure risk reduction or for exposures to high concentrations, a self-contained breathing apparatus (SCBA) with full

facepiece operated in pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn. Caution is warranted in glove selection since parathion will attack rubbers, some plastics, and many coatings. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with parathion.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where parathion is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Complete blood count (CBC) with plasma and red blood cell cholinesterase levels. If exposure stops, plasma levels return to normal within 1 to 2 weeks while red blood cell levels may be reduced for 1 to 3 months.
- ☑ Urinary metabolite monitoring for *p*-nitrophenol within 48 hours of exposure to assess parathion absorption.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- ☑ Wash thoroughly immediately after exposure to parathion and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of parathion should be communicated to all exposed workers.

- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is also at risk of exposure during the intended use as an insecticide, as well as during transportation, storage, disposal, or destruction of parathion. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Parathion is considered a Class IIIB combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of parathion. Should parathion ever come into contact with incompatible substances such as strong oxidizers, alkaline materials, or endrin, either during use, transportation, or storage, violent reactions can occur.

Parathion can enter the environment through its intended use as an insecticide, through industrial discharges, and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to parathion.

This chemical has high acute toxicity to aquatic life and to birds. Parathion has caused injury, including germination decreases and sterility increases in various agricultural and ornamental crops. Insufficient data are available to evaluate or predict the short-term effects of parathion to land animals.

☪ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Parathion has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of parathion to plants, birds, or land animals.

◆ *Water Solubility*

Parathion is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Parathion is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 69% of parathion will eventually end up in water; the remainder will be divided about equally between terrestrial soils and aquatic sediments.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of parathion found in fish tissues is expected to be somewhat higher than the average concentration of parathion in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of parathion should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. It should be kept in dry areas away from water and moisture.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If parathion should contact

the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of parathion. If parathion is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand and place in a sealed drum for disposal using non-sparking tools. Avoid using plastic or rubber tools during cleanup since parathion can attack such materials.
- ☑ It may be necessary to dispose of parathion as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving parathion can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, anxiety, hysteria, and ignorance can run equally high. This should be carefully considered whenever developing or implementing public relations policies or directives.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety

or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

|--|--|--|---|---|
| Pentaborane (derivation: From the hydrogenation of diborane). 1 ppm = 2.62 mg/m³ | PEL: 0.005 ppm 0.01 mg/m³ STEL (15-min): 0.015 ppm 0.03 mg/m³ | REL: 0.005 ppm 0.01 mg/m³ STEL (15-min): 0.015 ppm 0.03 mg/m³ | 1 ppm | TLV: 0.005 ppm 0.013 mg/m³ STEL: 0.015 ppm 0.039 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|------------------------------|---------------------------|---|--|
| Boiling Point | 145°F (60°C) | Specific Gravity (H ₂ O = 1) | 0.62 |
| Vapor Pressure (atmospheres) | 171 at 68°F (20°C) | Molecular Weight | 63.1 |
| Vapor Density (Air = 1) | 2.2 | Freezing Point | -189°F to -52°F (-123°C to -47°C) |

Solubility

Reacts and decomposes in water.

Appearance and Odor

Colorless liquid with a pungent odor like that of sour milk. Odor Threshold = 1.3 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|----------------------------------|-------------------------------------|----------------------------|
| Flash Point (method used) | 86°F (30°C) closed cup | Explosive Limits in Air % by Volume | LEL: 0.42% UEL: 98% |
| NFPA Classification | Class IC Flammable Liquid | Autoignition Temperature | 95°F (35°C) |

Extinguishing Media

Stop leak, if possible. Once leak is stopped, use dry chemical or carbon dioxide. Do NOT use water.

Special Fire Fighting Procedures

Pentaborane is poisonous: wear full protective clothing and self-contained breathing apparatus (SCBA). Fight fire from distance if possible. Stay away from ends of tanks.

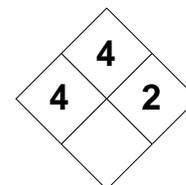

Unusual Fire and Explosion Hazards

Pentaborane presents a serious explosion hazard when exposed to flame or involved in fire. Containers can explode in fire. Can react explosively in air. May re-ignite explosively after fire has been extinguished. Cool fire-exposed containers with water spray (do not allow water to contact pentaborane).

| SECTION V - REACTIVITY DATA | | | | |
|---|--------------------------|---|--|--|
| Stability | | Conditions to Avoid Pentaborane is thermally unstable. It decomposes at 300°F (149°C) in closed containers. Avoid contact with heat and incompatible materials. Explosions are likely to be violent and severe. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Pentaborane is incompatible with oxidizers, halogens, water, tris(difluoroamine)fluoromethane, dimethyl sulfoxide, oxygen, halogenated hydrocarbons. May ignite spontaneously in moist air. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of pentaborane may occur. Avoid elevated temperatures. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products Pentaborane decomposes upon heating or when exposed to water to produce toxic boron fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Nausea, drowsiness, lethargy and fatigue headache, slurred speech, dizziness, nervous excitation, hiccups, muscle pain, cramps, facial spasms, confusion, shallow respiration, coma, behavioral changes, and possible progression to death. ABSORPTION: Tremors, confusion, seizures, shallow breathing, and cyanosis. Eye contact produces irritation of the eyes and lids causing symptoms of skin absorption. INGESTION: Nausea and vomiting along with symptoms of inhalation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 (Table Z-1) | Target Organs? Respiratory system, skin, eyes, CNS, kidney, liver. |
| Medical Conditions Generally Aggravated by Exposure Blood disorders, skin allergies, lung disorders, kidney and liver diseases. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Immediately flush with large amounts of water for 15 minutes (minimum), occasionally lifting eyelids; seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If <u>swallowed:</u> Not likely but possible (pentaborane is spontaneously flammable in air). Seek medical attention immediately. Never attempt to give anything by mouth to an unconscious or convulsing person. Unless advised otherwise, give 1 to 2 glasses of water and then induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Deny entry to those not involved in cleanup. Ventilate area. Absorb liquids in vermiculite or other material and place in sealed drum for disposal. Use non-sparking tools. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from heat and moisture. Suggest a nitrogen purge inside storage containers. Keep away from ignition sources such as fire, sparks, and flame. | | | | |
| Other Precautions and Warnings Bulk storage of pentaborane is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At any exposure level, use a powered supplied-air respirator set in positive pressure mode or use an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Synthetic Impervious Material | | Eye Protection Chemical Goggles and/or Face Mask | | Other Protective Clothing Protective Suit |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

PENTABORANEB₅H₉

CAS: 19624-22-7

**IDENTIFICATION AND TYPICAL USES**

Pentaborane is a colorless liquid with a pungent odor like that of sour milk. Used as a fuel for air-breathing engines, as a reducing agent in propellants, a catalyst, a corrosion inhibitor, as a chemical intermediate, as oxygen scavengers, and in fluxing agents.

RISK ASSESSMENT: HEALTH***General Assessment***

Pentaborane is a highly toxic compound by all major routes of exposure (skin *absorption*, *ingestion*, and primarily by *inhalation*). There are no reports of carcinogenic, teratogenic, or mutagenic effects on long-term exposure.

Inhalation of pentaborane is extremely dangerous, causing irritation of the eyes. Symptoms can range from mild to severe and include nausea, drowsiness, lethargy, fatigue, headache, slurred speech, dizziness, nervous excitation, hiccups, muscle pains and cramps, muscle spasms in the face and extremities, mental confusion, incoordination, cramps and convulsions, shallow respiration, coma, and possible death.

Skin absorption can lead to tremors, confusion, seizures, shallow breathing, and cyanosis. Eye contact causes irritation of the eyes and lid followed by the symptoms noted for skin absorption. Caution is warranted to ensure multiple-route exposures do not occur. For example, skin absorption *and* inhalation can result in severe overexposure and possibly lead to life-threatening symptoms.

Ingestion is not likely since pentaborane will usually ignite spontaneously on exposure to air. If ingestion should occur, symptoms include nausea and vomiting as well as the systemic effects noted for inhalation and skin absorption.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to pentaborane:

Skin: Irritation at the site of contact with potential for redness, swelling, and inflammation. Absorption is likely to be quick.

Eye: Mild to moderate irritation of the eyes, lids, and conjunctiva.

Lung: Mild to moderate irritation of the nose, throat, and mucous membranes of the respiratory tract. Pentaborane is rapidly absorbed through the respiration process and causes toxic systemic effects resulting from its action of the central nervous system (CNS).

CNS: High exposures may cause severe CNS irritation such as drowsiness, dizziness, visual disturbances, muscle twitching, and, in severe cases, painful muscle spasm, coma, and death.

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to pentaborane and can last for months or even years:

Cancer Hazards: According to information presented in the references, pentaborane has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazards: According to information presented in the references, pentaborane has not been tested for its ability to affect reproduction.

Other Chronic Effects: Prolonged exposures can lead to anorexia, vomiting and diarrhea, skin rash, hair loss, convulsions, and anemia. It may also cause injuries to the central nervous system, liver, and kidneys.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with pentaborane. It is extremely toxic and exposures can cause

death or serious physical injury or illness. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is always advisable whenever working with pentaborane. A NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with pentaborane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where pentaborane is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- ☑ Blood tests for glucose, calcium, urea nitrogen and carbon dioxide.

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Repeat blood tests.
- ☑ Complete neurological examination with careful evaluation of exposure history and special testing.

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that

personnel are trained in its use, care, and maintenance.

- ☑ Wash thoroughly immediately after exposure to pentaborane and at the end of the work shift or before eating, drinking, or smoking. Work clothing contaminated with pentaborane should never be taken home for laundering. Only personnel trained in the hazards of exposure should launder contaminated clothing.
- ☑ Safety shower and eyewash stations should be readily available in work areas where pentaborane is used or stored.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of pentaborane should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of pentaborane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Pentaborane is considered a Class IC flammable liquid per OSHA 29 CFR 1910.106. It is explosive by itself and, because it is incompatible with many other commodities, contact with any of them can result in violent explosion and fire. It is highly reactive and will ignite with moist air at room temperature. Pentaborane forms explosive mixtures in air over a very wide and dangerous range (0.42% - 98%) which makes it a serious fire and explosion risk. It will explode in contact with many oxidizing agents (especially fluorine, bromine, and chlorine). It is highly reactive in the presence of halogens and halogenated hydrocarbons. Therefore, pentaborane requires special consideration during any emergency involving a leak or release of pentaborane gas or liquid. Pentaborane can enter the environment through industrial and municipal waste plant discharges, or through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to pentaborane.

Insufficient data are available to evaluate or predict the short-term effects of pentaborane on aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of pentaborane on aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Pentaborane decomposes in water.

🕒 *Persistence in the Environment*

Pentaborane will react slowly with water and therefore will not accumulate in the aquatic environment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Pentaborane will react with water and therefore is not expected to accumulate in the edible tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of pentaborane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Under all circumstances, it should be protected from exposure to moisture. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms,

sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If pentaborane should contact the water table, aquifer, or navigable waterway, remediation may not be possible. It will readily react with water and decompose, and therefore total containment will not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of pentaborane. If pentaborane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry earth, sand, or other suitable material and collect using non-sparking tools. Place collected materials in tightly sealed drums for disposal.
- ☑ Keep pentaborane out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- ☑ It may be necessary to dispose of pentaborane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving pentaborane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding

an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Solubility

Slightly soluble (0.001%) in water. Soluble in dilute alkali, alcohol, ether, and benzene.

Appearance and Odor

Colorless to white, or light-brown to tan flakes or crystalline solid with a benzene-like odor and pungent taste.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Combustible Solid | Autoignition Temperature Not Determined |

Extinguishing Media

Use extinguishing media suitable to surrounding fire. Pentachlorophenol itself will not ignite.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Use water spray to keep fire-exposed containers cool. Move containers from fire if it can be done without risk. Fight fire from a distance or protected position, if possible.

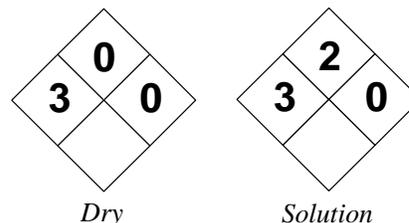

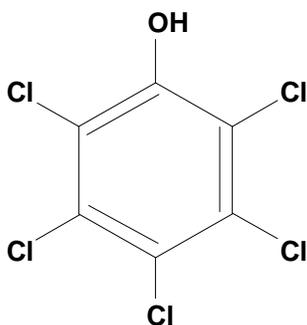

Unusual Fire and Explosion Hazards

Containers may explode in fire. Wood products that have been treated with 5% pentachlorophenol or a mixture of PCP with petroleum solvents as a preservative and for termite control are combustible.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|---|--|--|
| Stability | | Conditions to Avoid Pentachlorophenol is normally stable in closed containers under routine conditions of storage and handling. Keep away from exposure to heat or ultra violet (UV) radiation (e.g., sunlight). | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, (such as chlorine, bromine, and fluorine), acids, and alkalis. Pentachlorophenol solutions exposed to sunlight or UV radiation undergo photochemical degradation. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of pentachlorophenol cannot occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, pentachlorophenol can emit highly toxic/poisonous gases, including hydrogen chloride, chlorine, and chlorinated hydrocarbons. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Irritating to the eyes, nose, throat, and respiratory tract causing sneezing, coughing, and lachrymation (tearing). Can also cause tachycardia (rapid heartbeat), tachypnea (rapid breathing), hypertension, fever and muscle weakness, anorexia, sweating, dizziness, and nausea. High concentrations can cause convulsions, loss of consciousness, and death. | | | | |
| ABSORPTION: Irritation and possible development of chloracne with blackheads, whiteheads, yellow cysts and localized inflammation. Passes quickly through intact skin. | | | | |
| INGESTION: Burning of mouth and throat, salivation, dizziness, nausea, vomiting, bright yellow stool, and symptoms of inhalation. | | | | |
| Carcinogenicity Suspected Human Confirmed Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Skin, eyes, resp. system, CNS, CVS, liver, kidney |
| Medical Conditions Generally Aggravated by Exposure Liver, kidney, nervous system, cardiovascular system, endocrine system, and metabolic disorders. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide CPR if required. Transfer to medical facility. If swallowed: Contact poison control center. Unless advised otherwise, give 1-2 glasses of water and induce vomiting. Do NOT give milk or other materials containing vegetable or animal fats (they enhance absorption). Never give anything by mouth to unconscious people. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled For dry spills, minimize dust generation. Do NOT dry sweep. Use a vacuum equipped with a high efficiency particulate air (HEPA) filter instead. Damp mop residue. Collect and dispose of in sealed drum. For liquid spills, cover with absorbent (vermiculite or other) and dispose of in sealed drum. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from heat or flame. Heat may cause containers to build up pressure and explode. Store in detached facility away from main plant or facility. | | | | |
| Other Precautions and Warnings Protect containers from physical damage. Do NOT reuse containers without prior decontamination. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL is low and difficult to monitor. For any exposure level, use a supplied-air respirator with full face-piece in continuous flow mode, or an SCBA in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves PVC, Neoprene, or Nitrile Latex | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

PENTACHLOROPHENOLC₆Cl₅OH

CAS: 87-86-5

**IDENTIFICATION AND TYPICAL USES**

Pentachlorophenol is colorless to white, or light-brown to tan flake or crystalline solid with a benzene-like odor and pungent taste. It is used as a fungicide, a bactericide, a molluscicide, an algacide, an insecticide for termite control, and an herbicide. It is also used in the manufacture of sodium pentachlorophenolate. It has been used as a wood preservative, in wood products, and in glues. There are uses in boat construction, building construction, treatment of underground cable coverings, in canvas belting and nets, in lumber and poles (telephone poles), for mold control in petroleum drilling and production, in paints, in pulp and pulp stock products (paper, hardboard, particle board), and in cooling tower water.

RISK ASSESSMENT: HEALTH**General Assessment**

Pentachlorophenol is a deadly human poison by *ingestion*, with equally toxic systemic consequences occurring by way of *inhalation*, and skin contact (*absorption*). It has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. There is sufficient evidence to indicate that exposure to pentachlorophenol causes cancer in test animals and its human carcinogenic potential is considered highly suspect.

Symptoms by all routes of exposure include hypertension (high blood pressure), fever, muscular weakness, anorexia, headache, profuse sweating, warm and flushed skin, rapid respiration (tachypnea), vertigo, and nausea. Exposure to extremely high concen-

trations may cause loss of consciousness, convulsions, and death from cardiac arrest.

Skin contact can also cause the development of chloracne with blackheads, whiteheads, and yellow cysts. Eye contact causes burning pain, tearing, and inflammation of the eyelids. If not removed immediately, damage to vision may occur.

Ingestion can cause painful burning of the mouth and throat and may result in severe systemic poisoning.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to pentachlorophenol:

Skin: Irritation and localized inflammation. It will pass through unbroken skin to cause dangerous systemic effects.

Eye: Irritation with damage to the surrounding tissue. If not removed immediately, damage may be more severe and permanent.

Lung: Severe irritation to the respiratory tract and associated mucosa. Can cause coughing, sneezing, and congestion. Rapid absorption through the respiration process can result in life-threatening systemic effects.

CNS: Can cause confusion, anxiety, headache, changes in the function of the respiratory and circulatory systems, convulsions, coma.

CVS: Can cause a disruption in the function of the cardiovascular system with symptoms of elevated blood pressure, pulse, and respiration. Effects are more severe in hot climates.

☯ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to pentachlorophenol and can last for months or even years:

Cancer Hazards: According to the information available in the references, pentachlorophenol has been shown to cause cancer in test animals. Experimental mutation data have been reported and many scientists believe that such chemicals may have the ability to cause cancer.

Reproductive Hazard: According to information presented in the references, pentachlorophenol has been shown to cause adverse effects in reproduction in animals. It is considered an experimental teratogen. Human effects in this regard are inconclusive and require additional research.

Other Chronic Effects: Long-term exposures can result in damage to the liver or kidneys. Pentachlorophenol can cause bronchitis with cough and phlegm. Long-term exposures can lead to an acne-like skin rash (chloracne) with persistent blackheads, whiteheads, and yellow cysts. Chronic poisoning may cause weight loss, weakness, and excessive sweating.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with pentachlorophenol. The exact nature of its carcinogenic properties are not clearly understood in the references. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around pentachlorophenol. The exposure level is relatively low (0.5 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH-approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical hazard exists, a face shield and a rubber apron should

be worn. To prevent hand and skin exposures, butyl rubber gloves should be used. Polyvinyl chloride, neoprene, or nitrile latex all appear to provide acceptable protection. However, glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with pentachlorophenol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where pentachlorophenol is used or stored.

Before beginning employment with pentachlorophenol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- ☑ Complete blood count (establish baseline).
- ☑ Urinalysis (establish baseline nitrophenol levels).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Complete blood count (compare to baseline).
- ☑ Urine test for pentachlorophenol (compare to baseline urinalysis).
- ☑ Lung function tests.
- ☑ Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to pentachlorophenol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of pentachlorophenol should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to pentachlorophenol, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of pentachlorophenol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of pentachlorophenol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Pentachlorophenol is normally considered a non-combustible solid. In solution, it can often appear in mixtures with other combustible or flammable commodities. It is incompatible with common oxidizers, such as chlorine, bromine, and fluorine, as well as many acids and alkalis. These characteristics require caution in handling, storage, transportation, and disposal. Prolonged contact with heat may result in an explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of pentachlorophenol. Should pentachlorophenol ever come into contact with any incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Pentachlorophenol and its sodium salt are commonly used pesticides in the United States. It may enter the environment through its intended use as an insecticide, from treated wood, as well as through industrial discharges, municipal waste treatment plant discharges, spills, or from agricultural runoff.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to pentachlorophenol.

The toxicity of pentachlorophenol to aquatic life increases as the pH of the water decreases. Pentachlorophenol has high acute toxicity to aquatic life. It has caused plant and leaf kill and germination decrease in various agricultural and ornamental crops. Insufficient data are available on the short-term effects of pentachlorophenol exposure to birds or land animals.

☞ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Pentachlorophenol has high chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of pentachlorophenol to plants, birds, or land animals.

💧 Water Solubility

Pentachlorophenol is slightly soluble in cold water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

⌚ Persistence in the Environment

Pentachlorophenol is moderately persistent in water, with an ecological half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 48% of pentachlorophenol will eventually end up in terrestrial soil. Approximately 45% will end up in aquatic sediments, about 5.3% will end up in water, and about 1.4% will end up in air.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of pentachlorophenol found in fish tissue is expected to be much higher than the average concentration of pentachlorophenol in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of pentachlorophenol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If pentachlorophenol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of pentachlorophenol. If pentachlorophenol is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquid spills in vermiculite or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Do NOT dry sweep (generates airborne dusts). Use a HEPA vacuum instead and wet-mop spill area to collect residue.
- It may be necessary to dispose of pentachlorophenol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving pentachlorophenol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public hysteria, anxiety, emotion, and ignorance can all run equally high. This must be carefully considered when drafting or implementing public relations policies.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

***n*-PENTANE**

CAS: 109-66-0

**IDENTIFICATION AND TYPICAL USES**

n-Pentane is a colorless liquid with a mild odor of gasoline. It can exist as a gas above 97°F (36°C). It is used in the manufacture of artificial ice, in low-temperature thermometers, solvent extraction processes, as a blowing agent in plastics (expandable polystyrene), and as a pesticide.

RISK ASSESSMENT: HEALTH***General Assessment***

n-Pentane is a mild irritant by *inhalation*. It can also enter the body through *ingestion* and cause some degree of gastrointestinal discomfort. Skin contact can also produce some adverse topical effects but dermal absorption has not been reported. There is no clear evidence in the references to indicate that exposure to *n*-pentane will lead to carcinogenic, mutagenic, or teratogenic effects.

Significant inhalation may cause irritation of the respiratory tract and depress the central nervous system. Symptoms include nausea, dizziness, vomiting, lightheadedness, giddiness, stupor, vertigo, loss of coordination, loss of appetite, depression, and hallucinations. At high concentrations, it is a narcotic and can lead to muscle weakness, cold feeling in extremities, blurred vision, anorexia, headaches, polyneuropathy, loss of consciousness, coma, and death due to respiratory failure. Studies have shown that compounds similar in structure to *n*-pentane will accumulate in fatty tissues as is evidenced by its affinity for the blood, liver, and brain where lipids are prevalent. It is not known if *n*-pentane will cause these effects.

Skin and eye contact may produce immediate irritation with redness, painful burning, and possible blistering on contact. Prolonged or repeated contact with the skin can cause dryness, cracking, and derma-

titis. Ingestion will cause immediate gastrointestinal irritation and presents a serious aspiration hazard. If the liquid is aspirated into the lungs, oxygen can be displaced and the resultant asphyxiation can lead to brain damage or even cardiac arrest.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to *n*-pentane:

Skin: Severe and painful irritation with possible burns and blistering.

Eye: Severe irritation and burning on contact.

Lung: Direct irritation of the respiratory tract and associated mucosa. Exposure may cause dizziness, vomiting, nausea, and can lead to chemical pneumonia.

CNS: A CNS depressant: headache, dizziness, depression, hallucinations, changes in mood, loss of consciousness, coma, and death (respiratory failure).

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to *n*-pentane and can last for months or even years:

Cancer Hazards: According to the references, *n*-pentane has not been adequately tested for its ability to cause cancer in animals.

Reproductive Hazard: According to information presented in the references, *n*-pentane has not been tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated contact with the skin may cause dermatitis. Other chronic effects have not

been documented. Insufficient exposure data exist for humans or animals to properly evaluate or predict the effects of long-term exposure.

🔒 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with *n*-pentane since it is known to cause significant adverse health effects, especially if improperly used or if overexposures occur. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around *n*-pentane. For exposures above the PEL (1000 ppm), an organic vapor respirator should be used (per OSHA 29 CFR 1910.134). Better protection is provided by a supplied-air respirator with full facepiece operated in continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Rubber or neoprene gloves are recommended. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with *n*-pentane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *n*-pentane is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Lung function tests.
- ☑ Evaluation of nervous system function.
- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy and/or dermatitis).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and personnel are trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to *n*-pentane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of *n*-pentane should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to *n*-pentane, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of *n*-pentane.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *n*-pentane. In almost every case, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

n-Pentane is considered a Class 1A flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point make this chemical a serious fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with common peroxides and other oxi-

dizers and contact can cause fire or explosion. Its vapors are heavier than air and can travel for great distances to an ignition source to flashback and cause fire or explosion. If *n*-pentane containers or tanks are located near a fire or sustained high heat source (e.g., steam pipes, boilers), a boiling liquid expanding vapor explosion (BLEVE) is possible. The results can be extremely destructive. Therefore, special consideration is required during any emergency situation involving a leak or spill of *n*-pentane. Should *n*-pentane ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is possible.

n-Pentane may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *n*-pentane.

Insufficient data are available on the short-term effects of *n*-pentane exposure to aquatic life, plants, birds, or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of *n*-pentane to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

n-Pentane is nearly insoluble in water. Concentrations of less than 10 milligrams may mix with a liter of water.

🕒 *Persistence in the Environment*

n-Pentane is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of *n*-pentane will eventually end up in air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of *n*-pentane found in fish tissue is expected to be about the same as the average concentration of *n*-pentane in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *n*-pentane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). All transfers of *n*-pentane from storage containers to process containers should be done automatically whenever possible. All containers and equipment must be grounded and bonded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If *n*-pentane should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *n*-pentane.

To dispose of *n*-pentane properly, it should be burned in a chemical incinerator equipped with an afterburner and scrubber to ensure appropriate emission control.

If *n*-pentane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.

- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect materials using non-sparking tools.
- ☑ It may be necessary to dispose of *n*-pentane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving *n*-pentane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|--|
| Characterization Ketone | RCRA Number D001 | EPA Class Characteristic (I) Waste |
| DOT Proper Shipping Name Methyl Propyl Ketone | Chemical Abstract Service (CAS) Number 107-87-9 | |
| DOT Hazard Class and Label Requirements Flammable Liquid | DOT Emergency Guide Code 26 | |
| DOT Identification Number UN 1249 | Chemical Formula CH₃COCH₂CH₂CH₃ | |

Synonyms

Ethyl acetone; methyl propyl ketone; MPK; methyl n-propyl ketone.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|--|---|---|
| 2-Pentanone: (derivation: Synthesized by oxidation of 2-pentanol). 1 ppm = 3.58 mg/m³ | PEL: 200 ppm 700 mg/m ³ STEL (15-min): 250 ppm 875 mg/m ³ | REL: 150 ppm 530 mg/m ³ STEL: Not Established | 1500 ppm | TLV: 200 ppm 705 mg/m ³ STEL: 250 ppm 881 mg/m ³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 215°F (102°C) | Specific Gravity (H ₂ O = 1) 0.81 |
| Vapor Pressure (mm Hg) 27 at 68°F (20°C) | Molecular Weight 86.1 |
| Vapor Density (Air = 1) 3.00 | Freezing Point -108°F (-79°C) |

Solubility

Slightly soluble in water (6%). Also soluble in alcohol and diethyl ether.

Appearance and Odor

Colorless to water-white liquid with an acetone-like or fruity, ethereal odor. Odor Threshold = 8 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 45°F (7°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.5% UEL: 8.2% |
| NFPA Classification Class 1B Flammable Liquid | Autoignition Temperature 846°F (452°C) |

Extinguishing Media

Dry chemical, carbon dioxide, water spray, fog, or alcohol-resistant foam.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus. Fight fire from a distance if possible. Keep fire-exposed containers cool with water spray. A solid stream of water may spread fire. If it can be done safely, move fire-exposed containers from area.

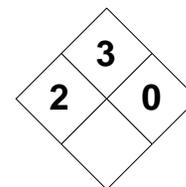

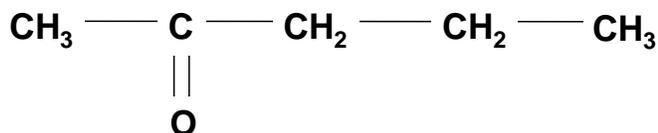

Unusual Fire and Explosion Hazards

Containers may explode in fire due to the build up of internal pressures. BLEVE (boiling liquid expanding vapor explosion) is possible. Immediately evacuate if rising sound is heard from venting device or a noticeable discoloration is observed on the sides of the tank or storage vessel.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|--|--|---|
| Stability | | Conditions to Avoid Normally stable. Do not allow 2-pentanone to come into contact with incompatible materials. Avoid contact with fire or high heat sources. Do not use in confined spaces. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with strong oxidizers (chlorine, bromine, fluorine) and bromine trifluoride (explodes on contact). | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of 2-pentanone is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, 2-pentanone emits acrid, irritating smoke and fumes, including oxides of carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Causes coughing, shortness of breath, and eye, nose, throat, and respiratory system irritation. At high concentration, there may be narcosis with headache, lightheadedness, nausea and vomiting, and the possibility of coma (extremely high exposures). | | | | |
| SKIN & EYES: Skin contact with liquid can result in irritation and may cause burning, dermatitis and redness (erythema). Eye contact causes pain, irritation, corneal damage, and tearing. | | | | |
| INGESTION: Symptoms of irritation with nausea and vomiting. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system; skin; eyes; CNS. |
| Medical Conditions Generally Aggravated by Exposure Skin conditions (dermatitis) and respiratory tract disorders may be aggravated. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Immediately flush with large amounts of water for 15 minutes (minimum), occasionally lifting eyelids. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For red or blistered skin, seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Seek medical attention immediately or contact poison control center. Unless advised otherwise, give victim 1 to 2 glasses of water and induce vomiting. Never attempt to give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Remove all ignition sources. Restrict persons not wearing protective equipment from entering area of spill or leak until cleanup is complete. Ventilate area. Absorb liquid in vermiculite or other material and deposit in sealed containers. Damp mop residue. Alert appropriate state or federal response agencies. | | | | |
| Preferred Waste Disposal Method | | | | |
| Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from fire, sparks, and flame. Use non-sparking tools on containers. Ground and bond metal containers during transfer operations. | | | | |
| Other Precautions and Warnings | | | | |
| Protect containers from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| Exposures above 200 ppm: MSHA/NIOSH-approved full facepiece respirator with organic vapor cartridge. Greater protection is obtained from a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Materials | | Eye Protection Chemical Goggles and/or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

2-PENTANONE

CAS: 107-87-9

**IDENTIFICATION AND TYPICAL USES**

2-Pentanone is a colorless to water-white liquid with a characteristic acetone-like odor. It is used as a solvent for surface coatings, as a flavoring agent, as an intermediate for cosmetics and pharmaceuticals, in organic synthesis, and in lacquers and lacquer removers.

RISK ASSESSMENT: HEALTH***General Assessment***

2-Pentanone is mildly toxic to humans by *inhalation* and *ingestion*. Skin or eye contact can also cause surface tissue damage and inflammation but dermal absorption has not been reported. The references contain no information on the carcinogenic, teratogenic, or mutagenic properties of 2-pentanone. Overexposure to this compound is not common. Its irritating properties and its penetrating odor are usually present at levels low enough to serve as a warning to personnel.

Inhalation of 2-pentanone causes irritation of the mucosa of the respiratory tract leading to mild respiratory depression with symptoms of coughing, shortness of breath, and mild discomfort. Exposure to higher concentrations can cause depression of the central nervous system (CNS) with symptoms of excitability, headache, lightheadedness, nausea, and vomiting. Higher concentrations can lead to dizziness, intoxication, stupor, staggering gait, loss of coordination, mental confusion, and coma.

Skin contact with the liquid can lead to chemical dermatitis, inflammation, redness, and rash. Eye contact causes irritation with lachrymation and, in prolonged contact, may lead to ocular pain, corneal injury, and possible visual disturbances (blurred vision). Although ingestion is unlikely in the occupational setting, it can cause irritation of the mouth and throat with nausea and vomiting.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to 2-pentanone:

Skin: Irritation and dermatitis with possible localized rash and redness.

Eye: Irritation with pain and inflammation that can lead to corneal injury and possible visual disturbances.

Lung: Irritation causing coughing and/or shortness of breath.

CNS: A mild to moderate narcotic compound producing narcosis with dizziness, lightheadedness, and possibly, coma.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to 2-pentanone and can last for months or even years:

Cancer Hazards: According to information presented in the references, 2-pentanone has not been adequately tested for its ability to cause cancer in laboratory test animals.

Reproduction: According to information presented in the references, 2-pentanone has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Studies with 2-pentanone have shown that long-term skin exposure may produce dry, scaly, and fissured dermatitis. Long-term exposure to similar organic compounds have caused damage to the nervous system and liver and kidney dysfunction. It is not known if chronic exposure to 2-pentanone will cause these problems.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with 2-pentanone. While 2-pentanone itself is usually used as

a substitute for more hazardous materials, such as diethyl ketone, substitution is still the best method to eliminate the risk of exposure to 2-pentanone. However, if a less toxic chemical cannot be substituted for a 2-pentanone, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. Because of its low flash point, maximum explosion-proof ventilation systems should be considered. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with 2-pentanone. For exposures over the PEL (200 ppm), use an MSHA/NIOSH-approved, full facepiece organic vapor respirator. For higher or prolonged exposures, or when exposure levels are unknown (as in an emergency) a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode, or a supplied-air respirator operated in continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around 2-pentanone.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 2-pentanone is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be helpful:

- Skin testing by a qualified allergist with special testing and careful evaluation of exposure history (may help diagnose allergy).
- Lung function tests.
- Neurological examination of the central nervous system.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Explosion-proof design is recommended. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to 2-pentanone and at the end of the work shift or before eating, drinking, or smoking. Never wear clothes contaminated with 2-pentanone home. Family members can be exposed.
- Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of 2-pentanone should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 2-pentanone. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

2-Pentanone is considered a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). Its low flash point and relatively low boiling point make this chemical an extremely dangerous fire and explosion hazard. It can react with strong oxidizers and bromine trifluoride to cause a serious fire and explosion hazard. When involved in a fire, it can release acrid and irritating oxides of carbon. A boiling liquid expanding vapor explosion (BLEVE) is also a possibility. These characteristics require special consideration during any emergency involving a leak or spill of 2-pentanone.

The proper disposal/destruction method for 2-pentanone is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

2-Pentanone can enter the environment through manufacturing, unchecked discharge into effluents from industrial or municipal waste treatment plants, and through spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 2-pentanone.

Insufficient data are available to evaluate or predict the short-term effects of 2-pentanone to aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of 2-pentanone to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

2-Pentanone is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

2-Pentanone is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 2-pentanone found in fish tissues is expected to be about the same as the average concentration of 2-pentanone in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 2-pentanone should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Maximum explosion-proof design of ventilation systems is recommended.

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If 2-pentanone should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and, therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities may require notification. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 2-pentanone.

If 2-pentanone is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers for disposal. Use non-sparking tools!
- ☑ Keep 2-pentanone out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- ☑ It may be necessary to dispose of 2-pentanone as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 2-pentanone can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result

from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business prospects.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| 2 | 0 | 0 | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|---|---|---------------------------------|
| Characterization Chlorinated Hydrocarbon, Aliphatic | RCRA Number U210 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Tetrachloroethylene | Chemical Abstract Service (CAS) Number 127-18-4 | |
| DOT Hazard Class and Label Requirements Poison B; St. Andrews Cross | DOT Emergency Guide Code 74 | |
| DOT Identification Number UN 1897 | Chemical Formula C₂Cl₄ | |

Synonyms

Ankilostin; carbon dichloride; carbon bichloride; Didakene, ethylene tetrachloride, Perchlor, Perclene, Perk, Tetracap, tetrachloroethylene; Percosolve.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|---|---|---|
| Perchloroethylene (derivation: By chlorination of hydrocarbons and pyrolysis of the carbon tetrachloride that is subsequently formed; or from acetylene and chlorine via trichloroethylene). 1 ppm = 6.80 mg/m³ | PEL (8-hour): 100 ppm 680 mg/m³ CEILING 200 ppm 1360 mg/m³ PEAK (5-min) 300 ppm | REL: Lowest Possible Level Possible Human Carcinogen | 150 ppm | TLV: 50 ppm 339 mg/m³ STEL: 200 ppm 1357 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 250°F (121°C) | Specific Gravity (H ₂ O = 1) 1.62 |
| Vapor Pressure (gas) 14 at 68°F (20°C) | Molecular Weight 165.8 |
| Vapor Density (Air = 1) 5.83 | Melting Point -2°F (-19°C) |

Solubility

Very slightly soluble in water (0.02%). Miscible with alcohol, ether, benzene, chloroform, and oils.

Appearance and Odor

Colorless liquid with a chloroform-like odor. Odor Threshold = 70 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Combustible Liquid | Autoignition Temperature Not Determined |

Extinguishing Media

Use dry chemical, carbon dioxide, water spray, fog, or regular foam.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Use water spray to keep fire-exposed containers cool. Containers may explode in fire.

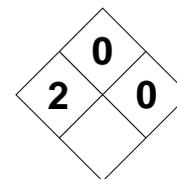

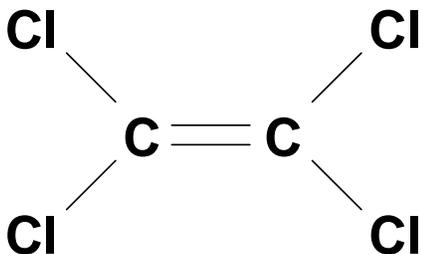

Unusual Fire and Explosion Hazards

A non-combustible liquid that will decompose in fire to produce hydrogen chloride and phosgene. Vapors are heavier than air and can collect in low-lying areas and cause displacement of oxygen.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|--|--|--|
| Stability | | Conditions to Avoid Normally stable at temperatures up to 932°F (500°C) as long as there are no catalysts present, and the air is dry and free of oxygen. It decomposes rapidly in warm, moist air. Keep away from heat and incompatibles. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, such as permanganates, peroxides, nitrates, chlorates, and perchlorates. Also reacts with chemically active metals (lithium, beryllium, barium), caustic soda, sodium hydroxide, and potash. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of perchloroethylene is not expected to occur. It slowly decomposes in the presence of light. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, perchloroethylene can emit highly toxic/poisonous and acrid fumes and gases, including chlorine, carbon dioxide, hydrogen chloride, and phosgene gas. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Can produce human systemic effects, including conjunctivitis and changes in the olfactory and respiratory systems. Can cause damage to the kidneys, liver, and blood vessels. Has narcotic-like action on high or prolonged exposures (headaches, dizziness). Also lachrymation, loss of coordination, convulsions, and possible effects on target organs. | | | | |
| ABSORPTION: Irritating to the skin and may produce dermatitis on repeated exposures. Absorbed in toxic amounts through intact skin. Eye contact may injure cornea. | | | | |
| INGESTION: Irritation and narcosis with burning of the mouth and lips. Can cause irregular heartbeat, nausea and vomiting, bloody diarrhea, drowsiness, unconsciousness, and pulmonary edema (fluid in the lungs). | | | | |
| Carcinogenicity Questioned Human Confirmed Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2B | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 & Z-2 | Target Organs? Respiratory system, eyes, skin, liver, kidney, CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported. Skin conditions (dermatitis) or respiratory problems (asthma) may be aggravated. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. Keep victim warm and at rest. Observe 48 hours for lung effects. If swallowed: Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Absorb large spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method | | | | |
| Mix with combustible solvent and burn in chemical incinerator with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. | | | | |
| Other Precautions and Warnings | | | | |
| Sources of ignition are prohibited where perchloroethylene is used, handled, or stored. Heat may cause containers to build up pressure and explode. Prevent damage to containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For exposures above the PEL, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece in continuous flow mode, or use a SCBA operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Neoprene or Viton Material | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

PERCHLOROETHYLENE

CAS: 127-18-4

**IDENTIFICATION AND TYPICAL USES**

Perchloroethylene is a colorless liquid with a mild, chloroform-like odor. It is used in dry cleaning as a solvent, in vapor-degreasing, as a drying agent for metals and certain other solids, as a heat-transfer medium, in the manufacture of fluorocarbons, as an insulating fluid and cooling gas in electrical transformers, in the production of adhesives, in aerosols, paints and coatings, as a chemical intermediate, as an extractant for pharmaceuticals, as a pesticide intermediate, and in veterinary medicine (for parasitic worm removal).

RISK ASSESSMENT: HEALTH**General Assessment**

Perchloroethylene is an extremely toxic compound to humans by *inhalation*, dermal *absorption*, and *ingestion*. Ingestion can occur, but is rare under most circumstances. It is listed as a confirmed animal carcinogen and its human carcinogenic potential is considered questioned by most reference sources. It has been shown to cause mutations in humans. Experimental teratogenic data have also been reported in animal tests.

Inhalation results in slight smarting of the eyes with lachrymation and slight smarting of the throat. Inhalation of high concentrations of the vapors (2000 ppm for 5 minutes) can also lead to CNS depression with symptoms of intoxication, loss of coordination, numbness around the mouth, dizziness, narcosis, and convulsions. It can also cause flushing of the face and neck, headache, somnolence, and slurred speech.

Skin contact may produce mild to moderate irritation on contact. Prolonged skin contact can cause dermatitis because of perchloroethylene's defatting action on the skin's surface. It will pass through un-

broken skin to cause toxic systemic effects including symptoms of inhalation. Direct eye contact causes burning but no permanent damage. Absorption through the skin or inhalation of perchloroethylene vapors may cause toxic reactions in the liver (in animal studies, it produced liver tumors).

On ingestion, perchloroethylene is expected to produce symptoms of irritation and narcosis with burning of the lips, mouth, and gastrointestinal tract. It may cause irregular heartbeat, nausea and vomiting, bloody diarrhea, drowsiness, unconsciousness, and possible pulmonary edema (fluid in the lungs) presumably from aspiration of the swallowed liquids into the lungs.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to perchloroethylene:

Skin: Moderate irritation with redness and possibly painful inflammation. It will pass through unbroken skin easily to cause toxic systemic effects.

Eye: Severe irritation and burning but rarely causes permanent damage.

Lung: Nose and throat irritation. Produces intoxicating effects and may cause lung effects as well.

CNS: Unconfirmed effects by all routes of exposure. There may be numbness around the lips and mouth, dizziness, loss of coordination, headache, somnolence, slurred speech, flushed face, irregular heartbeat, and other unspecified effects on nervous system functions.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to perchloroethylene and can last for months or even years:

Cancer Hazards: According to information presented in the references, perchloroethylene has been shown to cause cancer in test animals and its carcinogenic capability in humans is considered questioned. Some studies indicate that it causes mutations in humans, while others are inconclusive in this regard. Cancers in humans exposed to perchloroethylene (dry cleaning industry) have developed. However, these employees were also exposed to many other chemicals during their employ and a direct link to perchloroethylene cannot be substantiated in the references.

Reproductive Hazard: According to information presented in the references, perchloroethylene may cause teratogenic effects in animals and adversely affect reproduction as well.

Other Chronic Effects: Prolonged skin contact may cause drying, cracking, and chapping of the affected area leading to dermatitis. Prolonged exposure may also cause impaired memory, weakness in the hands and feet, peripheral neuropathy, visual disturbances and impairment, and muscular cramps. There may be liver injury (fatty degeneration, necrosis, jaundice, darkened urine) and kidney damage (oliguric uremia, congestion, and granular swelling).

🔹 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with perchloroethylene. The exact nature of the toxicity of this chemical is not entirely understood in the references but it is clearly a highly toxic chemical. Therefore, prudent risk management requires it be treated as though it posed a significant health risk in the event of overexposure. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around perchloroethylene. For long exposures above the PEL, a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles

should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber, Viton, or neoprene gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with perchloroethylene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where perchloroethylene is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Lung, kidney, and liver function tests.
- ☑ Electroencephalogram (EEG) to detect abnormalities which may be indicative of chronic toxicity.
- ☑ Complete blood count (CBC) with monitoring of blood enzyme levels.
- ☑ Electrocardiogram (EKG).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to perchloroethylene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of perchloroethylene should be communicated to all exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to perchloroethyl-

ene, emergency shower facilities should also be provided.

- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of perchloroethylene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of perchloroethylene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Perchloroethylene is considered a non-combustible liquid but it will decompose in a fire to produce toxic hydrogen chloride and phosgene gas. It is incompatible with a number of commonly encountered materials including strong oxidizers and many chemically active metals. Contact can cause fire or explosion. These characteristics require extreme caution in handling, storage, transportation, and disposal. Also, because containers and tankers can explode under conditions of extreme heat, special consideration is required during any emergency situation involving a leak or spill of perchloroethylene. Should perchloroethylene ever come into contact with incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities (including hydrogen chloride) is extremely possible.

The proper disposal method for perchloroethylene is to mix it with a combustible solvent and then burn it in a permitted chemical incinerator equipped with an afterburner and scrubber.

Perchloroethylene may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to perchloroethylene.

Insufficient data are available on the short-term effects of perchloroethylene exposure to aquatic life, birds, plants, or land animals.

☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of perchloroethylene exposure to aquatic life, birds, plants, or land animals.

💧 *Water Solubility*

Perchloroethylene is nearly insoluble in water. Concentrations of less than 10 milligrams may mix with a liter of water.

⌚ *Persistence in the Environment*

Perchloroethylene is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of perchloroethylene will eventually end up in air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of perchloroethylene found in fish tissue is expected to be somewhat higher than the average concentration of perchloroethylene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of perchloroethylene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If perchloroethylene should contact the water table, aquifer, or navigable waterway, cleanup should be started immediately. It is only slightly soluble in water and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of perchloroethylene. If perchloroethylene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- It may be necessary to dispose of perchloroethylene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving perchloroethylene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, ignorance, hysteria, and anxiety can all run equally high. This must be carefully considered when developing or implementing public relations policies.

U *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

PERCHLOROMETHYL MERCAPTAN

Cl₃CSCI

CAS: 594-42-3

IDENTIFICATION AND TYPICAL USES

Perchloromethyl mercaptan appears as a pale-yellow, oily liquid with an unbearable, acrid odor. It is used in the production of fungicides, organic synthesis, as a dye intermediate, a fumigant, and as a vulcanizing accelerator in the rubber industry. It has also been used in the past as a tear-gas agent in the military.

RISK ASSESSMENT: HEALTH

General Assessment

Perchloromethyl mercaptan is toxic to humans through *inhalation*, *absorption*, and *ingestion*. There are no data on the carcinogenicity, mutagenicity, and teratogenicity of this compound in humans.

Inhalation of even small concentrations for relatively short periods of time (e.g., 11 ppm for 10 minutes) has caused death, presumably due to the delayed onset of pulmonary edema (fluid in the lungs). Exposure to lower concentrations may cause depression of the central nervous system (CNS) with possible lung, liver, and heart congestion. Other symptoms of inhalation exposure can include eye, nose, throat, and mucosa irritation with lachrymation (tearing), difficulty breathing, chest pains, coarse rales, nausea and vomiting, pallor, acidosis, and anuria. Symptoms of pulmonary edema can be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk.

Skin contact may cause severe localized irritation at the site of contact as well as result in absorption through intact skin, leading to the systemic symptoms indicated for inhalation.

Ingestion can cause corrosion of the digestive tract with severe abdominal pain, bleeding, and possible perforation of the esophagus and/or stomach. There may also be liver or kidney damage/injury as a result of ingestion exposures.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to perchloromethyl mercaptan:

Skin: Severe irritation on exposure to the liquid and rapid absorption leading to toxic systemic effects.

Eye: Mild to severe conjunctival irritation in contact with the liquid or vapor.

Lung: Irritation to respiratory tract with the possibility of delayed pulmonary edema, which can be fatal. Absorption through the respiration process appears to cause a variety of adverse effects to the central nervous system.

CNS: A depressant of the central nervous system causing a variety of toxic effects including drowsiness, coma, and death.

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to perchloromethyl mercaptan and can last for months or even years:

Cancer Hazards: There are few human data on the effects of long-term exposure to perchloromethyl mercaptan. There are no reports of carcinogenic or mutagenic occurrences in humans or test animals resulting from exposure to perchloromethyl mercaptan.

Reproductive Hazard: There are no reports to substantiate claims of teratogenicity resulting from exposure to perchloromethyl mercaptan.

Other Chronic Effects: The acute irritating and damaging properties of this chemical limit the potential for chronic effects. However, there may be a possibility of liver or kidney damage on exposure to low levels for extended periods of time.

☞ *Recommended Risk-Reduction Measures*

Perchloromethyl mercaptan is an extremely irritating compound. Personnel should avoid direct contact with perchloromethyl mercaptan. If a less toxic material or compound cannot be substituted for perchloromethyl mercaptan, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of perchloromethyl mercaptan release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around perchloromethyl mercaptan. The OSHA permissible exposure ceiling for this chemical is relatively low (0.1 ppm) and difficult to accurately monitor, especially under emergency conditions. An air-purifying respirator may suffice for low-level, short duration exposures. However, best protection is provided using an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. Skin contact must be avoided. To prevent hand and skin exposures, butyl rubber or other non-permeable gloves should be used. Polycarbonate is incompatible with this chemical. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with perchloromethyl mercaptan.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where perchloromethyl mercaptan is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical test is recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Liver, kidney, and lung function tests.

- Complete evaluation of the central nervous system.
- Monitor for esophageal irritation (drooling and/or pain behind the sternum) and consider esophagoscopy to help diagnose extent of injury.
- Consider chest X-ray after acute overexposure (may be delayed if taken immediately after exposure due to delayed onset of pulmonary edema).

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, since smoking can cause lung cancer, emphysema, heart disease and other respiratory disorders, smokers exposed to perchloromethyl mercaptan may develop more severe symptoms than non-smokers under the same conditions of exposure. Prudent risk management requires *all* possible exposure factors be considered when evaluating health exposure risks in the workplace.

Other methods to reduce exposure include:

- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use, care, and maintenance.
- Wash thoroughly immediately after exposure to perchloromethyl mercaptan and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of perchloromethyl mercaptan should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to perchloromethyl mercaptan, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by perchloromethyl mercaptan should change into clean clothes before leaving work. Clothing worn home places family members at risk. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to perchloromethyl mercaptan.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of perchloromethyl mercaptan. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Perchloromethyl mercaptan is non-combustible liquid but it will support combustion in a fire. Pressure can build inside containers during a fire and explosions are likely if they are not removed or kept cool with a water spray. Harmful and toxic hydrogen chloride gas is produced in fire. It is incompatible with alkalis, amines, hot iron and steel, and even water. Therefore, caution is always required in handling, storage, transportation, and disposal of perchloromethyl mercaptan. Aside from hydrogen chloride, when heated to decomposition it emits very acrid smoke and toxic fumes of carbon tetrachloride, sulfur monochloride, heavy oil polymers, phosgene, and sulfur dioxide gas. Emergency responders, hazardous materials personnel, and firefighters should be made aware of the presence of perchloromethyl mercaptan at any emergency response situation.

Perchloromethyl mercaptan may enter the environment through industrial effluents and spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to perchloromethyl mercaptan.

Insufficient data are available to evaluate or predict the acute (short-term) effects of perchloromethyl mercaptan to aquatic life, plants, birds, or land animals.

🌱 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the chronic (long-term) effects of perchloromethyl mercaptan on aquatic life, plants, birds, or land animals.

💧 Water Solubility

Perchloromethyl mercaptan is insoluble in water. Concentrations of 1 milligram will not mix with a liter of water.

🕒 Persistence in the Environment

Perchloromethyl mercaptan is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of perchloromethyl mercaptan will end up in the air.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Insufficient data are available to evaluate or predict the bioaccumulation characteristics of perchloromethyl mercaptan in the edible tissues of fish.

🛡️ Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of perchloromethyl mercaptan into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of perchloromethyl mercaptan should be segregated from other chemicals to minimize the risk of cross-contamination. Perchloromethyl mercaptan must be stored to avoid contact with incompatible materials, since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If perchloromethyl mercaptan should contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble in water and total remediation may or may not be possible. The local and/or state emergency response authorities must

be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of perchloromethyl mercaptan.

If perchloromethyl mercaptan is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Absorb spilled liquids with vermiculite, dry sand, or a similar material and deposit in sealed drum for disposal.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ It may be necessary to dispose of perchloromethyl mercaptan as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving perchloromethyl mercaptan can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Appearance and Odor

Colorless gas with a characteristic, sweet odor. Normally shipped as a liquefied compressed gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---------------------------|-------------------------------------|
| Flash Point (method used) | Explosive Limits in Air % by Volume |
| Not Applicable | LEL: N/A UEL: N/A |
| NFPA Classification | Autoignition Temperature |
| Non-Flammable Gas | Not Applicable |

Extinguishing Media

Use agents suitable to surrounding fires. Perchloryl fluoride does not burn.

Special Fire Fighting Procedures

Perchloryl fluoride is non-flammable but supports combustion. A very powerful oxidizer, it greatly accelerates the fire and explosion potential of other materials. Wear full protective clothing and SCBA. Use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire. Isolate for 1/2 mile if rail or tank truck is involved. Containers may explode in fire or heat.

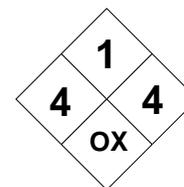

Unusual Fire and Explosion Hazards

Containers may explode in fire or heat. Remove fire-exposed containers from fire if it can be done without risk or keep them cool using a water spray.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|---|--|---|
| Stability | | Conditions to Avoid Perchloryl fluoride is normally stable in pressurized containers at room temperature under normal conditions of storage and handling. Avoid contact with incompatible materials, heat, and combustible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Combustible materials (sawdust, wood, charcoal), strong bases, amines, finely divided metals, reducing agents, and alcohols. Especially incompatible with oxygen. | | |

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Extremely irritating to the lungs, throat, nose, and eyes. Coughing and shortness of breath that may persist for hours after exposure. Can cause permanent damage to the lungs. Fluid can build in the lungs (pulmonary edema), which is a medical emergency. It can cause depression of the central nervous system, methemoglobinemia, and hypoxia. ABSORPTION: Contact with the liquid can cause severe skin burns (frostbite). The liquid can cause eye burns leading to permanent damage. Toxic amounts can be absorbed through the skin. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, blood. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 30 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24 - 48 hours since pulmonary edema may be a delayed reaction. If swallowed: Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. If gas is leaked, stop source if possible or remove leaking cylinders to safe area outdoors and allow to empty. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Perchloryl fluoride is a flammable gas and an extremely powerful oxidizer. Store to avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat and sunlight. Do not drag or roll cylinders. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where perchloryl fluoride is used, handled, or stored. Heat may cause containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low-level exposures, use a full facepiece respirator with an organic vapor gas cartridge. For higher exposures, use a supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a SCBA operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

PERCHLORYL FLUORIDEClO₃F

CAS: 7616-94-6

**IDENTIFICATION AND TYPICAL USES**

Perchloryl fluoride is a colorless gas with a characteristic sweet odor. It is normally shipped as a liquefied compressed gas. It is used as an oxidant in rocket fuels, and as an oxidizing agent in chemical reactions.

RISK ASSESSMENT: HEALTH***General Assessment***

Perchloryl fluoride is highly irritating to the eyes, nose, and throat. Moderately toxic by *inhalation*. There are no indications in the references that this material has any carcinogenic, mutagenic, or teratogenic effects on long-term exposure.

Breathing perchloryl fluoride vapors can cause coughing, nasal discharge, wheezing, respiratory distress, bronchitis, and congestion of the lungs. Its irritant effects can be intense. In the body, it forms methemoglobin which can significantly impair the blood's oxygen transport ability. Cyanosis (bluish discoloration of the lips and skin) and hypoxia (reduced level of oxygen in the blood) may indicate methemoglobinemia. High exposures can damage the lungs, causing a buildup of fluid (pulmonary edema) which is a medical emergency and can be fatal. There may also be headache, dizziness, sweating, weakness, coughing, difficulty in breathing, and congestion. The chronic toxicity signs are fluorosis (mottling of teeth enamel) and damaged blood function.

Skin contact with the liquid can result in severe burns (2nd or 3rd degree) due to the extremely cold temperatures of the compressed gas. This material can be absorbed through the skin in toxic amounts. Eye contact can be equally damaging.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to perchloryl fluoride:

Skin: Liquid may irritate the skin (cold temperature may cause deep burning).

Eye: Severe irritation; may cause eye injury.

Lung: Irritation of the nose, throat, and lungs following exposure. Pulmonary edema is possible (24 to 48 hours following a high exposure). It can cause chest pain, cough, bloody nose, and sputum.

Other: CNS effects include headache, dizziness, loss of consciousness, and muscle weakness. If the liquid should be ingested (not likely), there may be burning of the mouth, nausea, vomiting, and pneumonia.

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to perchloryl fluoride and can last for months or even years:

Cancer Hazards: According to information presented in the references, perchloryl fluoride has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, perchloryl fluoride has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated exposures can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. Chronic toxicity is also indicated with the development of fluorosis and possible damage to blood function.

☞ *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with perchloryl fluoride. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible,

isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around perchloryl fluoride. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. For low or infrequent concentrations a full facepiece respirator equipped with a cartridge containing non-combustible sorbents and providing protection against perchloryl fluoride gas is acceptable protection. Whenever working with the liquid and a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selection are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with perchloryl fluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where perchloryl fluoride is used or stored.

For those personnel with frequent or potentially high exposure (half the PEL or greater), the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- Lung function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Lung function tests.
- Consider chest X-ray after acute overexposures (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- Monitor blood methemoglobin levels.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, exposure to perchloryl fluoride may worsen pre-existing

respiratory conditions. Smokers may experience symptoms more rapidly than non-smokers under the same conditions of exposure.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to perchloryl fluoride and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of perchloryl fluoride should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to perchloryl fluoride, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of perchloryl fluoride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of perchloryl fluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Perchloryl fluoride is considered a non-flammable gas. However, it is an extremely powerful oxidizing agent and is highly reactive with many commonly encountered commodities such as dust and wood. Contact with incompatible materials can result in fire and serious explosions. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with organic matter, com-

bustible materials, strong bases, reducing agents, alcohols, powdered metals, and amines. These characteristics require special consideration during any emergency situation involving a leak or spill of perchloryl fluoride. Should perchloryl fluoride ever come into contact with incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Perchloryl fluoride can enter the environment through industrial and municipal discharges, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to perchloryl fluoride.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of perchloryl fluoride exposure to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Perchloryl fluoride has high chronic toxicity in aquatic life. No data are available on the long-term effects of perchloryl fluoride to plants, birds, or land animals.

💧 *Water Solubility*

Perchloryl fluoride is slightly soluble in water. Concentrations of 10 milligrams may mix with a liter of water.

⌚ *Persistence in the Environment*

Perchloryl fluoride is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the amount of perchloryl fluoride that will remain in air or water. However, as a gas, it might be assumed that nearly 100% of perchloryl fluoride will eventually end up in the air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Perchloryl fluoride is not expected to accumulate in the tissues of fish.

🔧 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. Transportation of pure perchloryl fluoride is forbidden by the Department of Transportation (DOT). It must be kept frozen when shipped. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment.

When not in use, perchloryl fluoride must be kept in a cool, dry, well-ventilated area. The cylinders must be stored vertically and secured properly. They should never be rolled or dragged and should always be protected against physical damage. Storage of perchloryl fluoride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. The first step should always be to determine if a leaking can be stopped. Contaminated soils should be removed for incineration and replaced with clean soil. If perchloryl fluoride should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of perchloryl fluoride. If perchloryl fluoride is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources and ventilate area.

- ☑ Absorb any liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Perchloryl fluoride will rapidly evaporate and, therefore, liquid spills are highly unlikely.
- ☑ If gas is leaking, stop the flow of gas. If the source is a cylinder and leak cannot be stopped in place, remove cylinder to a safe place in the open air and repair or allow to empty.
- ☑ It may be necessary to dispose of perchloryl fluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving perchloryl fluoride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of such procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Special Fire Fighting Procedures Wear full protective clothing and self-contained breathing apparatus (SCBA). Approach fire from upwind position. Use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire. Firefighters should avoid contact with vapors produced during fire. | | | | | | |
| Unusual Fire and Explosion Hazards Peroxyacetic acid is thermally unstable and may decompose explosively at high temperatures. Containers may explode in fire. | | | | | | |

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|---|--|
| Stability | | Conditions to Avoid Peroxyacetic acid is stable in dilute aqueous solution but is thermally unstable. It is shock-sensitive (concentrations above 56%). Avoid contact with metals and combustible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with acids, alkalis, and heavy metals. Reacts explosively with solvents (diethyl ether, tetrahydrofuran), metal chloride solutions (sodium chloride, calcium chloride), olefins, and organic matter. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of peroxyacetic acid CAN occur. Keep cool and away from most metals. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products When heated to decomposition, peroxyacetic acid can emit highly toxic/poisonous fumes including carbon dioxide. Other products may be produced, depending on the concentration of the peroxyacetic acid. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Causes coughing, dyspnea, irritation of the eyes, nose, throat, and mucosa of the upper respiratory tract. Delayed pulmonary edema (fluid in the lungs) may also develop. High or repeated exposures may cause liver and kidney damage. EYES & SKIN: Skin contact can result in redness, swelling, burning, painful blisters, and severe burns. Can cause severe eye burns, tearing, redness, swelling, pain, burns, damage to vision. INGESTION: Burns to the lips, mouth, and throat with pain in swallowing, salivation, intense thirst, swelling in the throat, and oral, esophageal, and gastrointestinal burns. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No Specific Listing | Target Organs? Respiratory system, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If swallowed: Seek medical attention immediately. Give 1 to 2 glasses of water to conscious person. Do NOT induce vomiting and do NOT give oral bicarbonate. Peroxyacetic acid is corrosive and vomiting may cause further injury or damage. Never give anything by mouth to an unconscious person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other material and place in sealed containers for disposal. Cleanup must be quick before the acetic acid content evaporates and leaves a more-shock-sensitive residue. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Peroxyacetic acid is a combustible liquid. Store in tightly closed containers in cool, dry, well-ventilated area away from heat, metals, or combustibles. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where peroxyacetic acid is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels have been established. For best protection, use a supplied-air respirator with full facepiece in continuous flow mode, or a full facepiece SCBA operated in pressure demand mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Butyl Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

PEROXYACETIC ACID

CAS: 79-21-0

**IDENTIFICATION AND TYPICAL USES**

Peroxyacetic acid is a colorless liquid with an acrid, irritating odor. Used in bleaching textiles, paper, oils, waxes, and starch. Also used as a polymerization catalyst, a bactericide and fungicide (especially in food processing), in the epoxidation of fatty acid esters and epoxy resin cursors, as a reagent in making caprolactum, and in synthetic glycerol.

RISK ASSESSMENT: HEALTH**General Assessment**

Peroxyacetic acid is a poison by *ingestion* and *inhalation*. It is also an extremely corrosive skin, eye, and mucous membrane irritant. It is a suspected carcinogen in animals. There are no reports of any mutagenic or teratogenic effects on long-term exposure.

Inhalation of peroxyacetic acid can irritate the nose, throat, and bronchial tubes. This may cause coughing, dyspnea, congestion, tightness in the chest, and a dangerous buildup of fluid in the lungs (pulmonary edema), which can be fatal. Symptoms of pulmonary edema may be delayed up to 48 hours which can create a false sense of security with regard to health exposure risk.

Skin contact causes redness and painful swelling. There may be a burning sensation at the site of contact, painful blisters, and possible burns. Eye contact also causes burns, lachrymation (tearing), redness, swelling, serious pain, and possible loss of visual acuity.

Ingestion causes serious burning of the lips, mouth, and throat. There may be pain on swallowing and the possible development of oral, esophageal, and gastrointestinal burns.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to peroxyacetic acid:

Skin: Possible irritation/rash or burning feeling. There can also be painful swelling, redness, and deep burns.

Eye: Severe irritation; may cause burns and damage to vision.

Lung: Irritation of the nose, throat, and lungs (bronchial tubes) following exposure. Delayed pulmonary edema may occur which can be fatal.

Other: Ingestion causes intense mouth, throat, and stomach pain. Severely corrosive destruction of the gastrointestinal tract is likely.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to peroxyacetic acid and can last for months or even years:

Cancer Hazards: According to information presented in the references, there is limited evidence that exposure to peroxyacetic acid may cause cancer in test animals. There is no evidence of carcinogenic action in humans. More research is required in this regard.

Reproductive Hazard: According to the data presented in the references, peroxyacetic acid has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated or long-term skin contact may cause rash from irritation. Repeated exposure can also damage the liver and kidneys. Very irritating substance can damage the lungs. It is not known whether long-term exposure to peroxyacetic acid will cause permanent damage to the lungs.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with peroxyacetic acid. It is extremely corrosive and highly destructive to human tissue. If a less toxic chemical cannot be substituted for a hazardous substance, then *engi-*

neering controls are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around peroxyacetic acid. No exposure levels have been established for this chemical. However, this does not mean that exposure is without health risk. For the best protection, use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece in pressure demand mode. In either case, if a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical/dust splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be used. Butyl rubber or fluorocarbon rubber should suffice. However, it is suggested that glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with peroxyacetic acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where peroxyacetic acid is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures, the following medical tests are recommended:

- Lung function tests.
- Kidney function tests.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Liver function tests.
- Consider chest X-ray after acute overexposure (may be negative if taken immediately following exposure due to the delayed development of pulmonary edema).

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release.

If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Where possible, automatically transfer peroxyacetic acid from drums or other storage containers to process containers.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to peroxyacetic acid and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of peroxyacetic acid should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of peroxyacetic acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Peroxyacetic acid is considered a Class II combustible liquid (per OSHA 29 CFR 1910.106). It is also corrosive to many materials. It is incompatible with acids, alkalis, and heavy metals, and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of peroxyacetic acid. Should peroxyacetic acid ever come into contact with any incompatible substances, violent and explosive reactions are possible. Peroxyacetic acid can enter the environment mainly through industrial discharges or spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to peroxyacetic acid.

Peroxyacetic acid has slight acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the acute (short-term) effects of peroxyacetic acid exposure to aquatic life, plants, birds, or land animals.

☼ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Peroxyacetic acid has slight chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of peroxyacetic acid to plants, birds, or land animals.

💧 *Water Solubility*

Peroxyacetic acid is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Peroxyacetic acid is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of peroxyacetic acid found in fish tissues is expected to be much lower than the average concentration of peroxyacetic acid in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of peroxyacetic acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If peroxyacetic acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of peroxyacetic acid. If peroxyacetic acid is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area of spill or leak.
- ☑ If liquid is spilled, absorb in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Response actions should be quick. If enough acetic acid evaporates, it will leave behind a highly shock-sensitive residue.
- ☑ It may be necessary to dispose of peroxyacetic acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving peroxyacetic acid can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious

expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that whenever the terms "cancer" or "carcinogen" are used, public emotion, hysteria, ignorance, and anxiety can all run equally high. This must be carefully considered whenever drafting or implementing public relations policies.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|---|---|---|
| Phenol (derivation: Made by the oxidation of cumene yielding acetone as a by-product. First, cumene hydroperoxide is produced, which decomposes with dilute sulfuric acid to the primary products, plus acetophenol and phenyl dimethyl carbinol). 1 ppm = 3.91 mg/m³ | PEL (skin): 5 ppm 19 mg/m³ STEL: Not Established | REL (skin): 5 ppm 19 mg/m³ CEILING (15 min): 15.6 ppm 60 mg/m³ | 250 ppm | TLV: 5 ppm 19 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 359°F (182°C) | Specific Gravity (H ₂ O = 1) 1.06 |
| Vapor Pressure (mm Hg) 0.35 at 77°F (25°C) | Molecular Weight 94.1 |
| Vapor Density (Air = 1) 3.24 | Melting Point 109°F (43°C) |

Solubility

Soluble in water (9%), alcohol, chloroform, glycerol, carbon disulfide, petrolatum, oils, and alkalis.

Appearance and Odor

Colorless to light-pink, crystalline solid with a sweet, acrid odor. Liquefies when mixed with 8% water.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 175°F (79°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.8% UEL: 8.6% |
| NFPA Classification Combustible Solid | Autoignition Temperature 1319°F (715°C) |

Extinguishing Media

Use water spray, carbon dioxide, dry chemical, or alcohol foam (do NOT use solid stream of water).

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Use water spray to keep fire-exposed containers cool.

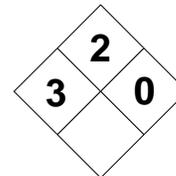

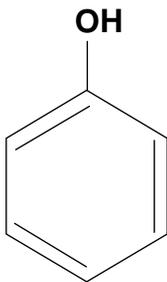

Unusual Fire and Explosion Hazards

Moderate fire and explosion hazard when exposed to heat or flame. Containers may explode in fire. Chemical will react on contact with oxidizable materials. In fire, it emits toxic fumes and vapors that form explosive mixtures with air. Water containing phenol can cause serious chemical burns.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|--|--|--|
| Stability | | Conditions to Avoid Phenol is stable at room temperature in closed containers under normal conditions of handling and storage. Keep away from heat and incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, calcium hypochlorite, aluminum chloride, and acids. Reacts violently and explosively with formaldehyde, peroxydisulfide acid, sodium nitrate + heat, and aluminum chloride + nitromethane. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of phenol cannot occur. Avoid heating phenol above temperatures of 122°F (90°C). | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, phenol can produce oxides of carbon and water. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X | |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and respiratory tract. Systemic toxic effects include anorexia, weight loss, weakness, muscle pains, pallor, nausea, vomiting, diarrhea, weakness, darkened urine, headache, tinnitus, sweating, convulsions, cyanosis, shock, loss of consciousness, respiratory failure, and death. ABSORPTION: Causes white, wrinkled discoloration, severe burns and/or systemic poisoning (due to rapid absorption). Eye contact causes serious corrosive damage (conjunctival edema, corneal opacification, and hypesthesia), and possible blindness. INGESTION: Gangrene and corrosion of the lips, mouth, throat, esophagus, and stomach. | | | | |
| Carcinogenicity Suspected Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, CNS, liver, kidney. |
| Medical Conditions Generally Aggravated by Exposure Chronic respiratory disorders, pre-existing skin disorders, convulsive disorders, kidney or liver disease. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact: Remove all contaminated clothing. Use decontaminating agent such as PEG (polyethyleneglycol-300) on affected area or, if PEG is not available, immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. If swallowed: Seek medical attention immediately. Unless advised otherwise, give conscious person 15 to 30 cc of vegetable oil and induce vomiting.</u> | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or other non-reactive material and deposit in sealed drum. Collect powdered material in safest manner possible. Do NOT dry sweep. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. | | | | |
| Other Precautions and Warnings Heat may cause solids to liquefy and containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For high exposures, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece in continuous flow mode, or use a SCBA operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

PHENOL

CAS: 108-95-2

**IDENTIFICATION AND TYPICAL USES**

Phenol is a colorless to light-pink crystalline solid with a characteristic, medicinal, sharp, sweet, tangy, acrid odor. It turns pink or red when impurities are present or it is exposed to heat or light. Phenol liquefies by mixing with approximately 8% water. Phenol is one of many aromatic compounds found in coal tar. It is used in the manufacture of various phenolic and epoxy resins, for refining lubricating oils, as a disinfectant, a fuel-oil sludge inhibitor, and as a reagent in chemical analysis. It is also used in the production or manufacture of a large variety of aromatic compounds including fertilizers, illuminating gases, coke, explosives, lampblack, paints, paint removers, asbestos goods, wood preservatives, textiles, perfumes, bakelite, rubber, and other plastics. It is used in medical and industrial organic compounds and dyes, and in germicidal paints and slimicides. Phenol has been identified as a constituent of cigarette smoke and automobile exhaust.

RISK ASSESSMENT: HEALTH***General Assessment***

Phenol is a human poison by *inhalation*, *ingestion*, and skin *absorption*. It is a severe irritant to the eyes, skin and respiratory system. Human mutation data have been reported for phenol. It is a questionable carcinogen in animals and a suspected carcinogen in humans, although the data are inconclusive in this area of study. It is also an experimental teratogen with adverse reproductive effects reported. Phenol is a general protoplasmic poison that is corrosive to any living tissue it contacts.

Inhalation can cause irritation to the respiratory system and associated mucosa. Although it is an irritant, its good warning properties and low volatility

make inhalation exposures less of a concern than absorption or ingestion. Symptoms of systemic exposure may include pallor, nausea, anorexia, vomiting, diarrhea, weakness, muscle aches, darkened urine, headache, tinnitus (ringing in the ears), sweating, convulsions, cyanosis, shock, loss of consciousness, and death due to respiratory failure. There may also be narcotic effects associated with the depression of the central nervous system (CNS).

In addition to the systemic symptoms noted above, skin contact can cause serious localized burns, possible skin eruptions, and dermatitis. If phenol should contact the eyes, there may be serious damage including conjunctival edema, corneal opacification, hypethesia, and possible blindness.

Ingestion of phenol can cause burns to the lips, mouth, esophagus, and stomach with gangrene and unspecified gastrointestinal disturbances.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to phenol:

Skin: Severe irritation and possible burns. Will pass through unbroken skin to cause toxic systemic effects, including weakness, nausea, collapse, and death.

Eye: Severe irritation with damage and possible loss of vision likely.

Lung: Severe irritation to the respiratory tract and associated mucosa. Can cause weakness, nausea, confusion, collapse, coma, and death (respiratory failure).

CNS: A CNS depressant. Weakness, confusion, mood changes and other personality changes, nausea, collapse, and death.

Other: Significant skin contact or ingestion can cause death in minutes.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to phenol and can last for months or even years:

Cancer Hazards: Some studies have suggested that exposure to phenol causes mutations (genetic changes) in humans. While there is no evidence of carcinogenicity of this chemical in humans, it has caused cancer in mice and is considered a *suspected* carcinogen. It is suggested that mutagenic chemicals be regarded as carcinogens during use and handling.

Reproductive Hazard: According to information presented in the references, phenol has been shown to cause teratogenic and adverse reproductive effects in animals.

Other Chronic Effects: Chronic effects are not common with phenol but can include digestive disturbances, neurological disorders, skin rash and dermatitis with dark pigmentation of the skin and whites of the eyes (sclera), and liver, kidney, pancreas, and heart muscle damage. Phenol has not been adequately evaluated to determine whether brain or other nerve damage could occur with repeated exposure. However, many solvents and other petroleum-based chemicals have been shown to cause such damage. Effects may include reduced memory and concentration, personality changes, fatigue, sleep disturbances, reduced coordination, and/or effects on nerves supplying internal organs and the peripheral nervous system.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with phenol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around phenol. For significant exposures over the PEL (5 ppm), use an MSHA/NIOSH-approved full facepiece respirator equipped with an organic vapor cartridge. Better protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing

apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious butyl rubber gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with phenol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where phenol is used or stored.

Before beginning employment with phenol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

Kidney and liver function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

Urinary phenol tests.

Kidney and liver function tests

Neurological evaluation for brain and nervous system effects.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Also, if possible, liquids should be transferred automatically from storage containers to process containers.

Always ensure that proper protective clothing is worn when using chemical substances and that personnel have been trained on the use, care, and maintenance of personal protective equipment.

- ☑ Wash thoroughly immediately after exposure to phenol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of phenol should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to phenol, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of phenol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of phenol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Phenol is considered a combustible solid. However, its vapors present a moderate fire hazard when exposed to heat or air. In fact, air mixtures containing just 3 to 10% phenol are explosive. It is reactive with many commonly encountered materials, including strong oxidizers (chlorine, fluorine, bromine), acids (hydrochloric, sulfuric, and nitric), calcium hypochlorite, and aluminum chloride. These characteristics require caution in handling, storage, transportation, and disposal. It is also a corrosive and, therefore, special consideration is required during any emergency situation involving a leak or spill of phenol. Should phenol ever come into contact with any incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Phenol may enter the environment through oil refinery discharges, coal conversion plants, municipal waste treatment plant and industrial plant discharges, or through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to phenol.

Phenol has moderate acute toxicity to aquatic life. Phenol can kill, and cause germination decreases in various agricultural crop plants. It has high acute toxicity to birds. Insufficient data are available to evaluate or predict the short-term effects of phenol exposure to land animals.

🦠 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Phenol has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of phenol to plants, birds, or land animals.

💧 *Water Solubility*

Phenol is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Phenol is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 26.3% of phenol will eventually end up in air, approximately 73.3% in water, and about 0.2% in terrestrial soil and aquatic sediments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of phenol found in fish tissue is expected to be about the same as the average concentration of phenol in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of phenol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If phenol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of phenol. If phenol is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of leak.
- Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid materials in safest manner possible and place in sealed containers. Do NOT dry sweep (creates airborne dusts). Use vacuum equipped with a high-efficiency particulate air (HEPA) filter instead.
- It may be necessary to dispose of phenol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving phenol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public hysteria, emotion, anxiety, and ignorance can run equally high. This must be carefully considered whenever drafting or implementing public relations policies.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

PHENYLHYDRAZINE

CAS: 100-63-0

**IDENTIFICATION AND TYPICAL USES**

Phenylhydrazine is a colorless to pale-yellow liquid or solid (below 67°F) with a faint, aromatic odor. It becomes reddish-brown on exposure to air. It is used in the manufacture of dyes and pharmaceuticals, as a stabilizer for explosives, as a reagent for aldehydes, ketones, and sugars during chemical analysis, and in organic synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

Phenylhydrazine is a suspected human and animal carcinogen (by the ACGIH and NIOSH). It is an experimental teratogen with adverse reproductive effects reported. Mutation data have also been reported. It is primarily toxic by *inhalation* and skin contact (*absorption*). It can also cause toxic and damaging effects by *ingestion*.

Symptoms of exposure by all routes include hematuria, changes in the liver and kidneys, vomiting, nausea, and respiratory arrest. There may also be a decrease in body temperature and blood pressure following exposure. Liver injury may be indicated by jaundice and cyanosis in exposed victims.

Inhalation also causes irritation and inflammation of the eyes, nose, throat, and upper respiratory tract with cough, dyspnea, congestion, and chest pains.

Skin contact also results in sensitization, dermatitis, and eczema-like rash with swelling and possible blistering at the site of contact. Absorption occurs rapidly. If skin contact is combined with another entry route (e.g., vapor inhalation), the subsequent compounded effects may be life-threatening.

Ingestion of phenylhydrazine will cause burning of the lips, mouth, throat, and stomach with unspecified gastrointestinal effects. Systemic effects include possible liver and kidney injury.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to phenylhydrazine:

Skin: Severe irritation and burning. Extremely damaging to skin surface. Skin absorption will occur causing toxic systemic effects.

Eye: Severe irritation and tissue damage up to and including loss of vision.

Lung: Irritation of the upper respiratory tract causing choking, coughing, dyspnea, and pulmonary irritation.

CNS: Dizziness, convulsions, tremors, nausea, headaches, possible injury to the nervous system.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to phenylhydrazine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, phenylhydrazine has been shown to cause cancer in test animals. Its carcinogenicity in humans is expected to be at least equal to that of animals. Mutation data have also been reported for this compound.

Reproductive Hazard: According to the information presented in the references, this chemical has been shown to cause teratogenic effects as well as adversely affect reproduction in test animals.

Other Chronic Effects: Repeated exposures can lead to hemolytic anemia with jaundice and possible effects on the kidney and liver. There can also be chronic inflammation of the nasal, tracheal, and bronchial tissue resulting in chronic bronchitis. Repeated skin exposure can cause dermatitis with a characteristic rash.

☠ Recommended Risk-Reduction Measures

Phenylhydrazine is listed by the ACGIH as a suspected human carcinogen and by NIOSH as a possible

human cancer agent. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around phenylhydrazine. The exposure level is extremely low (5 ppm) and difficult to accurately monitor. For any detectable exposures to a suspected carcinogenic agent, use a supplied-air respirator set in positive pressure or continuous flow mode, or use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever an eye or face contact hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selection has been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques as well as the exposure control measures that will be practiced whenever personnel are to work with or around phenylhydrazine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where phenylhydrazine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Complete blood count (CBC).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Liver and kidney function tests.
- Evaluation by a qualified allergist with careful consideration of exposure history and special tests (may help diagnose allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Since smoking can cause heart diseases, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers under the same exposure conditions. Also, because alcohol consumption can cause liver damage, drinking alcohol can increase the potential for liver damage caused by exposure to phenylhydrazine. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- Wash thoroughly immediately after exposure to phenylhydrazine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information must be posted in the work area. It is recommended that a regulated, controlled work area should be established wherever this chemical is used, handled, or stored. In addition, as part of an on-going education and training program, all information on the health and safety hazards of phenylhydrazine should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided in the immediately area.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of phenylhydrazine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Phenylhydrazine should always be handled with extreme caution. It is a Class IIIA combustible liquid per OSHA 29 CFR 1910.106. Its vapors are four

times heavier than air and can collect in low lying areas or travel for great distances to an ignition source to flashback and cause a fire or explosion. These vapors also form explosive mixtures in air. It is incompatible and highly reactive with a number of substances, especially oxidizers and oxidizing agents. These characteristics require special consideration during any emergency situation involving a leak or spill of phenylhydrazine.

Phenylhydrazine can enter the environment through industrial discharges or through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to phenylhydrazine.

This chemical has high acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of phenylhydrazine to plant, birds, or land animals.

☞ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Phenylhydrazine has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of phenylhydrazine to plants, birds, or land animals.

💧 *Water Solubility*

Phenylhydrazine is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Phenylhydrazine is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It is expected to absorb to sediment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become con-

centrated in the tissues and internal organs of animals as well as humans.

Phenylhydrazine is not expected to accumulate in the edible tissues of aquatic species consumed by humans.

🔧 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of phenylhydrazine should be segregated from other chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with proper fire protection and prevention equipment and explosion-proof electrical components and equipment. Bulk storage of phenylhydrazine is not recommended. Phenylhydrazine is somewhat hypergolic (ignites explosively) with incompatible materials such as oxidizers.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures and the health hazards associated with carcinogenic materials. Contaminated soils should be removed for incineration and replaced with clean soil. Non-sparking tools should always be used in cleanup operations.

If phenylhydrazine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. It is slightly soluble in water and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of phenylhydrazine. Burning phenylhydrazine in a chemical incinerator equipped with an afterburner and an air scrubber is an acceptable disposal method.

If phenylhydrazine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove all ignition sources.

- ☑ Absorb liquids in vermiculite or sand and place in a sealed drums for disposal. Use non-sparking tools during cleanup.
- ☑ It may be necessary to dispose of phenylhydrazine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving phenylhydrazine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Always remember that anytime the term "carcinogen," "cancer," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This should be considered during the development of any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Non-flammable Gas | Autoignition Temperature Not Applicable |

Extinguishing Media

Use extinguishing agent suitable to surrounding media. Phosgene itself does not burn.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). If possible, remove containers or cylinders from fire areas or use a water spray to keep fire-exposed containers cool. Continue cooling long after fire has been extinguished. Poisonous gases are produced in fire.

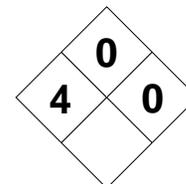

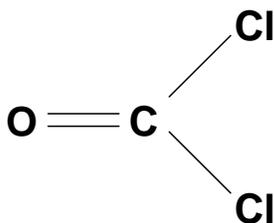

Unusual Fire and Explosion Hazards

Containers may explode in fire. Firefighters should avoid contact with vapors produced during fire.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|--|--|
| Stability | | Conditions to Avoid Phosgene is normally stable in closed containers under routine conditions of handling and storage. Keep away from moisture and exposure to incompatible materials. Keep away from heat. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with moisture, alkalis, ammonia, alcohols, copper, sodium, potassium, and aluminum. It slowly reacts in water to form hydrochloric acid and carbon dioxide. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of phosgene is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, phosgene can emit highly toxic/poisonous gases, including carbon dioxide. Phosgene itself is an extremely hazardous material and should be handled with extreme caution. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: Extremely irritating to the lungs, throat, nose, and eyes with coughing and shortness of breath that may persist for hours after exposure. It can cause permanent damage to the lungs. Fluid can build up in the lungs (pulmonary edema), which is a medical emergency. Once inhaled, it is slowly hydrolyzed to hydrochloric acid and carbon dioxide. SKIN & EYES: Contact with the liquid can cause severe skin burns (from frostbite). The liquid can also cause severe eye burns leading to permanent damage. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure Existing respiratory problems may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours since pulmonary edema may be a delayed reaction. If <u>swallowed:</u> Not likely. If it does occur, seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. If gas is leaked, stop source if possible or remove leaking cylinders to safe area outdoors and allow to empty. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat and sunlight. Ship in steel pressure cylinders and tank cars. Protect containers from physical damage. Store cylinders in upright position. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where phosgene is used, handled, or stored. Heat may cause containers to buildup pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure level is relatively low (0.1 ppm) and difficult to monitor. For the best protection, use a supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber, PVC, or Neoprene | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

PHOSGENECOCl₂

CAS: 75-44-5

**IDENTIFICATION AND TYPICAL USES**

Phosgene is a colorless gas with a suffocating odor like that of musty hay. It is a fuming liquid at temperatures below 47°F (8°C). It is typically shipped as a liquefied compressed gas. It is used in the synthesis of dyes, pharmaceuticals, isocyanates, polyurethane and polycarbonate resins, and pesticides. It is also used as a war gas.

RISK ASSESSMENT: HEALTH**General Assessment**

Phosgene is a severely irritating gas, causing irritation of the eyes, nose, throat, and upper respiratory tract (URT). There may be no immediate indications of URT effects, but damage can occur in a relatively short period of time. It is a human poison by *inhalation*. When phosgene gas is inhaled, the heavy moisture content of the respiratory tract causes the gas to hydrolyze to corrosive hydrochloric acid and toxic carbon dioxide. Symptoms of exposure include burning of the mouth, cyanosis (bluish discoloration of the lips, face, fingers, toes and ears), coughing, choking, nausea, vomiting, headache, dizziness, foamy sputum, congestion, respiratory distress, and pulmonary edema (fluid in the lungs), which can be fatal. The symptoms of pulmonary edema may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk. However, when an exposure has been particularly severe, the development of pulmonary edema may be so rapid that death can occur within 36 hours of exposure.

Chronic exposure to low concentrations may not cause pulmonary edema but can lead to emphysema, pulmonary fibrosis, and other respiratory disorders. In cases where such exposures do occur, the worker will feel a burning sensation in the eyes, nose and throat, followed by tightness and pain in chest.

Skin contact can cause irritating rash and possible deep burns due to frostbite effect of the compressed liquid on the skin's surface. Eye contact with the vapor may be irritating and the liquid may cause damage to vision and destruction of tissue.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to phosgene:

- Skin:** Immediate irritation and burn on contact with the liquid. May cause irritating rash and possible permanent damage to skin tissue.
- Eye:** Severe irritation; may cause burns and permanent damage.
- Lung:** Irritation of the nose, throat, and lungs following exposure. Pulmonary edema is possible (24 to 48 hours following a high exposure). It can cause tearing, choking, coughing, foamy sputum, and chest pain.
- Other:** Headache, dizziness, loss of consciousness, muscle weakness, burning of the mouth, nausea, vomiting, and respiratory distress.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to phosgene and can last for months or even years:

Cancer Hazards: According to information presented in the references, phosgene has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, phosgene has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Phosgene can irritate the lungs. Repeated exposure may cause bronchitis to develop with cough, phlegm, and/or shortness of breath. Long-term exposure can cause other respiratory ailments, including emphysema and pulmonary fibrosis.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with phosgene. It is extremely irritating and highly toxic to humans. If a less toxic chemical cannot be substituted for a hazardous substance such as phosgene, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around phosgene. The PEL of 0.1 ppm is relatively low and difficult to accurately monitor, especially in emergency conditions. A powered supplied-air purifying respirator operated in continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, chemical resistant gloves should be used. Polyvinyl chloride, butyl rubber, or neoprene appear to provide adequate protection. However, glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with phosgene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where phosgene is used or stored.

For those personnel with frequent or potentially high exposure, the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- Lung function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Lung function tests.
- Consider chest X-ray after acute overexposures (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, exposure to phosgene may worsen pre-existing respiratory conditions. Smokers may experience symptoms more quickly than non-smokers under the same conditions of exposure.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to phosgene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of phosgene should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to phosgene, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of phosgene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of phosgene. In almost every scenario, the threat of environmental exposure is contingent upon the proper han-

dling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and especially air).

Phosgene is considered a non-flammable gas. However, its pressurized state can present a serious explosion hazard if containers/cylinders of phosgene gas are exposed to heat or fire. This gas is more than three times heavier than air. It can travel low to the ground for great distances and collect in low-lying areas to create a serious health hazard risk. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with moisture (water, steam, humid air), most alkalis, ammonia, alcohol, and copper, and contact can cause fire or explosion. It will slowly hydrolyze in water to form corrosive hydrochloric acid and toxic carbon dioxide. These characteristics require special consideration during any emergency situation involving a leak or spill of phosgene. Should phosgene ever come into contact with incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Phosgene may enter the environment through industrial discharges or through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to phosgene.

Insufficient data are available to evaluate or predict the short-term (acute) effects of phosgene exposure to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available in the references to evaluate or predict the long-term effects of phosgene to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Phosgene will react rapidly in water and will not accumulate in the aquatic environment.

⌚ *Persistence in the Environment*

Phosgene is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Once in water, phosgene will hydrolyze to hydrochloric acid and carbon dioxide and it is therefore not expected to be present in the environment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Phosgene is not expected to accumulate in the tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of phosgene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Cylinders must always be stored upright and properly secured. They should never be rolled or dragged. If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Any contaminated soils should be

removed for incineration and replaced with clean soil. If phosgene should contact the water table, aquifer, or navigable waterway, time is of the essence. It reacts rapidly in water to form other materials and total remediation and containment may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of phosgene. If phosgene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ If gas is leaking, stop the flow of gas. If the source is a cylinder and leak cannot be stopped in place, remove cylinder to a safe place in the open air and repair or allow to empty.
- ☑ It may be necessary to dispose of phosgene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving phosgene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with spe-

cific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 48 hours for lung effects. If swallowed: Seek medical attention immediately. If person is conscious, give several glasses of water or milk followed by milk of magnesia or aluminum hydroxide gel. Do NOT induce vomiting. If vomiting occurs, give more milk. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area. Remove all ignition sources. Collect solid materials in safest manner possible and deposit in sealed drums. Do NOT dry sweep. Absorb liquid spills in vermiculite or other material and place in sealed drums for disposal. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat. Avoid generating dusty conditions. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where phosphoric acid is used, handled, or stored. Take measures to prevent damage to containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure levels are relatively low. Recommend using a supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Neoprene or Nitrile | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

PHOSPHORIC ACID

CAS: 7664-38-2

**IDENTIFICATION AND TYPICAL USES**

Phosphoric acid is a thick, colorless, odorless, crystalline solid. It can also appear in aqueous solution as a viscous, water-white, odorless liquid. It is one of the most widely used chemicals. It is found in fertilizers, soaps and detergents, and inorganic phosphates. It is used in the pickling and rust-proofing of metals, in pharmaceuticals, in sugar refining, in the manufacture of gelatin, in water treatment, animal feeds, in electropolishing, as a gasoline additive, in conversion coatings for metals, as a catalyst for ethanol manufacture, in cotton dyeing, in yeast, as a soil stabilizer, in waxes and polishes, as a binder for ceramics, in activated carbon, in foods and carbonated beverages as an acidulant and sequestrant, and as a laboratory reagent.

RISK ASSESSMENT: HEALTH**General Assessment**

Exposure to phosphoric acid is possible through *inhalation* of its vapors and by skin contact (although dermal absorption through intact skin has not been reported). It can also enter the body through *ingestion* of the solid (dusts) or the liquid solution. Although it is considered to be of moderate toxicity, it is a highly caustic and, therefore, corrosive compound. There are no reports on its carcinogenic, mutagenic, or teratogenic properties.

Inhalation severely dehydrates tissues and causes destructive, corrosive damage to the nose, throat, and mucosa of the upper respiratory tract. There can be coughing, dyspnea (labored breathing), lachrymation, and nausea. Severe exposures may lead to chemical pneumonitis or cause pulmonary edema (fluid in the lungs), which is a medical emergency and can be fatal. The development of pulmonary edema can be delayed

up to 48 hours after exposure, thereby creating a false sense of security with regard to health exposure risk.

Skin contact with the vapor or the liquid solution causes severe burning and irritation, although this reaction may not occur immediately. Eye contact causes immediate stinging and watering with tissue damage and the possibility of corneal damage. There will be redness and swelling of the lids, intense pain, and tissue destruction. Loss of vision may occur.

Ingestion can cause severe burns to the lips, mouth, throat, and stomach. If vomiting occurs and the liquid is aspirated into the lungs, the corrosive action on the lung tissues can be life-threatening. Other symptoms include nausea, bloody diarrhea, abdominal pain, shock, and severe gastrointestinal damage.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to phosphoric acid:

Skin: Irritation/rash or burning feeling (possibly delayed) with redness, blistering, and localized tissue damage.

Eye: Severe irritation; may cause burns and damage with permanent loss of vision.

Lung: Severe irritation of the mucous membranes in the nose, throat, and lungs following exposure. It can also cause chemical pneumonitis or even delayed pulmonary edema (fluid in the lungs).

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to phosphoric acid and can last for months or even years:

Cancer Hazards: According to information presented in the references, phosphoric acid has not been adequately tested for its ability to cause cancer in laboratory test animals.

Reproductive Hazard: According to information presented in the references, phosphoric acid has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated, prolonged exposures may cause dermatitis and chronic respiratory disease, such as bronchitis, with persistent cough, phlegm, and shortness of breath.

🕒 **Recommended Risk-Reduction Measures**

Since phosphoric acid is one of the most widely used chemicals, personnel must take extra care to avoid direct contact with phosphoric acid. It is extremely corrosive and moderately toxic to humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around phosphoric acid. The exposure level is extremely low (1 mg/m^3) and difficult to accurately monitor, even under normal operating conditions. For low or infrequent exposures, an acid vapor respirator or gas mask may suffice. However, better protection is obtained using a self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, acid resistant neoprene or nitrile gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with phosphoric acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where phosphoric acid is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

Lung function tests (establish baseline).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

Lung function tests (compare to baseline).

Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to phosphoric acid and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of phosphoric acid should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of phosphoric acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and especially air).

Phosphoric acid is considered a non-flammable solid (or liquid solution). However, it is extremely corrosive to many materials. It is incompatible with hydroxides, amines, and alkalis and contact can cause fire or explosion. In contact with many common metals (copper, brass, zinc), it can liberate extremely explosive hydrogen gas. It reacts exothermically (liberates heat) with aldehydes, amines, amides, alco-

hols and glycols, azo-compounds, carbamates, esters, caustics, phenols and cresols, ketones, organophosphates, epoxides, explosives, combustible materials, unsaturated halides, and organic peroxides. It forms flammable gases with sulfides, mercaptans, cyanides, and aldehydes. These characteristics require special consideration during any emergency situation involving a leak or spill of phosphoric acid. Should phosphoric acid ever come into contact with any incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Phosphoric acid can enter the environment through mining operations (runoff), industrial discharges, or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to phosphoric acid.

Phosphoric acid has moderate acute toxicity to aquatic life in waters of low alkalinity. The estimate is based on the criterion for pH of water which considers the pH of 6.5 as the lower limit for healthy populations of aquatic life. The quantity of phosphoric acid required to cause a toxic response will be determined by the buffering capacity of the receiving water. Water with low alkalinity will require less phosphoric acid for toxic effects to occur. Insufficient data are available to evaluate or predict the short-term effects of phosphoric acid exposure to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Phosphoric acid has moderate chronic toxicity to aquatic life in waters of low alkalinity. The estimate is based on the criterion for pH of water which considers the pH of 6.5 as the lower limit for healthy populations of aquatic life. The quantity of phosphoric acid required to cause a toxic response will be determined by the buffering capacity of the receiving water. Water with low alkalinity will require less phosphoric acid for toxic effects to occur. Insufficient data are available to evaluate or predict the long-term effects of phosphoric acid exposure to plants, birds, or land animals.

💧 *Water Solubility*

Phosphoric acid is highly soluble in water. Concentrations of over 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Phosphoric acid is highly persistent in the aquatic environment, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Small quantities of acids will be neutralized by the alkalinity in aquatic ecosystems, but larger quantities can lower the pH for extended periods of time. Phosphoric acid contains phosphate whose concentrations in edible tissues of most aquatic species that are consumed by humans is expected to be about the same as the average concentration in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of phosphoric acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Containers should be protected against physical damage and stored away from direct sunlight or other heat sources. Personnel must avoid the generation of dusty conditions in areas where solid phosphoric acid is handled or stored.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and

replaced with clean soil. If phosphoric acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of phosphoric acid. If phosphoric acid is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all sources of heat and ignition.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb solution spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid materials in safest manner possible and place in sealed containers.
- ☑ It may be necessary to dispose of phosphoric acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving phosphoric acid can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Irritation of the eyes, nose, throat, and respiratory tract with nausea and vomiting, severe abdominal pain, diarrhea, coma, and convulsions. There may be damage to the lungs, kidney, and liver with bronchopneumonia, bone changes, necrosis of the jaw ("phossy" jaw), chronic cough, pallor, anemia, and weight loss. | | | | |
| ABSORPTION: Causes serious burns on skin contact. Absorption through skin can result in swelling, jaw pain, anemia, and cachexia (malnutrition and debility). Eye contact can damage vision. Prolonged absorption can cause mossy teeth and brittle bones. | | | | |
| INGESTION: Local irritation, nausea, vomiting, severe abdominal pain, and liver damage. The skin may turn yellow within two weeks due to this liver damage. Kidney damage possible. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, liver, kidney, jaw, teeth, blood, res. sys. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); skin conditions (dermatitis); liver or kidney disorders. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of water and then rewash with 3% copper sulfate. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. If person is conscious, induce vomiting. Gastric lavage with potassium permanganate is indicated. Gastric contents in stool may be smoking, luminescent in the dark, or fluorescent under UV light. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Ventilate area. Remove all ignition sources. Keep spilled material wet and covered with wet sand or dirt. Do NOT allow exposure to air. Collect solidified materials and keep under water in sealed drums. Prevent runoff into waterways or sewers. Cleanup personnel must wear SCBA and protective gear. | | | | |
| Preferred Waste Disposal Method | | | | |
| Consider reclamation or destruction (by incineration). | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Avoid contact with incompatible materials since violent reactions can occur. Store under water in tightly closed containers. Air contact must be prevented. Prevent damage to containers. | | | | |
| Other Precautions and Warnings | | | | |
| Sources of ignition are prohibited where phosphorus is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| Exposure levels are relatively low. Recommend using a supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |

PHOSPHORUS

P₄

CAS: 7723-14-0

IDENTIFICATION AND TYPICAL USES

Phosphorus (yellow) is a white to yellow, soft, waxy solid with acrid fumes in air. Usually shipped or stored in water. It is used in smoke screens, in making rat poison (rodenticide), and in analytical chemistry work.

RISK ASSESSMENT: HEALTH

General Assessment

Yellow phosphorus is a highly poisonous substance. Exposure is possible through *inhalation* of its vapors and by skin contact (dermal *absorption*). It can also enter the body through *ingestion*. Since the vapor pressure of phosphorus is low, the acute health hazard from a short exposure to its vapors under normal conditions are expected to be relatively low. Health risk increases with concentration level and duration of exposure. There are no reports on its carcinogenic, mutagenic, or teratogenic properties.

Inhalation of its vapors can cause corrosive irritation of the eyes, nose, throat, and mucosa of the respiratory tract. This irritation can severely affect the lungs causing serious burns to tissues. Toxic symptoms include bronchopneumonia, anemia, loss of appetite, gastrointestinal complaints, chronic cough, pallor, and necrosis of the jaw ("phossy" jaw). A garlic odor may be noticeable on the breath or in skin wounds of exposed persons. Inhalation of the fumes from burning phosphorus can be extremely irritating.

Skin contact results in severe burns on contact. Absorption through intact skin can result in swelling, jaw pain, anemia, and cachexia (a condition similar to malnutrition). Eye contact can cause damage, serious burns, and probable damage to vision.

Ingestion of yellow phosphorus is extremely dangerous with severe systemic poisoning likely to occur relatively quickly. A single oral dose in humans of 70 to 100 milligrams can be fatal. Toxic symptoms include nausea and vomiting, severe abdominal pain,

diarrhea, coma, and convulsions. Ingested phosphorus can be absorbed by the gastrointestinal tract resulting in liver damage. The skin surface may turn yellow within two weeks of exposure due to this liver damage.

Prolonged absorption of small amounts of phosphorus may cause mossy teeth (detectable by a dental examination) and brittle bones. Other acute effects include hypotension and shock due to direct toxicity to the heart.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to phosphorus:

Skin: Irritation/rash or burning feeling (possibly delayed) with redness, blistering, and localized tissue damage. Absorption is likely.

Eye: Severe irritation; may cause burns and damage with permanent loss of vision.

Lung: Severe irritation of the mucous membranes in the nose, throat, and lungs following exposure.

Other: Can cause headaches, neurotoxicity, hypotension, and shock as a result of toxicity to the heart.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to phosphorus and can last for months or even years:

Cancer Hazards: According to information presented in the references, yellow phosphorus has not been adequately tested for its ability to cause cancer in laboratory test animals.

Reproductive Hazard: According to information presented in the references, phosphorus has not been ade-

quately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated exposure can cause destruction of bone, especially the jaw bone. This process can extend into one or both eye sockets. There can be pain and loosening of the teeth, ulcerative stomatitis (inflammation of the mucosa of the mouth), leukopenia (low number of white blood cells), anemia, hepatomegaly (enlarged liver), jaundice, periostitis (inflammation of the periosteum) with suppuration, ulceration, and necrosis of the mandible. There can be chronic hypotension and possible shock. Chronic chemical bronchitis may occur as well as hepatic encephalopathy (due to liver failure), and kidney failure.

🕒 **Recommended Risk-Reduction Measures**

Personnel must take extra care to avoid direct contact with phosphorus. It is extremely corrosive and severely toxic to humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around phosphorus. The exposure level is extremely low (0.1 mg/m^3) and difficult to accurately monitor, even under normal operating conditions. The best protection is obtained using a self-contained breathing apparatus (SCBA) or a supplied air respirator with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, acid resistant neoprene or nitrile gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with phosphorus.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where phosphorus is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

- ☑ Lung function tests (establish baseline).
- ☑ Consider X-ray of teeth and jaw and a dental examination.
- ☑ Complete blood count (CBC) with differential.

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

- ☑ Lung function tests (compare to baseline).
- ☑ Electrocardiogram (EKG).

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- ☑ Wash thoroughly immediately after exposure to phosphorus and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of phosphorus should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of phosphorus. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and especially air).

Phosphorus is considered a flammable solid and can ignite spontaneously in moist air without any added source of ignition at temperatures greater than 86°F (30°C). In fact, it is so reactive in air that it must be stored under water. Other incompatible materials include halogens, strong caustics, and all oxidizing agents, including sulfur. These characteristics require

special consideration during any emergency situation involving a leak or spill of phosphorus. Should phosphorus ever come into contact with any incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Phosphorus can enter the environment through industrial discharges, agricultural runoff, municipal waste treatment plant discharges, or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to phosphorus.

Acute toxicity of phosphorus to aquatic life is unknown and cannot be predicted as no toxicity tests have been conducted with elemental phosphorus. Insufficient data are available to evaluate or predict the short-term effects of phosphorus to plants, birds, and land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chronic toxicity of phosphorus to aquatic life is unknown and cannot be predicted as no toxicity tests have been conducted with elemental phosphorus. Insufficient data are available to evaluate or predict the long-term effects of phosphorus to plants, birds, and land animals.

💧 *Water Solubility*

Phosphorus is moderately soluble in water. Concentrations between 1 to 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Phosphorus is slightly persistent in the aquatic environment, with a half-life of less than 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Yellow phosphorus, also known as white phosphorus, is a form of elemental phosphorus that will probably be slowly oxidized by the dissolved oxygen in water, but which burns in air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of phosphorus found in fish tissues is expected to be somewhat higher than the average concentration of phosphorus in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of phosphorus should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Containers should be protected against physical damage and stored away from direct sunlight or other heat sources. Because phosphorus will ignite spontaneously in air, it must be stored under water.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If phosphorus should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of phosphorus. If phosphorus is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all sources of heat and ignition.

- ☑ Ventilate area or spill or leak.
- ☑ As quickly as possible, cover spilled materials with wet sand or dirt and keep wet until cleanup is completed. Collect solidified material and keep submerged in water inside drums.
- ☑ It may be necessary to dispose of phosphorus as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving phosphorus can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, phthalic anhydride emits toxic and irritating fumes and vapors, including toxic oxides of carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Causes irritation of the eyes, nose, throat, and respiratory system with coughing, sneezing, dyspnea, mucous membrane irritation in the nasal cavity leading to ulceration of the septum, nasal bleeding, loss of the sense of smell, conjunctivitis, hoarseness, possible blood changes, and chemical bronchitis with asthma-like symptoms. SKIN & EYES: Skin contact causes serious caustic burns, itchy rash, and dermatitis. Eye contact may cause burns, irritation, corneal scarring, and perhaps permanent damage. INGESTION: Burning of the mouth, esophagus, and digestive tract. Pain in the chest, stomach, and painful swallowing. In moist tissues, it hydrolyzes to phthalic acid, which is corrosive. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Skin, eyes, liver, kidney, respiratory system. |
| Medical Conditions Generally Aggravated by Exposure Existing chronic respiratory diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Spray or gargle with water to relieve throat irritation. If <u>swallowed</u>: Contact poison control center. Unless told otherwise, give soapy water to drink and induce vomiting. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material using a vacuum equipped with HEPA filter, deposit in sealed drums for disposal. Avoid skin contact. Do NOT dry sweep (generates dusts). Allow molten materials to solidify, then treat as a solid. Ventilate area of spill to disperse any collection of gas, vapors, or dusts. | | | | |
| Preferred Waste Disposal Method Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Do not store phthalic anhydride in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, dark, well-ventilated area. Electrically ground and bond all containers and equipment to prevent static sparks and possible ignition. | | | | |
| Other Precautions and Warnings Keep away from water, moisture, and incompatible materials. Prevent damage to containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL is extremely low (2 ppm). Use a self-contained breathing apparatus (SCBA) with full facepiece or a supplied-air respirator operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

PHTHALIC ANHYDRIDE

CAS: 85-44-9

**IDENTIFICATION AND TYPICAL USES**

Phthalic anhydride is a white solid flake or a clear, colorless, molten liquid with a characteristic, irritating, choking odor. It is used in the manufacture of alkyd resins, plasticizers, as a hardener for other resins, in polyesters, in the synthesis of phenolphthalein and other phthaleins, many other dyes, chlorinated products, pharmaceutical intermediates, insecticides, diethyl phthalate, dimethyl phthalate, and as a laboratory reagent.

RISK ASSESSMENT: HEALTH***General Assessment***

Phthalic anhydride is a human poison primarily by *inhalation*, causing toxic systemic effects targeting the respiratory system. It can also cause toxic effects by *ingestion*. It is an experimental teratogen, causing fetal development problems in test animals. There are no reports regarding its carcinogenic or mutagenic potential in humans or animals.

Inhalation of phthalic anhydride can be irritating to the nose, throat, mucosa, and the upper respiratory tract. Asthmatic-like symptoms include coughing, sneezing, and dyspnea. There may also be ulceration of the nasal septa, nose bleeds, loss of sense of smell, hoarseness, bronchitis, blood changes, and chemical bronchitis. In the presence of moist tissues, it hydrolyzes to phthalic acid which is corrosive and irritating.

Ingestion of phthalic anhydride can cause burning of the mouth, esophagus, and gastrointestinal tract with deep, burning pain in the chest and stomach, and pain on swallowing.

Skin contact may not result in any immediate effects. However, if the chemical is not removed quickly, there can be deep and painful burning, blis-

tering, and possible dermatitis and allergic sensitization in some individuals.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to phthalic anhydride:

Skin: Irritation and possible rash. Moisture on skin's surface will enhance the reaction.

Eye: Severe burns, corneal scarring, and possible damage to vision.

Lung: Severe irritation of the nose, throat, and esophagus. Nasal cavity irritation can lead to ulceration of the septa with nose bleeds and loss of the sense of smell.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to phthalic anhydride and can last for months or even years:

Cancer Hazards: According to the information presented in the references, phthalic anhydride has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, phthalic anhydride has been shown to cause teratogenic effects in test animals. It is not known if human exposure will have the same results. More research is required in this regard.

Other Chronic Effects: Prolonged contact with phthalic anhydride can lead to the development of a skin allergy. If an allergy develops, very low future exposures can cause itching and a skin rash. It may also cause an asthma-like lung allergy with shortness

of breath, wheezing, coughing, and or tightness in the chest. Very irritating substances may affect the lungs. It is not known if phthalic anhydride causes permanent lung damage on chronic exposure.

🔊 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with phthalic anhydride. It is a toxic, human poison on inhalation. Its human teratogenic properties are not clearly understood in the references. If a less toxic chemical cannot be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around phthalic anhydride. This chemical has an extremely low permissible exposure limit (1 ppm), which is difficult to accurately monitor. Therefore, prudent risk management requires a conservative approach to personal protection. While a chemical respirator with a dust/mist pre-filter may suffice, the best protection is obtained using a supplied-air respirator operated in continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or positive pressure mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever phthalic anhydride is being mixed with liquids, a chemical splash hazard exists and a face shield and rubber apron should be worn. To prevent hand and skin exposures, protective gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with phthalic anhydride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where phthalic anhydride is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for persons with frequent or anticipated high exposure to phthalic anhydride:

- ☑ Lung function tests (may be normal if person is not experiencing symptoms at the time of the test).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests.
- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, lung cancer, and other respiratory diseases, smokers may experience symptoms more rapidly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* possible factors that may be causing the appearance of exposure symptoms in the workplace.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, then respiratory protection should be mandatory and its use enforced.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- ☑ Wash thoroughly immediately after exposure to phthalic anhydride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of phthalic anhydride should be communicated to all exposed or potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided in the immediate work area. Even if no immediate or noticeable effects occur on skin contact, personnel must still be instructed to use the safety showers to remove the chemical.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of phthalic

anhydride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Phthalic anhydride is considered a combustible solid. It can react with water or moisture to produce phthalic acid which is corrosive to most metals. Phthalic anhydride mist, dust, or vapor can explode in proper mixtures with air in contact with an ignition source. These characteristics require special consideration during any emergency situation involving a leak or spill of phthalic anhydride or phthalic anhydride mixtures. Should phthalic anhydride ever come into contact with other incompatible substances, such as strong oxidizers, either during use, transportation, or storage, violent and even explosive reactions can occur. Phthalic anhydride can enter the environment from industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to phthalic anhydride.

Phthalic anhydride has low acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of phthalic anhydride to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Phthalic anhydride has low chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of phthalic anhydride to plants, birds, or land animals.

💧 *Water Solubility*

Phthalic anhydride is slightly soluble. Concentrations of 10 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Phthalic anhydride is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the

chemical to be degraded. It will hydrolyze rapidly to produce phthalic acid.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Since phthalic anhydride will react rapidly in water to produce phthalic acid, it is not expected to accumulate in the edible tissues of fish normally consumed by humans.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of phthalic anhydride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Precautions must be taken to ensure all contact with water or moisture is prevented in use or storage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If phthalic anhydride should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of phthalic anhydride.

If phthalic anhydride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened to normal work.
- ☑ Collect powdered material in the most convenient (safe) manner possible and deposit in sealed containers. Do NOT dry sweep (generates air-

borne dusts). Use a vacuum equipped with a HEPA filter instead. If liquid solutions are spilled, use vermiculite to absorb and place in a sealed drum.

- ☑ It may be necessary to dispose of phthalic anhydride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving phthalic anhydride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "reproductive hazard" or "birth defects" are used, public hysteria, emotion, and ignorance can run equally high. This should be carefully considered when developing or implementing any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.
