- ☑ Electrocardiogram (EKG), to establish baseline and test for pre-existing heart rhythm abnormalities.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Electrocardiogram (EKG), to compare to baseline and test for heart rhythm disorders.
- ☑ Liver function tests.
- ☑ Lung function tests.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken within first 24 to 48 hours of exposure).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and other serious respiratory disorders, symptoms of exposure may be more pronounced in smokers than in non smokers under the same conditions. Prudent risk management requires proper consideration of *all* possible factors which may be causing the appearance of exposure symptoms among workers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- ☑ Wash thoroughly immediately after exposure to difluorodibromomethane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of difluorodibromomethane should be communicated to all potentially exposed workers.
- ☑ Clothes that may be contaminated with chemical substances should never be worn home (family members may be exposed). Clothes should be removed at work and laundered only by personnel who have been trained on the hazards associated with the particular chemical contaminant.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT *General Assessment*

The environment is at risk of exposure during use, transportation, storage, disposal, or destruction of difluorodibromomethane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Difluorodibromomethane is considered a non-flammable liquid (or gas). However, it is incompatible with a number of common, chemically active metals and caution is required to ensure contact is prevented. It is also a chlorofluorocarbon (CFC) which is a group of halogenated hydrocarbons alleged to cause damage to the earth's protective ozone layer. Therefore, accidental release to the environment must not occur. These characteristics require special consideration during any emergency situation involving a leak or spill of difluorodibromomethane. Should difluorodibromomethane ever come into contact with incompatible substances either during use, transportation, or storage, violent and explosive reactions can occur.

Difluorodibromomethane can exist as a gas or liquid. It is usually shipped as a liquefied compressed gas. It can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to difluorodibromomethane.

This chemical is not expected to cause adverse short-term effects on aquatic life, plants, birds, or terrestrial animals.

☪ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of difluorodibromomethane to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Difluorodibromomethane is insoluble in water. It is a gas above 76°F. As a liquid, it will not mix with water.

⌚ *Persistence in the Environment*

Difluorodibromomethane is virtually non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 100% of difluorodibromomethane will eventually end up in air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of difluorodibromomethane found in fish tissues is expected to be much lower than the average concentration of difluorodibromomethane in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of difluorodibromomethane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from shock, excessive heat (including the sun's rays), and damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If any liquid has spilled, contaminated soils may need to be removed for incineration and replaced with clean soil. If difluorodibromomethane should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. It is not soluble in water and

total containment may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of difluorodibromomethane. If difluorodibromomethane is spilled or leaked, the following specific steps are recommended:

- ☑ Evacuate area and deny entry until cleanup is completed. Restrict persons not wearing protective clothing from hazard area.
- ☑ Ventilate area of spill or leak.
- ☑ If source of leak is a cylinder and it cannot be repaired in place, remove to safe location (e.g., outdoors).
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of dichlorodifluoromethane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving difluorodibromomethane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CRC NEITHER ASSUMES NOR AUTHORIZES ANY OTHER PERSON TO ASSUME FOR IT, ANY OTHER ADDITIONAL RESPONSIBILITY OR LIABILITY FOR THE USE OF, OR RELIANCE UPON, THIS INFORMATION.

HAZARD WARNING INFORMATION

| HEALTH | FIRE | REACTIVE | OTHER | DEGREE OF HAZARD | COLOR CODING | OTHER CODES |
|----------|----------|----------|-------|--|---|--|
| 1 | 4 | 0 | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|---|--|--|
| Characterization Halogenated Hydrocarbon | RCRA Number D001 | EPA Class Characteristic Waste (I) |
| DOT Proper Shipping Name Difluoroethane, R152a | Chemical Abstract Service (CAS) Number 75-37-6 | |
| DOT Hazard Class and Label Requirements Flammable Gas | DOT Emergency Guide Code 18 | |
| DOT Identification Number UN 1030 | Chemical Formula C₂H₄F₂ | |

Synonyms

Algofrene type 67; Freon® 152a; Genetron® 152a; Halocarbon 152a; 1,1-difluoroethane; ethylene fluoride; ethylene difluoride; ethylidene fluoride.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| Difluoroethane (derivation: By adding hydrogen fluoride to acetylene). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point -12°F (-25°C) | Specific Gravity (H ₂ O = 1) 0.95 |
| Vapor Pressure (mm Hg) 4437 at 77°F (25°C) | Molecular Weight 66.06 |
| Vapor Density (Air = 1) 2.27 | Freezing Point -179°F (-117°C) |

Solubility

Insoluble in water.

Appearance and Odor

Colorless and odorless gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) Flammable Gas | Explosive Limits in Air % by Volume LEL: 3.7% UEL: 18% |
| NFPA Classification Flammable Gas | Autoignition Temperature Flammable Gas |

Extinguishing Media

Use dry chemical or carbon dioxide on small fires. For larger fires, use water spray of fog.

Special Fire Fighting Procedures

Poisonous and extremely irritating gases are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Do not attempt to fight fire unless flow of gas can first be stopped. Apply cooling water to sides of containers until well after fire is out.

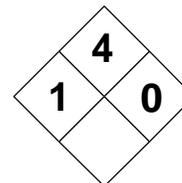

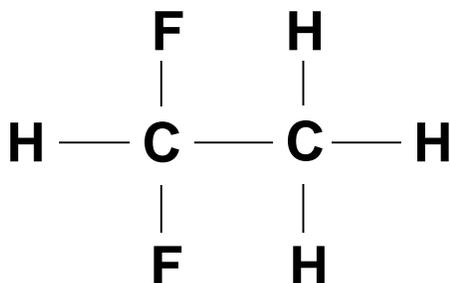

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. BLEVE (boiling liquid expanding vapor explosion) is possible. Evacuate area if rising sound is heard from venting device or there is a noticeable discoloration of the storage tank or vessel.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|---|------------------------------|---|
| Stability | | Conditions to Avoid Difluoroethane is stable at room temperature and pressure. Avoid exposures to excessive heat, ignition sources, and contact with incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Difluoroethane will react in the presence of strong oxidizers (such as chlorine, bromine, and fluorine), and powdered or heated aluminum and other light, divalent metals (will form reactive materials). | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of difluoroethane cannot occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating fumes and gases are produced when difluoroethane is involved in fire, including extremely toxic hydrogen fluoride (hydrofluoric acid) and carbonyl fluoride. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: Can act as a simple asphyxiant and may produce narcosis at high concentrations. May also cause irritation of the respiratory tract, especially at high temperatures. Death can occur as a result of pulmonary edema (fluid in the lungs), oxygen displacement (asphyxiation), or ventricular fibrillation (heart muscle fluttering). SKIN & EYES: Direct contact with the eyes or skin can cause frostbite. INGESTION: Ingestion not likely since difluoroethane is a gas at room temperatures. | | | | |
| Carcinogenicity No Citation (Human) No Citation (Animal) | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, skin, eyes, and CVS. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with tepid water for 15 minutes (minimum), seek medical attention. Skin contact: For frostbite, rapidly re-warm using water at 107°F (42°C) until flush returns, Do NOT use dry heat! Do NOT rub affected area. Seek medical assistance. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24 - 48 hours for lung effects. If <u>swallowed</u>: Not likely. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Evacuate area, deny entry, stay upwind. If it can be done without risk, shut off leak. If possible, stop gas flow and remove all ignition sources. If leak from cylinder cannot be stopped, remove to safe area (outdoors) and allow to vent until empty. Keep area clear of personnel. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Avoid inhaling vapors. Do not store difluoroethane in the presence of incompatible materials. Store in tightly closed containers in a cool, well-ventilated area away from heat, flame, ignition sources, and even the sun's rays. | | | | |
| Other Precautions and Warnings Prevent physical damage to storage cylinders. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels have been established and this compound is an asphyxiant. For best protection, use a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious, Insulated Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIFLUOROETHANE

CAS: 75-37-6

**IDENTIFICATION AND TYPICAL USES**

Difluoroethane is a colorless and odorless gas. It is used primarily as a chemical intermediate, a refrigerant, and as an aerosol propellant.

RISK ASSESSMENT: HEALTH**General Assessment**

Difluoroethane is considered mildly toxic by *inhalation*. Skin and eye contact with the compressed gas or the super-cooled liquid also presents some level of health risk, although absorption is not likely to occur. Ingestion is also not likely since this compound is normally a gas at room temperatures. There is no evidence in the references regarding the real or potential carcinogenicity or teratogenicity of this chemical in humans or test animals. There is some evidence to indicate that exposure to difluoroethane may cause mutations (genetic changes) in animals. There are no human data in this area of study.

Inhalation can cause asphyxiation by displacing oxygen content in the cells. This may produce narcosis at high concentrations with numbness and tingling in the extremities, headache, loss of orientation, discomfort, loss of coordination, ataxia, loss of consciousness, and death. Inhalation may also cause respiratory tract irritation, especially at high temperatures due to the formation of irritating hydrogen chloride gas. Death can occur as a result of laryngeal spasm or edema (fluid buildup), pulmonary edema (fluid in the lungs), oxygen displacement (asphyxiation), or ventricular fibrillation (a fluttering of the heart muscle causing a loss of the necessary synchronization between pulse and heartbeat). It should be noted that symptoms of pul-

monary edema (congestion, labored breathing, cough with phlegm, nausea) may be delayed up to 48 hours following exposure. This can create a false sense of security in terms of health risk.

Skin and eye contact can result in frostbite and subsequent damage to tissues.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to difluoroethane:

Skin: Irritation and possible frostbite (liquid or gas contact).

Eye: Mild to severe irritation. Liquid or gas bursts will burn tissue (frostbite on contact).

Lung: Irritation of the eyes, nose, and throat. Possible fatal disturbance in heartbeat synchronization (ventricular fibrillation), and lightheadedness. May cause asphyxiation or pulmonary edema (fluid in the lungs), both of which can be fatal.

Other: A narcotic at high concentrations with unspecified effect on the CNS.

☪ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to dichlorodifluoromethane and can last for months or even years:

Cancer Hazards: According to the information presented in the references, difluoroethane has not been adequately tested for its ability to cause cancer in test animals. Additional research is required.

Reproductive Hazard: According to the information presented in the references, difluoroethane has not been adequately tested for its ability to adversely affect reproduction in test animals.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dichlorodifluoromethane. No exposure levels have yet been established for difluoroethane. However, this does not mean that it presents no risks to human health. The best protection is provided using a supplied air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, impervious and insulated rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with difluoroethane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where difluoroethane is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical protocol is suggested for those assigned to work with difluoroethane:

- ☑ Electrocardiogram (EKG), to establish baseline and test for pre-existing heart rhythm abnormalities.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Electrocardiogram (EKG), to compare to baseline and test for heart rhythm disorders.
- ☑ Lung function tests.

- ☑ Consider chest X-ray following acute overexposure (may be negative if taken within first 24 to 48 hours of exposure).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and other serious respiratory disorders, symptoms of exposure may be more pronounced in smokers than in non-smokers under the same conditions. Prudent risk management requires proper consideration of *all* possible factors which may be causing the appearance of exposure symptoms among workers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to difluoroethane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of difluoroethane should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during use, transportation, storage, disposal, or destruction of difluoroethane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Difluoroethane is considered a flammable gas. It presents an extremely dangerous fire and explosion hazard. It is incompatible with a number of common,

chemically active metals and caution is required to ensure contact is prevented. It is also incompatible with commonly encountered oxidizers, such as chlorine and bromine. These characteristics require special consideration during any emergency situation involving a leak or spill of difluoroethane. Should difluoroethane ever come into contact with incompatible substances either during use, transportation, or storage, violent and explosive reactions can occur.

Although difluoroethane can exist as a gas or liquid, it is normally present as a gas at room temperature. It can enter the environment through industrial discharges and leaks.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to difluoroethane. This chemical is not expected to cause adverse short-term effects on aquatic life, plants, birds, or terrestrial animals.

🌱 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of difluoroethane to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Difluoroethane is insoluble in water. It is normally present as a gas above -178°F.

🕒 *Persistence in the Environment*

Difluoroethane is virtually non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 100% of difluoroethane will eventually end up in air where it exists entirely in the vapor phase. It will react with photochemical-produced hydroxyl radicals with a half life of 472 days in the troposphere. May gradually diffuse to the stratosphere where it will slowly photolyze. Its half-life there is expected to be equal to 20 years. Its contribution to ozone depletion requires more study. However, as a halogenated fluorocarbon (HFC), it is

believed to be less of a threat to the stratospheric ozone layer than that posed by the chlorofluorocarbons (CFC) and halogenated chlorofluorocarbons (HCFCs).

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Bioaccumulation of difluoroethane is not expected to occur in aquatic organisms.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of difluoroethane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from shock, excessive heat (including the sun's rays), and damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If any liquid has spilled, it will rapidly volatilize although some may leach through soil to groundwater. Contaminated soils may need to be removed for incineration and replaced with clean soil. If difluoroethane should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of difluoroethane. If difluoroethane is spilled or leaked, the following specific steps are recommended:

- Evacuate area and deny entry until cleanup is completed. Restrict persons not wearing protective clothing from hazard area.
- Ventilate area of spill or leak.

- ☑ Remove all sources of ignition.
- ☑ If source of leak is a cylinder and it cannot be repaired in place, remove to safe location (e.g., outdoors). Keep personnel clear.
- ☑ It may be necessary to dispose of dichlorodifluoromethane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving difluoroethane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: Severe irritant. Overexposure not likely due to the extreme irritating properties of this chemical. Vapors can cause severe irritation of the eyes, nose, throat, and skin at very low concentrations. May cause CNS depression, ataxia, loss of coordination, coma, and liver and kidney damage. Pulmonary edema (fluid in lungs) is also possible. ABSORPTION: A severe eye and skin irritant. Can pass through unbroken skin causing toxic systemic effects. Causes skin burns and eye irritation. INGESTION: May cause gastrointestinal tract irritation. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Skin, eyes, respiratory system, repro. system, CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, existing respiratory problems (bronchitis, asthma) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Wash with large amounts of soap and water for a minimum of 15 minutes. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Seek medical attention immediately. Give 1 to 2 glasses of milk or water. Do not induce vomiting or attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Absorb liquids in vermiculite or other absorbent and deposit in sealed drum. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, well-ventilated area away from heat. Protect containers from physical damage. | | | | |
| Other Precautions and Warnings Diglycidyl ether must be stored to avoid contact with strong oxidizers since violent reactions can occur. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) NIOSH suggests that diglycidyl ether is a possible human carcinogen. Use a NIOSH/MSHA-approved self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Butyl Rubber (or other non-permeable) | Eye Protection Chemical Goggles and Face Mask | | Other Protective Clothing Protective Uniform or Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIGLYCIDYL ETHER

CAS: 2238-07-5

**IDENTIFICATION AND TYPICAL USES**

Diglycidyl ether appears as a colorless, clear liquid with a strong, pungent, irritating odor. It is used as a chemical intermediate, a stabilizer of chlorinated organic compounds, a textile-treating agent, and a reactive diluting agent for epoxy resins. It may also be a trace contaminant in epoxy derivatives of epichlorohydrin.

RISK ASSESSMENT: HEALTH**General Assessment**

Diglycidyl ether is a possible human carcinogen (has cancer-causing properties), according to NIOSH, with experimental mutagenic data reported. It is poisonous by *ingestion*, *inhalation*, and by *absorption* through the skin. A number of toxic systemic effects will result from either route of exposure.

Exposure to its vapors can cause severe irritation to the eyes, nose, and respiratory tract. Exposure to as little as 10 ppm will cause instant irritation of the respiratory tract. Higher exposures can cause death within days as a result of lung damage, chemical pneumonitis, or possibly pulmonary edema. In addition, animal studies have shown that exposure to diglycidyl ether causes significant changes in blood cell elements (up to and including possible bone marrow depression), depression of the central nervous system, ataxia, loss of coordination, coma, and liver and kidney damage. It has also demonstrated mutagenic properties and produces hyperkeratosis, epithelial hyperplasia, and skin papillomas.

Skin contact is quite irritating, causing redness, swelling, and burns. It will pass through unbroken skin to cause toxic systemic effects. Eye contact can cause conjunctival irritation and injury to the cornea.

Ingestion of this compound in small amounts may produce nausea, vomiting and gastrointestinal irritation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to diglycidyl ether:

Skin: Severe irritation and possible burns. On prolonged exposure, can be absorbed though intact skin causing toxic systemic effects.

Eye: Severe conjunctival irritation and possible damage to the cornea.

Lung: Severe irritation to respiratory tract causing shortness of breath and cough. High acute exposures can be fatal due to a buildup of fluid in the lungs (pulmonary edema).

CNS: Possible depression of the central nervous system causing a variety of toxic effects including loss of coordination and consciousness.

Other: Ingestion will result in gastritis and possible damage to the liver and kidneys.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to diglycidyl ether and can last for months or even years:

Cancer Hazards: Diglycidyl ether may be a cancer causing agent in humans. NIOSH suggests it be treated as a potential human carcinogen. It is a mutagen (causes cell changes) in animals.

Reproductive Hazard: According to the references, diglycidyl ether has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated low-dose exposures can irritate the lungs and result in bronchitis with symptoms of cough, phlegm, and shortness of breath. It may damage the liver and kidneys. Chronic exposure may produce bone marrow depression.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with diglycidyl ether. If a less toxic material or compound cannot be substituted for diglycidyl ether, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of diglycidyl ether release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around diglycidyl ether. Exposure levels are extremely low (0.01 ppm) and difficult to accurately monitor. It is also suggested that diglycidyl ether is a possible human carcinogen. Therefore, for the best protection at any exposure level, a MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, rubber or other non-permeable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diglycidyl ether.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where diglycidyl ether is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical test is recommended:

- ☑ Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Liver, kidney, and lung function tests.
- ☑ Consider chest X-ray after acute exposure.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other respiratory ailments, any exposure to diglycidyl ether can result in quicker and more devastating

symptoms. Smokers should therefore avoid unprotected contact with this chemical. Prudent risk management requires proper consideration of *all* possible factors that may be causing the appearance of exposure symptoms among workers.

Other methods to reduce exposure include:

- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to diglycidyl ether and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of diglycidyl ether should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to diglycidyl ether, emergency shower facilities should be provided.
- ☑ Workers whose clothing has been contaminated by diglycidyl ether should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to diglycidyl ether.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of diglycidyl ether. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Diglycidyl ether is Class IIIA combustible liquid. It will support combustion as well as intensify any fire. It is incompatible with oxidizers and caution is always required in its handling, storage, transportation, and disposal. When heated to decomposition it emits very acrid and irritating smoke and fumes. Emergency responders should be made aware of the presence of diglycidyl ether at any emergency response situation.

Diglycidyl ether may enter the environment through industrial effluents and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diglycidyl ether. Insufficient data are available to evaluate or predict the acute (short-term) effects of diglycidyl ether to aquatic life, plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the chronic (long-term) effects of diglycidyl ether on aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

The solubility of diglycidyl ether has not been established in the references.

🕒 *Persistence in the Environment*

There is no information in the references concerning the persistence of diglycidyl ether in the environment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The references do not address the bioaccumulation capabilities of diglycidyl ether in aquatic organisms.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of diglycidyl ether into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diglycidyl ether should be segregated from other chemicals to minimize the risk of cross-contamination. Diglycidyl ether must be stored to

avoid contact with strong oxidizers, such as chlorine and bromine, since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If diglycidyl ether should contact the water table, aquifer, or navigable waterway, time is of the essence. Its specific solubility in water has not been established and total remediation may or may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of diglycidyl ether.

If diglycidyl ether is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- Absorb spilled liquids with vermiculite, dry sand, or a similar material and deposit in sealed drum for disposal.
- Ventilate area of spill or leak.
- Remove all ignition sources.
- It may be necessary to dispose of diglycidyl ether as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving diglycidyl ether can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as

well as future business. Always remember that anytime the terms “cancer,” or “carcinogen” are used, public emotion, hysteria, and ignorance can run equally high. This requires careful consideration during the development of public relations policies.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, diisobutyl ketone emits acrid, irritating smoke and fumes, including oxides of carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the conjunctiva of the eyes and mucosa of the nose and throat. Symptoms include dizziness, headache, nausea, vomiting, ataxia, and unconsciousness. Narcotic effects also possible at high concentrations. Vapors can cause dermatitis. SKIN & EYES: Skin contact can result in irritation and may cause dermatitis. Severe eye irritation likely. INGESTION: Symptoms of nausea and vomiting. Abdominal cramps. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Respiratory system; skin; eyes; CNS, liver, kidneys. |
| Medical Conditions Generally Aggravated by Exposure None Reported. However, respiratory impairments, skin conditions (dermatitis) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Seek medical attention immediately. Give victim several glasses of water and induce vomiting. Never try to give an unconscious or convulsing person anything by mouth and never attempt to make such a person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Restrict persons not wearing protective equipment from entering area of spill or leak until cleanup is complete. Ventilate area. Absorb liquid in dry sand or other material and deposit in sealed containers. Alert appropriate state or federal response agencies. | | | | |
| Preferred Waste Disposal Method Incineration (with afterburner and scrubber), molten metal salt destruction. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from fire, sparks, and flame. Use non-sparking tools on containers. Ground and bond metal containers during transfer operations. | | | | |
| Other Precautions and Warnings Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). Protect containers from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposures above 50 ppm: MSHA/NIOSH-approved full facepiece respirator with organic vapor cartridge. Greater protection is obtained from a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Solvent Resistant Butyl Rubber | Chemical Goggles and/or Face Mask | Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIISOBUTYL KETONE

CAS: 108-83-8

**IDENTIFICATION AND TYPICAL USES**

Diisobutyl ketone (DIBK) is a colorless liquid with a mild, sweet odor. It is used as a solvent for nitrocellulose, lacquers, and synthetic resins. It is also used in organic synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

DIBK is moderately toxic to humans by *inhalation* and *ingestion*. There are no reports in the references that indicate skin absorption is a risk factor. However, skin or eye contact can cause damage.

Inhalation of DIBK vapors produces dryness and irritation of the eyes, nose, mouth, and throat. It will cause headache, vertigo, nausea, vomiting, coughing, and difficulty breathing. Inhalation may also produce mild narcotic effects at high concentrations. DIBK has also caused increased liver and kidney weights in test animals. It is not known if this chemical will have this same effect in humans.

Skin contact will result in mild to severe irritation. Because DIBK will defat the surface of the skin, cracking, scaling, and dermatitis can develop. Even contact with the vapors can cause skin reaction. Eye contact will also cause severe tissue irritation. May lead to damage of the cornea on prolonged contact.

Ingestion can result in headache, dizziness, and dermatitis.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to DIBK:

Skin: Irritation/rash, cracking, scaling, and possible dermatitis.

Eye: Irritation which can lead to permanent damage.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can cause dizziness, headache, and, possibly, coma.

CNS: A mild narcotic compound. Inhalation of high concentrations of the vapor may cause dizziness, lightheadedness, and possible loss of consciousness.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to DIBK and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to DIBK has not been shown to cause carcinogenic effects. Animal mutation data have been reported.

Reproduction: There are no reports to support any claims of reproductive hazards in humans or animals.

Sensitivity: Exposure to the skin may result in allergy (sensitization). If allergy develops, very low future exposure can result in skin irritation and rash. Repeated exposure can cause chronic irritation of the eyes and lungs.

Other Chronic Effects: Long-term exposures may cause damage to the liver and kidneys.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with DIBK. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned

above, but is still advisable whenever working with DIBK. For exposures to the PEL (50 ppm), use a NIOSH-approved, full facepiece organic vapor respirator. For higher or prolonged exposures, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with DIBK.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where DIBK is used or stored.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel that trained on its use and care.
- ☑ Wash thoroughly immediately after exposure to DIBK and at the end of the work shift or before eating, drinking, or smoking. Never wear clothes contaminated with DIBK home. Family members can be exposed.
- ☑ Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of DIBK should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of DIBK. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the

chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

DIBK is considered a Class II combustible liquid (per OSHA 29 CFR 1910.106). It can react with strong oxidizers to cause a serious fire and explosion hazard. When involved in a fire, it can release acrid and irritating oxides of carbon. A boiling liquid expanding vapor explosion (BLEVE) is also a possibility. These characteristics require special consideration during any emergency involving a leak or spill of DIBK.

The proper disposal/destruction method for DIBK is to burn it in a chemical incinerator (with molten salt treatment) equipped with an afterburner and air scrubber.

DIBK can enter the environment through manufacturing, unchecked discharge into effluents from industrial or municipal waste treatment plants, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to DIBK. This chemical has a slight acute toxicity to aquatic life. No data are available on the short-term effects of DIBK on plants, birds, or land animals.

☠* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. DIBK has slight chronic toxicity in aquatic life. No data are available to evaluate the long-term effects of DIBK to plants, birds, or land animals.

💧 *Water Solubility*

DIBK is slightly soluble in water. Concentrations of less than 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

DIBK is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to

be degraded. Approximately 75% of DIBK will eventually end up in air; the rest will end up in water.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of DIBK found in fish tissues is expected to be about the same as the average concentration of DIBK in water from which the fish was taken.

🔍 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of DIBK should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If DIBK should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of DIBK. If DIBK is spilled or leaked, the following specific steps are recommended:

- ☑ Remove ignition sources and ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep DIBK out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- ☑ It may be necessary to dispose of DIBK as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving DIBK can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔍 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Diisopropylamine (derivation: From isopropyl chloride and ammonia). 1 ppm = 4.21 mg/m³ | PEL (skin): 5 ppm 20 mg/m³ STEL: Not Established | REL (skin): 5 ppm 20 mg/m³ STEL: Not Established | 200 ppm | TLV (skin): 5 ppm 20 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 183°F (84°C) | Specific Gravity (H ₂ O = 1) 0.72 |
| Vapor Pressure (mm Hg) 70 at 69°F (20°C) | Molecular Weight 101.2 |
| Vapor Density (Air = 1) 3.5 | Melting Point -141°F (-96°C) |

Solubility

Slightly soluble in water. Soluble in most organic solvents.

Appearance and Odor

Colorless liquid with a fishy, ammonia-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) 21°F (-6°C) opened cup | Explosive Limits in Air % by Volume LEL: 1.1% UEL: 7.1% |
| NFPA Classification Class IB Flammable Liquid | Autoignition Temperature 600°F (316°C) |

Extinguishing Media

Use dry chemical, carbon dioxide, alcohol foam, water spray. Water or foam may cause frothing.

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Vapors are heavier than air and may travel for some distance to ignition source and flashback. Move containers from fire area if it can be done safely. Cool exposed container with water. Use water spray to disperse vapor of non-burning leak and to flush spills away from exposures.

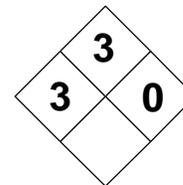

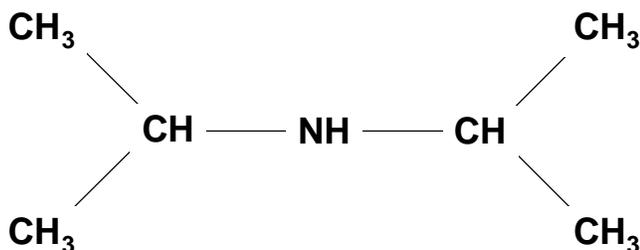

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Aqueous solutions are flammable unless diluted extensively. This chemical presents a vapor explosion hazard indoors, outdoors, and in sewers.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|---|--|--|
| Stability | | Conditions to Avoid Diisopropylamine is normally stable at room temperature in closed containers under normal conditions of storage and handling. Avoid contact with incompatible materials. Keep away from heat and flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (such as chlorine, bromine, fluorine), and strong acids (such as sulfuric, nitric, and hydrochloric). | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of diisopropylamine is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating fumes and vapors are produced when diisopropylamine is heated to decomposition. These include carbon monoxide, carbon dioxide, hydrocarbons, nitrogen oxides, and amine vapors. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Symptoms of nausea, headache, vomiting, visual disturbance (haziness), pulmonary and eye irritation. There may be cloudy swelling of the cornea with total or partial loss of vision. Pulmonary edema (fluid in lungs) is possible on high exposures. ABSORPTION: A corrosive. Severe burns to the skin and eye on contact, with corneal damage and permanent vision impairment. Vapor may cause fogging of vision. Liquid will absorb through skin and cause systemic effects. INGESTION: Severe pain and irritation to the digestive tract. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, respiratory system. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Unlikely. Call the poison control center and seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of milk to dilute. Do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Neutralize with sodium bisulfate and small amounts of water. Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store diisopropylamine in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Personnel working with diisopropylamine should be trained on its proper handling and storage prior to being assigned to such responsibilities. | | | | |
| Other Precautions and Warnings Recommend storage in external (detached) facility away from main work areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposures, use an organic vapor respirator. Otherwise, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Butyl Rubber Gloves | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIISOPROPYLAMINE

CAS: 108-18-9

**IDENTIFICATION AND TYPICAL USES**

Diisopropylamine is a colorless or clear liquid with a strong, fishy, ammonia-like odor. It is used as a catalyst in organic synthesis and as an intermediate in chemical reactions.

RISK ASSESSMENT: HEALTH**General Assessment**

Diisopropylamine is a severe irritant and corrosive on contact with human tissue. Primary route of exposure is *inhalation*. It can also cause serious health effects on *ingestion* and by skin contact (*absorption*). There is no information in the references to indicate any carcinogenic or teratogenic risks. Mutation data have been reported. Some scientists believe that mutagenic chemicals may pose a cancer risk in the long-term. Additional research is required in this regard.

Inhalation will result in irritation of the mucosa, especially in the nose, throat, and upper respiratory tract. Symptoms may include headache, nausea, laryngitis, and difficulty or labored breathing. Exposure may also result in chemical pneumonitis and pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can be fatal. Vapors will also cause eye irritation leading to possible visual disturbances (such as haziness) and cloudy swelling of the cornea with total or partial loss of vision.

Skin contact with the liquid can cause severe irritation with burns on contact. Absorption is likely to occur on prolonged contact to cause toxic systemic effects. Eye contact can result in corneal injury and permanent damage or loss of vision.

Ingestion toxicity is relatively low. Symptoms include irritation, nausea, and headache.

The following acute (short-term) health effects may occur immediately or shortly after exposure to diisopropylamine:

Skin: Irritation, inflammation, redness, possible burning, and tissue damage. Absorption is likely on prolonged contact.

Eye: Severe irritation, inflammation, with possible damage to the cornea and loss of vision. Vapor can cause foggy or hazy vision, and inflammation of tissues.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs).

*** Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to diisopropylamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, diisopropylamine has not been adequately tested for its ability to cause cancer in test animals. More research is required. Mutation data have been reported.

Reproductive Hazard: According to the information presented in the references, diisopropylamine has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Low, chronic exposures may cause corneal damage, foggy vision, and irritation of the lungs, bronchi, and throat.

Recommended Risk-Reduction Measures**☠ Acute Health Effects**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around diisopropylamine. For relatively low, infrequent, or transient exposures, an organic vapor respirator may suffice. For higher or prolonged exposure, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diisopropylamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diisopropylamine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests. Doctor: If pulmonary edema is present, consider Positive Expiration End Pressure (PEEP) test. Steroids may be effective, but antibiotics are useful only if there is evidence of infection.
- Consider chest X-ray after acute overexposure.
- Complete blood count and blood gases.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also,

since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to diisopropylamine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of diisopropylamine should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of diisopropylamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Diisopropylamine is considered a Class IB flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and its relatively low boiling point make it a serious and dangerous fire and explosion risk. It can react with many common oxidizing agents and strong acids to cause a fire or explosion. These characteristics require special consideration

during any emergency situation involving a leak or spill of diisopropylamine. Should diisopropylamine ever come into contact with incompatible substances, such as oxidizers or acids, either during use, transportation, or storage, violent reactions can occur.

Diisopropylamine can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diisopropylamine.

Insufficient data are available to evaluate or predict the short-term effects of diisopropylamine to aquatic life, plants, birds, or land animals.

☞ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of diisopropylamine to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Diisopropylamine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Diisopropylamine is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans who may ingest contaminated animals tissue.

The amount of diisopropylamine in edible fish tissue is expected to be about the same as that found in the water from which the fish was taken.

🔧 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diisopropylamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. This chemical will remain in soil for extended periods and may leach to underground aquifers. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If diisopropylamine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of diisopropylamine. If diisopropylamine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ Use water spray to disperse vapors and dilute to non-flammable mixtures. Dispose of accordingly.
- ☑ It may be necessary to dispose of diisopropylamine as a hazardous waste. The responsible state agency or the regional office of the federal

Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving diisopropylamine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

MATERIAL SAFETY DATA SHEET

CHEMICAL NAME

DIMETHYLACETAMIDE

CRC PRESS/LEWIS PUBLISHERS DISCLAIMER: THE INFORMATION AND RECOMMENDATIONS PRESENTED HEREIN ARE BASED ON SOURCES BELIEVED TO BE RELIABLE. CRC MAKES NO REPRESENTATION ON ITS COMPLETENESS OR ACCURACY. IT IS THE RESPONSIBILITY OF THE USER TO DETERMINE THE CHEMICAL'S SUITABILITY FOR ITS INTENDED USE, THE CHEMICAL'S SAFE USE, AND THE CHEMICAL'S PROPER DISPOSAL. NO REPRESENTATIONS AND/OR WARRANTIES, EITHER EXPRESSED OR IMPLIED, OF THE MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR OF ANY OTHER NATURE, ARE MADE WITH RESPECT TO THE INFORMATION PROVIDED IN THIS MSDS OR TO THE CHEMICAL TO WHICH INFORMATION MAY REFER. CRC NEITHER ASSUMES NOR AUTHORIZES ANY OTHER PERSON TO ASSUME FOR IT, ANY OTHER ADDITIONAL RESPONSIBILITY OR LIABILITY FOR THE USE OF, OR RELIANCE UPON, THIS INFORMATION.

HAZARD WARNING INFORMATION

| HEALTH | FIRE | REACTIVE | OTHER | DEGREE OF HAZARD | COLOR CODING | OTHER CODES |
|----------|----------|----------|-------|---|---|---|
| 2 | 2 | 0 | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|--|--|------------------------------------|
| Characterization Acetic Anhydride | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name Dimethylacetamide | Chemical Abstract Service (CAS) Number 127-19-5 | |
| DOT Hazard Class and Label Requirements Combustible Liquid, N.O.S. | DOT Emergency Guide Code No Citation | |
| DOT Identification Number NA 1993 | Chemical Formula CH₃CON(CH₃)₂ | |

Synonyms

N,N-dimethyl acetamide; DMAC; acetic acid dimethylamide; dimethylamide acetate.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|--|---|---|
| Dimethylacetamide (derivation: From acetic anhydride and dimethylformamide or from tris(dimethylamido) phosphate and acetic anhydride). 1 ppm = 3.62 mg/m³ | PEL: 10 ppm 35 mg/m³ STEL: Not Established | REL: 10 ppm 35 mg/m³ STEL: Not Established | 300 ppm | TLV (skin): 10 ppm 35 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 329°F (165°C) | Specific Gravity (H ₂ O = 1) 0.94 |
| Vapor Pressure (mm Hg) 2 at 69°F (20°C) | Molecular Weight 87.1 |
| Vapor Density (Air = 1) 3 | Melting Point --4°F (-20°C) |

Solubility

Miscible in water, aromatics, esters, ketones, and ethers.

Appearance and Odor

Colorless liquid with a weak fishy or ammonia-like odor. Odor Threshold between 21 and 48 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 158°F (70°C) opened cup | Explosive Limits in Air % by Volume LEL: 1.8% UEL: 11.5% |
| NFPA Classification Class IIIA Combustible Liquid | Autoignition Temperature 914°F (490°C) |

Extinguishing Media

Use dry chemical, carbon dioxide, alcohol foam, water spray. Water or foam may cause frothing.

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Move containers from fire area if it can be done safely. Cool exposed container with water. Do not direct stream of water into burning liquid (will scatter fire).

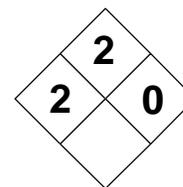

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Vapors are heavier than air and may travel for some distance to ignition source and flashback. This chemical presents a vapor explosion hazard indoors, outdoors, and in sewers.

| SECTION V - REACTIVITY DATA | | | | |
|--|--------------------------------------|--|---------------------------------------|--|
| Stability | | Conditions to Avoid Dimethylacetamide is normally stable at room temperature in closed containers under normal conditions of storage and handling. Avoid contact with incompatible materials. Keep away from heat and flame. | | |
| Stable | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (such as chlorine, bromine, fluorine), and halogenated compounds (such as carbon tetrachloride, benzene) in the presence or in contact with iron. | | |
| X | | | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of dimethylacetamide is not expected to occur. | | |
| May Occur | Will Not Occur | Hazardous Decomposition or By-products Toxic and irritating fumes and vapors are produced when dimethylacetamide is heated to decomposition. These include ammonia, carbon monoxide, and carbon dioxide. | | |
| | X | | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? | Absorption (skin)? | Ingestion? |
| | | X | X | |
| Health Hazards | | | | |
| INHALATION: Symptoms of headache, nausea, drowsiness, delusions, auditory and visual hallucinations, disorientation, depression of the CNS, lethargy, sweating, weakness, and moderate irritation of the respiratory system. May cause liver enlargement and affect reproduction. Cumulative liver damage is possible with elevated cholesterol levels. | | | | |
| ABSORPTION: Will pass through unbroken skin to cause toxic system effects (see inhalation above). | | | | |
| INGESTION: Depression, lethargy, confusion, visual and auditory hallucinations, disorientation, perceptual distortion, delusions, emotional detachment, and effective blunting. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Eyes, skin, respiratory system, liver, kidney, CNS. |
| Medical Conditions Generally Aggravated by Exposure Liver disorders. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Unlikely. Call the poison control center and seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of milk and induce vomiting. DOCTOR: Suggest follow vomiting with gastric lavage and saline cathartics. Treatment for liver and kidney injury is supportive and symptomatic. Recommend Liver Function Test (LFT). | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method | | | | |
| No Citation. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store dimethylacetamide in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area away from heat and ignition sources. Shield from exposure to direct sunlight. Protect containers from physical damage. | | | | |
| Other Precautions and Warnings | | | | |
| If color or iron contamination is a concern, use aluminum or stainless steel containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For low exposures, use an organic vapor respirator. Otherwise, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Impervious Gloves | Chemical Goggles or Face Mask | Protective Apron | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIMETHYLACETAMIDE

CAS: 127-19-5

**IDENTIFICATION AND TYPICAL USES**

Dimethylacetamide is a colorless or clear liquid with a weak fishy, ammonia-like odor. It is used as a solvent for plastics, resins, gums, and electrolytes. It is an intermediate, a catalyst, a paint remover, and a high purity solvent for crystallization and purification.

RISK ASSESSMENT: HEALTH***General Assessment***

Dimethylacetamide is an irritant to the skin and eyes. Primary routes of exposure are *inhalation* and skin contact (*absorption*). Although unlikely in the occupational setting, *ingestion* can also cause serious toxic systemic effects. There is no information in the references to indicate any carcinogenic properties. However, it has been shown to cause teratogenic and mutagenic effects in test animals. There is also some limited evidence that exposure will adversely affect human reproduction.

Inhalation, absorption, and even ingestion will result in a wide range of toxic systemic effects with noted action on the central nervous system (CNS). Symptoms include headache, dizziness, drowsiness, delusions, auditory and visual hallucinations, disorientation and confusion, perceptual distortion, emotional detachment, CNS depression, lethargy, sweating, weakness, and irritation of the skin, eyes, and respiratory system. There may also be liver enlargement and damage, elevated cholesterol, and jaundice.

Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to dimethylacetamide:

Skin: Irritation, inflammation, and redness. Absorption is likely causing toxic systemic effects.

Eye: Mild irritation leading to severe and permanent damage if allowed to remain in contact with the liquid.

Lung: Irritation of the respiratory system causing coughing and/or shortness of breath, headache, and dizziness.

CNS: A known CNS depressant. Can cause hallucinations (both auditory and visual), with confusion, disorientation, emotional detachment, dizziness, drowsiness, lethargy, general weakness, and loss of consciousness.

Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to dimethylacetamide and can last for months or even years:

Cancer Hazards: According to the information presented in the references, dimethylacetamide has not been adequately tested for its ability to cause cancer in test animals. More research is required. Mutation data have been reported.

Reproductive Hazard: According to the information presented in the references, dimethylacetamide may damage the liver in the developing fetus. It is a known teratogen in test animals.

Other Chronic Effects: Low, chronic exposures may cause liver enlargement, elevated cholesterol, cumulative liver damage, and jaundice.

Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not

always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dimethylacetamide. For relatively low, infrequent, or transient exposures, an organic vapor respirator may suffice. For higher or prolonged exposure, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impermeous butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dimethylacetamide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where dimethylacetamide is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Complete blood count and blood gases.
- Liver function tests.
- Examination of the nervous system by a qualified neurologist, with careful evaluation of exposure history and special tests to determine CNS effects.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- Always ensure that proper protective clothing is worn when using chemical substances.

- Electrically ground and bond all containers and equipment used in shipping, handling, or storage.
- Containers or drums labeled "EMPTY" may still contain potentially explosive residues. Handle with extreme caution and never use pressurized air to empty drums that have contained dimethylacetamide.
- Wash thoroughly immediately after exposure to dimethylacetamide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of dimethylacetamide should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of dimethylacetamide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Dimethylacetamide is considered a Class IIIA combustible liquid (per OSHA 29 CFR 1910.106). It can react with many common oxidizing agents to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of dimethylacetamide. Should dimethylacetamide ever come into contact with incompatible substances either during use, transportation, or storage, violent reactions can occur.

Dimethylacetamide can enter the environment through industrial discharges and spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dimethylacetamide. In-

sufficient data are available to evaluate or predict the short-term effects of dimethylacetamide to aquatic life, plants, birds, or land animals.

☛ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of dimethylacetamide to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Dimethylacetamide is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Dimethylacetamide is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The amount of dimethylacetamide in edible fish tissue is expected to be about the same as that found in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dimethylacetamide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. This chemical will remain in soil for extended periods and may leach to underground aquifers. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If dimethylacetamide should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dimethylacetamide. If dimethylacetamide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ Use water spray to disperse vapors and dilute to non-flammable mixtures. Dispose of accordingly.
- ☑ It may be necessary to dispose of dimethylacetamide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dimethylacetamide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms “reproductive hazard” or “teratogen” are used,

public emotion, hysteria, and ignorance can run equally high. This must be carefully considered during the development of public relation policies.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|---------------------------------|
| Characterization Aliphatic Amine | RCRA Number U092 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Dimethylamine (aqueous solution) | Chemical Abstract Service (CAS) Number 124-40-3 | |
| DOT Hazard Class and Label Requirements Flammable Gas/Flammable Liquid (aqueous) | DOT Emergency Guide Code 19 (gas) 26 (solution) | |
| DOT Identification Number UN 1032 (gas) UN 1160 (solution) | Chemical Formula (CH₃)₂NH | |
| Synonyms Diethamine; N,N-dimethylamine, N-ethylethanamine. | | |

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|--|---|---|
| Dimethylamine (derivation: From the interaction of methanol and ammonia over a catalyst at high temperatures (572-932°F). The mono-, di-, and trimethylamines are all produced). 1 ppm = 1.87 mg/m³ | PEL (8-hour): 10 ppm 18 mg/m³ STEL: Not Established | REL (10-hour): 10 ppm 18 mg/m³ STEL: Not Established | 500 ppm | TLV: 5 ppm 9.2 mg/m³ STEL: 15 ppm 27.6 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 45.3°F (7.4°C) | Specific Gravity (H ₂ O = 1) 0.94 |
| Vapor Pressure (atmospheres) 1.7 at 69°F (20°C) | Molecular Weight 45.1 |
| Vapor Density (Air = 1) 1.6 | Freezing Point -134°F (-92°C) |

Solubility

Soluble in water, alcohol, and ether. Aqueous solution is strongly alkaline.

Appearance and Odor

Colorless gas with a fishy, ammonia-like odor. A liquid below 44°F. Normally shipped as a liquefied compressed gas. Odor Threshold = 0.005 - 0.016 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 0°F (-17.7°C) for gas; 20°F (-7°C) for liquid, (CC) | Explosive Limits in Air % by Volume LEL: 2.8% UEL: 14.4% |
| NFPA Classification Class IA Flammable Liquid | Autoignition Temperature 806°F (430°C) |

Extinguishing Media

Stop flow of gas before fighting fire. Use water spray, dry chemical, or alcohol resistant foam.

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Vapors are heavier than air and may travel for some distance to ignition source and flashback. Move containers from fire area if it can be done safely. Cool exposed container with water.

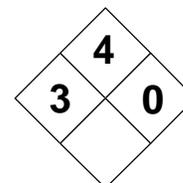

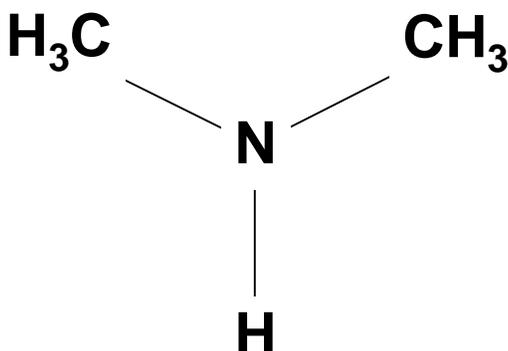

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Aqueous solutions are flammable unless diluted extensively.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|---------------------------------------|---|
| Stability | | Conditions to Avoid Dimethylamine is normally stable at room temperature in closed containers under normal conditions of storage and handling. Avoid contact with incompatible materials. Keep away from heat and flame. | | |
| Stable | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers and materials (fluorides, chlorine), acids, sources of halogens, mercury (will explode), hypochlorite, acraldehyde, maleic anhydride, aluminum, brass, copper, zinc, and 4-chloroacetophenone. | | |
| X | | | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of dimethylamine is not expected to occur. Avoid contact with plastics, rubber, and coatings. | | |
| May Occur | Will Not Occur | Hazardous Decomposition or By-products Toxic and irritating fumes and vapors are produced when dimethylamine is heated to decomposition, including carbon monoxide, carbon dioxide, hydrocarbons, toxic oxides of nitrogen, and amine vapors. | | |
| | X | | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? | Absorption (skin)? | Ingestion? |
| | | X | | X |
| Health Hazards | | | | |
| INHALATION: Symptoms of coughing, sneezing, labored breathing, nausea, severe irritation of the eyes, nose, and throat. Pulmonary edema (fluid in the lungs) is possible and can lead to death. May cause chemical bronchitis and possible liver damage in the long-term. | | | | |
| SKIN & EYES: Vapor contact causes severe irritation to skin and eyes, conjunctivitis, and corneal damage. Liquid will burn skin and eyes (frostbite) and damage tissue (necrosis). | | | | |
| INGESTION: Unlikely (dimethylamine is a gas at room temperature). The liquid will burn the mouth lips, throat, and gastrointestinal tract. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Eyes, skin, respiratory system, liver. |
| Medical Conditions Generally Aggravated by Exposure | | | | |
| Respiratory disorders (asthma, bronchitis); skin disease (eczema, dermatitis); eye or vision problems. | | | | |
| Emergency and First-aid Procedures | | | | |
| <u>Eye contact:</u> Flush immediately with water for 30 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If <u>swallowed:</u> Seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water. Do NOT induce vomiting. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method | | | | |
| No Citation. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store dimethylamine in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Protect containers from physical damage. | | | | |
| Other Precautions and Warnings | | | | |
| Store and handle cylinders in accordance with provisions of 29 CFR 1910.101. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| Use an MSHA/NIOSH-approved supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Impervious Butyl Rubber Gloves | Chemical/Gas Goggles or Face Mask | Protective Apron | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIMETHYLAMINE

CAS: 124-40-3

**IDENTIFICATION AND TYPICAL USES**

Dimethylamine is a colorless gas with an ammonia or fish-like odor. It is a liquid below 44°F (6.6°C) and is normally shipped as a liquefied compressed gas. It is used as an acid-gas absorbent, a solvent antioxidant, in the manufacture of dimethylformamide and dimethylacetamide, in dyes, as a flotation agent, a gasoline stabilizer, in pharmaceuticals, in the manufacture of textile chemicals, as a rubber accelerator, in electroplating, as a dehairing agent, in missile fuels, as a pesticide propellant, in rocket propellants, as a surfactant, and a reagent for magnesium.

RISK ASSESSMENT: HEALTH**General Assessment**

Dimethylamine is a moderately toxic gas (or liquid) by *inhalation* and skin contact (absorption, however, has not been reported). Ingestion can occur, but is not likely since dimethylamine is normally a gas at room temperatures. Mutation data have been reported. There is no information in the references to indicate that this compound has carcinogenic or teratogenic properties.

Inhalation of the vapors of dimethylamine is corrosive to the mucosa of the respiratory tract. It causes coughing, sneezing, difficulty breathing, nausea, severe irritation of the eyes, nose, and throat. It can also cause respiratory distress, bronchitis, pneumonitis, and pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can be fatal. Symptoms of pulmonary edema may be delayed up to 48 hours cre-

ating a false sense of security with regard to exposure risk.

Skin contact with the vapors causes severe irritation. Liquid contact will cause frostbite, burns, and tissue necrosis. Eye contact with the vapors causes severe irritation and conjunctivitis. Corneal damage is quite likely to occur, either in contact with the liquid or the gas. Liquid contact with the eyes will cause intense pain with a potential for permanent corneal opacity and even blindness.

Ingestion is not likely. However, the liquid can burn the lips, mouth, and digestive tract.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to dimethylamine:

- Skin: Irritation, inflammation, redness, and possible dermatitis. May cause necrosis and frostbite.
- Eye: Severe irritation, inflammation, with possible damage to the cornea and loss of vision. Can cause permanent clouding of vision.
- Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including life-threatening pulmonary edema (fluid buildup in lungs).

☛ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to dimethylamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, dimethylamine has not been adequately tested for its ability to cause cancer in test animals. Mutation data have been reported and more research is required.

Reproductive Hazard: According to the information presented in the references, dimethylamine has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Animal studies have shown a propensity for liver damage. It is not known if these effects will occur in humans. Long-term exposures to low concentrations can cause dermatitis, chronic conjunctivitis, and chemical bronchitis. Also, severely irritating compounds are known to cause lung damage. It is not known if exposure to dimethylamine will have this effect in humans.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. Work areas should be equipped with Class I, Group C electrical equipment. Mercury-containing equipment or instruments must not be used. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dimethylamine. For the best protection, a supplied-air respirator operated in the continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious butyl rubber chemical gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dimethylamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where dimethylamine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

Lung function tests.

Consider chest X-ray after acute overexposure (may be negative if taken within first 48 hours of exposure).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances and that they are trained on its use and care.

Wash thoroughly immediately after exposure to dimethylamine and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of dimethylamine should be communicated to all exposed and potentially exposed workers.

Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of dimethylamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Dimethylamine is considered a Class IA flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and its relatively low boiling point make it a serious and dangerous fire and explosion risk. Dimethylamine can react with many common oxidizing materials to cause a fire or explosion. Contact with acids, halogens, many metals (aluminum, brass, copper, zinc) can cause fire or violent explosion. In contact with mercury, dimethylamine explodes instantly. It can attack many plastic, rubber, and coating products (butyl rubber appears to hold up for longer than 8 hours). These characteristics require special consideration during any emergency situation involving a leak or spill of dimethylamine. Should dimethylamine ever come into contact with incompatible substances either during use, transportation, or storage, violent reactions can occur.

Dimethylamine can enter the environment through industrial discharges and spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dimethylamine.

This chemical has low acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of dimethylamine to plants, birds, or land animals.

☞ Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of dimethylamine to aquatic life, plants, birds, or land animals.

◆ Water Solubility

Dimethylamine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ Persistence in the Environment

Dimethylamine is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It will volatilize slowly and its accumulation in aquatic or terrestrial sediments is not expected to be high.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of dimethylamine found in fish tissues is expected to be somewhat lower than that found in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dimethylamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If dimethylamine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan

should be in place prior to any operations involving the use, transportation, storage, or disposal of dimethylamine. If dimethylamine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Gas leaks should be stopped and repaired. If repair cannot be done safely, cylinder should be removed to an open area and allowed to vent until empty. Liquids should be absorbed with vermiculite or sand and disposed of in a sealed container or drum.
- ☑ It may be necessary to dispose of dimethylamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dimethylamine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

4-DIMETHYLAMINOAZOBENZENE

CAS: 60-11-7

**IDENTIFICATION AND TYPICAL USES**

4-Dimethylaminoazobenzene appears as yellow, leaf-shaped crystals. It is no longer produced commercially in the United States and is only currently used for research in the determination of hydrochloric acid in gastric juice, in spot-test identification of peroxidized fats, as a pH indicator, and in laboratory testing for carcinogenicity. It was formally used for coloring polishes, in wax products, in butter, and in margarine.

RISK ASSESSMENT: HEALTH**General Assessment**

4-Dimethylaminoazobenzene is a confirmed human and animal carcinogen. Human mutation data have been reported and there are animal studies to show some ability to produce adverse reproductive effects. It is primarily toxic by *inhalation*, but skin contact (*absorption*) and *ingestion* can also occur.

Inhalation, ingestion, and absorption can cause weakness, dizziness, euphoria, shortness of breath, and irregular muscular action. There can also be wheezing, dyspnea, bloody sputum, bronchial secretions, frequent urination, hematuria (blood in urine), and dysuria (painful urination). Systemic effects may lead to enlarged liver, kidney and liver dysfunction and, in test animals, it has been shown to cause liver, lung, and bladder tumors. It can also lead to chronic contact dermatitis, irritation, and rash.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to 4-dimethylaminoazobenzene:

Skin: Mild to moderate irritation and possible dermatitis. Skin absorption is likely with subsequent toxic systemic effects.

Eye: Mild to severe irritation.

Lung: Irritation of the upper respiratory tract causing coughing and/or shortness of breath, wheezing, bronchial secretions, bloody sputum, and possible damage to lung tissue up to an including cancer (confirmed in laboratory test animals).

CNS: Dizziness, euphoria, weakness, and irregular muscle action.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to 4-dimethylaminoazobenzene and can last for months or even years:

Cancer Hazards: According to the information presented in the references, 4-dimethylaminoazobenzene has been shown to cause tumors in the liver, bladder, and lungs of test animals. Its carcinogenicity in humans is expected to be at least equal to that of animals. Human mutation data have been reported for this compound.

Reproductive Hazard: According to the information presented in the references, this chemical has been shown to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated skin contact can cause contact dermatitis. Chronic inhalation may cause cancer of the liver, bladder, and lung cancer.

🛡 Recommended Risk-Reduction Measures

4-Dimethylaminoazobenzene is listed by IARC, NTP, NIOSH, and OSHA as a carcinogen. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. Dusts must be

prevented from entering the work area. Containers must be labeled “cancer-suspect agent.” While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 4-dimethylaminoazobenzene. For any detectable exposures to a carcinogenic agent, use a supplied-air respirator set in positive pressure or continuous flow mode, or use self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever an eye or face contact hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around 4-dimethylaminoazobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 4-dimethylaminoazobenzene is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Liver and kidney function tests.
- Urinalysis.
- Consider chest X-ray after acute overexposure.
- Evaluation by a qualified allergist with careful consideration of exposure history and special tests (may help diagnose allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be

affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to 4-dimethylaminoazobenzene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information must be posted in the work area. All containers and work areas should be labeled as “cancer-suspect agent.” A regulated, controlled work area should be established wherever this chemical is used, handled, or stored. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 4-dimethyl-aminoazobenzene should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of 4-dimethylaminoazobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

4-Dimethylaminoazobenzene should always be handled with extreme caution. While it is not flammable or combustible and is not reported to be incompatible with other commodities, it is an extremely hazardous and highly toxic substance. These characteristics require special consideration during any emergency situation involving a leak or spill of 4-dimethylaminoazobenzene.

4-Dimethylaminoazobenzene is no longer commercially produced and its use in laboratory research is extremely controlled such that release to the environment is unlikely. However, it may enter the environment through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 4-dimethylaminoazobenzene. Insufficient data are available to evaluate or predict the short-term effects of 4-dimethylaminoazobenzene to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of 4-dimethylaminoazobenzene to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

4-Dimethylaminoazobenzene is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

4-Dimethylaminoazobenzene is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It is expected to adsorb to sediment. In water, it should not hydrolyze.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 4-dimethylaminoazobenzene found in fish tissues is expected to be about the same as

the average concentration found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 4-dimethylaminoazobenzene should be segregated from other chemicals to minimize the risk of cross-contamination or contact. Containers should be protected from physical damage and labeled as “cancer-suspect agent.”

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures and the health hazards associated with carcinogenic materials. Contaminated soils should be removed for incineration and replaced with clean soil. If 4-dimethylaminoazobenzene should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 4-dimethylaminoazobenzene. If 4-dimethylaminoazobenzene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup of the area is complete.
- ☑ Ventilate area of leak or spill.
- ☑ Collect powders in safest manner possible and dispose of in sealed drums. Do NOT dry sweep (creates airborne dusts). Wet mopping is also prohibited (by OSHA). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter attachment.
- ☑ It may be necessary to dispose of 4-dimethylaminoazobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA)

should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 4-dimethylaminoazobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "carcinogen" or "cancer" are used, public emotion, hysteria, and ignorance can run equally high. This should be considered during the development of any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|--|------------------------------------|
| Characterization Aromatic Amine | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name N,N-dimethylaniline | Chemical Abstract Service (CAS) Number 121-69-7 | |
| DOT Hazard Class and Label Requirements Poison | DOT Emergency Guide Code 57 | |
| DOT Identification Number UN 2253 | Chemical Formula C₆H₅N(CH₃)₂ | |

Synonyms

Aniline, N,N-dimethyl; N,N-dimethylbenzeneamine; N,N-dimethylphenylamine; (dimethylamino) benzene.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| N,N-dimethylaniline (derivation: By heating a mixture of aniline, aniline hydrochloride, and methyl alcohol (free from acetone) in an autoclave and distilling). 1 ppm = 5.04 mg/m³ | PEL (skin): 5 ppm 25 mg/m³ STEL: 10 ppm 50 mg/m³ | REL (skin): 5 ppm 25 mg/m³ STEL: 10 ppm 50 mg/m³ | 100 ppm | TLV (skin): 5 ppm 25 mg/m³ STEL: 10 ppm 50 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 379°F (193°C) | Specific Gravity (H ₂ O = 1) 0.96 |
| Vapor Pressure (mm Hg) 1 at 69°F (20°C) | Molecular Weight 121.2 |
| Vapor Density (Air = 1) 4.2 | Freezing Point 36°F (2°C) |

Solubility

Insoluble in water. Soluble in alcohol, ether, and chloroform.

Appearance and Odor

Pale-yellow, oily liquid with an amine-like odor. A solid below 36°F (2°C). Odor Threshold - 0.013 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 145°F (62°C) closed cup | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Class IIIA Combustible Liquid | Autoignition Temperature 700°F (371°C) |

Extinguishing Media

High or low expansion foam, water fog, dry chemical, or carbon dioxide.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire.

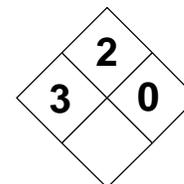

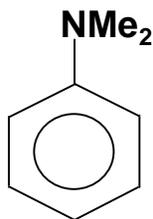

Unusual Fire and Explosion Hazards

Moderately flammable when exposed to heat. Containers may explode in fire. Firefighters should avoid contact with vapors produced during fire. Explodes on contact with benzoyl peroxide. Vapors are heavier than air and can travel for some distance to an ignition source and flashback to cause fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|--|--|---|
| Stability | | Conditions to Avoid Under normal conditions of handling and storage, N,N-dimethylamine is stable at room temperature and pressure. Avoid exposure to incompatible chemicals, heat, and ignition sources. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates); strong acids (such as hydrochloric, sulfuric, and nitric). Explodes on contact with benzoyl peroxide. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of N,N-dimethylaniline is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, N,N-dimethylaniline can emit highly toxic/poisonous gases, including carbon monoxide and toxic aniline vapors. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Causes anoxia due to the formation of methemoglobin. Symptoms: headache, dizziness, ataxia, and cyanosis. Over exposure may lead to death due to respiratory paralysis. May also result in depression of the CNS, decreases in blood pressure, and tachycardia. ABSORPTION: Absorbs freely through intact skin. Symptoms include headache and cyanosis, over-exposure can result in death. Skin contact with pure liquid can produce mild irritation. INGESTION: Unspecified effects resulting from ingestion. Liver damage is suspect. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, blood, kidneys, liver, CNS, CVS. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed, seek medical attention immediately. Unless advised otherwise, give 2-3 glasses of water to a conscious person and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Cover spill with a 9:1 mixture of sand and soda ash and deposit in sealed containers. Remove all ignition sources. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by SARA III, if applicable. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from heat. Ground and bond all containers prior to transferring liquids. Protect containers from physical damage and protect from exposure to direct sunlight. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where N,N-dimethylaniline is used, handled, or stored. Bulk storage of N,N-dimethylaniline should be kept in isolated or detached buildings or facilities. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposures (half the PEL), use an organic vapor respirator. Otherwise, use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust at site of chemical work. | | | | |
| Protective Gloves Impervious Rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

N,N-DIMETHYLANILINE

CAS: 121-69-7

**IDENTIFICATION AND TYPICAL USES**

N,N-Dimethylaniline is a pale yellow to brown oily liquid with an amine-like odor. It is used in the manufacture of vanillin, Michler's Ketone, methyl violet, and other dyes. It is also used as a reagent in determination of ferric and ferrous ions for formaldehyde, methanol, methyl furfural, and hydrogen peroxide.

RISK ASSESSMENT: HEALTH**General Assessment**

N,N-Dimethylaniline is a human poison by *ingestion* and is moderately toxic by *inhalation* and skin contact (*absorption*). There is insufficient evidence in the references to support any claims of human carcinogenicity, mutagenicity, or teratogenicity for this chemical. However, some related compounds (e.g., aniline) have demonstrated an ability to adversely affect female reproductive cycles disorders.

Inhalation is likely to cause systemic poisoning and depression of the central nervous system (CNS). Systemic poisoning is also characterized by methemoglobinemia, a dangerous and possibly fatal reduction in the red blood cell's capability to carry oxygen to the body's cells. An additional and completely separate effect (from the methemoglobinemia), is a dangerous reduction in blood pressure and tachycardia (rapid heartbeat). Symptoms include non-specific discomfort, nausea, headache, weakness, shortness of breath, anemia, and cyanosis. These symptoms may be delayed for several hours after exposure, creating a false sense of security with regard to health exposure risk.

Eye and skin contact will result in irritation. More importantly, however, is the fact that this compound is easily absorbed through intact skin causing the same toxic systemic effects as that noted for inhalation (especially depression of the CNS).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to N,N-dimethylaniline:

Skin: Irritation and easy absorption through unbroken skin.

Eye: Severe irritation with possible corneal necrosis (tissue damage).

Lung: Irritation of the nose, throat, and upper respiratory tract. Easily absorbed and distributed through the respiration process to cause toxic systemic effects.

CVS: N,N-Dimethylaniline affects the blood's ability to transport oxygen and high exposure can cause death. It may also cause an unrelated drop in blood pressure and/or tachycardia.

CNS: A depressant of the central nervous system. Symptoms include headaches, weakness, irritability, drowsiness, and shortness of breath.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to N,N-dimethylaniline and can last for months or even years:

Cancer Hazards: N,N-Dimethylaniline has been tested for its ability to cause cancer in test animals and the results are inconclusive and conflicting. More research and testing is required in this regard.

Reproductive Hazard: There is limited evidence to show that exposure to N,N-dimethylaniline may adversely affect the female reproductive cycle and may lead to fetal abortion in exposed workers. Additional study is required in this regard.

Other Chronic Effects: Continuous exposure to small doses of N,N-dimethylaniline may produce anemia, loss of energy, digestive disturbance, and headache. Repeated exposures may cause anemia and methemoglobinemia to occur gradually over time rather than all at once.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with N,N-dimethylaniline. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around N,N-dimethylaniline. For relatively low exposures (half the PEL, or 2.5 ppm), a NIOSH-approved full facepiece respirator equipped with an organic vapor respirator will suffice. For higher exposures, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. Skin contact must be prevented. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with N,N-dimethylaniline.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where N,N-dimethylaniline is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Methemoglobin tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Safety showers should be provided in areas where work is performed around N,N-dimethylaniline.
- Wash thoroughly immediately after exposure to N,N-dimethylaniline and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of N,N-dimethylaniline should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to N,N-dimethylaniline, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of N,N-dimethylaniline. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

N,N-Dimethylaniline is considered a Class IIIA combustible liquid. Alone, its high flash point and autoignition temperature do not present a serious fire or explosion hazard. However, because it is incompatible with so very many other commodities, extreme caution is required in handling, storage, transportation, and disposal of N,N-dimethylaniline. These characteristics also require special consideration during any emergency situation involving a leak or spill of N,N-dimethylaniline. Should N,N-dimethylaniline ever come into contact with incompatible substances such as oxidizers and acids, either during use, transportation, storage, or disposal, the formation of highly toxic

and/or highly explosive commodities is extremely possible.

N,N-Dimethylaniline can enter the environment through industrial and municipal waste treatment plant discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to N,N-dimethylaniline.

N,N-Dimethylaniline has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of N,N-dimethylaniline to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

N,N-Dimethylaniline has moderate chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of N,N-dimethylaniline to plants, birds, or land animals.

💧 *Water Solubility*

N,N-Dimethylaniline is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

N,N-Dimethylaniline is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 83% of N,N-dimethylaniline will eventually end up in air; about 16.5% will end up in water; and less than 1% will end up in about equally divided between terrestrial soil and aquatic sediments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated

in the tissues and internal organs of animals as well as humans.

The concentration of N,N-dimethylaniline found in fish tissues is expected to be somewhat higher than the average concentration of N,N-dimethylaniline in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of N,N-dimethylaniline should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If N,N-dimethylaniline should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of N,N-dimethylaniline. If N,N-dimethylaniline is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal.
- ☑ Remove all ignition sources.
- ☑ Cover liquid spills with a 9:1 mixture of sand and soda ash and mix. Collect neutralized product in safest manner possible using a scoop or shovel (non-sparking). Deposit in sealed drums for proper disposal.
- ☑ It may be necessary to dispose of N,N-dimethylaniline as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving N,N-dimethylaniline can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|---|------------------------------------|
| Characterization Aliphatic Amine | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name N,N-Dimethylformamide | Chemical Abstract Service (CAS) Number 68-12-2 | |
| DOT Hazard Class and Label Requirements Flammable or Combustible Liquid | DOT Emergency Guide Code 57 | |
| DOT Identification Number UN 2265 | Chemical Formula HCON(CH₃)₂ | |

Synonyms

Dimethyl formamide; N,N-dimethylformamide; DMF; N-formyldiemthylamine.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Dimethylformamide (derivation: By reaction of dimethylamine and formic acid; or from dimethylamine and hydrocyanic acid). 1 ppm = 3.04 mg/m³ | PEL (skin): 10 ppm 30 mg/m³ STEL: Not Established | REL (skin): 10 ppm 30 mg/m³ STEL: Not Established | 500 ppm | TLV (skin): 10 ppm 30 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 307°F (153°C) | Specific Gravity (H ₂ O = 1) 0.95 |
| Vapor Pressure (mm Hg) 3 at 69°F (20°C) | Molecular Weight 73.1 |
| Vapor Density (Air = 1) 2.51 | Freezing Point -78°F (-61°C) |

Solubility

Miscible in water and most organic solvents (except halogenated hydrocarbons).

Appearance and Odor

Colorless to pale yellow, high boiling liquid with a faint, amine-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 136°F (58°C) closed cup | Explosive Limits in Air % by Volume LEL: 2.2% (at 212°F) UEL: 15.2 |
| NFPA Classification Class II Combustible Liquid | Autoignition Temperature 833°F (445°C) |

Extinguishing Media

Use carbon dioxide, dry chemical, alcohol foam. Use water spray to cool fire-exposed containers, to subdue a leak that has not yet ignited, to protect personnel attempting to shut off leak, to disperse vapors, to dilute spills to nonflammable mixtures, and to flush spills away from incompatible chemicals.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Move containers from fire area if it can be done without risk. Do NOT use Halon extinguishing agents to fight fire.

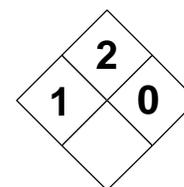

Unusual Fire and Explosion Hazards

Moderately flammable when exposed to heat. Containers may explode in fire. Vapors are heavier than air and can travel for some distance to an ignition source and flashback to cause fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|---|--|--|
| Stability | | Conditions to Avoid Under normal conditions of handling and storage, N,N-dimethylamine is stable at room temperature and pressure. Avoid exposure to incompatible chemicals, heat, and ignition sources. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Bromine, carbon tetrachloride, chromic anhydride, phosphorus oxychloride, hexachlorobenzene, magnesium nitrate, methylene diisocyanate, phosphorus trioxide, triethyl aluminum, organic nitrates. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of dimethylformamide is not expected to occur. However, methylene diisocyanate can polymerize violently on contact. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, dimethylformamide can emit highly toxic/poisonous gases, including carbon monoxide, dimethyl amine, and oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Irritation of the eyes, mucosa, and upper respiratory tract, with dizziness, headache, liver and kidney damage, and intolerance to alcohol. May also cause abdominal distress, colicky abdominal pain, loss of appetite, nausea, vomiting, diarrhea or constipation, facial flushing, agitation, increased blood pressure, weakness, anorexia, abnormal liver function, dermatitis, hallucinations, hepatomegaly, and digestive tract disturbance. ABSORPTION: Absorbs freely through intact skin. Systemic effects same as irritation. Eye contact will produce corneal damage. INGESTION: Unspecified effects, possibly the same as inhalation. Liver damage is possible. | | | | |
| Carcinogenicity Questioned Human Suspected Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2B | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, resp. system, kidneys, liver, CNS, CVS. |
| Medical Conditions Generally Aggravated by Exposure Liver, kidney, and CNS disorders may be aggravated upon exposure to dimethylformamide. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed</u>, seek medical attention immediately. Unless advised otherwise, give 2-3 glasses of water or milk to a conscious person. Gastric lavage is preferable to induced vomiting due to the potential for additional injury to the mucosa. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other material and deposit in sealed drums for disposal. Remove all ignition sources. Ventilate area of spill or leak. Restrict those not involved in cleanup from area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from heat and sources of ignition. Protect containers from physical damage and from exposure to direct sunlight. | | | | |
| Other Precautions and Warnings Ground and bond all equipment used with this chemical to prevent static sparks. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposures (half the PEL), use an organic vapor respirator. Otherwise, use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust at site of chemical work. | | | | |
| Protective Gloves Impervious Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIMETHYLFORMAMIDE

CAS: 68-12-2

**IDENTIFICATION AND TYPICAL USES**

Dimethylformamide is a colorless to pale yellow liquid with a faint, amine-like odor. It is used as a solvent for vinyl resins and acetylene, butadiene, acid gases, polyacrylic fibers, as a catalyst in carboxylation reactions, organic synthesis, and as a carrier for gases. It is also used as a booster or co-solvent in protective coatings, adhesives, films, printing inks, and whenever a solvent with a slow evaporation rate is required.

RISK ASSESSMENT: HEALTH***General Assessment***

Dimethylformamide is moderately toxic by *ingestion* and mildly toxic by *inhalation* and *absorption*. It is a suspected animal carcinogen and a suspect human carcinogen. Human mutation data have also been reported and caution in use, handling, and storage is therefore warranted.

Inhalation, ingestion, and absorption will result in a variety of toxic systemic effects with action on the central nervous system (CNS), the cardiovascular system (CVS), and the respiratory system. Symptoms of exposure include irritation to the eyes, mucous membranes and upper respiratory tract. There may be dizziness, headache, liver and kidney damage, and a marked intolerance to alcoholic beverages that may last up to four days after exposure. This may cause facial flushing and blotchy redness of the neck, face, and upper extremities after consuming alcohol. These may be accompanied dizziness, nausea, dyspnea, and chest palpitations. Aside from the alcohol reaction, there may also be symptoms of abdominal distress, colicky abdominal pain, loss of appetite, nausea, vomiting, diarrhea or constipation, agitation, increased blood pressure, skin irritation, and rash. There may be other symptoms of weakness, abnormal liver function, dermatitis, anorexia, and hepatomegaly (enlarged liver).

Further CNS effects include loss of coordination, hallucinations, and digestive tract disturbances with gastric cramps. The liquid can burn the skin and eyes and cause corneal damage and necrosis on contact.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to dimethylformamide:

Skin: Irritation, dermatitis, rash, and inflammation with, easy absorption through unbroken skin.

Eye: Severe irritation with possible corneal necrosis (tissue damage).

Lung: Irritation of the nose, throat, and upper respiratory tract. Easily absorbed and distributed through the respiration process to cause a wide range of toxic systemic effects with action on the CNS and CVS pronounced.

CVS: Effects an increase in blood pressure and may cause potentially threatening heart palpitations.

CNS: A depressant of the central nervous system. Symptoms include headaches, weakness, irritability, drowsiness, and shortness of breath.

Other: Causes a marked intolerance to alcohol that can last up to four days after exposure. Consumption of amounts that may normally be tolerated under non-exposure circumstances can cause serious adverse health reactions.

●* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to dimethylformamide and can last for months or even years:

Cancer Hazards: Dimethylformamide has been tested for its ability to cause cancer in test animals and the

results are inconclusive and conflicting. More research and testing is required in this regard. Its carcinogenicity is highly suspect in animals and questioned in humans.

Reproductive Hazard: There is limited evidence to show that exposure to dimethylformamide may adversely affect reproduction in test animals. Additional study is required in this regard.

Other Chronic Effects: Continuous exposure to small doses of dimethylformamide may produce chronic dermatitis. Liver damage may also occur in the long-term.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with dimethylformamide. If a less toxic chemical can not be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dimethylformamide. For relatively low exposures (half the PEL, or 5 ppm), a NIOSH-approved full facepiece respirator equipped with an organic vapor respirator will suffice. For higher exposures, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. This chemical will easily pass through unbroken skin. Skin contact must therefore be avoided. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dimethylformamide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where dimethylformamide is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests.
- ☑ Liver function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ All equipment used with dimethylformamide should be electrically grounded and bonded to prevent static spark and ignition.
- ☑ Wash thoroughly immediately after exposure to dimethylformamide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards dimethylformamide should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to dimethylformamide, emergency shower facilities should be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of dimethylformamide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Dimethylformamide is considered a Class II combustible liquid. Alone, its high flash point and autoignition temperature do not present a serious fire or explosion hazard. However, because it is incompatible with so very many other commodities, extreme caution is required in handling, storage, transportation, and dis-

posal of dimethylformamide. These characteristics also require special consideration during any emergency situation involving a leak or spill of dimethylformamide. Should dimethylformamide ever come into contact with incompatible substances, such as bromine and other oxidizing materials, either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Dimethylformamide can enter the environment through industrial and municipal waste treatment plant discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dimethylformamide. Insufficient data are available to evaluate or predict the short-term effects of dimethylformamide to aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available on the long-term effects of dimethylformamide to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Dimethylformamide is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Dimethylformamide is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated

in the tissues and internal organs of animals as well as humans.

The concentration of dimethylformamide found in fish tissues is expected to be about the same as the average concentration of dimethylformamide in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dimethylformamide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with proper fire protection and prevention equipment.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If dimethylformamide should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dimethylformamide. If dimethylformamide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area of spill or leak.
- ☑ Liquids should be absorbed in vermiculite, sand, or other suitable, non-reactive material and disposed of in a sealed drum.
- ☑ It may be necessary to dispose of dimethylformamide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving dimethylformamide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms “cancer” or “carcinogen” are used, public emotion, hysteria, and ignorance can run equally high. This should be a consideration during the development of public relation policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

1,1-DIMETHYLHYDRAZINE

CAS: 57-14-7

**IDENTIFICATION AND TYPICAL USES**

1,1-Dimethylhydrazine is a colorless liquid with an ammonia or fish-like odor. It is used as a component of jet and rocket fuel, as an absorbent for acid gases, and as an agent to control the growth of plants.

RISK ASSESSMENT: HEALTH***General Assessment***

1,1-Dimethylhydrazine is a confirmed human and animal carcinogen. Human mutation data have also been reported. It is primarily toxic by *inhalation* and skin contact (*absorption*). It can also cause toxic and damaging effects by *ingestion*.

Inhalation will cause pulmonary irritation up to and including pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can lead to death. Symptoms may be delayed up to 48 hours creating a false sense of security with regard to health exposure risk. Symptoms include choking, extreme chest pain, dyspnea (difficulty in breathing), lethargy, nausea, convulsions, tremors, liver injury, and hypoxia (reduced oxygen levels in the blood) leading to hemolytic anemia. Systemic intoxication, depression of the central nervous system (CNS), and delayed gastrointestinal irritation may also occur.

Aside from its ability to pass through intact skin (absorption), 1,1-dimethylhydrazine is also extremely corrosive to skin tissue and can cause 2nd and 3rd degree burns on contact. Damage to the eyes and cornea can be severe causing partial or complete loss of vision.

Ingestion is very unusual since the vapors of this chemical are so irritating, personnel are not likely to get close enough to ingest it. However, should it be swallowed, there can be burning of the mouth, throat, and esophagus, followed by gastrointestinal irritation.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to 1,1-dimethylhydrazine:

Skin: Severe irritation and burning. Skin absorption will occur causing toxic systemic effects.

Eye: Severe irritation and tissue damage up to and including loss of vision.

Lung: Irritation of the upper respiratory tract causing choking, coughing, dyspnea, and pulmonary irritation leading to pulmonary edema (fluid in the lungs), which can be fatal.

CNS: Dizziness, convulsions, tremors, nausea, headaches, possible injury to the central nervous system.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to 1,1-dimethylhydrazine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, 1,1-dimethylhydrazine has been shown to cause cancer in test animals. Its carcinogenicity in humans is expected to be at least equal to that of animals. Human mutation data have been reported for this compound.

Reproductive Hazard: According to the information presented in the references, this chemical has been shown to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated exposures can lead to hemolytic anemia and convulsions. Chronic exposures may lead to cancer.

☠ *Recommended Risk-Reduction Measures*

1,1-Dimethylhydrazine is listed by the IARC as a confirmed animal carcinogen and the ACGIH as a suspected human carcinogen. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 1,1-dimethylhydrazine. The exposure level is extremely low (0.5 ppm) and difficult to detect and monitor. For any detectable exposures to a suspected carcinogenic agent, use a supplied-air respirator set in positive pressure or continuous flow mode, or use a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever an eye or face contact hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around 1,1-dimethylhydrazine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 1,1-dimethylhydrazine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Liver and kidney function tests.
- Consider chest X-ray after acute overexposure.
- Evaluation by a qualified allergist with careful consideration of exposure history and special tests (may help diagnose allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to 1,1-dimethylhydrazine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information must be posted in the work area. It is recommended that a regulated, controlled work area should be established whenever this chemical is used, handled, or stored. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 1,1-dimethylhydrazine should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of 1,1-dimethylhydrazine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

1,1-Dimethylhydrazine should always be handled with extreme caution. It is a Class 1B flammable liquid. Its extremely low flash point and relatively low boiling point make this chemical a dangerous fire and explo-

sion hazard. Its vapors form explosive mixtures in air over a wide range of concentrations. It forms shock-sensitive explosive products when combined with metal perchlorates, alkali metals, or their dichromates. It is highly reactive with a number of substances, especially oxidizers and oxidizing agents. These characteristics require special consideration during any emergency situation involving a leak or spill of 1,1-dimethylhydrazine.

1,1-Dimethylhydrazine can enter the environment through industrial discharges or through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 1,1-dimethylhydrazine. This chemical has moderate acute toxicity to aquatic life and plant life. It has been used to control the growth rate of some ornamental and agricultural crops. Insufficient data are available to evaluate or predict the short-term effects of 1,1-dimethylhydrazine to birds or land animals.

☪ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. 1,1-Dimethylhydrazine has low chronic toxicity to aquatic life and moderate chronic toxicity to plant life. Insufficient data are available to evaluate or predict the long-term effects of 1,1-dimethylhydrazine to birds or land animals.

💧 *Water Solubility*

1,1-Dimethylhydrazine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

1,1-Dimethylhydrazine is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It is expected to absorb to sediment. No information is available in the references on the expected percentages of 1,1-dimethylhydrazine that will be divided through the environmental mediums (primarily air and water).

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 1,1-dimethylhydrazine found in fish tissues is expected to be somewhat higher than the average concentration found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 1,1-dimethylhydrazine should be segregated from other chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with proper fire protection and prevention equipment and explosion-proof electrical components and equipment. Bulk storage of 1,1-dimethylhydrazine is not recommended.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures and the health hazards associated with carcinogenic materials. Contaminated soils should be removed for incineration and replaced with clean soil.

If 1,1-dimethylhydrazine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. It is highly soluble in water and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 1,1-dimethylhydrazine. Burning 1,1-dimethylhydrazine in a chemical incinerator equipped with an afterburner and an air scrubber is an acceptable disposal method.

If 1,1-dimethylhydrazine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup of the area is complete.
- ☑ Ventilate area and remove all ignition sources.
- ☑ Absorb liquids in vermiculite or sand and place in a sealed drums for disposal.
- ☑ It may be necessary to dispose of 1,1-dimethylhydrazine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 1,1-dimethylhydrazine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "carcinogen" or "cancer" are used, public emotion, hysteria, and ignorance can run equally high. This should be considered during the development of any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

1,2-DIMETHYLHYDRAZINE

CAS: 540-73-8

**IDENTIFICATION AND TYPICAL USES**

1,2-Dimethylhydrazine is a colorless liquid with an ammonia or fish-like odor. It is used as a component of jet and rocket fuel, as an absorbent for acid gases, in photography, and as an agent to control the growth of plants.

RISK ASSESSMENT: HEALTH**General Assessment**

1,2-Dimethylhydrazine is a confirmed human and animal carcinogen. Human mutation data have also been reported. It is primarily toxic by *inhalation* and skin contact (*absorption*). It can also cause toxic and damaging effects by *ingestion*.

Inhalation will cause pulmonary irritation up to and including pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can lead to death. Symptoms may be delayed up to 48 hours creating a false sense of security with regard to health exposure risk. Symptoms include choking, extreme chest pain, dyspnea (difficulty in breathing), lethargy, nausea, convulsions, tremors, liver injury, and hypoxia (reduced oxygen levels in the blood) leading to hemolytic anemia. Systemic intoxication, depression of the central nervous system (CNS), and delayed gastrointestinal irritation may also occur.

Aside from its ability to pass through intact skin (absorption), 1,2-dimethylhydrazine is also extremely corrosive to skin tissue and can cause 2nd and 3rd degree burns on contact. Damage to the eyes and cornea can be severe causing partial or complete loss of vision.

Ingestion is very unusual since the vapors of this chemical are so irritating, personnel are not likely to get close enough to ingest it. However, should it be swallowed, there can be burning of the mouth, throat, and esophagus, followed by gastrointestinal irritation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to 1,2-dimethylhydrazine:

Skin: Severe irritation and burning. Skin absorption will occur causing toxic systemic effects.

Eye: Severe irritation and tissue damage up to and including loss of vision.

Lung: Irritation of the upper respiratory tract causing choking, coughing, dyspnea, and pulmonary irritation leading to pulmonary edema (fluid in the lungs), which can be fatal.

CNS: Dizziness, convulsions, tremors, nausea, headaches, possible injury to the central nervous system.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to 1,2-dimethylhydrazine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, 1,2-dimethylhydrazine has been shown to cause cancer in test animals. Its carcinogenicity in humans is expected to be at least equal to that of animals. Human mutation data have been reported for this compound.

Reproductive Hazard: According to the information presented in the references, this chemical has been shown to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated exposures can lead to hemolytic anemia and convulsions. Chronic exposures may lead to cancer.

🕒 **Recommended Risk-Reduction Measures**

1,2-Dimethylhydrazine is listed by the IARC as a confirmed animal carcinogen and the ACGIH as a suspected human carcinogen. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 1,2-dimethylhydrazine. The exposure level is extremely low (0.5 ppm) and difficult to detect and monitor. For any detectable exposures to a suspected carcinogenic agent, use a supplied-air respirator set in positive pressure or continuous flow mode, or use a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever an eye or face contact hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around 1,2-dimethylhydrazine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 1,2-dimethylhydrazine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Liver and kidney function tests.
- Consider chest X-ray after acute overexposure.

- Evaluation by a qualified allergist with careful consideration of exposure history and special tests (may help diagnose allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to 1,2-dimethylhydrazine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information must be posted in the work area. It is recommended that a regulated, controlled work area should be established wherever this chemical is used, handled, or stored. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 1,2-dimethylhydrazine should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of 1,2-dimethylhydrazine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

1,2-Dimethylhydrazine should always be handled with extreme caution. It is a Class 1B flammable liquid. Its extremely low flash point and relatively low boiling point make this chemical a dangerous fire and explosion hazard. Its vapors form explosive mixtures in air over a wide range of concentrations. It forms shock-sensitive explosive products when combined with metal perchlorates, alkali metals, or their dichromates. It is highly reactive with a number of substances, especially oxidizers and oxidizing agents. These characteristics require special consideration during any emergency situation involving a leak or spill of 1,2-dimethylhydrazine.

1,2-Dimethylhydrazine can enter the environment through industrial discharges or through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 1,2-dimethylhydrazine. This chemical has moderate acute toxicity to aquatic life and plant life. It has been used to control the growth rate of some ornamental and agricultural crops. Insufficient data are available to evaluate or predict the short-term effects of 1,2-dimethylhydrazine to birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. 1,2-Dimethylhydrazine has low chronic toxicity to aquatic life and moderate chronic toxicity to plant life. Insufficient data are available to evaluate or predict the long-term effects of 1,2-dimethylhydrazine to birds or land animals.

💧 *Water Solubility*

1,2-Dimethylhydrazine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

1,2-Dimethylhydrazine is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It is expected

to absorb to sediment. No information is available in the references on the expected percentages of 1,2-dimethylhydrazine that will be divided through the environmental mediums (primarily air and water).

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 1,2-dimethylhydrazine found in fish tissues is expected to be somewhat higher than the average concentration found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 1,2-dimethylhydrazine should be segregated from other chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with proper fire protection and prevention equipment and explosion-proof electrical components and equipment. Bulk storage of 1,2-dimethylhydrazine is not recommended.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures and the health hazards associated with carcinogenic materials. Contaminated soils should be removed for incineration and replaced with clean soil. If 1,2-dimethylhydrazine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. It is highly soluble in water and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 1,2-dimethylhydrazine. If

1,2-dimethylhydrazine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup of the area is complete.
- ☑ Ventilate area and remove ignition sources.
- ☑ Absorb liquids in vermiculite or sand and place in sealed drums for disposal.
- ☑ It may be necessary to dispose of 1,2-dimethylhydrazine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 1,2-dimethylhydrazine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term “carcinogen” or “cancer” are used, public emotion, hysteria, and ignorance can run equally high. This should be considered during the development of any public relations policies.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| 2 | 1 | 0 | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|--|--|---------------------------------|
| Characterization Phthalate Ester | RCRA Number U069 | EPA Class Toxic Waste |
| DOT Proper Shipping Name n-Butyl Phthalate | Chemical Abstract Service (CAS) Number 84-74-2 | |
| DOT Hazard Class and Label Requirements Combustible Liquid | DOT Emergency Guide Code 31 | |
| DOT Identification Number NA 9095 | Chemical Formula C₆H₄(COOC₄H₉)₂ | |

Synonyms

Dibutyl phthalate; o-benzenedicarboxylic acid, dibutyl ester; Celluflex DPB; dibutyl-1,2-benzenedicarboxylate; n-butyl phthalate.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|--|---|--|
| Di-n-butyl phthalate (derivation: By treating n-butyl alcohol with phthalic anhydride followed by purification, which results in a product unusually free of odor and color). 1 ppm = 11.57 mg/m³ | PEL: 0.4 ppm 5 mg/m³ STEL: Not Established | REL: 0.4 ppm 5 mg/m³ STEL: Not Established | 4000 mg/m³ | TLV: 0.4 ppm 5 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 644°F (340°C) | Specific Gravity (H ₂ O = 1) 1.05 |
| Vapor Pressure (mm Hg) <1 at 69°F (20°C) | Molecular Weight 278.3 |
| Vapor Density (Air = 1) 9.58 | Freezing Point -31°F (-35°C) |

Solubility

Miscible in common organic solvents, insoluble (0.001%) in water.

Appearance and Odor

Colorless to faint yellow oily liquid. Depending on the grade, there may be no noticeable odor or a slight aromatic odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 315°F (157°C) closed cup | Explosive Limits in Air % by Volume LEL: 0.5% (at 415°F) UEL: Not Determined |
| NFPA Classification Class IIIB Combustible Liquid | Autoignition Temperature 757°F (403°C) |

Extinguishing Media

Use dry chemical or carbon dioxide.

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Vapors are heavier than air and may travel for some distance to ignition source and flashback. Move containers from fire area if it can be done safely.

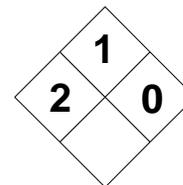

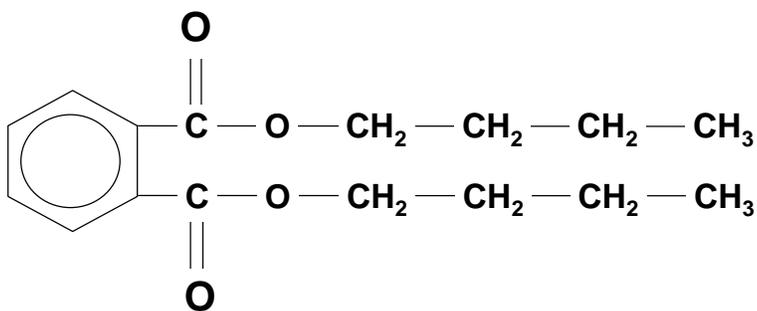

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Exercise extreme caution when attempting to move or relocate containers that may have been exposed to high heat.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|--|--|---|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials. Keep away from heat and flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, such as chlorine (especially liquid chlorine), bromine, and fluorine, strong alkalis (sodium hydroxide, potassium hydroxide, lithium hydroxide), strong acids, and nitrates. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of di-n-butyl phthalate is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Acrid and irritated gases and fumes are produced when di-n-butyl phthalate is involved in fire. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Symptoms include irritation to the eyes and mucosa (especially in the upper respiratory tract). There may be nausea and vomiting. SKIN & EYES: Contact may irritate the skin and eyes. May cause conjunctivitis with quick recovery. INGESTION: Mildly toxic by ingestion. Gastrointestinal irritation. Systemic effects include blurred vision, hallucinations, distorted perceptions, nausea or vomiting, and kidney, ureter, or bladder changes. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, respiratory system, GI tract, kidney, bladder. |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Call the poison control center and seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method Burn in chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Do not store di-n-butyl phthalate in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Personnel working with di-n-butyl phthalate should be trained on its proper handling and storage <i>prior</i> to being assigned to such responsibilities. | | | | |
| Other Precautions and Warnings Bulk storage of di-n-butyl phthalate should be avoided. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For relatively low or infrequent exposure, use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and dust/mist pre-filter. For greater protection, use a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DI-N-BUTYL PHTHALATE

CAS: 84-74-2

**IDENTIFICATION AND TYPICAL USES**

Di-n-butyl phthalate is a colorless to faint yellow oily, stable, liquid. Depending upon the grade, it may be odorless or have a slight, aromatic odor. It is used as a plasticizer in nitrocellulose lacquers, elastomers, nail polish, and solid rocket propellants. It is also used as a solvent for perfume oils, as a perfume fixative, a textile lubricating agent, in the manufacture of safety glass, and in the production of insecticides. It may also be found in certain printing inks, is resin solvents, in paper coatings, adhesives, and as an insect repellent for textiles.

RISK ASSESSMENT: HEALTH**General Assessment**

Di-n-butyl phthalate is primarily toxic to humans by *ingestion*. However, its vapors can also cause adverse systemic effects by *inhalation*. Contact with the eyes or skin will result in irritation. It is known to cause damage to male reproductive organs in test animals. Human mutation data have been reported for this chemical.

Ingestion of di-n-butyl phthalate will result in systemic effects with symptoms of vomiting or nausea, and numerous vision-related disorders. Symptoms include hallucinations and distorted perceptions. There may also be kidney, ureter, or bladder changes.

Inhalation will irritate the mucous membranes of the nose and throat. There may also be systemic effects similar to those caused by ingestion, but this has not been confirmed by the references (the data are inconclusive and conflicting).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to di-n-butyl phthalate:

Skin: Irritation and possible inflammation.

Eye: Severe irritation with redness, lachrymation, and possible conjunctivitis with prompt recovery.

Lung: Irritation of the mucosa of the nose, throat, and upper respiratory tract.

Other: Ingestion may cause hallucinations, blurred vision, and distorted perceptions. There may be vomiting or nausea.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to di-n-butyl phthalate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, di-n-butyl phthalate has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, di-n-butyl phthalate may damage the developing fetus in humans since it has been shown to be fetotoxic in animals. It may also damage the testes (male reproductive glands).

Other Chronic Effects: Chronic exposure to di-n-butyl phthalate has not been sufficiently studied. However, there is some indication that long-term exposure or frequent high exposures may cause changes in the kidney, ureter, or bladder.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around di-n-butyl phthalate. At low or infrequent exposures, use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist pre-filter. For high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, rubber gloves should be used. Glove manufacturers should be contacted for assistance with selection.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with di-n-butyl phthalate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where di-n-butyl phthalate is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Kidney function tests.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.

- Wash thoroughly immediately after exposure to di-n-butyl phthalate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of di-n-butyl phthalate should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during use, transportation, storage, disposal, or destruction of di-n-butyl phthalate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Di-n-butyl phthalate is considered a Class IIIB combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of di-n-butyl phthalate. Should di-n-butyl phthalate ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine, and chlorine dioxide), strong alkali materials (sodium hydroxide, potassium hydroxide, and lithium hydroxide), and strong acids (sulfuric acid, hydrochloric acid, and nitric acid), and other nitrates either during use, transportation, or storage, violent reaction can occur. Di-n-butyl phthalate is especially reactive in contact with liquid chlorine.

Di-n-butyl phthalate can enter the environment through industrial discharges, in non-point discharges from the wide and general use of this chemical, and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to di-n-butyl phthalate. This chemical has high acute toxicity to aquatic life.

Insufficient data are available to evaluate or predict the short-term effects of di-n-butyl phthalate to plants, birds, or land animals.

☛ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Di-n-butyl phthalate has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of di-n-butyl phthalate to plants, birds, or land animals.

💧 *Water Solubility*

Di-n-butyl phthalate is very slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

⌚ *Persistence in the Environment*

Di-n-butyl phthalate is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 33% of di-n-butyl phthalate will eventually end up in terrestrial soil; about 31% will end up in aquatic sediments, about 26% will end up in air, and about 8% will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of di-n-butyl phthalate found in fish tissues is expected to be much higher than the average concentration of di-n-butyl phthalate in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of di-n-butyl phthalate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

Di-n-butyl phthalate is destroyed by burning in a chemical incinerator equipped with an afterburner and scrubber.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If di-n-butyl phthalate should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of di-n-butyl phthalate. If di-n-butyl phthalate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of di-n-butyl phthalate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving di-n-butyl phthalate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental dam-

age can also result in a loss of profits and loss of current as well as future business.

● Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|--|
| Characterization Phenol | RCRA Number D001 | EPA Class Characteristic (I) Waste |
| DOT Proper Shipping Name Dinitrobenzene, solid, or Dinitrobenzol | Chemical Abstract Service (CAS) Number 25154-54-5 | |
| DOT Hazard Class and Label Requirements Poison B | DOT Emergency Guide Code 56 | |
| DOT Identification Number UN 1597 | Chemical Formula C₆H₄(NO₂)₂ | |

Synonyms
Dinitrobenzene (solution); dinitrobenzene (solid).

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|--|
| Dinitrobenzene (derivation: From the nitration of nitrobenzene with hot mixed acid). 1 ppm = 6.6 mg/m³ | PEL (skin): 1 ppm 6.6 mg/m³ STEL: Not Established | REL (skin): 1 ppm 6.6 mg/m³ STEL: Not Established | 50 mg/m³ | TLV (skin): 0.15 ppm 1 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 572°F (300°C) | Specific Gravity (H ₂ O = 1) 1.58 |
| Vapor Pressure (gas) <1 at 69°F (20°C) | Molecular Weight 168.1 |
| Vapor Density (Air = 1) 5.8 | Melting Point 192°F (89°C) |

Solubility
Slightly soluble in water. Soluble in chloroform and ethyl acetate and sparingly soluble in benzene.

Appearance and Odor
Pale white or yellow crystalline solid.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 302°F (150°C) closed cup | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Combustible Solid | Autoignition Temperature Not Determined |

Extinguishing Media
For small fires, use dry chemical, carbon dioxide, water spray, or regular foam. For large fires, use water spray, fog, or regular foam. Apply water as fog in flooding amounts (solid stream may be ineffective).

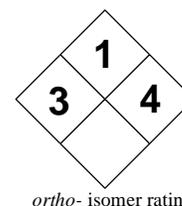

Special Fire Fighting Procedures
Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Use water spray to keep fire-exposed containers cool.

Unusual Fire and Explosion Hazards
Containers may explode in fire. Highly friction- and shock-sensitive. Dusts form explosive concentrations in air. May spontaneously ignite or explode at high temperatures due to spontaneous combustion.

| SECTION V - REACTIVITY DATA | | | | |
|--|---|---|---------------------------------------|--|
| Stability | | Conditions to Avoid Dinitrobenzene is unstable at high temperatures and is extremely shock- and friction-sensitive. Keep containers away from areas where shock, heat, and/or friction are likely to occur. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, (such as chlorine, bromine, and fluorine), caustics, and many metals (such as zinc and tin). Explosive when mixed with nitric acid. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of dinitrobenzene is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, dinitrobenzene can emit highly toxic/poisonous gases, including carbon dioxide and oxides of nitrogen. Dinitrobenzene can explode when heated. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Anoxia; visual disturbances; central scotomas; yellowing of hair, eyes, and skin; anemia; and liver, kidney, and central nervous system injury is possible. Forms methemoglobin. ABSORPTION: Skin irritant. Will pass through skin to cause toxic systemic effects (same as inhalation). INGESTION: Gastrointestinal disorders; tremor; convulsions; bad taste and burning feeling in mouth; dry throat; and thirst. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Eyes, skin, blood, CVS, CNS, liver, kidney. |
| Medical Conditions Generally Aggravated by Exposure Blood and liver disorders. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. If swallowed: Unless advised otherwise, give 2 tablespoons Ipecac (adult dose) and 1-2 glasses of water. Induce vomiting. After vomiting, give 2 tablespoons of activated charcoal in 8 ounces of water. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or other non-reactive material and deposit in sealed drum. Ventilate area of spill or leak. For dry spills, collect for reuse or disposal. Do NOT dry sweep. Use water spray to knock-down vapors (for solution spills) and wet mop residue of dry spills. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Store in detached facility away from main plant or facility. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where dinitrobenzene is used, handled, or stored. Heat may cause solids to liquefy and containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL is low and difficult to monitor. For exposures above the PEL, use an MSHA/NIOSH-approved supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Butyl Rubber | Chemical/Dust Goggles or Face Mask | Butyl Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DINITROBENZENE

CAS: 25154-54-5

**IDENTIFICATION AND TYPICAL USES**

Dinitrobenzene is a mixture of the three isomeric dinitrobenzenes, *m*- (*meta*), *o* (*ortho*), and *p* (*para*). It is derived through the nitration of nitrobenzene with hot mixed acid. It is used organic synthesis, in the manufacture of dyes, as a camphor substitute in cellulose nitrate, and in explosives (the *ortho*- polymer is used in blasting charges and to fill artillery shells). It is extremely important to know which isomer is being assessed since their individual physical and toxicological properties differ.

RISK ASSESSMENT: HEALTH***General Assessment***

Dinitrobenzene is a human poison by *inhalation*, *ingestion*, and skin *absorption*. It is an irritant to the eyes, skin, and respiratory system. It is a confirmed carcinogen in animals. Human carcinogenicity is suspect, although the data are inconclusive in this area of study. The “*m*” or *meta*-isomer is somewhat more toxicologically important than the other two isomers (“*p*” or *para*- and “*o*” or *ortho*-).

Inhalation can cause irritation to the respiratory system and associated mucosa. It can cause cough, congestion, with narcotic effects associated with the depression of the central nervous system (CNS). These include weakness, dyspnea (difficult or labored breathing), nausea, personality changes (irritability, mood changes), collapse, coma, and death (from respiratory failure). It also results in the formation of methemoglobin (a pigment similar to hemoglobin that is unable to perform the normal oxygenation process). Symptoms include headache, nausea, vomiting, dizziness, and jaundice (yellow coloring of the eyes, hair, and skin). There may be difficulty in breathing, visual disturbances (scotomas), general weakness, cyanosis, with

possible progression to convulsions, coma, and even death.

Skin contact can produce the same systemic systems as inhalation as well as irritation, the appearance of small vesicles or blisters, redness or swelling, ulceration, and necrosis (issue death). Eye contact with the liquid solution or dusts can cause irritation, redness and swelling of the eyelids, painful sensitivity to light, and can cause severe eye damage and possible loss of vision.

Ingestion of dinitrobenzene can also cause systemic effects similar to those of inhalation. There can also be painful irritation of the mouth and stomach, stomach cramps, and diarrhea. A bitter almond taste or burning sensation in the mouth, dry throat, and thirst can occur.

Alcohol consumption, some medications, exposure to sunlight, or hot baths can aggravate and enhance symptoms.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to dinitrobenzene:

- Skin:** Irritation and possible blistering, with ulceration. Will pass through unbroken skin to cause toxic systemic effects, including weakness, nausea, collapse, and death.
- Eye:** Severe irritation with damage and possible loss of vision likely.
- Lung:** Irritation to the respiratory tract and associated mucosa. Can cause weakness, nausea, confusion, collapse, coma, and death (respiratory failure).
- CNS:** A CNS depressant. Weakness, confusion, vertigo, mood changes and other personality changes, nausea, collapse.

Other: Ingestion will cause irritation to the gastrointestinal system with nausea, vomiting, convulsions, dyspnea, jaundice, tremor, confusion, and nervousness. It has also been found to be hepatotoxic (toxic to the liver) and nephrotoxic (toxic to the kidneys).

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to dinitrobenzene and can last for months or even years:

Cancer Hazards: Some studies have suggested that exposure to dinitrobenzene causes cancer in some test animals. While there is no evidence of carcinogenicity of this chemical in humans or animals, it is still considered a *suspected* carcinogen by some authorities.

Reproductive Hazard: According to information presented in the references, dinitrobenzene has not been adequately tested for its ability to adversely affect reproduction in animals.

Other Chronic Effects: High or repeated lower skin or inhalation exposures can cause liver or kidney disorders. Symptoms of late toxicity include secondary anemia, liver damage, irritability, weakness, headache, anorexia, weight loss, nausea, vomiting, cyanosis, dyspnea, and skin disorders. There may also be paresthesia in the feet, ankles, hands, and feet.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with dinitrobenzene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dinitrobenzene. Exposure level is low (1 ppm) and difficult to monitor. For exposures above the PEL, use an MSHA/NIOSH-approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to

protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dinitrobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where dinitrobenzene is used or stored.

Before beginning employment with dinitrobenzene and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- Kidney and liver function tests.
- Complete blood count.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Kidney and liver function tests.
- Complete blood count.
- Consider possible reactions caused by alcohol consumption and/or medications.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Physicians should note that symptoms may be delayed, so victim should be kept under observation. The methemoglobin concentration should be determined at regular intervals until indications of full reduction to hemoglobin. For ingestion, gastric lavage is suggested followed by saline catharsis.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its care and use.
- Wash thoroughly immediately after exposure to dinitrobenzene and at the end of the work shift or before eating, drinking, or smoking.

- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of dinitrobenzene should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to dinitrobenzene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of dinitrobenzene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of dinitrobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Dinitrobenzene is normally considered a combustible solid, but it can also appear in mixed solutions. Its dusts can form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, caustics, and some metals (such as zinc and tin). Contact with either can cause fire or explosion. Prolonged contact with heat may result in an explosion due to spontaneous decomposition. Therefore, special consideration is required during any emergency situation involving a leak or spill of dinitrobenzene. Should dinitrobenzene ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Dinitrobenzene may enter the environment through industrial effluents or spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dinitrobenzene. Insufficient data are available on the short-term effects of dinitrobenzene exposure to aquatic life, plants, birds or land animals.

Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available on the long-term effects of dinitrobenzene to aquatic life, plants, birds, or land animals.

Water Solubility

Dinitrobenzene is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

Persistence in the Environment

Dinitrobenzene is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of dinitrobenzene found in fish tissue is expected to be somewhat higher than the average concentration of dinitrobenzene in the water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dinitrobenzene should be segregated from incompatible chemicals to minimize the risk of

cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If dinitrobenzene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dinitrobenzene. If dinitrobenzene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet mop spill area to collect residue.
- It may be necessary to dispose of dinitrobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dinitrobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the terms "carcinogen" or "cancer" are used, public emo-

tion, hysteria, and ignorance can run equally high. This should be a consideration during the development of public relation policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

***m*-DINITROBENZENE**

CAS: 99-65-0

**IDENTIFICATION AND TYPICAL USES**

m-Dinitrobenzene, or *meta*-dinitrobenzene, is one of three dinitrobenzene isomers, *o*- (*ortho*), and *p*- (*para*) being the other two. It is derived through the nitration of nitrobenzene with hot mixed acid. It is used organic synthesis, in the manufacture of dyes, as a camphor substitute in cellulose nitrate, and in explosives (the *ortho*- polymer is used in blasting charges and to fill artillery shells).

RISK ASSESSMENT: HEALTH***General Assessment***

m-Dinitrobenzene is a human poison by *inhalation*, *ingestion*, and *skin absorption*. In contrast to the other isomers of dinitrobenzene, the *meta*-isomer is considered the most important from a health risk perspective. While exposure symptoms may be the same, it appears to cause toxic systemic effects more readily than other dinitrobenzene isomers of similar exposure levels and conditions. It is an irritant to the eyes, skin and respiratory system. It is a confirmed carcinogen in animals. Human carcinogenicity is suspect, although the data are inconclusive in this area of study.

Inhalation can cause irritation to the respiratory system and associated mucosa. It can cause cough, congestion, with narcotic effects associated with the depression of the central nervous system (CNS). These include weakness, dyspnea, nausea, personality changes (irritability, mood changes), collapse, coma, and death (from respiratory failure). It also results in the formation of methemoglobin (a pigment similar to hemoglobin that is unable to perform the normal oxygenation process). Symptoms include headache, nausea, vomiting, dizziness, and jaundice (yellow coloring of the eyes, hair, and skin). There may be difficulty in breathing, visual disturbances (scotomas), general

weakness, cyanosis, with possible progression to convulsions, coma, and even death.

Skin contact can produce the same systemic systems as inhalation as well as irritation, the appearance of small vesicles or blisters, redness or swelling, ulceration, and necrosis (issue death). Eye contact with the liquid solution or dusts can cause irritation, redness and swelling of the eyelids, painful sensitivity to light, and can cause severe eye damage and possible loss of vision.

Ingestion of *m*-dinitrobenzene can also cause systemic effects similar to those of inhalation. There can also be painful irritation of the mouth and stomach, stomach cramps, and diarrhea. A bitter almond taste or burning sensation in the mouth, dry throat, and thirst can occur.

Alcohol consumption, some medications, exposure to sunlight, or hot baths can aggravate and enhance symptoms.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to *m*-dinitrobenzene:

- Skin:** Irritation and possible blistering, with ulceration. Will pass through unbroken skin to cause toxic systemic effects, including weakness, nausea, collapse, and death.
- Eye:** Severe irritation with damage and possible loss of vision likely.
- Lung:** Irritation to the respiratory tract and associated mucosa with weakness, nausea, confusion, collapse, coma, and death (respiratory failure).
- CNS:** A CNS depressant. Weakness, confusion, vertigo, mood changes and other personality changes, nausea, collapse.

Other: Ingestion will cause irritation to the gastrointestinal system with nausea, vomiting, convulsions, dyspnea, jaundice, tremor, confusion, and nervousness. It has also been found to be hepatotoxic (toxic to the liver) and nephrotoxic (toxic to the kidneys).

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to *m*-dinitrobenzene and can last for months or even years:

Cancer Hazards: Some studies have suggested that exposure to *m*-dinitrobenzene causes cancer in some test animals. While there is no evidence of carcinogenicity of this chemical in humans or animals, it is still considered a *suspected* carcinogen by some authorities.

Reproductive Hazard: According to information presented in the references, *m*-dinitrobenzene has not been adequately tested for its ability to adversely affect reproductively in animals.

Other Chronic Effects: High or repeated lower skin or inhalation exposures can cause liver or kidney disorders. Symptoms of late toxicity include secondary anemia, liver damage, irritability, weakness, headache, anorexia, weight loss, nausea, vomiting, cyanosis, dyspnea, and skin disorders. There may also be paresis in the feet, ankles, hands, and feet.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with *m*-dinitrobenzene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around *m*-dinitrobenzene. Exposure level is low (1 ppm) and difficult to monitor. For exposures above the PEL, use an MSHA/NIOSH-approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn

to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with *m*-dinitrobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *m*-dinitrobenzene is used or stored.

Before beginning employment with *m*-dinitrobenzene and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- Kidney and liver function tests.
- Complete blood count.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Kidney and liver function tests.
- Complete blood count.
- Consider possible reactions caused by alcohol consumption and/or medications.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Physicians should note that symptoms may be delayed, so victim should be kept under observation. The methemoglobin concentration should be determined at regular intervals until indications of full reduction to hemoglobin. For ingestion, gastric lavage is suggested followed by saline catharsis.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to *m*-dinitrobenzene and at the end of the work shift or before eating, drinking, or smoking.

- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of *m*-dinitrobenzene should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to *m*-dinitrobenzene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of *m*-dinitrobenzene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *m*-dinitrobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

m-Dinitrobenzene is normally considered a combustible solid, but it can also appear in mixed solutions. Its dusts can form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, caustics, and some metals (such as zinc and tin). Contact with either can cause fire or explosion. Prolonged contact with heat may result in an explosion due to spontaneous decomposition. Therefore, special consideration is required during any emergency situation involving a leak or spill of *m*-dinitrobenzene. Should *m*-dinitrobenzene ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible. *m*-Dinitrobenzene may enter the environment through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *m*-dinitrobenzene. Insufficient data are available on the short-term effects of *m*-dinitrobenzene exposure to aquatic life, plants, birds or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available on the long-term effects of *m*-dinitrobenzene to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

m-Dinitrobenzene is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

m-Dinitrobenzene is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of *m*-dinitrobenzene found in fish tissue is expected to be somewhat higher than the average concentration of *m*-dinitrobenzene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *m*-dinitrobenzene should be segregated from incompatible chemicals to minimize the risk of

cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If *m*-dinitrobenzene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *m*-dinitrobenzene. If *m*-dinitrobenzene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet mop spill area to collect residue.
- It may be necessary to dispose of *m*-dinitrobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving *m*-dinitrobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the terms "carcinogen" or "cancer" are used, public emo-

tion, hysteria, and ignorance can run equally high. This should be a consideration during the development of public relation policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

***o*-DINITROBENZENE**

CAS: 528-29-0

**IDENTIFICATION AND TYPICAL USES**

o-Dinitrobenzene, or *ortho*-dinitrobenzene, is one of three dinitrobenzene isomers, *m*- (*meta*), and *p*- (*para*) being the other two. It is derived through the nitration of nitrobenzene with hot mixed acid. It is used in organic synthesis, in the manufacture of dyes, as a camphor substitute in cellulose nitrate, and in explosives (the *ortho*- polymer is used in blasting charges and to fill artillery shells).

RISK ASSESSMENT: HEALTH***General Assessment***

o-Dinitrobenzene is a human poison by *inhalation*, *ingestion*, and *skin absorption*. It is an irritant to the eyes, skin and respiratory system. It is a confirmed carcinogen in animals. Human carcinogenicity is suspect, although the data are inconclusive in this area of study.

Inhalation can cause irritation to the respiratory system and associated mucosa. It can cause cough, congestion, with narcotic effects associated with the depression of the central nervous system (CNS). These include weakness, dyspnea, nausea, personality changes (irritability, mood changes), collapse, coma, and death (from respiratory failure). It also results in the formation of methemoglobin (a pigment similar to hemoglobin that is unable to perform the normal oxygenation process). Symptoms include headache, nausea, vomiting, dizziness, and jaundice (yellow coloring of the eyes, hair, and skin). There may be difficulty in breathing, visual disturbances (scotomas), general weakness, cyanosis, with possible progression to convulsions, coma, and even death.

Skin contact can produce the same systemic systems as inhalation as well as irritation, the appearance of small vesicles or blisters, redness or swelling, ul-

ceration, and necrosis (issue death). Eye contact with the liquid solution or dusts can cause irritation, redness and swelling of the eyelids, painful sensitivity to light, and can cause severe eye damage and possible loss of vision.

Ingestion of *o*-dinitrobenzene can also cause systemic effects similar to those of inhalation. There can also be painful irritation of the mouth and stomach, stomach cramps, and diarrhea. A bitter almond taste or burning sensation in the mouth, dry throat, and thirst can occur.

Alcohol consumption, some medications, exposure to sunlight, or hot baths can aggravate and enhance symptoms.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to *o*-dinitrobenzene:

Skin: Irritation and possible blistering, with ulceration. Will pass through unbroken skin to cause toxic systemic effects, including weakness, nausea, collapse, and death.

Eye: Severe irritation with damage and possible loss of vision likely.

Lung: Irritation to the respiratory tract and associated mucosa. Can cause weakness, nausea, confusion, collapse, coma, and death (respiratory failure).

CNS: A CNS depressant. Weakness, confusion, vertigo, mood changes and other personality changes, nausea, collapse.

Other: Ingestion will cause irritation to the gastrointestinal system with nausea, vomiting, convulsions, dyspnea, jaundice, tremor, confusion, and nervousness. It has also been found to be

hepatotoxic (toxic to the liver) and nephrotoxic (toxic to the kidneys).

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to *o*-dinitrobenzene and can last for months or even years:

Cancer Hazards: Some studies have suggested that exposure to *o*-dinitrobenzene causes cancer in some test animals. While there is no evidence of carcinogenicity of this chemical in humans or animals, it is still considered a *suspected* carcinogen by some authorities.

Reproductive Hazard: According to information presented in the references, *o*-dinitrobenzene has not been adequately tested for its ability to adversely affect reproductively in animals.

Other Chronic Effects: High or repeated lower skin or inhalation exposures can cause liver or kidney disorders. Symptoms of late toxicity include secondary anemia, liver damage, irritability, weakness, headache, anorexia, weight loss, nausea, vomiting, cyanosis, dyspnea, and skin disorders. There may also be paresis in the feet, ankles, hands, and feet.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with *o*-dinitrobenzene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable when ever working with or around *o*-dinitrobenzene. Exposure level is low (1 ppm) and difficult to monitor. For exposures above the PEL, use an MSHA/NIOSH-approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with *o*-dinitrobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *o*-dinitrobenzene is used or stored.

Before beginning employment with *o*-dinitrobenzene and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- Kidney and liver function tests.
- Complete blood count.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Kidney and liver function tests.
- Complete blood count.
- Consider possible reactions caused by alcohol consumption and/or medications.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Physicians should note that symptoms may be delayed, so victim should be kept under observation. The methemoglobin concentration should be determined at regular intervals until indications of full reduction to hemoglobin. For ingestion, gastric lavage is suggested followed by saline catharsis.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to *o*-dinitrobenzene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on

the health and safety hazards of *o*-dinitrobenzene should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to *o*-dinitrobenzene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of *o*-dinitrobenzene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *o*-dinitrobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

o-Dinitrobenzene is normally considered a combustible solid, but it can also appear in mixed solutions. Its dusts can form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, caustics, and some metals (such as zinc and tin). Contact with either can cause fire or explosion. Prolonged contact with heat may result in an explosion due to spontaneous decomposition. Therefore, special consideration is required during any emergency situation involving a leak or spill of *o*-dinitrobenzene. Should *o*-dinitrobenzene ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

o-Dinitrobenzene may enter the environment through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *o*-dinitrobenzene. Insuf-

ficient data are available on the short-term effects of *o*-dinitrobenzene exposure to aquatic life, plants, birds or land animals.

🌱 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available on the long-term effects of *o*-dinitrobenzene to aquatic life, plants, birds, or land animals.

💧 Water Solubility

o-Dinitrobenzene is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 Persistence in the Environment

o-Dinitrobenzene is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of *o*-dinitrobenzene found in fish tissue is expected to be somewhat higher than the average concentration of *o*-dinitrobenzene in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *o*-dinitrobenzene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire

protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If *o*-dinitrobenzene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *o*-dinitrobenzene. If *o*-dinitrobenzene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet mop spill area to collect residue.
- It may be necessary to dispose of *o*-dinitrobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving *o*-dinitrobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the terms "carcinogen" or "cancer" are used, public emotion, hysteria, and ignorance can run equally high. This

should be a consideration during the development of public relation policies.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X | |
| Health Hazards INHALATION: Anoxia; visual disturbances; central scotomas; yellowing of hair, eyes, and skin; anemia; and liver, kidney, and central nervous system injury is possible. Forms methemoglobin. ABSORPTION: Skin irritant. Will pass through skin to cause toxic systemic effects (same as inhalation). INGESTION: Gastrointestinal disorders; tremor; convulsions; bad taste and burning feeling in mouth; dry throat; and thirst. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, blood, CVS, CNS, liver, kidney. |
| Medical Conditions Generally Aggravated by Exposure Blood and liver disorders. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. If swallowed: Unless advised otherwise, give 2 tablespoons Ipecac (adult dose) and 1-2 glasses of water. Induce vomiting. After vomiting, give 2 tablespoons of activated charcoal in 8 ounces of water. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or other non-reactive material and deposit in sealed drum. Ventilate area of spill or leak. For dry spills, collect for reuse or disposal. Do NOT dry sweep. Use water spray to knock-down vapors (for solution spills) and wet mop residue of dry spills. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Store in detached facility away from main plant or facility. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where p-dinitrobenzene is used, handled, or stored. Heat may cause solids to liquefy and containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL is low and difficult to monitor. For exposures above the PEL, use an MSHA/NIOSH-approved supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Butyl Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

***p*-DINITROBENZENE**

CAS: 100-25-4

*ortho*- isomer rating**IDENTIFICATION AND TYPICAL USES**

p-Dinitrobenzene, or *para*-dinitrobenzene, is one of three dinitrobenzene isomers, *o*- (*ortho*), and *m*- (*meta*) being the other two. It is derived through the nitration of nitrobenzene with hot mixed acid. It is used in organic synthesis, in the manufacture of dyes, as a camphor substitute in cellulose nitrate, and in explosives (the *ortho*- polymer is used in blasting charges and to fill artillery shells).

RISK ASSESSMENT: HEALTH***General Assessment***

p-Dinitrobenzene is a human poison by *inhalation*, *ingestion*, and *skin absorption*. It is an irritant to the eyes, skin and respiratory system. It is a confirmed carcinogen in animals. Human carcinogenicity is suspect, although the data are inconclusive in this area of study.

Inhalation can cause irritation to the respiratory system and associated mucosa. It can cause cough, congestion, with narcotic effects associated with the depression of the central nervous system (CNS). These include weakness, dyspnea, nausea, personality changes (irritability, mood changes), collapse, coma, and death (from respiratory failure). It also results in the formation of methemoglobin (a pigment similar to hemoglobin that is unable to perform the normal oxygenation process). Symptoms include headache, nausea, vomiting, dizziness, and jaundice (yellow coloring of the eyes, hair, and skin). There may be difficulty in breathing, visual disturbances (scotomas), general weakness, cyanosis, with possible progression to convulsions, coma, and even death.

Skin contact can produce the same systemic systems as inhalation as well as irritation, the appearance of small vesicles or blisters, redness or swelling, ul-

ceration, and necrosis (issue death). Eye contact with the liquid solution or dusts can cause irritation, redness and swelling of the eyelids, painful sensitivity to light, and can cause severe eye damage and possible loss of vision.

Ingestion of *p*-dinitrobenzene can also cause systemic effects similar to those of inhalation. There can also be painful irritation of the mouth and stomach, stomach cramps, and diarrhea. A bitter almond taste or burning sensation in the mouth, dry throat, and thirst can occur.

Alcohol consumption, some medications, exposure to sunlight, or hot baths can aggravate and enhance symptoms.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to *p*-dinitrobenzene:

Skin: Irritation and possible blistering, with ulceration. Will pass through unbroken skin to cause toxic systemic effects, including weakness, nausea, collapse, and death.

Eye: Severe irritation with damage and possible loss of vision likely.

Lung: Irritation to the respiratory tract and associated mucosa. Can cause weakness, nausea, confusion, collapse, coma, and death (respiratory failure).

CNS: A CNS depressant. Weakness, confusion, vertigo, mood changes and other personality changes, nausea, collapse.

Other: Ingestion will cause irritation to the gastrointestinal system with nausea, vomiting, convulsions, dyspnea, jaundice, tremor, confusion, and nervousness. It has also been found to be

hepatotoxic (toxic to the liver) and nephrotoxic (toxic to the kidneys).

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to *p*-dinitrobenzene and can last for months or even years:

Cancer Hazards: Some studies have suggested that exposure to *p*-dinitrobenzene causes cancer in some test animals. While there is no evidence of carcinogenicity of this chemical in humans or animals, it is still considered a *suspected* carcinogen by some authorities.

Reproductive Hazard: According to information presented in the references, *p*-dinitrobenzene has not been adequately tested for its ability to adversely affect reproductively in animals.

Other Chronic Effects: High or repeated lower skin or inhalation exposures can cause liver or kidney disorders. Symptoms of late toxicity include secondary anemia, liver damage, irritability, weakness, headache, anorexia, weight loss, nausea, vomiting, cyanosis, dyspnea, and skin disorders. There may also be paresis in the feet, ankles, hands, and feet.

🔒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with *p*-dinitrobenzene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable when working with or around *p*-dinitrobenzene. Exposure level is low (1 ppm) and difficult to monitor. For exposures above the PEL, use an MSHA/NIOSH-approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with *p*-dinitrobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *p*-dinitrobenzene is used or stored.

Before beginning employment with *p*-dinitrobenzene and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- Kidney and liver function tests.
- Complete blood count.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Kidney and liver function tests.
- Complete blood count.
- Consider possible reactions caused by alcohol consumption and/or medications.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Physicians should note that symptoms may be delayed, so victim should be kept under observation. The methemoglobin concentration should be determined at regular intervals until indications of full reduction to hemoglobin. For ingestion, gastric lavage is suggested followed by saline catharsis.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to *p*-dinitrobenzene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on

the health and safety hazards of *p*-dinitrobenzene should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to *p*-dinitrobenzene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of *p*-dinitrobenzene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *p*-dinitrobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

p-Dinitrobenzene is normally considered a combustible solid, but it can also appear in mixed solutions. Its dusts can form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, caustics, and some metals (such as zinc and tin). Contact with either can cause fire or explosion. Prolonged contact with heat may result in an explosion due to spontaneous decomposition. Therefore, special consideration is required during any emergency situation involving a leak or spill of *p*-dinitrobenzene. Should *p*-dinitrobenzene ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

p-Dinitrobenzene may enter the environment through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *p*-dinitrobenzene.

Insufficient data are available on the short-term effects of *p*-dinitrobenzene exposure to aquatic life, plants, birds or land animals.

🌱 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of *p*-dinitrobenzene to aquatic life, plants, birds, or land animals.

💧 Water Solubility

p-Dinitrobenzene is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 Persistence in the Environment

p-Dinitrobenzene is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of *p*-dinitrobenzene found in fish tissue is expected to be somewhat higher than the average concentration of *p*-dinitrobenzene in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *p*-dinitrobenzene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated

for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If *p*-dinitrobenzene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *p*-dinitrobenzene. If *p*-dinitrobenzene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet mop spill area to collect residue.
- It may be necessary to dispose of *p*-dinitrobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving *p*-dinitrobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the terms "carcinogen" or "cancer" are used, public emotion, hysteria, and ignorance can run equally high. This

should be a consideration during the development of public relation policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

DINITRO-O-CRESOL

CAS: 534-52-1

**IDENTIFICATION AND TYPICAL USES**

Dinitro-o-cresol is a yellow, odorless solid that appears as a powder. A dormant ovicidal spray for fruit trees (highly phototoxic and cannot be used successfully on actively growing plants), a selective herbicide as well as an insecticide.

RISK ASSESSMENT: HEALTH**General Assessment**

Dinitro-o-cresol exhibits cumulative toxicity in humans. Although the specific route of exposure has not been accurately determined, it is believed to be a human poison by *inhalation*, *ingestion*, and *skin absorption*. It is an irritant to the eyes and skin. It is a confirmed carcinogen in animals. Mutation data (genetic changes) have been reported in test animals. The human carcinogenicity of this compound has not been adequately investigated.

Inhalation, ingestion, and absorption can cause a variety of toxic systemic effects. Symptoms of exposure include an initial false sense of well-being followed by somnolence (sleepiness or unnatural drowsiness), headache, fever, lassitude (weakness or exhaustion), profuse sweating, excessive thirst, tachycardia (abnormally rapid heart rate), hyperpnea (abnormal increase in depth and rate of respiration), cough, shortness of breath, coma, and death. On examination, brain recordings from specific areas of the central nervous, cardiac, and gastrointestinal systems may show functional changes.

Skin or eye contact will result in irritation and possible local necrosis (tissue damage) at point of contact.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to dinitro-o-cresol:

Skin: Irritation and possible tissue damage. Will pass through unbroken skin to cause dangerous systemic effects.

Eye: Irritation with damage to the surrounding tissue. If not removed immediately, damage may be more severe and permanent.

Lung: Mild irritation to the respiratory tract and associated mucosa. Not particularly damaging to the lungs on acute exposures. Primary effects of inhalation are the subsequent absorption into the body leading to toxic systemic effects.

CNS: Causes unspecified changes in the function of the central nervous system with euphoria, headache, fever, lassitude, sweating, thirst, hyperpnea, coma, and even death.

Other: Ingestion will cause a variety of systemic effects, including euphoria, sweating, increased basal metabolism, yellow urine, marked thirst, vomiting, convulsions, coma, and death. These may be due to this compound's apparent ability to affect the function of the central nervous system (CNS) and the endocrine system.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to dinitro-o-cresol and can last for months or even years:

Cancer Hazards: According to the information available in the references, dinitro-o-cresol has not been adequately tested for its ability to cause cancer in test animals. Experimental mutation data have been reported and many scientists believe that such chemicals may have the ability to cause cancer. This, however, requires much more study and research before any claims of carcinogenicity can be accurately asserted.

Reproductive Hazard: According to information presented in the references, dinitro-o-cresol has not been adequately tested for its ability to adversely affect reproductively in animals.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with dinitro-o-cresol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dinitro-o-cresol. The exposure level is low (0.2 mg/m^3) and difficult to monitor. Therefore, an MSHA/NIOSH-approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dinitro-o-cresol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where dinitro-o-cresol is used or stored.

Before beginning employment with dinitro-o-cresol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- ☑ Complete blood count (establish baseline).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Complete blood count (compare to baseline). Some authorities suggest all exposed workers have blood tests regularly to determine the level of the substance present. Further contact with dinitro-o-cresol should be avoided if the blood levels exceed 20 micrograms per gram.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. It is suggested that physicians try application of ice packs to promote heat loss. Fluids and electrolytes should be replaced.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to dinitro-o-cresol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of dinitro-o-cresol should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to dinitro-o-cresol, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered only by personnel

who have been specifically trained on the hazards of dinitro-o-cresol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of dinitro-o-cresol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Dinitro-o-cresol is normally considered a non-combustible solid, but it can often appear in mixtures with combustible or flammable solutions. Its dusts may form explosive mixtures in air, especially in confined areas. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers (such as chlorine, fluorine, and bromine) and contact can cause fire or explosion. Prolonged contact with heat may result in an explosion due to the potential for spontaneous decomposition. Therefore, special consideration is required during any emergency situation involving a leak or spill of dinitro-o-cresol. Should dinitro-o-cresol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Dinitro-o-cresol may enter the environment through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dinitro-o-cresol.

Insufficient data are available on the short-term effects of dinitro-o-cresol exposure to aquatic life, plants, birds or land animals.

☪ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of dinitro-o-cresol to aquatic life, plants, birds, or land animals.

💧 Water Solubility

Dinitro-o-cresol is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 Persistence in the Environment

Dinitro-o-cresol is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of dinitro-o-cresol found in fish tissue is expected to be somewhat higher than the average concentration of dinitro-o-cresol in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dinitro-o-cresol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If dinitro-o-cresol should

contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dinitro-*o*-cresol. If dinitro-*o*-cresol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet-mop spill area to collect residue.
- ☑ It may be necessary to dispose of dinitro-*o*-cresol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dinitro-*o*-cresol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

DINITROPHENOL

CAS: 25550-58-7

**IDENTIFICATION AND TYPICAL USES**

Dinitrophenol is a yellow, odorless solid that appears as a powder. It is used in the manufacture of dyes, especially sulfur colors, in picric acid picramic acid, in the preservation of lumber, in the manufacture of the photographic developer diaminophenol hydrochloride, in explosives manufacture, as an indicator, and a reagent for potassium and ammonium ions.

RISK ASSESSMENT: HEALTH**General Assessment**

Dinitrophenol is a deadly human poison by *ingestion*, with equally toxic systemic consequences occurring by way of *inhalation*, and skin contact (*absorption*). It has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. Its carcinogenic properties are unknown. Liver or kidney damage can occur up to 3 days following exposure (in test animals).

Inhalation can result in headache, coughing, profuse sweating, marked thirst, intense fatigue, high fever, rapid pulse or heart rate (tachycardia), warm and flushed skin, rapid respiration (tachypnea), anxiety and confusion, convulsions, loss of consciousness, pulmonary edema (fluid in the lungs), and death due to circulatory or respiratory collapse. Exposure may also lead to a deadly buildup of fluids in the lungs in a condition known as pulmonary edema. This is a medical emergency requiring immediate attention. Symptoms of cough, tightness in chest, congestion, and dyspnea can be delayed up to 48 hours, creating a false sense of security with regard to health exposure risk.

Skin contact will result in nearly immediate yellow staining, irritation, swelling, redness, blisters, and de-

layed systemic effects from absorption with symptoms nearly identical to those of inhalation. Eye contact causes burning pain, tearing, and inflammation of the eyelids. If not removed immediately, damage to vision may occur.

Ingestion can cause painful burning of the mouth and throat, salivation, dizziness, nausea and vomiting, the appearance of bright yellow stools, and the symptoms of systemic poisoning similar to those of inhalation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to dinitrophenol:

- Skin:** Irritation with yellowing of skin and possible tissue damage. Will pass through unbroken skin to cause dangerous systemic effects.
- Eye:** Irritation with damage to the surrounding tissue. If not removed immediately, damage may be more severe and permanent.
- Lung:** Severe irritation to the respiratory tract and associated mucosa. Can cause coughing, congestion, and possibly pulmonary edema (fluid in the lungs), which can be fatal.
- CNS:** Can cause confusion, anxiety, headache, changes in the function of the respiratory and circulatory systems, convulsions, coma.
- Other:** Can cause a disruption in cellular metabolism in all tissues resulting in high fever, elevated blood pressure, pulse, and respiration. Can also cause death by hyperthermia. Effects are more severe in hot work environments.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to dinitrophenol and can last for months or even years:

Cancer Hazards: According to the information available in the references, dinitrophenol has not been adequately tested for its ability to cause cancer in test animals. Experimental mutation data have been reported and many scientists believe that such chemicals may have the ability to cause cancer. This, however, requires much more study and research before any claims of carcinogenicity can be accurately asserted.

Reproductive Hazard: According to information presented in the references, dinitrophenol has been shown to cause adverse effects in reproduction in animals. It is considered an experimental teratogen. Human effects in this regard are inconclusive and require additional research.

Other Chronic Effects: Long-term exposures can result in damage to the liver or kidneys. Hypersensitivity may also result from repeated exposures.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with dinitrophenol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dinitrophenol. The exposure level is low (0.2 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dinitrophenol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where dinitrophenol is used or stored.

Before beginning employment with dinitrophenol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- ☑ Complete blood count (establish baseline).
- ☑ Urinalysis (establish baseline nitrophenol levels).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Complete blood count (compare to baseline).
- ☑ Urinalysis (compare to baseline).
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- ☑ Lung function tests.
- ☑ Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Physician should monitor fluids and electrolytes, control hyperthermia, and test for dinitrophenol or its metabolite (aminophenol) in the urine using Derrian's Test. The biological half-life of dinitrophenol is 5-14 days.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to dinitrophenol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of dinitrophenol should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to dinitrophenol, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of dinitrophenol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of dinitrophenol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Dinitrophenol is normally considered a flammable solid. In solution, it can often appear in mixtures with other combustible or flammable commodities. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers and contact can cause fire or explosion. It forms explosive salts in contact with alkalis or with ammonia. Prolonged contact with heat may result in an explosion due to spontaneous decomposition. Therefore, special consideration is required during any emergency situation involving a leak or spill of dinitrophenol. Should dinitrophenol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Dinitrophenol may enter the environment through its intended use as an insecticide, as well as through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dinitrophenol.

Dinitrophenol has moderate acute toxicity to aquatic life and mild acute toxicity to plant life. Insufficient data are available on the short-term effects of dinitrophenol exposure to birds or land animals.

🕒* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Dinitrophenol has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of dinitrophenol to plants, birds, or land animals.

💧 *Water Solubility*

Dinitrophenol is slightly soluble in cold water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Dinitrophenol is slightly persistent in water, with an ecological half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of dinitrophenol found in fish tissue is expected to be somewhat higher than the average concentration of dinitrophenol in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and

quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dinitrophenol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If dinitrophenol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dinitrophenol. If dinitrophenol is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet-mop spill area to collect residue.
- It may be necessary to dispose of dinitrophenol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dinitrophenol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious ex-

penditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Special Fire Fighting Procedures Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Use water spray to keep fire-exposed containers cool. Move containers from fire if it can be done without risk. Fight fire from a distance or protected position, if possible. | | | | | |
| Unusual Fire and Explosion Hazards Containers may explode in fire. Fires involving this material should be considered an explosion hazard. Extremely explosive in dry form when exposed to heat, flame, or shock. | | | | | |

| SECTION V - REACTIVITY DATA | | | | |
|---|---|--|--------------------------------|--|
| Stability | | Conditions to Avoid 2,3-Dinitrophenol is normally stable. It will remain stable in mixtures up to 15% by weight with water. It becomes explosive when dry and subjected to shock, heat, or flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, (such as chlorine, bromine, and fluorine), and steam. It will form explosive salts with alkalis and/or ammonia. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of 2,3-dinitrophenol is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, 2,3-dinitrophenol can emit highly toxic/poisonous gases, including carbon dioxide and oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Can cause headache, coughing, sweating, thirst, intense fatigue, high fever, rapid pulse, warm and flushed skin, rapid and difficult breathing, anxiety, confusion, convulsions, loss of consciousness, pulmonary edema (fluid in lungs), and death. | | | | |
| ABSORPTION: Irritation with yellow staining, redness, swelling, blisters, and delayed symptoms like those of inhalation (will pass through skin to cause same toxic systemic effects). | | | | |
| INGESTION: Burning of mouth and throat, salivation, dizziness, nausea, vomiting, bright yellow stool, and symptoms of inhalation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Skin, respiratory system, CNS, CVS, liver, kidney |
| Medical Conditions Generally Aggravated by Exposure None reported. However, existing thyroid, liver, kidney, and cardiovascular diseases may be aggravated. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. Yellow discoloration need not be totally removed to prevent absorption. For inhalation: Remove the person from exposure. Provide CPR if required. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Unless advised otherwise, give 1-2 glasses of water and induce vomiting, then give 2 tablespoons of activated charcoal in 8 ounces of water. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Minimize dust generation. Do NOT dry sweep. Use a vacuum equipped with a high efficiency particulate air (HEPA) filter instead. Collect and dispose of in sealed drum. If in run-off, dike area to contain, cover with absorbent (vermiculite or other) and dispose of in sealed drum. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from heat or flame. Heat may cause containers to build up pressure and explode. Store in detached facility away from main plant or facility. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where 2,3-dinitrophenol is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL is low and difficult to monitor. For any exposure level, recommend a MSHA/NIOSH-approved supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Butyl Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

2,3-DINITROPHENOL

CAS: 66-56-8

**IDENTIFICATION AND TYPICAL USES**

2,3-Dinitrophenol is a yellow, odorless solid that appears as a powder. It is used in the manufacture of dyes, especially sulfur colors, in picric acid picramic acid, in the preservation of lumber, in the manufacture of the photographic developer diaminophenol hydrochloride, in explosives manufacture as a component in shell and bomb charges, as an indicator, and a reagent for potassium and ammonium ions.

RISK ASSESSMENT: HEALTH**General Assessment**

2,3-Dinitrophenol is a deadly human poison by *ingestion*, with equally toxic systemic consequences occurring by way of *inhalation*, and skin contact (*absorption*). It has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. Its carcinogenic properties are unknown. Liver or kidney damage can occur up to 3 days following exposure. It is a powerful stimulant of the metabolism by excessive oxidation.

Inhalation can result in headache, coughing, profuse sweating, marked thirst, intense fatigue, high fever, rapid pulse or heart rate (tachycardia), warm and flushed skin, rapid respiration (tachypnea), anxiety and confusion, convulsions, loss of consciousness, pulmonary edema (fluid in the lungs), and death due to circulatory or respiratory collapse. Exposure may also lead to a deadly buildup of fluids in the lungs in a condition known as pulmonary edema. This is a medical emergency requiring immediate attention. Symptoms can be delayed up to 48 hours, creating a false sense of security with regard to health exposure risk.

Skin contact will result in nearly immediate yellow staining, irritation, swelling, redness, blisters, and delayed systemic effects from absorption with symptoms identical to those of inhalation. It is also a skin allergen. Eye contact causes burning pain, tearing, and inflammation of the eyelids.

Ingestion can cause painful burning of the mouth and throat, salivation, dizziness, nausea and vomiting, the appearance of bright yellow stools, and the symptoms of systemic poisoning similar to those of inhalation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to 2,3-dinitrophenol:

- Skin:** Irritation with yellowing of skin and possible tissue damage. Can cause skin allergies. Will pass through unbroken skin to cause dangerous systemic effects.
- Eye:** Irritation with damage to the surrounding tissue. If not removed immediately, damage may be more severe and permanent.
- Lung:** Severe irritation to the respiratory tract and associated mucosa. Can cause coughing, congestion, and possibly pulmonary edema (fluid in the lungs), which can be fatal.
- CNS:** Can cause confusion, anxiety, headache, changes in the function of the respiratory and circulatory systems, convulsions, coma.
- Other:** Can cause a disruption in cellular metabolism in all tissues resulting in high fever, elevated blood pressure, pulse, and respiration. Can

also cause death by hyperthermia. Effects are more severe in hot work environments.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to 2,3-dinitrophenol and can last for months or even years:

Cancer Hazards: According to the information available in the references, 2,3-dinitrophenol has not been adequately tested for its ability to cause cancer in test animals. Experimental mutation data have been reported.

Reproductive Hazard: According to information presented in the references, 2,3-dinitrophenol has not been adequately tested for its ability to adversely affect reproduction. However, a similar compound, 2,4-dinitrophenol, has demonstrated teratogenic effects in test animals. Human effects in this regard are inconclusive and require additional research.

Other Chronic Effects: Long-term exposures can result in damage to the liver or kidneys. Hypersensitivity may also result from repeated exposures.

🔒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with 2,3-dinitrophenol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 2,3-dinitrophenol. The exposure level is low (0.2 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 2,3-dinitrophenol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 2,3-dinitrophenol is used or stored.

Before beginning employment with 2,3-dinitrophenol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- Complete blood count (establish baseline).
- Urinalysis (establish baseline nitrophenol levels).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Complete blood count (compare to baseline).
- Urinalysis (compare to baseline).
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure).
- Lung function tests.
- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Physician should monitor fluids and electrolytes, control hyperthermia, and test for dinitrophenol or its metabolite (aminophenol) in the urine using Derrian's Test. The biological half-life of 2,3-dinitrophenol is 5-14 days.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to 2,3-dinitrophenol and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of 2,3-dinitrophenol should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 2,3-dinitrophenol, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of 2,3-dinitrophenol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 2,3-dinitrophenol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

2,3-Dinitrophenol is normally considered a flammable solid. In solution, it can often appear in mixtures with other combustible or flammable commodities. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers and contact can cause fire or explosion. It forms explosive salts in contact with alkalis or with ammonia. Prolonged contact with heat may result in an explosion due to spontaneous decomposition. Therefore, special consideration is required during any emergency situation involving a leak or spill of 2,3-dinitrophenol. Should 2,3-dinitrophenol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

2,3-Dinitrophenol may enter the environment through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 2,3-dinitrophenol. Insufficient data are available on the short-term effects of 2,3-dinitrophenol exposure to aquatic life, plants, birds or land animals.

☠* Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available on the long-term effects of 2,3-dinitrophenol to aquatic life, plants, birds, or land animals.

💧 Water Solubility

2,3-Dinitrophenol is slightly soluble in cold water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 Persistence in the Environment

2,3-Dinitrophenol is slightly persistent in water, with an ecological half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

It is not known if 2,3-dinitrophenol will accumulate in the edible tissues of fish.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 2,3-dinitrophenol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings

designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 2,3-dinitrophenol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 2,3-dinitrophenol. If 2,3-dinitrophenol is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet mop spill area to collect residue.
- It may be necessary to dispose of 2,3-dinitrophenol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 2,3-dinitrophenol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

2,4-DINITROPHENOL

CAS: 51-28-5

**IDENTIFICATION AND TYPICAL USES**

2,4-Dinitrophenol is a yellow, odorless solid that appears as a powder. It is used in the manufacture of dyes, especially sulfur colors, in picric acid picramic acid, in the preservation of lumber, in the manufacture of the photographic developer diaminophenol hydrochloride, in explosives manufacture, as an indicator, and a reagent for potassium and ammonium ions.

RISK ASSESSMENT: HEALTH***General Assessment***

2,4-Dinitrophenol is a human poison by *ingestion*, with equally toxic systemic consequences occurring by way of *inhalation*, and skin contact (*absorption*). It has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. Its carcinogenic properties are unknown. Liver or kidney damage can occur up to 3 days following exposure.

Inhalation can result in headache, coughing, profuse sweating, marked thirst, intense fatigue, high fever, rapid pulse or heart rate (tachycardia), warm and flushed skin, difficulty in breathing (tachypnea), anxiety and confusion, convulsions, loss of consciousness, pulmonary edema (fluid in the lungs), and death due to circulatory or respiratory collapse. Exposure may also lead to a deadly buildup of fluids in the lungs in a condition known as pulmonary edema. This is a medical emergency requiring immediate attention. Symptoms can be delayed up to 48 hours, creating a false sense of security with regard to health exposure risk.

Skin contact will result in nearly immediate yellow staining, irritation, swelling, redness, blisters, and delayed systemic effects from absorption with symptoms identical to those of inhalation. Eye contact causes burning pain, tearing, and inflammation of the eyelids.

Ingestion can cause painful burning of the mouth and throat, salivation, dizziness, nausea and vomiting, the appearance of bright yellow stools, and the symptoms of systemic poisoning similar to those of inhalation.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to 2,4-dinitrophenol:

- Skin:** Irritation with yellowing of skin and possible tissue damage. Will pass through unbroken skin to cause dangerous systemic effects.
- Eye:** Irritation with damage to the surrounding tissue. If not removed immediately, damage may be more severe and permanent.
- Lung:** Severe irritation to the respiratory tract and associated mucosa. Can cause coughing, congestion, and possibly pulmonary edema (fluid in the lungs), which can be fatal.
- CNS:** Can cause confusion, anxiety, headache, changes in the function of the respiratory and circulatory systems, convulsions, coma.
- Other:** Can cause a disruption in cellular metabolism in all tissues resulting in high fever, elevated

blood pressure, pulse, and respiration. Can also cause death by hyperthermia. Effects are more severe in hot work environments.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to 2,4-dinitrophenol and can last for months or even years:

Cancer Hazards: According to the information available in the references, 2,4-dinitrophenol has not been adequately tested for its ability to cause cancer in test animals. Experimental mutation data have been reported and many scientists believe that such chemicals may have the ability to cause cancer. This, however, requires much more study and research before any claims of carcinogenicity can be accurately asserted.

Reproductive Hazard: According to information presented in the references, 2,4-dinitrophenol has been shown to cause adverse effects in reproduction in animals. It is considered an experimental teratogen. Human effects in this regard are inconclusive and require additional research.

Other Chronic Effects: Long-term exposures can result in damage to the liver or kidneys. Hypersensitivity may also result from repeated exposures.

🔒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with 2,4-dinitrophenol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 2,4-dinitrophenol. The exposure level is low (0.2 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemi-

cal dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 2,4-dinitrophenol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 2,4-dinitrophenol is used or stored.

Before beginning employment with 2,4-dinitrophenol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- Complete blood count (establish baseline).
- Urinalysis (establish baseline nitrophenol levels).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Complete blood count (compare to baseline).
- Urinalysis (compare to baseline).
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure).
- Lung function tests.
- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Physician should monitor fluids and electrolytes, control hyperthermia, and test for dinitrophenol or its metabolite (aminophenol) in the urine using Derrian's Test. The biological half-life of 2,4-dinitrophenol is 5-14 days.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to 2,4-dinitrophenol and at the end of the work shift or before eating, drinking, or smoking.

- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 2,4-dinitrophenol should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 2,4-dinitrophenol, emergency shower facilities should also be provided in the work area.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of working with and around 2,4-dinitrophenol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 2,4-dinitrophenol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

2,4-Dinitrophenol is normally considered a flammable solid. In solution, it can often appear in mixtures with other combustible or flammable commodities. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers and contact can cause fire or explosion. It forms explosive salts in contact with alkalis or with ammonia. Prolonged contact with heat may result in an explosion due to spontaneous decomposition. Therefore, special consideration is required during any emergency situation involving a leak or spill of 2,4-dinitrophenol. Should 2,4-dinitrophenol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

2,4-Dinitrophenol may enter the environment through its intended use as an insecticide, through agricultural use, as well as through municipal waste discharges, industrial effluents, or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 2,4-dinitrophenol.

2,4-Dinitrophenol has moderate acute toxicity to aquatic life and mild acute toxicity to plant life. Insufficient data are available on the short-term effects of 2,4-dinitrophenol exposure to birds or land animals.

🌱* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

2,4-Dinitrophenol has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of 2,4-dinitrophenol to plants, birds, or land animals.

💧 *Water Solubility*

2,4-Dinitrophenol is slightly soluble in cold water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

2,4-Dinitrophenol is slightly persistent in water, with a half-life between 2 and 20 days. The ecological half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 2,4-dinitrophenol found in fish tissue is expected to be somewhat higher than the average concentration of 2,4-dinitrophenol in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling

(per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 2,4-dinitrophenol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 2,4-dinitrophenol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 2,4-dinitrophenol. If 2,4-dinitrophenol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet mop spill area to collect residue.
- ☑ It may be necessary to dispose of 2,4-dinitrophenol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 2,4-dinitrophenol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result

from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

2,5-DINITROPHENOL

CAS: 329-71-5

**IDENTIFICATION AND TYPICAL USES**

2,5-Dinitrophenol is a yellow, odorless solid that appears as a powder. It is used in the manufacture of dyes, especially sulfur colors, in picric acid picramic acid, in the preservation of lumber, in the manufacture of the photographic developer diaminophenol hydrochloride, in explosives manufacture, as an indicator, and a reagent for potassium and ammonium ions.

RISK ASSESSMENT: HEALTH**General Assessment**

2,5-Dinitrophenol is a deadly human poison by *ingestion*, with equally toxic systemic consequences occurring by way of *inhalation*, and skin contact (*absorption*). It has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. Its carcinogenic properties are unknown. Liver or kidney damage can occur up to 3 days following exposure (in test animals).

Inhalation can result in headache, coughing, profuse sweating, marked thirst, intense fatigue, high fever, rapid pulse or heart rate (tachycardia), warm and flushed skin, rapid respiration (tachypnea), anxiety and confusion, convulsions, loss of consciousness, pulmonary edema (fluid in the lungs), and death due to circulatory or respiratory collapse. Exposure may also lead to a deadly buildup of fluids in the lungs in a condition known as pulmonary edema. This is a medical emergency requiring immediate attention. Symptoms of cough, tightness in chest, congestion, and dyspnea can be delayed up to 48 hours, creating a false sense of security with regard to health exposure risk.

Skin contact will result in nearly immediate yellow staining, irritation, swelling, redness, blisters, and de-

layed systemic effects from absorption with symptoms nearly identical to those of inhalation. Eye contact causes burning pain, tearing, and inflammation of the eyelids. If not removed immediately, damage to vision may occur.

Ingestion can cause painful burning of the mouth and throat, salivation, dizziness, nausea and vomiting, the appearance of bright yellow stools, and the symptoms of systemic poisoning similar to those of inhalation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to 2,5-dinitrophenol:

- Skin:** Irritation with yellowing of skin and possible tissue damage. Will pass through unbroken skin to cause dangerous systemic effects.
- Eye:** Irritation with damage to the surrounding tissue. If not removed immediately, damage may be more severe and permanent.
- Lung:** Severe irritation to the respiratory tract and associated mucosa. Can cause coughing, congestion, and possibly pulmonary edema (fluid in the lungs), which can be fatal.
- CNS:** Can cause confusion, anxiety, headache, changes in the function of the respiratory and circulatory systems, convulsions, coma.
- Other:** Can cause a disruption in cellular metabolism in all tissues resulting in high fever, elevated blood pressure, pulse, and respiration. Can also cause death by hyperthermia. Effects are more severe in hot work environments.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to 2,5-dinitrophenol and can last for months or even years:

Cancer Hazards: According to the information available in the references, 2,5-dinitrophenol has not been adequately tested for its ability to cause cancer in test animals. Experimental mutation data have been reported and many scientists believe that such chemicals may have the ability to cause cancer. This, however, requires much more study and research before any claims of carcinogenicity can be accurately asserted.

Reproductive Hazard: According to information presented in the references, 2,5-dinitrophenol has been shown to cause adverse effects in reproduction in animals. It is considered an experimental teratogen. Human effects in this regard are inconclusive and require additional research.

Other Chronic Effects: Long-term exposures can result in damage to the liver or kidneys. Hypersensitivity may also result from repeated exposures.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with 2,5-dinitrophenol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 2,5-dinitrophenol. The exposure level is low (0.2 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 2,5-dinitrophenol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 2,5-dinitrophenol is used or stored.

Before beginning employment with 2,5-dinitrophenol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- Complete blood count (establish baseline).
- Urinalysis (establish baseline nitrophenol levels).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Complete blood count (compare to baseline).
- Urinalysis (compare to baseline).
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure).
- Lung function tests.
- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Physician should monitor fluids and electrolytes, control hyperthermia, and test for dinitrophenol or its metabolite (aminophenol) in the urine using Derrian's Test. The biological half-life of 2,5-dinitrophenol is 5-14 days.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to 2,5-dinitrophenol and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of 2,5-dinitrophenol should be communicated to all exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 2,5-dinitrophenol, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of 2,5-dinitrophenol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 2,5-dinitrophenol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

2,5-Dinitrophenol is normally considered a flammable solid. In solution, it can often appear in mixtures with other combustible or flammable commodities. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers and contact can cause fire or explosion. It forms explosive salts in contact with alkalis or with ammonia. Prolonged contact with heat may result in an explosion due to spontaneous decomposition. Therefore, special consideration is required during any emergency situation involving a leak or spill of 2,5-dinitrophenol. Should 2,5-dinitrophenol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

2,5-Dinitrophenol may enter the environment through its intended use as an insecticide, as well as through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 2,5-dinitrophenol.

2,5-Dinitrophenol has moderate acute toxicity to aquatic life and mild acute toxicity to plant life. Insufficient data are available on the short-term effects of 2,5-dinitrophenol exposure to birds or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

2,5-Dinitrophenol has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of 2,5-dinitrophenol to plants, birds, or land animals.

💧 *Water Solubility*

2,5-Dinitrophenol is slightly soluble in cold water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

2,5-Dinitrophenol is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 2,5-dinitrophenol found in fish tissue is expected to be somewhat higher than the average concentration of 2,5-dinitrophenol in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and

quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 2,5-dinitrophenol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 2,5-dinitrophenol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 2,5-dinitrophenol. If 2,5-dinitrophenol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet-mop spill area to collect residue.
- ☑ It may be necessary to dispose of 2,5-dinitrophenol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 2,5-dinitrophenol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious

expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

3,4-DINITROPHENOL

CAS: 577-71-9

**IDENTIFICATION AND TYPICAL USES**

3,4-Dinitrophenol is a yellow, odorless solid that appears as a powder. It is used in the manufacture of dyes, especially sulfur colors, in picric acid picramic acid, in the preservation of lumber, in the manufacture of the photographic developer diaminophenol hydrochloride, in explosives manufacture, as an indicator, and a reagent for potassium and ammonium ions.

RISK ASSESSMENT: HEALTH**General Assessment**

3,4-Dinitrophenol is a deadly human poison by unspecified routes of exposure. Therefore, all routes of exposure (*ingestion, inhalation, and skin absorption*) are suspect in this regard. While the 3,4-isomer of dinitrophenol has not been specifically tested for its ability to adversely affect reproduction, the very closely related compound 2,4-dinitrophenol, has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. Its carcinogenic properties are unknown. Liver or kidney damage can occur up to 3 days following exposure.

Inhalation can result in headache, coughing, profuse sweating, marked thirst, intense fatigue, high fever, rapid pulse or heart rate (tachycardia), warm and flushed skin, difficulty in breathing (tachypnea), anxiety and confusion, convulsions, loss of consciousness, pulmonary edema (fluid in the lungs), and death due to circulatory or respiratory collapse. Exposure may also lead to a deadly buildup of fluids in the lungs in a condition known as pulmonary edema. This is a medical emergency requiring immediate attention. Symptoms can be delayed up to 48 hours, creating a false sense of security with regard to health exposure risk.

Skin contact will result in nearly immediate yellow staining, irritation, swelling, redness, blisters, and delayed systemic effects from absorption with symptoms identical to those of inhalation. Eye contact causes burning pain, tearing, and inflammation of the eyelids.

Ingestion can cause painful burning of the mouth and throat, salivation, dizziness, nausea and vomiting, the appearance of bright yellow stools, and the symptoms of systemic poisoning similar to those of inhalation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to 3,4-dinitrophenol:

- Skin:** Irritation with yellowing of skin and possible tissue damage. Will pass through unbroken skin to cause dangerous systemic effects.
- Eye:** Irritation with damage to the surrounding tissue. If not removed immediately, damage may be more severe and permanent.
- Lung:** Severe irritation to the respiratory tract and associated mucosa. Can cause coughing, congestion, and possibly pulmonary edema (fluid in the lungs), which can be fatal.
- CNS:** Can cause confusion, anxiety, headache, changes in the function of the respiratory and circulatory systems, convulsions, coma.
- Other:** Can cause a disruption in cellular metabolism in all tissues resulting in high fever, elevated blood pressure, pulse, and respiration. Can also cause death by hyperthermia. Effects are more severe in hot work environments.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to 3,4-dinitrophenol and can last for months or even years:

Cancer Hazards: According to the information available in the references, 3,4-dinitrophenol has not been adequately tested for its ability to cause cancer in test animals. A closely related compound, 2,4-dinitrophenol, has been shown to produce mutagenic effects in test animals. Data on human effects are inconclusive.

Reproductive Hazard: According to information presented in the references, 3,4-dinitrophenol not been adequately tested for its ability to produce reproductive effects in test animals. The 2,4-isomer of dinitrophenol, which is closely related to the 3,4-isomer, has been shown to adversely affect reproduction in animals. It is considered an experimental teratogen.

Other Chronic Effects: Long-term exposures can result in damage to the liver or kidneys. Hypersensitivity may also result from repeated exposures.

🔒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with 3,4-dinitrophenol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 3,4-dinitrophenol. The exposure level is low (0.2 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These

may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 3,4-dinitrophenol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 3,4-dinitrophenol is used or stored.

Before beginning employment with 3,4-dinitrophenol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- ☑ Complete blood count (establish baseline).
- ☑ Urinalysis (establish baseline nitrophenol levels).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Complete blood count (compare to baseline).
- ☑ Urinalysis (compare to baseline).
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure).
- ☑ Lung function tests.
- ☑ Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Physician should monitor fluids and electrolytes, control hyperthermia, and test for dinitrophenol or its metabolite (aminophenol) in the urine using Derrian's Test. The biological half-life of 3,4-dinitrophenol is 5-14 days.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to 3,4-dinitrophenol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 3,4-dinitrophenol

should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 3,4-dinitrophenol, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of 3,4-dinitrophenol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 3,4-dinitrophenol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

3,4-Dinitrophenol is normally considered a flammable solid. In solution, it can often appear in mixtures with other combustible or flammable commodities. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers and contact can cause fire or explosion. Should 3,4-dinitrophenol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

3,4-Dinitrophenol may enter the environment through its intended use as an insecticide, as well as through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after ani-

mals or plants are exposed to 3,4-dinitrophenol. Insufficient data are available on the short-term effects of 3,4-dinitrophenol exposure to aquatic life, plants, birds or land animals.

☀ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available on the long-term effects of 3,4-dinitrophenol to aquatic life, plants, birds, or land animals.

💧 Water Solubility

3,4-Dinitrophenol is slightly soluble in cold water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 Persistence in the Environment

3,4-Dinitrophenol is slightly persistent in water, with an ecological half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

It is not known if 3,4-dinitrophenol will accumulate in the edible tissues of fish.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 3,4-dinitrophenol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appro-

priate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 3,4-dinitrophenol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 3,4-dinitrophenol. If 3,4-dinitrophenol is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet-mop spill area to collect residue.
- It may be necessary to dispose of 3,4-dinitrophenol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 3,4-dinitrophenol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, 3,5-dinitrophenol can emit highly toxic/poisonous gases, including carbon dioxide and oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Can cause headache, coughing, sweating, thirst, intense fatigue, high fever, rapid pulse, warm and flushed skin, rapid and difficult breathing, anxiety, confusion, convulsions, loss of consciousness, pulmonary edema (fluid in lungs), and death. ABSORPTION: Irritation with yellow staining, redness, swelling, blisters, and delayed symptoms like those of inhalation (will pass through skin to cause same toxic systemic effects). INGESTION: Burning of mouth and throat, salivation, dizziness, nausea, vomiting, bright yellow stool, and symptoms of inhalation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Skin, respiratory system, CNS, CVS, liver, kidney |
| Medical Conditions Generally Aggravated by Exposure None reported. However, existing thyroid, liver, kidney, and cardiovascular diseases may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. Yellow discoloration need not be totally removed to prevent absorption. For inhalation: Remove the person from exposure. Provide CPR if required. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Unless advised otherwise, give 1-2 glasses of water and induce vomiting, then give 2 tablespoons of activated charcoal in 8 ounces of water. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Minimize dust generation. Do NOT dry sweep. Use a vacuum equipped with a high efficiency particulate air (HEPA) filter instead. Collect and dispose of in sealed drum. If in run-off, dike area to contain, cover with absorbent (vermiculite or other) and dispose of in sealed drum. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from heat or flame. Heat may cause containers to build up pressure and explode. Store in detached facility away from main plant or facility. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where 3,5-dinitrophenol is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) PEL is low and difficult to monitor. For any exposure level, recommend a MSHA/NIOSH-approved supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Butyl Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

3,5-DINITROPHENOLC₆H₄N₂O₅

CAS: 586-11-8

**IDENTIFICATION AND TYPICAL USES**

3,5-Dinitrophenol is a yellow, odorless solid that appears as a powder. It is used in the manufacture of dyes, especially sulfur colors, in picric acid picramic acid, in the preservation of lumber, in the manufacture of the photographic developer diaminophenol hydrochloride, in explosives manufacture, as an indicator, and a reagent for potassium and ammonium ions.

RISK ASSESSMENT: HEALTH**General Assessment**

3,5-Dinitrophenol is a deadly human poison by unspecified routes of exposure. Therefore, all routes of exposure (*ingestion, inhalation, and skin absorption*) are suspect in this regard. While the 3,5-isomer of dinitrophenol has not been specifically tested for its ability to adversely affect reproduction, the very closely related compound 2,4-dinitrophenol, has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. Its carcinogenic properties are unknown. Liver or kidney damage can occur up to 3 days following exposure.

Inhalation can result in headache, coughing, profuse sweating, marked thirst, intense fatigue, high fever, rapid pulse or heart rate (tachycardia), warm and flushed skin, difficulty in breathing (tachypnea), anxiety and confusion, convulsions, loss of consciousness, pulmonary edema (fluid in the lungs), and death due to circulatory or respiratory collapse. Exposure may also lead to a deadly buildup of fluids in the lungs in a condition known as pulmonary edema. This is a

medical emergency requiring immediate attention. Symptoms can be delayed up to 48-hours, creating a false sense of security with regard to health exposure risk.

Skin contact will result in nearly immediate yellow staining, irritation, swelling, redness, blisters, and delayed systemic effects from absorption with symptoms nearly identical to those of inhalation. Eye contact causes burning pain, tearing, and inflammation of the eyelids.

Ingestion can cause painful burning of the mouth and throat, salivation, dizziness, nausea and vomiting, the appearance of bright yellow stools, and the symptoms of systemic poisoning similar to those of inhalation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to 3,5-dinitrophenol:

- Skin:** Irritation with yellowing of skin and possible tissue damage. Will pass through unbroken skin to cause dangerous systemic effects.
- Eye:** Irritation with damage to the surrounding tissue. If not removed immediately, damage may be more severe and permanent.
- Lung:** Severe irritation to the respiratory tract and associated mucosa. Can cause coughing, congestion, and possibly pulmonary edema (fluid in the lungs), which can be fatal.

CNS: Can cause confusion, anxiety, headache, changes in the function of the respiratory and circulatory systems, convulsions, coma.

Other: Can cause a disruption in cellular metabolism in all tissues resulting in high fever, elevated blood pressure, pulse, and respiration. Can also cause death by hyperthermia. Effects are more severe in hot work environments.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to 3,5-dinitrophenol and can last for months or even years:

Cancer Hazards: According to the information available in the references, 3,5-dinitrophenol has not been adequately tested for its ability to cause cancer in test animals. A closely related compound, 2,4-dinitrophenol, has been shown to produce mutagenic effects in test animals. Data on human effects are inconclusive.

Reproductive Hazard: According to information presented in the references, 3,5-dinitrophenol not been adequately tested for its ability to produce reproductive effects in test animals. The 2,4-isomer of dinitrophenol, which is closely related to the 3,5-isomer, has been shown to adversely affect reproduction in animals. It is considered an experimental teratogen.

Other Chronic Effects: Long-term exposures can result in damage to the liver or kidneys. Hypersensitivity may also result from repeated exposures.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with 3,5-dinitrophenol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 3,5-dinitrophenol. The exposure level is low (0.2 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a sup-

plied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 3,5-dinitrophenol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 3,5-dinitrophenol is used or stored.

Before beginning employment with 3,5-dinitrophenol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- ☑ Complete blood count (establish baseline).
- ☑ Urinalysis (establish baseline nitrophenol levels).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Complete blood count (compare to baseline).
- ☑ Urinalysis (compare to baseline).
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure).
- ☑ Lung function tests.
- ☑ Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Physician should monitor fluids and electrolytes, control hyperthermia, and test for dinitrophenol or its metabolite (aminophenol) in the urine using Derrian's Test. The biological half-life of 3,5-dinitrophenol is 5-14 days.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release.

If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to 3,5-dinitrophenol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 3,5-dinitrophenol should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 3,5-dinitrophenol, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of 3,5-dinitrophenol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 3,5-dinitrophenol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

3,5-Dinitrophenol is normally considered a flammable solid. In solution, it can often appear in mixtures with other combustible or flammable commodities. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers and contact can cause fire or explosion. It forms explosive salts in contact with alkalis or with ammonia. Prolonged contact with heat may result in an explosion due to spontaneous decomposition. Therefore, special consideration is required during any emergency situation involving a leak or spill of 3,5-dinitrophenol. Should 3,5-dinitrophenol ever come into contact with these incompatible sub-

stances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible. 3,5-Dinitrophenol may enter the environment through its intended use as an insecticide, as well as through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 3,5-dinitrophenol. Insufficient data are available on the short-term effects of 3,5-dinitrophenol exposure to aquatic life, plants, birds or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available on the long-term effects of 3,5-dinitrophenol to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

3,5-Dinitrophenol is slightly soluble in cold water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

3,5-Dinitrophenol is slightly persistent in water, with a half-life between 2 and 20 days. The ecological half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

It is not known if 3,5-dinitrophenol will accumulate in the edible tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or

spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 3,5-dinitrophenol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 3,5-dinitrophenol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 3,5-dinitrophenol. If 3,5-dinitrophenol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solid spills for reuse or disposal. Wet mop spill area to collect residue.
- ☑ It may be necessary to dispose of 3,5-dinitrophenol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 3,5-dinitrophenol can present a significant threat to business operations.

The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Appearance and Odor

Orange to yellow crystalline solid with a slight characteristic odor. Usually shipped as molten.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 404°F (207°C) closed cup | Explosive Limits in Air % by Volume LEL: 0.3% at 474°F (245°C) UEL: Not Determined |
| NFPA Classification Combustible Solid | Autoignition Temperature Not Determined |

Extinguishing Media

Use carbon dioxide, water, or dry chemical from a protected location.

Special Fire Fighting Procedures

A carcinogenic. Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Use water spray to keep fire-exposed containers cool. Move containers from fire if it can be done without risk. Fight fire from a distance or protected position, if possible.

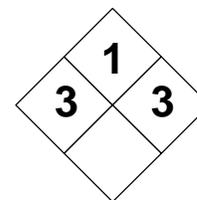

Unusual Fire and Explosion Hazards

Containers may explode in fire. Fires involving this material should be considered an explosion hazard. Extremely explosive in dry form when exposed to heat, flame, or shock. Decomposition is self-sustaining at 280°F (138°C).

| SECTION V - REACTIVITY DATA | | | | |
|--|--|--|--|--|
| Stability | | Conditions to Avoid Dinitrotoluene is explosive when exposed to heat, friction, or contamination. It can be detonated using a very strong initiating device. It is slightly sensitive to impact shock, especially in solid form. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, (such as chlorine, bromine, and fluorine), organic materials, strong reducing agents (such as sodium sulfide, zinc powder, sodium hyposulfite, and metallic hydrides), caustics, and metals. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of dinitrotoluene is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, dinitrotoluene can emit highly toxic/poisonous gases, including carbon dioxide and oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Can cause cyanosis, headache, irritability, anoxia, anemia, dizziness, weakness, nausea, vomiting, dyspnea, drowsiness, collapse, loss of consciousness, and death by cardiovascular collapse. ABSORPTION: Irritation, small blisters, redness, swelling, ulceration, and necrosis (will pass through skin to cause same toxic systemic effects as inhalation). Eye contact will result in burns, irritation of the lids, redness, swelling, pain on exposure to light, and tissue damage. INGESTION: Irritation of the mouth, throat, and stomach, stomach cramps, and diarrhea. | | | | |
| Carcinogenicity | NTP Listed? 5th Annual Report | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910-1000 Table Z-1 | Target Organs? Blood, liver, CVS, reproductive system, liver, skin |
| Medical Conditions Generally Aggravated by Exposure Persons with blood disorders may be at an increased risk if exposed to dinitrotoluene. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide CPR if required. Transfer to medical facility. If <u>swallowed:</u> Give large amounts of water or milk and seek medical attention. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources and ventilate area. Evacuate personnel not involved in cleanup. Stay up-wind. Cleanup crew should wear fully-encapsulating suits. Use water spray to reduce vapors. Collect spilled powders and place in sealed steel drums for disposal. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from heat or flame. Heat may cause containers to build up pressure and explode. Usually stored as a molten liquid. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where dinitrotoluene is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL is low and difficult to monitor. For any exposure to a suspected carcinogen, recommend a supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |

| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DINITROTOLUENEC₇H₆N₂O₄

CAS: 25321-14-6

**IDENTIFICATION AND TYPICAL USES**

Dinitrotoluene is an orange to yellow crystalline solid with a characteristic odor. It is normally shipped as a molten liquid. It is a mixture of numerous isomers of dinitrotoluene. It is used primarily in the manufacture of explosives and dyes, in organic synthesis, as a chemical intermediate, a plasticizer, and as a modifier for smokeless powders in the munitions industry.

RISK ASSESSMENT: HEALTH***General Assessment***

Dinitrotoluene is a human poison by *ingestion*, with equally toxic systemic consequences occurring by way of *inhalation*, and skin contact (*absorption*). It has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. It is a confirmed animal carcinogen and a suspected human carcinogen. Liver or kidney damage can occur up to 3 days following exposure.

Inhalation and skin absorption can result in cyanosis, methemoglobinemia, headache, irritability, dizziness, weakness, nausea, vomiting, dyspnea, drowsiness, and loss of consciousness. If allowed to go untreated, the result can be death due to cardiovascular collapse. Repeated exposures can lead to anemia, and liver damage. It has caused mutations and liver tumors in test animals.

Ingestion will result in irritation of the mouth and stomach, stomach cramps, and diarrhea. Possible systemic effects similar to inhalation and absorption may also occur. Ingestion of alcohol shortly before or after exposure may increase individual susceptibility to toxicity.

Skin contact will not only result in absorption, it will also produce irritation, small blisters, redness,

swelling, ulceration, and localized necrosis. Eye contact causes burning pain, irritation, redness, and swelling of the eyelids. There may be pain on exposure to light and severe eye damage. Contact with the molten liquid will cause thermal burns.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to dinitrotoluene:

Skin: Irritation and possible tissue damage. Will pass through unbroken skin to cause serious systemic effects.

Eye: Irritation, swelling, redness, pain on exposure to light, and potential damage to the surrounding tissue.

Lung: Irritation to the respiratory tract and associated mucosa. Absorption through the respiration process causes toxic systemic effects (including anemia and methemoglobinemia).

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to dinitrotoluene and can last for months or even years:

Cancer Hazards: According to the information available in the references, dinitrotoluene is a confirmed carcinogen in test animals. Its carcinogenic properties in humans is highly suspect. Experimental mutation data have been reported and many scientists believe that such chemicals may have the ability to cause cancer.

Reproductive Hazard: According to information presented in the references, dinitrotoluene has been

shown to cause adverse effects in reproduction in animals. It is considered an experimental teratogen. Human effects in this regard are inconclusive and require additional research.

Other Chronic Effects: Long-term exposures can result in anemia and possible liver damage. It is also known to cause mutations and tumors in the livers of test animals.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with dinitrotoluene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dinitrotoluene. The exposure level is low (1.5 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dinitrotoluene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where dinitrotoluene is used or stored.

Before beginning employment with dinitrotoluene and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- Liver and kidney function tests.
- Urinalysis (establish baseline).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Urinalysis (compare to baseline).
- Complete blood count.
- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to dinitrotoluene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of dinitrotoluene should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to dinitrotoluene, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of dinitrotoluene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of dinitrotoluene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possi-

ble contamination of the surrounding environmental mediums (water, soil, and air).

Dinitrotoluene is normally considered a combustible solid. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, caustics, and metals (such as tin and zinc). Contact with either of these can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of dinitrotoluene. Should dinitrotoluene ever come into contact with any incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Dinitrotoluene may enter the environment through its intended use as an insecticide, as well as through industrial effluents or spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dinitrotoluene.

Dinitrotoluene has high acute toxicity to aquatic life. Insufficient data are available on the short-term effects of dinitrotoluene exposure to plants, birds, or land animals.

Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Dinitrotoluene has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of dinitrotoluene to plants, birds, or land animals.

Water Solubility

Dinitrotoluene is nearly insoluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

Persistence in the Environment

Dinitrotoluene is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of dinitrotoluene found in fish tissue is expected to be somewhat higher than the average concentration of dinitrotoluene in the water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dinitrotoluene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If dinitrotoluene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dinitrotoluene.

If dinitrotoluene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.

- ☑ Use a water spray to knock-down vapors. Spills should be collected and placed in steel drums. Area should be flushed with hot water to remove solid particulates. Any liquids should be contained, as well as any liquid run-off.
- ☑ It may be necessary to dispose of dinitrotoluene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dinitrotoluene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "carcinogen," "cancer," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be properly considered whenever developing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

2,3-DINITROTOLUENEC₇H₆N₂O₄

CAS: 602-01-7

**IDENTIFICATION AND TYPICAL USES**

2,3-Dinitrotoluene is an orange to yellow crystalline solid with a characteristic odor. It is normally shipped as a molten liquid. It is one of numerous isomers of dinitrotoluene. It is used primarily in the manufacture of explosives and dyes, in organic synthesis, as a chemical intermediate, a plasticizer, and as a modifier for smokeless powders in the munitions industry.

RISK ASSESSMENT: HEALTH***General Assessment***

2,3-Dinitrotoluene is a human poison by *ingestion*, with equally toxic systemic consequences occurring by way of *inhalation*, and skin contact (*absorption*). The closely-related 2,4-isomer has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. It is also a confirmed animal carcinogen and a suspected human carcinogen. Liver or kidney damage can occur up to 3 days following exposure. While these effects have not been confirmed for the 2,3-isomer, extreme caution is recommended in use, handling, storage, or disposal.

Inhalation and skin absorption can result in cyanosis, methemoglobinemia, headache, irritability, dizziness, weakness, nausea, vomiting, dyspnea, drowsiness, and loss of consciousness. If allowed to go untreated, the result can be death due to cardiovascular collapse. Repeated exposures can lead to anemia and liver damage. It has caused mutations and liver tumors in test animals.

Ingestion will result in irritation of the mouth and stomach, stomach cramps, and diarrhea. Possible systemic effects similar to inhalation and absorption may also occur. Ingestion of alcohol shortly before or

after exposure may increase individual susceptibility to toxicity.

Skin contact will not only result in absorption, it will also produce irritation, small blisters, redness, swelling, ulceration, and localized necrosis. Eye contact causes burning pain, irritation, redness, and swelling of the eyelids. There may be pain on exposure to light and severe eye damage. Contact with the molten liquid will cause thermal burns.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to 2,3-dinitrotoluene:

- Skin:** Irritation and possible tissue damage. Will pass through unbroken skin to cause serious systemic effects.
- Eye:** Irritation, swelling, redness, pain on exposure to light, and potential damage to the surrounding tissue.
- Lung:** Irritation to the respiratory tract and associated mucosa. Absorption through the respiration process causes toxic systemic effects (including anemia and methemoglobinemia).

●* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to 2,3-dinitrotoluene and can last for months or even years:

Cancer Hazards: According to the information available in the references, the 2,4-isomer of dinitrotoluene is a confirmed carcinogen in test animals. Its carcinogenic properties in humans is highly suspect. Experimental mutation data have been reported and many scientists believe that such chemicals may have the

ability to cause cancer. It is not known whether 2,3-isomer of dinitrotoluene will cause these effects.

Reproductive Hazard: According to information presented in the references, 2,4-dinitrotoluene has been shown to cause adverse effects in reproduction in animals. It is considered an experimental teratogen. It is not known whether 2,3-isomer of dinitrotoluene will cause these effects. Human effects in this regard are inconclusive for both isomers.

Other Chronic Effects: Long-term exposures can result in anemia and possible liver damage. It is also known to cause mutations and tumors in the livers of animals.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with 2,3-dinitrotoluene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 2,3-dinitrotoluene. The exposure level is low (1.5 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 2,3-dinitrotoluene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where 2,3-dinitrotoluene is used or stored.

Before beginning employment with 2,3-dinitrotoluene and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- ☑ Liver and kidney function tests.
- ☑ Urinalysis (establish baseline).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Urinalysis (compare to baseline).
- ☑ Complete blood count.
- ☑ Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to 2,3-dinitrotoluene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 2,3-dinitrotoluene should be communicated to all exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 2,3-dinitrotoluene, emergency shower facilities should be provided.
- ☑ Personnel should not wear contaminated clothing home (family members can be exposed). Clothing should be laundered by persons who have been trained on the hazards of 2,3-dinitrotoluene.

RISK ASSESSMENT: ENVIRONMENT *General Assessment*

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 2,3-dinitrotoluene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

2,3-Dinitrotoluene is normally considered a combustible solid. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, caustics, and metals (such as tin and zinc). Contact with either of these can cause fire or explosion. Also, commercial grades will decompose at 482°F (250°C) with sustaining decomposition at 536°F (280°C). Therefore, special consideration is required during any emergency situation involving a leak or spill of 2,3-dinitrotoluene. Should 2,3-dinitrotoluene ever come into contact with any incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

2,3-Dinitrotoluene may enter the environment through its intended use as an insecticide, as well as through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 2,3-dinitrotoluene.

2,3-Dinitrotoluene has high acute toxicity to aquatic life. Insufficient data are available on the short-term effects of 2,3-dinitrotoluene exposure to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

2,3-Dinitrotoluene has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of 2,3-dinitrotoluene to plants, birds, or land animals.

💧 *Water Solubility*

2,3-Dinitrotoluene is nearly insoluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

🕒 *Persistence in the Environment*

2,3-Dinitrotoluene is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 2,3-dinitrotoluene found in fish tissue is expected to be somewhat higher than the average concentration of 2,3-dinitrotoluene in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 2,3-dinitrotoluene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 2,3-dinitrotoluene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery

plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 2,3-dinitro-toluene. If 2,3-dinitrotoluene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Use a water spray to knock-down vapors. Spills should be collected and placed in steel drums. Area should be flushed with hot water to remove solid particulates. Any liquids should be contained, as well as any liquid run-off.
- ☑ It may be necessary to dispose of 2,3-dinitrotoluene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 2,3-dinitrotoluene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "carcinogen," "cancer," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be properly considered whenever developing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Special Fire Fighting Procedures A carcinogenic. Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Use water spray to keep fire-exposed containers cool. Move containers from fire if it can be done without risk. Fight fire from a distance or protected position, if possible. | | | | | | |
| Unusual Fire and Explosion Hazards Containers may explode in fire. Fires involving this material should be considered an explosion hazard. Extremely explosive in dry form when exposed to heat, flame, or shock. Decomposition is self-sustaining at 280°F (138°C). | | | | | | |

| SECTION V - REACTIVITY DATA | | | | |
|--|-------------------------------------|--|--|--|
| Stability | | Conditions to Avoid 2,4-Dinitrotoluene is explosive when exposed to heat, friction, or contamination. It can be detonated using a very strong initiating device. It is slightly sensitive to impact shock, especially in solid form. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, (such as chlorine, bromine, and fluorine), organic materials, strong reducing agents (such as sodium sulfide, zinc powder, sodium hyposulfite, and metallic hydrides), caustics, and metals. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of 2,4-dinitrotoluene is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, 2,4-dinitrotoluene can emit highly toxic/poisonous gases, including carbon dioxide and oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Can cause cyanosis, headache, irritability, anoxia, anemia, dizziness, weakness, nausea, vomiting, dyspnea, drowsiness, collapse, loss of consciousness, and death by cardiovascular collapse. ABSORPTION: Irritation, small blisters, redness, swelling, ulceration, and necrosis (will pass through skin to cause same toxic systemic effects as inhalation). Eye contact will result in burns, irritation of the lids, redness, swelling, pain on exposure to light, and tissue damage. INGESTION: Irritation of the mouth, throat, and stomach, stomach cramps, and diarrhea. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | 5th Annual Report | No | 29 CFR 1910-1000 Table Z-1 | Blood, liver, CVS, reproductive system, liver, skin |
| Medical Conditions Generally Aggravated by Exposure Persons with blood disorders may be at an increased risk if exposed to 2,4-dinitrotoluene. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide CPR if required. Transfer to medical facility. If <u>swallowed:</u> Give large amounts of water or milk and seek medical attention. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources and ventilate area. Evacuate personnel not involved in cleanup. Stay up-wind. Cleanup crew should wear fully-encapsulating suits. Use water spray to reduce vapors. Collect spilled powders and place in sealed steel drums for disposal. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from heat or flame. Heat may cause containers to build up pressure and explode. Usually stored as a molten liquid. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where 2,4-dinitrotoluene is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL is low and difficult to monitor. For any exposure to a suspected carcinogen, recommend a supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Butyl Rubber Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

2,4-DINITROTOLUENEC₇H₆N₂O₄

CAS: 121-14-2

**IDENTIFICATION AND TYPICAL USES**

2,4-Dinitrotoluene is an orange to yellow crystalline solid with a characteristic odor. It is normally shipped as a molten liquid. It is one of numerous isomers of dinitrotoluene and is generally considered the most commonly encountered in industry. It is used primarily in the manufacture of explosives and dyes, in organic synthesis, as a chemical intermediate, a plasticizer, and as a modifier for smokeless powders in the munitions industry.

RISK ASSESSMENT: HEALTH***General Assessment***

2,4-Dinitrotoluene is a human poison by *ingestion*, with equally toxic systemic consequences occurring by way of *inhalation*, and skin contact (*absorption*). It has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. It is a confirmed animal carcinogen and a suspected human carcinogen. Liver or kidney damage can occur up to 3 days following exposure.

Inhalation and skin absorption can result in cyanosis, methemoglobinemia, headache, irritability, dizziness, weakness, nausea, vomiting, dyspnea, drowsiness, and loss of consciousness. If allowed to go untreated, death due to cardiovascular collapse can occur. Repeated exposures can lead to anemia and liver damage. It has also been known to cause mutations and liver tumors in tests animals.

Ingestion will result in irritation of the mouth and stomach, stomach cramps, and diarrhea. Possible systemic effects similar to inhalation and absorption may also occur. Ingestion of alcohol shortly before or after exposure may increase individual susceptibility to toxicity.

Skin contact will not only result in absorption, it will also produce irritation, small blisters, redness, swelling, ulceration, and localized necrosis. Eye contact causes burning pain, irritation, redness, and swelling of the eyelids. There may be intense pain on exposure to light and severe eye damage (may be permanent). Contact with the molten liquid will cause thermal burns.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to 2,4-dinitrotoluene:

Skin: Irritation and possible tissue damage. Will pass through unbroken skin to cause serious systemic effects.

Eye: Irritation, swelling, redness, pain on exposure to light, and potential damage to the surrounding tissue.

Lung: Irritation to the respiratory tract and associated mucosa. Absorption through the respiration process causes toxic systemic effects (including anemia and methemoglobinemia).

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to 2,4-dinitrotoluene and can last for months or even years:

Cancer Hazards: According to the information available in the references, 2,4-dinitrotoluene is a confirmed carcinogen in test animals. Its carcinogenic properties in humans is highly suspect. Experimental mutation data have been reported and many scientists believe that such chemicals may have the ability to cause cancer.

Reproductive Hazard: According to information presented in the references, 2,4-dinitrotoluene has been shown to cause adverse effects in reproduction in animals. It is considered an experimental teratogen. Human effects in this regard are inconclusive and require additional research.

Other Chronic Effects: Long-term exposures can result in anemia and possible liver damage. It is also known to cause mutations and tumors in the livers of test animals.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with 2,4-dinitrotoluene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 2,4-dinitrotoluene. The exposure level is low (1.5 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 2,4-dinitrotoluene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 2,4-dinitrotoluene is used or stored.

Before beginning employment with 2,4-dinitrotoluene and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- Liver and kidney function tests.
- Urinalysis (establish baseline).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Urinalysis (compare to baseline).
- Complete blood count.
- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to 2,4-dinitrotoluene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 2,4-dinitrotoluene should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 2,4-dinitrotoluene, emergency shower facilities should be provided.

- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of 2,4-dinitrotoluene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 2,4-dinitrotoluene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

2,4-Dinitrotoluene is normally considered a combustible solid. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, caustics, and metals (such as tin and zinc). Contact with either of these can cause fire or explosion. Also, commercial grades will decompose at 482°F (250°C) with sustaining decomposition at 536°F (280°C). Therefore, special consideration is required during any emergency situation involving a leak or spill of 2,4-dinitrotoluene. Should 2,4-dinitrotoluene ever come into contact with any incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

2,4-Dinitrotoluene may enter the environment through its intended use as an insecticide, as well as through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 2,4-dinitrotoluene.

2,4-Dinitrotoluene has high acute toxicity to aquatic life. Insufficient data are available on the short-term effects of 2,4-dinitrotoluene exposure to plants, birds, or land animals.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility,

and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

2,4-Dinitrotoluene has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of 2,4-dinitrotoluene to plants, birds, or land animals.

💧 Water Solubility

2,4-Dinitrotoluene is nearly insoluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

⌚ Persistence in the Environment

2,4-Dinitrotoluene is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 2,4-dinitrotoluene found in fish tissue is expected to be somewhat higher than the average concentration of 2,4-dinitrotoluene in the water from which the fish was taken.

🛡️ Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 2,4-dinitrotoluene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 2,4-dinitrotoluene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 2,4-dinitrotoluene. If 2,4-dinitrotoluene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Use a water spray to knock-down vapors. Spills should be collected and placed in steel drums. Area should be flushed with hot water to remove solid particulates. Any liquids should be contained, as well as any liquid run-off.
- ☑ It may be necessary to dispose of 2,4-dinitrotoluene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 2,4-dinitrotoluene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "carcinogen," "cancer," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be properly considered whenever developing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

2,6-DINITROTOLUENE

CAS: 606-20-2

**IDENTIFICATION AND TYPICAL USES**

2,6-Dinitrotoluene is an orange to yellow crystalline solid with a characteristic odor. It is normally shipped as a molten liquid. It is one of numerous isomers of dinitrotoluene. It is used in the manufacture of explosives and dyes, in organic synthesis, as a chemical intermediate, a plasticizer, and as a modifier for smokeless powders in the munitions industry.

RISK ASSESSMENT: HEALTH***General Assessment***

2,6-Dinitrotoluene is a human poison by *ingestion*, with equally toxic systemic consequences occurring by way of *inhalation*, and skin contact (*absorption*). The closely-related 2,4-isomer has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. It is also a confirmed animal carcinogen and a suspected human carcinogen. Liver or kidney damage can occur up to 3 days following exposure. While these effects have not been confirmed for the 2,6-isomer, extreme caution is recommended in use, handling, storage, or disposal.

Inhalation and skin absorption can result in cyanosis, methemoglobinemia, headache, irritability, dizziness, weakness, nausea, vomiting, dyspnea, drowsiness, and loss of consciousness. If allowed to go untreated, the result can be death due to cardiovascular collapse. Repeated exposures can lead to anemia and liver damage. It has caused mutations and liver tumors in test animals.

Ingestion will result in irritation of the mouth and stomach, stomach cramps, and diarrhea. Possible systemic effects similar to inhalation and absorption may also occur. Ingestion of alcohol shortly before or

after exposure may increase individual susceptibility to toxicity.

Skin contact will not only result in absorption, it will also produce irritation, small blisters, redness, swelling, ulceration, and localized necrosis. Eye contact causes burning pain, irritation, redness, and swelling of the eyelids. There may be pain on exposure to light and severe eye damage. Contact with the molten liquid will cause thermal burns.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to 2,6-dinitrotoluene:

- Skin:** Irritation and possible tissue damage. Will pass through unbroken skin to cause serious systemic effects.
- Eye:** Irritation, swelling, redness, pain on exposure to light, and potential damage to the surrounding tissue.
- Lung:** Irritation to the respiratory tract and associated mucosa. Absorption through the respiration process causes toxic systemic effects (including anemia and methemoglobinemia).

●* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to 2,6-dinitrotoluene and can last for months or even years:

Cancer Hazards: According to the information available in the references, the 2,4-isomer of dinitrotoluene is a confirmed carcinogen in test animals. Its carcinogenic properties in humans is highly suspect. Experimental mutation data have been reported and many scientists believe that such chemicals may have the

ability to cause cancer. It is not known whether 2,6-isomer of dinitrotoluene will cause these effects.

Reproductive Hazard: According to information presented in the references, 2,4-dinitrotoluene has been shown to cause adverse effects in reproduction in animals. It is considered an experimental teratogen. It is not known whether 2,6-isomer of dinitrotoluene will cause these effects. Human effects in this regard are inconclusive for both isomers and additional research is required.

Other Chronic Effects: Long-term exposures can result in anemia and possible liver damage. It is also known to cause mutations and tumors in the livers of test animals.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with 2,6-dinitrotoluene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 2,6-dinitrotoluene. The exposure level is low (1.5 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 2,6-dinitrotoluene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 2,6-dinitrotoluene is used or stored.

Before beginning employment with 2,6-dinitrotoluene and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- Liver and kidney function tests.
- Urinalysis (establish baseline).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Urinalysis (compare to baseline).
- Complete blood count.
- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- Wash thoroughly immediately after exposure to 2,6-dinitrotoluene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 2,6-dinitrotoluene should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 2,6-dinitrotoluene, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who

have been trained on the hazards of 2,6-dinitrotoluene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 2,6-dinitrotoluene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

2,6-Dinitrotoluene is normally considered a combustible solid. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, caustics, and metals (such as tin and zinc). Contact with either of these can cause fire or explosion. Also, commercial grades will decompose at 482°F (250°C) with sustaining decomposition at 536°F (280°C). Therefore, special consideration is required during any emergency situation involving a leak or spill of 2,6-dinitrotoluene. Should 2,6-dinitrotoluene ever come into contact with any incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

2,6-Dinitrotoluene may enter the environment through its intended use as an insecticide, as well as through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 2,6-dinitrotoluene.

2,6-Dinitrotoluene has high acute toxicity to aquatic life. Insufficient data are available on the short-term effects of 2,6-dinitrotoluene exposure to plants, birds, or land animals.

☠* Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

2,6-Dinitrotoluene has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of 2,6-dinitrotoluene to plants, birds, or land animals.

💧 Water Solubility

2,6-Dinitrotoluene is nearly insoluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

🕒 Persistence in the Environment

2,6-Dinitrotoluene is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 2,6-dinitrotoluene found in fish tissue is expected to be somewhat higher than the average concentration of 2,6-dinitrotoluene in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 2,6-dinitrotoluene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 2,6-dinitrotoluene should contact the water table, aquifer, or navigable

waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 2,6-dinitrotoluene. If 2,6-dinitrotoluene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Use a water spray to knock-down vapors. Spills should be collected and placed in steel drums. Area should be flushed with hot water to remove solid particulates. Any liquids should be contained, as well as any liquid run-off.
- ☑ It may be necessary to dispose of 2,6-dinitrotoluene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 2,6-dinitrotoluene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "carcinogen," "cancer," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be properly considered whenever developing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should

be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

3,4-DINITROTOLUENE

CAS: 610-39-9

**IDENTIFICATION AND TYPICAL USES**

3,4-Dinitrotoluene is an orange to yellow crystalline solid with a characteristic odor. It is normally shipped as a molten liquid. It is one of numerous isomers of dinitrotoluene. It is used in the manufacture of explosives and dyes, in organic synthesis, as a chemical intermediate, a plasticizer, and as a modifier for smokeless powders in the munitions industry.

RISK ASSESSMENT: HEALTH***General Assessment***

3,4-Dinitrotoluene is a human poison by *ingestion*, with equally toxic systemic consequences occurring by way of *inhalation*, and skin contact (*absorption*). The closely-related 2,4-isomer has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. It is also a confirmed animal carcinogen and a suspected human carcinogen. Liver or kidney damage can occur up to 3 days following exposure. While these effects have not been confirmed for the 3,4-isomer, extreme caution is recommended in use, handling, storage, or disposal.

Inhalation and skin absorption can result in cyanosis, methemoglobinemia, headache, irritability, dizziness, weakness, nausea, vomiting, dyspnea, drowsiness, and loss of consciousness. If allowed to go untreated, the result can be death due to cardiovascular collapse. Repeated exposures can lead to anemia and liver damage. It has caused mutations and liver tumors in test animals.

Ingestion will result in irritation of the mouth and stomach, stomach cramps, and diarrhea. Possible systemic effects similar to inhalation and absorption may also occur. Ingestion of alcohol shortly before or

after exposure may increase individual susceptibility to the chemical's toxicity.

Skin contact will not only result in absorption, it will also produce irritation, small blisters, redness, swelling, ulceration, and localized necrosis. Eye contact causes burning pain, irritation, redness, and swelling of the eyelids. There may be pain on exposure to light and severe eye damage. Contact with the molten liquid will cause thermal burns.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to 3,4-dinitrotoluene:

- Skin:** Irritation and possible tissue damage. Will pass through unbroken skin to cause serious systemic effects.
- Eye:** Irritation, swelling, redness, pain on exposure to light, and potential damage to the surrounding tissue.
- Lung:** Irritation to the respiratory tract and associated mucosa. Absorption through the respiration process causes toxic systemic effects (including anemia and methemoglobinemia).

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to 3,4-dinitrotoluene and can last for months or even years:

Cancer Hazards: According to the information available in the references, the 2,4-isomer of dinitrotoluene is a confirmed carcinogen in test animals. Its carcinogenic properties in humans is highly suspect. Experimental mutation data have been reported and many scientists believe that such chemicals may have the

ability to cause cancer. It is not known whether 3,4-isomer of dinitrotoluene will cause these effects.

Reproductive Hazard: According to information presented in the references, 2,4-dinitrotoluene has been shown to cause adverse effects in reproduction in animals. It is considered an experimental teratogen. It is not known whether 3,4-isomer of dinitrotoluene will cause these effects. Human effects in this regard are inconclusive for both isomers and additional research is required.

Other Chronic Effects: Long-term exposures can result in anemia and possible liver damage. It is also known to cause mutations and tumors in the livers of test animals.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with 3,4-dinitrotoluene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 3,4-dinitrotoluene. The exposure level is low (1.5 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 3,4-dinitrotoluene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 3,4-dinitrotoluene is used or stored.

Before beginning employment with 3,4-dinitrotoluene and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- Liver and kidney function tests.
- Urinalysis (establish baseline).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Urinalysis (compare to baseline).
- Complete blood count.
- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to 3,4-dinitrotoluene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 3,4-dinitrotoluene should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 3,4-dinitrotoluene, emergency shower facilities should also be provided.
- Personnel should not wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of 3,4-dinitrotoluene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 3,4-dinitrotoluene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

3,4-Dinitrotoluene is normally considered a combustible solid. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, caustics, and metals (such as tin and zinc). Contact with either of these can cause fire or explosion. Also, commercial grades will decompose at 482°F (250°C) with sustaining decomposition at 536°F (280°C). Therefore, special consideration is required during any emergency situation involving a leak or spill of 3,4-dinitrotoluene. Should 3,4-dinitrotoluene ever come into contact with any incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

3,4-Dinitrotoluene may enter the environment through its intended use as an insecticide, as well as through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 3,4-dinitrotoluene.

3,4-Dinitrotoluene has high acute toxicity to aquatic life. Insufficient data are available on the short-term effects of 3,4-dinitrotoluene exposure to plants, birds, or land animals.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

3,4-Dinitrotoluene has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of 3,4-dinitrotoluene to plants, birds, or land animals.

💧 Water Solubility

3,4-Dinitrotoluene is nearly insoluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

⌚ Persistence in the Environment

3,4-Dinitrotoluene is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 3,4-dinitrotoluene found in fish tissue is expected to be somewhat higher than the average concentration of 3,4-dinitrotoluene in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 3,4-dinitrotoluene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 3,4-dinitrotoluene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery

plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 3,4-dinitrotoluene. If 3,4-dinitrotoluene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Use a water spray to knock-down vapors. Spills should be collected and placed in steel drums. Area should be flushed with hot water to remove solid particulates. Any liquids should be contained, as well as any liquid run-off.
- ☑ It may be necessary to dispose of 3,4-dinitrotoluene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 3,4-dinitrotoluene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "carcinogen," "cancer," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be properly considered whenever developing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

3,5-DINITROTOLUENE

CAS: 618-85-9

IDENTIFICATION AND TYPICAL USES

3,5-Dinitrotoluene is an orange to yellow crystalline solid with a characteristic odor. It is normally shipped as a molten liquid. It is one of numerous isomers of dinitrotoluene. It is used in the manufacture of explosives and dyes, in organic synthesis, as a chemical intermediate, a plasticizer, and as a modifier for smokeless powders in the munitions industry.

RISK ASSESSMENT: HEALTH

General Assessment

3,5-Dinitrotoluene is a human poison by *ingestion*, with equally toxic systemic consequences occurring by way of *inhalation*, and skin contact (*absorption*). The 2,4-isomer has been shown to cause teratogenic effects in experimental tests and mutation data have also been reported. It is also a confirmed animal carcinogen and a suspected human carcinogen. Liver or kidney damage can occur up to 3 days following exposure. While these effects have not been confirmed for the 3,5-isomer, extreme caution is recommended in use, handling, storage, or disposal.

Inhalation and skin absorption can result in cyanosis, methemoglobinemia, headache, irritability, dizziness, weakness, nausea, vomiting, dyspnea, drowsiness, and loss of consciousness. If allowed to go untreated, the result can be death due to cardiovascular collapse. Repeated exposures can lead to anemia and liver damage. It has caused mutations and liver tumors in test animals.

Ingestion will result in irritation of the mouth and stomach, stomach cramps, and diarrhea. Possible systemic effects similar to inhalation and absorption may also occur. Ingestion of alcohol shortly before or after exposure to 3,5-dinitrotoluene may increase individual susceptibility to toxicity.

Skin contact will not only result in absorption, it will also produce irritation, small blisters, redness, swelling, ulceration, and localized necrosis. Eye contact causes burning pain, irritation, redness, and swelling of the eyelids. There may be pain on exposure to light and severe eye damage. Contact with the molten liquid will cause thermal burns.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to 3,5-dinitrotoluene:

- Skin:** Irritation and possible tissue damage. Will pass through unbroken skin to cause serious systemic effects.
- Eye:** Irritation, swelling, redness, pain on exposure to light, and potential damage to the surrounding tissue.
- Lung:** Irritation to the respiratory tract and associated mucosa. Absorption through the respiration process causes toxic systemic effects (including anemia and methemoglobinemia).

🕒 *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to 3,5-dinitrotoluene and can last for months or even years:

Cancer Hazards: According to the information available in the references, the 2,4-isomer of dinitrotoluene is a confirmed carcinogen in test animals. Its carcinogenic properties in humans is highly suspect. Experimental mutation data have been reported and many scientists believe that such chemicals may have the ability to cause cancer. It is not known whether 3,5-isomer of dinitrotoluene will cause these effects.

Reproductive Hazard: According to information presented in the references, 2,4-dinitrotoluene has been shown to cause adverse effects in reproduction in animals. It is considered an experimental teratogen. It is not known whether 3,5-isomer of dinitrotoluene will cause these effects. Human effects in this regard are inconclusive for both isomers and additional research is required.

Other Chronic Effects: Long-term exposures can result in anemia and possible liver damage. It is also known to cause mutations and tumors in the livers of test animals.

🔍 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with 3,5-dinitrotoluene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 3,5-dinitrotoluene. The exposure level is low (1.5 mg/m^3) and difficult to monitor. Therefore, a MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge equipped with a dust pre-filter should be used if any exposure is anticipated or known. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be used. Glove manufacturers should be contacted for glove selection.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 3,5-dinitrotoluene. All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 3,5-dinitrotoluene is used or stored.

Before beginning employment with 3,5-dinitrotoluene and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- ☑ Liver and kidney function tests.
- ☑ Urinalysis (establish baseline).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Urinalysis (compare to baseline).
- ☑ Complete blood count.
- ☑ Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to 3,5-dinitrotoluene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 3,5-dinitrotoluene should be communicated to all exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 3,5-dinitrotoluene, emergency shower facilities should be provided.
- ☑ Personnel should not wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of 3,5-dinitrotoluene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 3,5-di-

nitrotoluene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

3,5-Dinitrotoluene is normally considered a combustible solid. Its dusts may form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, caustics, and metals (such as tin and zinc). Contact with either of these can cause fire or explosion. Also, commercial grades will decompose at 482°F (250°C) with sustaining decomposition at 536°F (280°C). Therefore, special consideration is required during any emergency situation involving a leak or spill of 3,5-dinitrotoluene. Should 3,5-dinitrotoluene ever come into contact with any incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

3,5-Dinitrotoluene may enter the environment through its intended use as an insecticide, as well as through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 3,5-dinitrotoluene.

3,5-Dinitrotoluene has high acute toxicity to aquatic life. Insufficient data are available on the short-term effects of 3,5-dinitrotoluene exposure to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

3,5-Dinitrotoluene has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of 3,5-dinitrotoluene to plants, birds, or land animals.

💧 *Water Solubility*

3,5-Dinitrotoluene is nearly insoluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

🕒 *Persistence in the Environment*

3,5-Dinitrotoluene is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 3,5-dinitrotoluene found in fish tissue is expected to be somewhat higher than the average concentration of 3,5-dinitrotoluene in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 3,5-dinitrotoluene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from heat, damage, and shock. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Personnel must be trained on the storage of hazardous chemicals.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 3,5-dinitrotoluene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive

emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 3,5-dinitrotoluene. If 3,5-dinitrotoluene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of leak or spill.
- ☑ Use a water spray to knock-down vapors. Spills should be collected and placed in steel drums. Area should be flushed with hot water to remove solid particulates. Any liquids should be contained, as well as any liquid run-off.
- ☑ It may be necessary to dispose of 3,5-dinitrotoluene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 3,5-dinitrotoluene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "carcinogen," "cancer," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be properly considered whenever developing public relations policies.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate

plans and policies should be developed, approved, and implemented long before any need for such arises.

Extinguishing Media

Use dry chemical, foam, carbon dioxide, or water.

Special Fire Fighting Procedures

Acrid and irritating gases and fumes are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Water and foam may cause frothing. Move containers from fire area if it can be done safely.

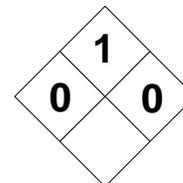

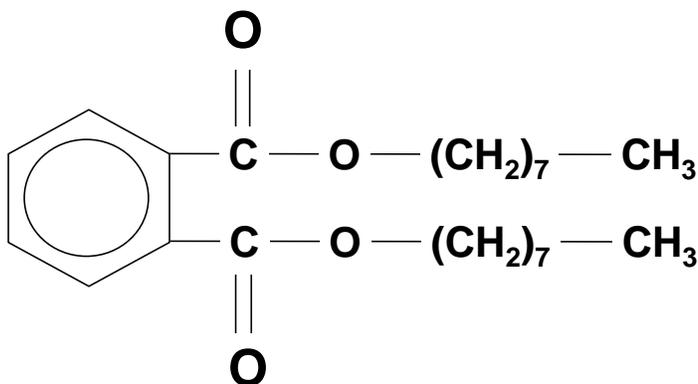

Unusual Fire and Explosion Hazards

Exercise extreme caution when attempting to move or relocate containers that may have been exposed to high heat. Cool exposed containers. Containers may explode at high temperatures.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|---|--------------------------------|---|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials. Keep away from heat and flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, such as chlorine, bromine, and fluorine, strong alkalis (sodium hydroxide, potassium hydroxide, lithium hydroxide), strong acids, and nitrates. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of di-n-octyl phthalate is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Acrid and irritated gases and fumes are produced when di-n-octyl phthalate is involved in fire. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Symptoms include irritation to the eyes and mucosa (especially in the upper respiratory tract). High exposures can irritate the lungs and may cause death by pulmonary edema. ABSORPTION: Contact may irritate the skin and eyes. Absorption is possible. May cause drying and cracking of skin and secondary infections. INGESTION: Mildly toxic by ingestion. Gastrointestinal irritation. Systemic effects and possibility of liver and/or kidney damage on high exposures. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Eyes, respiratory system, GI tract, kidney, liver. |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Call the poison control center and seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method Burn in chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Do not store di-n-octyl phthalate in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Personnel working with di-n-octyl phthalate should be trained on its proper handling and storage <i>prior</i> to being assigned to such responsibilities. | | | | |
| Other Precautions and Warnings Bulk storage of di-n-octyl phthalate should be avoided. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For relatively low or infrequent exposure, use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and dust/mist pre-filter. For greater protection, use a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DI-N-OCTYL PHTHALATEC₂₄H₃₈O₄

CAS: 117-84-0

**IDENTIFICATION AND TYPICAL USES**

Di-n-octyl phthalate is a colorless oily liquid with a slight, ester-like odor. It is used as a plasticizer in nitrocellulose lacquers, elastomers, nail polish, and solid rocket propellants. It is also used as a solvent for perfume oils, as a perfume fixative, a textile lubricating agent, in the manufacture of safety glass, and in the production of insecticides. It may also be found in certain printing inks, is resin solvents, in paper coatings, adhesives, and as an insect repellent for textiles.

RISK ASSESSMENT: HEALTH***General Assessment***

Di-n-octyl phthalate is primarily toxic to humans by *ingestion*. However, its vapors can also cause adverse systemic effects by *inhalation*. Contact with the eyes or skin will result in irritation and, if in contact for long periods, *absorption*. It is known to be a teratogen in test animals. Human mutation data have been reported for this chemical.

Inhalation of di-n-octyl phthalate will directly irritate the mucous membranes of the respiratory tract (nose, throat, and bronchial tubes). Inhalation will also result in systemic effects with symptoms of vomiting or nausea, and numerous indications of depression of the central nervous system (CNS). These include hallucinations and distorted perceptions. There may be somnolence and lachrymation. In high exposures, lung irritation can lead to pulmonary edema (fluid in the lungs) and death. In animals, exposure

has caused liver tumors. It is not known whether human exposure will have this effect.

Ingestion toxicity is considered relatively low compared to other phthalates. There may also be systemic effects similar to those caused by inhalation.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to di-n-octyl phthalate:

Skin: Irritation and possible inflammation. Absorption on prolonged exposure is likely, leading to toxic systemic effects.

Eye: Severe irritation with redness, lachrymation, and possible conjunctivitis.

Lung: Irritation of the mucosa of the nose, throat, and respiratory tract (especially the bronchial tubes). High exposure can lead to pulmonary edema and death.

Other: Ingestion may cause hallucinations, blurred vision, and distorted perceptions. There may be vomiting or nausea.

●* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to di-n-octyl phthalate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, di-n-octyl phthalate has not

been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: There is limited evidence that di-n-octyl phthalate is a teratogen in test animals. Until further testing has been performed, it is suggested that it be treated as a possible teratogen in humans.

Other Chronic Effects: Repeated skin contact causes dryness, cracking, and rash. Frequent or repeated high exposures may damage the kidneys and liver. Very irritating substances may affect the lungs. It has not been confirmed whether di-n-octyl phthalate causes lung damage (pulmonary edema usually occurs before damage can be assessed).

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around di-n-octyl phthalate. At low or infrequent exposures, use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist pre-filter. For high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with di-n-octyl phthalate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where di-n-octyl phthalate is used or stored.

Before beginning employment and at regular times thereafter (e.g., annually), for those with frequent or

potentially high exposures, the following medical test is recommended:

Lung function tests.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

Liver and kidney function tests.

Consider chest X-ray after acute overexposure.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, because smoking can cause heart disease as well as lung cancer, emphysema, and other respiratory problems, smokers exposed to di-n-octyl phthalate may have a more severe reaction than non-smokers. Prudent risk assessment and management requires consideration of *all* possible causes of health related symptoms.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to di-n-octyl phthalate and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of di-n-octyl phthalate should be communicated to all potentially exposed workers.

Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of di-n-octyl phthalate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in

fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Di-n-octyl phthalate is considered a class IIIB combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of di-n-octyl phthalate. Should di-n-octyl phthalate ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine, and chlorine dioxide), strong alkali materials (sodium hydroxide, potassium hydroxide, and lithium hydroxide), and strong acids (sulfuric acid, hydrochloric acid, and nitric acid), and other nitrates either during use, transportation, or storage, violent reaction can occur. Di-n-octyl phthalate is especially reactive in contact with liquid chlorine.

Di-n-octyl phthalate can enter the environment through industrial discharges, in non-point discharges from the wide and general use of this chemical, and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to di-n-octyl phthalate.

This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of di-n-octyl phthalate to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Di-n-octyl phthalate has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of di-n-octyl phthalate to plants, birds, or land animals.

💧 *Water Solubility*

Di-n-octyl phthalate is very slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

🕒 *Persistence in the Environment*

Di-n-octyl phthalate is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life

of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 51% of di-n-octyl phthalate will eventually end up in terrestrial soil; about 47% will end up in aquatic sediments, and about 2% will end up in air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of di-n-octyl phthalate found in fish tissues is expected to be considerably higher than the average concentration of di-n-octyl phthalate in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of di-n-octyl phthalate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

Di-n-octyl phthalate is destroyed by burning in a chemical incinerator equipped with an afterburner and scrubber. Destruction of chemicals must be performed by a properly permitted facility.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If di-n-octyl phthalate should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of di-n-octyl phthalate.

If di-n-octyl phthalate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of di-n-octyl phthalate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving di-n-octyl phthalate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|---------------------------------|
| Characterization Glycol Ether | RCRA Number U108 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Dioxane | Chemical Abstract Service (CAS) Number 123-91-1 | |
| DOT Hazard Class and Label Requirements Flammable Liquid | DOT Emergency Guide Code 26 | |
| DOT Identification Number UN 1165 | Molecular Formula C₄H₈O₂ | |

Synonyms
Diethylene dioxide; diethylene ether; p-Dioxane; 1,4-dioxane; 1,4-dioxacyclohexane; 1,4-diethylene dioxide; di(ethylene oxide).

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Dioxane: (derivation: From ethylene glycol by treatment with acid; from β,β-dichloroethyl ether by treatment with alkali). 1 ppm = 3.66 mg/m³ | PEL (skin): 25 ppm 90 mg/m³ STEL: Not Established | REL (ceiling): 1 ppm 3.6 mg/m³ (30 minutes) Possible Cancer Agent | 500 ppm | TLV (skin): 25 ppm 90 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 214°F (103°C) | Specific Gravity (H ₂ O = 1) 1.03 |
| Vapor Pressure (mm Hg) 29 at 68°F (20°C) | Molecular Weight (atomic weight) 88.1 |
| Vapor Density (Air = 1) 3 | Melting Point 14°F (-10°C) |

Solubility
Miscible with water and most organic solvents.

Appearance and Odor
Colorless liquid (or solid, below 53°F) with a mild, ether-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) 55°F (13°C) closed cup | Explosive Limits in Air % by Volume LEL: 2% UEL: 22% |
| NFPA Classification Class IB Combustible Liquid | Autoignition Temperature 356°F (180°C) |

Extinguishing Media
Dry chemical, carbon dioxide, or alcohol foam.

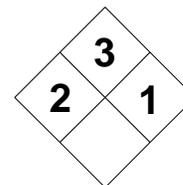

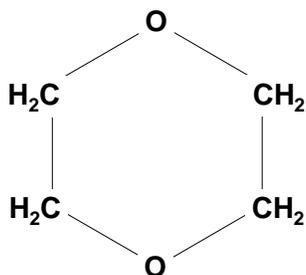

Special Fire Fighting Procedures
Acrid and irritating smoke and fumes are produced in fire. Structural fire-fighting protective clothing will not provide adequate protection. Wear full protective clothing and self-contained breathing apparatus (SCBA). Move container from fire area if it can be done without risk. Use water spray to cool containers.

Unusual Fire and Explosion Hazards
Containers may explode in fire. Presents a vapor explosion hazard indoors, outdoors, and in sewers.

| SECTION V - REACTIVITY DATA | | | | |
|--|---|---|---------------------------------------|---|
| Stability | | Conditions to Avoid Normally stable at room temperature, if kept under a nitrogen blanket purge. Dioxane is extremely volatile and very flammable. Keep away from ALL sources of heat or ignition and incompatible materials. | | |
| Stable | Unstable | Incompatibility (<i>materials to avoid</i>) A dangerous fire and explosion hazard when exposed to heat or flame. Reacts vigorously with oxidizing materials. Forms explosive peroxides in air. Incompatible with acids and some metals. | | |
| X | | | | |

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? | Absorption (skin/eye)? | Ingestion? |
| | | X | X | X |
| Health Hazards | | | | |
| INHALATION: Extremely dangerous to humans. Systemic poisoning. Causes drowsiness, headache, respiratory distress, nausea, anorexia, and vomiting. Depression of the CNS, coma, and death may occur (from kidney failure, liver necrosis, pulmonary edema, or brain edema). | | | | |
| ABSORPTION: Can pass through unbroken skin causing toxic systemic effects. May cause mild to no surface irritation on initial contact. Toxic systemic effects can equal that of inhalation. | | | | |
| INGESTION: Moderately toxic. May cause unspecified gastrointestinal effects. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | 5th Annual Report | Group 2B | 29 CFR 1910.1000 Table Z-1 | Skin, eyes, liver, kidneys, CNS, brain, resp. system |
| Medical Conditions Generally Aggravated by Exposure | | | | |
| Kidney, liver, and skin disorders may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Wash with large amounts of soap and water for a minimum of 15 minutes. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Seek medical attention immediately. Give large amounts of milk or water and induce vomiting. Do NOT attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Spills of this material constitute a serious emergency. Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Absorb in vermiculite or other material and dispose of in sealed drums. | | | | |
| Preferred Waste Disposal Method | | | | |
| Burn in chemical incinerator equipped with and afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store in tightly closed containers (preferably under a nitrogen purge) in a cool, well ventilated area away from heat (including direct sunlight). Protect containers from physical damage. | | | | |
| Other Precautions and Warnings | | | | |
| Dioxane must be stored to avoid contact with strong oxidizers since violent reactions can occur. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| Dioxane is a possible human carcinogen. Use a NIOSH/MSHA approved self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | Eye Protection | | Other Protective Clothing | |
| Butyl Rubber (or other non-permeable) | Chemical Goggles and Face Mask | | Protective Uniform or Apron | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIOXANE

CAS: 123-91-1

**IDENTIFICATION AND TYPICAL USES**

Dioxane appears as a colorless liquid (or a solid below 55°F) with a mild, ether-like odor. It is used as a solvent for cellulose esters and a wide range of organic products. It is found in lacquers, varnishes, and paints, as well as paint and varnish removers. It is a wetting and dispersing agent in textile processing, in dye baths, and in stain and printing compositions. It has uses in cleaning and detergent preparations, in cements, in cosmetics and deodorants, as a fumigant, in emulsions, in polishing compositions, as a stabilizer for chlorinated solvents, and in scintillation counters.

RISK ASSESSMENT: HEALTH**General Assessment**

Dioxane presents a serious human health risk. It is a confirmed animal carcinogen and its carcinogenicity in humans is highly suspect. In addition, mutation data have been reported and it has been shown to adversely affect reproduction in test animals. It can enter the body and cause dangerous, life-threatening toxic systemic effects through *inhalation*, *ingestion*, and by passing through intact skin (*absorption*).

Inhalation and absorption will cause symptoms of systemic poisoning with epigastric (intestinal) pain, anorexia, headache, drowsiness, vomiting, nausea, coma, and death. There may be lachrymation and respiratory distress with irritation of the eyes, nose, and throat. It may lead to pulmonary edema (fluid in the lungs), which can be fatal. Symptoms of cough, congestion, and shortness of breath may be delayed for 24-48 hours, creating a false sense of security with regard to health exposure risk. Dioxane can also act to depress the central nervous system (CNS) and lead

to damage of the liver (tissue destruction, or “necrosis”), kidneys, lungs (edema), and brain (edema).

Skin contact may produce no significant or apparent irritation on brief exposure. However, prolonged or repeated contact may cause a rash or even a burn to tissues.

Ingestion may result in unspecified gastrointestinal and respiratory effects. Systemic poisoning is extremely possible with symptoms similar to that of inhalation and absorption.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to dioxane:

- Skin:** Mild to severe irritation and possible burns. On prolonged exposure, can be absorbed through intact skin causing toxic systemic effects.
- Eye:** Severe conjunctival irritation and possible damage to the cornea.
- Lung:** Severe irritation to respiratory tract causing shortness of breath and cough. High acute exposures can be fatal due to a buildup of fluid in the lungs (pulmonary edema), a medical emergency.
- CNS:** A depressant of the central nervous system causing a variety of toxic effects including drowsiness, coma, and death.
- Other:** May cause fluid to build up in the skull (brain edema), which can lead to unconsciousness, coma, and death. Ingestion can cause systemic poisoning along with gastrointestinal

distress and symptoms of vomiting and nausea. There may be oliguria (reduce urinary function), or even anuria (almost no urinary function) depending upon the nature and extent of kidney damage.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to dioxane and can last for months or even years:

Cancer Hazards: Dioxane may be a cancer causing agent in humans. Both the National Toxicology Program (NTP) and the International Agency for Research on Cancer (IARC) list dioxane as an anticipated or probable human carcinogen. It is a mutagen (causes cell changes) in animals.

Reproductive Hazard: According to the references, dioxane has been shown to cause adverse effects in reproduction in test animals. Its teratogenic effects in humans have not been adequately studied.

Other Chronic Effects: Repeated low-dose exposures can irritate the lungs and result in bronchitis with symptoms of cough, phlegm, and shortness of breath. It may damage the liver and kidneys. Chronic exposure can lead to jaundice and renal failure.

☛ **Recommended Risk-Reduction Measures**

Dioxane is extremely hazardous and poses a serious (toxic) risk to human health. Personnel should avoid direct contact with dioxane. If a less toxic material or compound cannot be substituted for dioxane, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of dioxane release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around dioxane. Exposure levels are relatively low (25 ppm) and may be difficult to accurately monitor. A NIOSH/MSHA-approved organic vapor respirator may be used for low-level exposures (at or near the PEL). However, the warning properties of dioxane are low and cartridge-type respirators may not suffice. Also, it has been suggested that dioxane is a possible human carcinogen. Therefore, for the best protection at any exposure level, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of

respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. Skin contact must be avoided. To prevent hand and skin exposures, rubber or other non-permeable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dioxane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where dioxane is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical test is recommended:

Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

Liver, kidney, and lung function tests.

Consider chest X-ray after acute exposure (may be negative if taken immediately following exposure).

Blood urea nitrogen test with serum creatinine and urine sediment.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other respiratory ailments, any exposure to dioxane can result in quicker and more devastating symptoms. Smokers should therefore avoid unprotected contact with this chemical. Prudent risk management requires proper consideration of *all* possible factors that may be causing the appearance of exposure symptoms among workers.

Other methods to reduce exposure include:

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to dioxane and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of dioxane should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to dioxane, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by dioxane should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to dioxane.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of dioxane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Dioxane is class IB combustible liquid (per OSHA 29 CFR 1910.106). It is extremely volatile and presents a serious risk of fire and or explosion. It will form dangerous (explosive) peroxides in air. It also forms explosive complexes with the perchlorates of many metals, such as silver or mercury. It is incompatible with oxidizers and some acids (nitric, for example), reacting vigorously and violently on contact. Therefore, caution is always required in handling, storage, transportation, and disposal of dioxane. When heated to decomposition it emits very acrid and irritating smoke and fumes. Emergency responders, hazardous materials personnel, and firefighters should be made aware of the presence of dioxane at any emergency response situation.

Dioxane may enter the environment through industrial effluents and spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dioxane.

Insufficient data are available to evaluate or predict the acute (short-term) effects of dioxane to aquatic life, plants, birds, or land animals.

Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the chronic (long-term) effects of dioxane on aquatic life, plants, birds, or land animals.

Water Solubility

Dioxane is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

Persistence in the Environment

Dioxane is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 50% of dioxane will eventually end up in air; the rest will end up in water.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Dioxane is not expected to accumulate in aquatic organisms. The concentration of dioxane in edible fish tissues is expected to be negligible (trace levels) as compared to the levels found the water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of dioxane into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dioxane should be segregated from other chemicals to minimize the risk of cross-

contamination. Dioxane must be stored to avoid contact with strong oxidizers, such as chlorine and bromine, since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat and direct sunlight.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If dioxane should contact the water table, aquifer, or navigable waterway, time is of the essence. Its specific solubility in water has not been established and total remediation may or may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dioxane.

If dioxane is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- Absorb spilled liquids with vermiculite, dry sand, or a similar material and deposit in sealed drum for disposal.
- Ventilate area of spill or leak.
- Remove all ignition sources.
- It may be necessary to dispose of dioxane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dioxane can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that

anytime the terms “cancer,” or “carcinogen” are used, public emotion, hysteria, and ignorance can run equally high. This requires careful consideration during the development of public relations policies.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

DIPHENYLC₆H₅C₆H₅

CAS: 92-52-4

**IDENTIFICATION AND TYPICAL USES**

Diphenyl is a colorless to pale yellow solid (scales or leaf-like crystals) with a pleasant, peculiar, aromatic odor characteristic of fungicides. It is used in organic synthesis, as a heat transfer agent (either with or without diphenyl oxide) because of its high thermal stability. It is also used as a fungicide in the packaging of citrus fruits and to prevent the growth of blue mold and other plant diseases. It has also been used as a dyeing assistant for polyester fibers.

RISK ASSESSMENT: HEALTH**General Assessment**

Diphenyl is a human poison by *inhalation*, *ingestion*, and *absorption* through intact skin. While its human carcinogenicity is unknown, there are some studies which suspect cancer-causing capabilities in laboratory test animals. However, the data in the references are conflicting and inconclusive in this regard. Mutation data have been reported and some scientists believe that mutagenic chemicals may also have carcinogenic properties.

Inhalation of the dusts, as well as skin absorption, causes toxic systemic effects with action on the central nervous system (CNS) and the peripheral nervous system (PNS). There may be headaches with nausea, general fatigue, malaise, gastrointestinal pain, indigestion, numbness and aching pain in the legs and arms, and possible damage to the liver (necrosis or atrophy). In addition, inhalation will irritate the mucosa of the nose, throat, and upper respiratory tract.

Skin contact may result in mild to severe irritation. In some individuals, sensitization may develop with dermatitis and itching rash. Once sensitization occurs, even the slightest future exposures will cause a recurrence of the symptoms.

Ingestion is not likely in the industrial setting but is still a possible route of entry. Swallowing diphenyl dusts can result in unspecified but diffuse gastrointestinal irritation and possible indigestion. The symptoms of inhalation and absorption may also appear on ingestion, although not as pronounced or as quick.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to diphenyl:

- Skin: Irritation with rash and localized inflammation. Absorption through intact skin is extremely likely on short exposures.
- Eye: Severe irritation; pain and inflammation.
- Lung: Nose, throat, and respiratory tract irritation causing difficulty in breathing.
- CNS: Confusion, dizziness, numbness in the leg and arm muscles, cranial pressure (headaches), possible coma and death.

⚙ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to diphenyl and can last for months or even years:

Cancer Hazards: According to the information presented in the references, diphenyl has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: There is no information in the references to indicate that diphenyl causes adverse effects in the reproduction process of test animals. Additional research is required in this area of study.

Other Chronic Effects: Chronic dermatitis sensitization is possible in certain individuals. Once sensitization occurs, even slight future exposures will cause a

recurrence of symptoms. Liver damage (necrosis and/or atrophy) can occur on long-term exposures.

U Recommended Risk-Reduction Measures

Personnel should avoid direct contact with diphenyl. Occupational poisoning occurs most commonly by inhalation. If a less toxic material or compound cannot be substituted for diphenyl, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of diphenyl release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around diphenyl. Personnel should wear an MSHA/NIOSH-approved respirator equipped with a high efficiency particulate air (HEPA) filter for low or infrequent exposures. An MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is a more appropriate level of respiratory protection when high exposures to diphenyl are anticipated. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, polyvinyl alcohol gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diphenyl.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diphenyl is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered:

- Complete blood count (CBC).
- Urinary phenol (a test to see if diphenyl is already present in the body).

If symptoms should develop or overexposure is suspected, the following additional tests may be helpful:

- Complete blood count.
- Urinary phenol.

- Evaluation by a qualified allergist, with careful review of exposure history and special tests (may help diagnose skin allergy).

- Liver function tests.

- Neurological tests of the CNS and PNS.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to diphenyl and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of diphenyl should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to diphenyl, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by diphenyl should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to diphenyl.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of diphenyl. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Diphenyl is a combustible solid. It can present a dangerous explosion hazard if its dusts form a cloud

and come into contact with an ignition source. It is also incompatible with oxidizing materials and contact can result in violent and explosive reactions. Caution is always required in handling, storage, transportation, and disposal of diphenyl. Emergency responders should be made aware of the presence of diphenyl at any emergency response situation.

Diphenyl can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diphenyl.

Diphenyl has moderate acute toxicity to aquatic life, moderate-to-high acute toxicity to land animals, and high acute toxicity to birds. While it has not been shown to cause damage or injury to agricultural crops or plants in its use as a fungicide, insufficient data are available to properly evaluate the short-term effects of diphenyl on plants.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Diphenyl has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of diphenyl to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Diphenyl is insoluble in water. Concentrations of less than 1 milligram will not mix with a liter of water.

🕒 *Persistence in the Environment*

Diphenyl is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Approximately 59% of diphenyl will eventually end up in air; about 15.6% will end up in water; and the rest will be divided nearly equally between terrestrial soils and aquatic sediments.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of diphenyl found in fish tissues is expected to be somewhat higher than the average concentration of diphenyl in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of diphenyl into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diphenyl should be segregated from other chemicals and materials to minimize the risk of cross-contamination. Storage facilities should be designed with explosion-proof electrical equipment.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If diphenyl should contact the water table, aquifer, or navigable waterway, time is of the essence. It is insoluble and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of diphenyl.

For disposal, diphenyl may be burned in a chemical incinerator equipped with an afterburner and scrubber.

If diphenyl is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Do NOT generate dusts. Use a scoop or a vacuum equipped with a high efficiency particulate

air filter (HEPA) to collect spills. Place materials in drum for recovery or disposal, as required.

- ☑ Ventilate area of spill or leak. Container should be removed to safer area if it can be done without increasing the risk.
- ☑ It may be necessary to dispose of diphenyl as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving diphenyl can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness (leukemia), injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

DIPHENYLAMINE $(C_6H_5)_2NH$

CAS: 122-39-4

**IDENTIFICATION AND TYPICAL USES**

Diphenylamine is a colorless, tan, amber, or brown crystalline solid with a pleasant, floral odor. It is used in rubber antioxidants and accelerators, in solid rocket propellants, in pesticides, dyes, pharmaceuticals, veterinary medicines, as a storage preservative for apples, as a stabilizer for nitrocellulose, and applications in analytical chemistry as a reagent for colorimetric tests for nitrate and chlorate.

RISK ASSESSMENT: HEALTH**General Assessment**

Diphenylamine is a human poison by *inhalation* and *absorption* through intact skin. *Ingestion* is unlikely but may also be a route of entry into the body. Its human carcinogenicity is unknown. It has caused adverse reproductive effects in animals causing developmental abnormalities. Its human teratogenicity is unknown. Diphenylamine is soluble in fats and lipids. Once absorbed, it can accumulate in body organs, such as the brain, liver, and kidneys.

Inhalation of the dusts, as well as skin absorption, causes irritation of the skin, eyes, nose, throat, and the mucous membranes lining the respiratory tract. There can be eczema, tachycardia (rapid heartbeat) hypertension (increased blood pressure) coughing, sneezing, headache, fatigue, anorexia, painful diarrhea, loss of appetite with subsequent weight loss, low body temperature, cyanosis (blue discoloration of the skin, especially on face, hands, and feet due to oxygen deficiency), vomiting, and emaciation. There can also be serious bladder disorders, including hematuria (blood in urine) and proteinuria (excessive proteins in urine), as well as bladder damage.

Prolonged exposures can lead to methemoglobinemia (decrease in blood's oxygen-carrying capabilities).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to diphenylamine:

Skin: Irritation with rash and localized inflammation. Absorption through intact skin is likely on short exposures.

Eye: Severe irritation; pain and inflammation.

Lung: Nose, throat, and respiratory tract irritation causing coughing, sneezing, and toxic systemic effects.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to diphenylamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, diphenylamine has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, diphenylamine has been shown to adversely affect reproduction in test animals causing developmental abnormalities. Its human teratogenicity is unknown and requires additional study.

Other Chronic Effects: Chronic exposure to skin can cause eczema. Long-term or repeated contact may result in loss of appetite and weight loss, diarrhea, low body temperature, and accumulation of diphenylamine in the liver, kidney, and brain with unspecified but potentially detrimental effects.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with diphenylamine. Occupational poisoning occurs most com-

monly by inhalation and skin absorption. If a less toxic material or compound cannot be substituted for diphenylamine, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of diphenylamine release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around diphenylamine. Personnel should be required to wear an MSHA/NIOSH-approved respirator equipped with a high efficiency particulate air (HEPA) filter for low or infrequent exposures. An MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is a more appropriate level of respiratory protection when high exposures to diphenylamine are anticipated. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, polyvinyl alcohol gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diphenylamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diphenylamine is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered:

- Complete blood count (CBC).
- Urinalysis to test for blood and protein levels in urine (establish baseline).

If symptoms should develop or overexposure is suspected, the following additional tests may be helpful:

- Complete blood count.
- Urinalysis (compare to baseline).
- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
- Wash thoroughly immediately after exposure to diphenylamine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of diphenylamine should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to diphenylamine, emergency shower facilities should be provided.
- Workers whose clothing has been contaminated by diphenylamine should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to diphenylamine.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of diphenylamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Diphenylamine is a combustible solid. It can present a dangerous explosion hazard if its dusts form a cloud and come into contact with an ignition source. It is also incompatible with oxidizing materials and contact can result in violent and explosive reactions. Caution is always required in handling, storage, transportation, and disposal of diphenylamine. Emergency responders should be made aware of the presence of diphenylamine at any emergency response situation.

Diphenylamine can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diphenylamine. Diphenylamine has high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of diphenylamine on plants, birds, or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Diphenylamine has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of diphenylamine to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Diphenylamine is nearly insoluble in water. Concentrations of less than 1 milligram will mix with a liter of water.

🕒 *Persistence in the Environment*

Diphenylamine is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of diphenylamine found in fish tissues is expected to be somewhat higher than the average concentration of diphenylamine in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or

spill of diphenylamine into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diphenylamine should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If diphenylamine should contact the water table, aquifer, or navigable waterway, time is of the essence. It is practically insoluble and total containment and remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of diphenylamine.

If diphenylamine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Do NOT generate dusts. Dust clouds of the right proportions in air present a dangerous explosion hazard. Use a scoop or a vacuum equipped with a high efficiency particulate air filter (HEPA) to collect spills. Place materials in drum for recovery or disposal, as required.
- ☑ Ventilate area and remove ignition sources.
- ☑ Containers should be removed to safer area if it can be done without increasing the risk.
- ☑ It may be necessary to dispose of diphenylamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving diphenylamine can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔍 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|--|---|--|
| Dipropylene glycol methyl ether (derivation: By reaction of ethylene oxide and <i>n</i> -butyl alcohol). 1 ppm = 6.16 mg/m³ | PEL (skin): 100 ppm 600 mg/m³ STEL: Not Established | REL (skin): 100 ppm 600 mg/m³ STEL: 150 ppm 900 mg/m³ | 600 ppm | TLV (skin): 100 ppm 600 mg/m³ STEL: 150 ppm 900 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|-------------------------|---------------------------|---|-----------------------|
| Boiling Point | 372°F (189°C) | Specific Gravity (H ₂ O = 1) | 0.95 |
| Vapor Pressure (mm Hg) | 0.5 at 69°F (20°C) | Molecular Weight | 148.2 |
| Vapor Density (Air = 1) | 5.1 | Melting Point | -112°F (-80°C) |

Solubility

Completely miscible in water, VM&P naphtha, acetone, ethanol, benzene, carbon tetrachloride, ether, methanol, monochlorobenzene, and petroleum ether.

Appearance and Odor

Colorless liquid with a mild, pleasant, ether-like odor with a bitter taste.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|--------------------------------------|-------------------------------------|---|
| Flash Point (method used) | 185°F (85°C) opened cup | Explosive Limits in Air % by Volume | LEL: 1.1% at 392°F (200°C) UEL: 3.0% |
| NFPA Classification | Class IIIA Combustible Liquid | Autoignition Temperature | Not Determined |

Extinguishing Media

Use dry chemical, alcohol foam, carbon dioxide, or water fog. Water and foam may cause frothing.

Special Fire Fighting Procedures

Acrid and irritating fumes and smoke are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Use water spray to cool fire-exposed containers. Fight fire from distance if possible. Move containers from fire area if it can be done safely. Exercise extreme caution when moving containers.

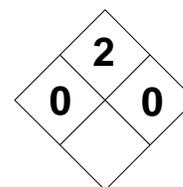

Unusual Fire and Explosion Hazards

A combustible liquid. A moderate fire hazard when exposed to heat, sparks, or open flame. Apply cooling water to sides of container until long after fire has been extinguished.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|--|--|--|
| Stability | | Conditions to Avoid Under normal conditions of temperature and pressure, dipropylene glycol methyl ether is stable. Avoid contact with incompatible materials. Keep away from heat, sparks, and flame. | | |

| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of dipropylene glycol methyl ether is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Acrid and irritated gases and fumes are produced when dipropylene glycol methyl ether is involved in fire, including carbon dioxide and carbon monoxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Causes irritation of the eyes, nose, throat, weakness, lightheadedness, headache, and possible effects on the central nervous system (CNS). Overexposure to hazardous concentrations is not likely due to the irritating and disagreeable odor and cannot normally be tolerated. ABSORPTION: Repeated or heavy contact will pass through unbroken skin to cause toxic systemic effects. Eye contact with liquid can cause burns. INGESTION: Mildly toxic with systemic effects as those noted for inhalation. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? CNS, respiratory system, skin. |
| Medical Conditions Generally Aggravated by Exposure Pre-existing disorders of the CNS may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water to prevent absorption. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Call the poison control center and seek medical attention immediately. Unless advised otherwise, give a conscious and alert person 1-2 glasses of water or milk to drink. Do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Evacuate area of spill and remove all ignition sources. Remove leaking containers to a safe place (outdoors), if it can be done without risk. Absorb liquids with vermiculite or other material and place in sealed drum for disposal. Use non-sparking tools. Use water spray to flush spills away from exposures and dilute to nonflammable mixtures (keep out of sewers). | | | | |
| Preferred Waste Disposal Method Consider reclamation, recycling before disposal. | | | | |
| Precautions to be Taken in Handling and Storage Do not store dipropylene glycol methyl ether in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, dry, well-ventilated area away from ignition sources. | | | | |
| Other Precautions and Warnings Use non-sparking tools and electrically ground and bond all containers, especially during transfer. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use an air-purifying respirator or a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus with operated in pressure demand mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Clothing or Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIPROPYLENE GLYCOL METHYL ETHERCH₃OC₃H₆OC₃H₆OH

CAS: 34590-94-8

**IDENTIFICATION AND TYPICAL USES**

Dipropylene glycol methyl ether (DPGME) is a colorless liquid with a mild, pleasant, ether-like odor and a bitter taste. It is used primarily in hydraulic brake fluids and as a high-boiling point solvent.

RISK ASSESSMENT: HEALTH***General Assessment***

DPGME is mildly toxic by *ingestion* and *absorption* through the skin. *Inhalation* of its vapors at high concentrations (above 300 ppm) can will also present a significant health hazard risk. There is no information in the references on the carcinogenic, teratogenic, or mutagenic properties of DPGME. Because of its extremely disagreeable (at high concentrations) and irritating (intolerable) odor, overexposure is unlikely under normal operating conditions.

Inhalation can cause irritation of the eyes, nose, throat, and the mucosa of the upper respiratory tract. Inhalation and skin absorption can lead to headaches, lightheadedness, weakness, and action to depress the function of the central nervous system (CNS). On the skin, there may be rash with irritation and localized inflammation. DPGME will absorb rapidly through intact skin.

Ingestion will cause unspecified gastrointestinal effects and possibly lead to toxic systemic effects with action primarily to depress the CNS.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to DPGME:

Skin: Irritation with possible rash and quick absorption causing toxic systemic effects.

Eye: Severe irritation with localized inflammation.

Lung: Irritation of the mucosa of the nose, throat, and upper respiratory tract. Can cause a number of toxic systemic effects with symptoms of headaches, lightheadedness, weakness, and CNS depression.

Other: Ingestion can cause the same symptoms as inhalation. Adverse action on the central nervous system is likely on high acute exposures.

☠ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to DPGME and can last for months or even years:

Cancer Hazards: According to the information presented in the references, DPGME has not been shown to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, DPGME has not been adequately tested for its ability to cause adverse effects on reproduction in test animals.

Other Chronic Effects: Low, repeated exposures may lead to damage to the central nervous system (CNS).

🛡 *Recommended Risk-Reduction Measures*

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure, especially if DPGME is to be agitated or heated.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around DPGME. For low exposures up to or over the PEL (100 ppm), use a NIOSH-approved organic vapor respirator with full

facepiece. For the best protection, especially at high exposures or during emergency situations, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode, or a supplied-air respirator operated in pressure demand or continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. Skin contact must be avoided. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with DPGME.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where DPGME is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Evaluation by a neurologist with special tests for central nervous system (CNS) functions.
- ☑ Lung function tests.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, exposure to DPGME can have a more pronounced effect on smokers than on non-smokers exposed to the same levels. Prudent risk assessment and management requires consideration of *all* possible risk factors when exposure symptoms appear in the workforce.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of liquids from storage containers to process containers is recommended.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.

- ☑ Wash thoroughly immediately after exposure to DPGME and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of DPGME should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during use, transportation, storage, disposal, or destruction of DPGME. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

DPGME is considered a class IIIA combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of DPGME. Should DPGME ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine, chlorine dioxide, and peroxides) either during use, transportation, or storage, violent reaction can occur.

Wastes should be considered for recovery, reclamation, or recycling rather than land-fill disposal. Destruction in a chemical incinerator equipped with an afterburner and scrubber is also acceptable.

DPGME can enter the environment through industrial discharges and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to DPGME. Insufficient data are available to evaluate or predict the acute (short-term) effects of DPGME to aquatic life, plants, birds, or land animals.

☠ Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term (chronic) effects of DPGME to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

DPGME is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

DPGME is highly persistent in the aquatic environment with a half-life of 200 days and more. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It is highly mobile in both water and soil and undergoes aerobic biodegeneration.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of DPGME found in fish tissues is expected to be about the same as that found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of DPGME should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. All containers used in shipping or transfer operations must be electrically grounded to prevent static sparks. Buildings should be properly constructed for storage of hazardous chemicals (fire suppression equipment, alarms, separation and distance requirements, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous

materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If DPGME should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. It is highly soluble in water and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of DPGME. If DPGME is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Collect liquid using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of DPGME as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving DPGME can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with

specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|---|--|
| Characterization Ketone | RCRA Number D001 | EPA Class Characteristic (I) Waste |
| DOT Proper Shipping Name Butyrene | Chemical Abstract Service (CAS) Number 123-19-3 | |
| DOT Hazard Class and Label Requirements Flammable or Combustible Liquid | DOT Emergency Guide Code 26 | |
| DOT Identification Number UN 2710 | Chemical Formula (CH₃CH₂CH₂)₂CO | |

Synonyms

Butyrene; DPK; 4-heptanone; heptan-4-one; propyl ketone.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Dipropyl ketone (derivation: By passing butyric acid over precipitated calcium carbonate at 842°F or 450°C) 1 ppm = 4.75 mg/m³ | PEL: 50 ppm 235 mg/m³ STEL: Not Established | REL: 50 ppm 235 mg/m³ STEL: Not Established | Not Determined | TLV: 50 ppm 235 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 290°F (144°C) | Specific Gravity (H ₂ O = 1) 0.82 |
| Vapor Pressure (mm Hg) 5.2 at 69°F (20°C) | Molecular Weight 142.2 |
| Vapor Density (Air = 1) 3.93 | Freezing Point -27°F (-33°C) |

Solubility

Insoluble in water. Soluble in alcohol and ether.

Appearance and Odor

Colorless liquid with a strong, penetrating, but pleasant odor and burning taste.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 120°F (49°C) closed cup | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Class II Combustible Liquid | Autoignition Temperature Not Found |

Extinguishing Media

Large fires: Alcohol foam or water spray. Small fires: Dry chemical, carbon dioxide, water spray, foam.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus. Fight fire from a distance if possible. Keep fire-exposed containers cool with water spray. A solid stream of water may spread fire. If it can be done safely, move fire-exposed containers from area.

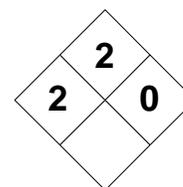

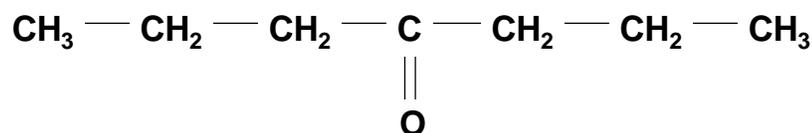

Unusual Fire and Explosion Hazards

Containers may explode in fire due to the buildup of internal pressures. BLEVE (boiling liquid expanding vapor explosion) is possible. Immediately evacuate if rising sound is heard from venting device or a noticeable discoloration is observed on the sides of the tank or storage vessel.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------|--|---------------------------------------|--|
| Stability | | Conditions to Avoid Normally stable. Do not allow dipropyl ketone to come into contact with incompatible materials. Avoid contact with fire or high heat sources. Do not use in confined spaces. | | |
| Stable | Unstable | Incompatibility (<i>materials to avoid</i>) | | |
| X | | Incompatible with strong oxidizers (bromine, chlorine, fluorine). | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of dipropyl ketone is not expected to occur. | | |
| May Occur | Will Not Occur | Hazardous Decomposition or By-products | | |
| | X | When heated to decomposition, dipropyl ketone emits acrid, irritating smoke and fumes, including oxides of carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Irritation of the mucosa of the respiratory tract causing respiratory depression causing gasping, choking, and dyspnea. Higher concentrations causes CNS depression with headache, dizziness, fainting, tremor, chemical pneumonitis, coma, and possibly death. | | | | |
| SKIN & EYES: Skin contact with liquid or vapor can result in irritation and may cause dermatitis and paresthesia (tingling). Eye contact causes pain, irritation, and corneal damage, tearing. | | | | |
| INGESTION: Unlikely. Symptoms of irritation, sore throat, nausea, coughing, salivation, vomiting. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Respiratory system; skin; eyes; CNS, liver. |
| Medical Conditions Generally Aggravated by Exposure | | | | |
| Respiratory impairments, skin conditions (dermatitis), and liver disorders may be aggravated. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Immediately flush with large amounts of water for 15 minutes (minimum), occasionally lifting eyelids. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Seek medical attention immediately. Give a conscious and alert victim several glasses of milk or water. Vomiting is not recommended (causes direct aspiration of the liquid which may cause chemical pneumonitis). | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Remove all ignition sources. Restrict persons not wearing protective equipment from entering area of spill or leak until cleanup is complete. Ventilate area. Absorb liquid in dry sand or other material and deposit in sealed containers. Alert appropriate state or federal response agencies. | | | | |
| Preferred Waste Disposal Method | | | | |
| Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from fire, sparks, and flame. Use non-sparking tools on containers. Ground and bond metal containers during transfer operations. | | | | |
| Other Precautions and Warnings | | | | |
| Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). Protect containers from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| Exposures above 50 ppm: MSHA/NIOSH approved full facepiece respirator with organic vapor cartridge. Greater protection is obtained from a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Solvent Resistant Butyl Rubber | | Chemical Goggles and/or Face Mask | | Rubber Apron |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIPROPYL KETONE

CAS: 123-19-3

**IDENTIFICATION AND TYPICAL USES**

Dipropyl ketone is a colorless liquid with a strong, penetrating, but pleasant odor and a burning taste. It is used in lacquers and as a solvent for raw and blown oils, resins, nitrocellulose, and polymers. It is also used as a flavoring compound.

RISK ASSESSMENT: HEALTH**General Assessment**

Dipropyl ketone is moderately toxic to humans by *inhalation* and *ingestion*. There are no reports in the references that indicate skin absorption is a risk factor. However, skin or eye contact can cause surface tissue damage and inflammation. The references contain no information on the carcinogenic, mutagenic, or teratogenic properties of dipropyl ketone. However, long-term exposures have caused damage to the liver in test animals.

Inhalation of dipropyl ketone causes irritation of the mucosa of the respiratory tract leading to respiratory depression with symptoms of gasping, choking, and dyspnea. Exposure to higher concentrations can cause depression of the central nervous system (CNS) with symptoms of headache, lachrymation, somnolence, decreased breathing, dizziness, fainting, tremor, coma, and possibly death (rare but possible). If the liquid should be aspirated, it can lead to chemical pneumonitis.

Skin contact with the liquid or vapor can lead to chemical dermatitis and localized paresthesia with symptoms of prickling or tingling with no apparent stimulus and associated sensory nerve damage. Eye contact causes ocular pain, corneal damage, lachrymation, and possible loss of vision.

Although ingestion is unlikely in the occupational setting, it can cause irritation of the mouth, sore throat, coughing, salivation, nausea, and vomiting.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to dipropyl ketone:

Skin: Irritation, dermatitis, and possible localized paresthesia.

Eye: Irritation with pain and inflammation that can lead to corneal damage and possible loss of vision.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can cause dizziness, headache, and, possibly, coma and death.

CNS: A mild narcotic compound. Inhalation of high concentrations of the vapor may cause dizziness, lightheadedness, and possible loss of consciousness.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to dipropyl ketone and can last for months or even years:

Cancer Hazards: According to information presented in the references, dipropyl ketone has not been adequately tested for its ability to cause cancer in laboratory test animals.

Reproduction: There are no reports to support any claims of reproductive hazards in humans or animals.

Sensitivity: Exposure to the skin may result in dermatitis and allergy (sensitization). If allergy develops, very low future exposure can result in skin irritation and rash. Repeated exposure can cause chronic irritation of the eyes and lungs.

Other Chronic Effects: Long-term exposures may cause damage to the liver and/or injury to the central nervous system.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with dipropyl ketone. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with dipropyl ketone. For exposures to the PEL (50 ppm), use a NIOSH-approved, full facepiece organic vapor respirator. For higher or prolonged exposures, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode, or a supplied-air respirator operated in continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dipropyl ketone.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where dipropyl ketone is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be helpful:

- Liver function tests.
- Neurological evaluation of the central nervous system.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.

- Wash thoroughly immediately after exposure to dipropyl ketone and at the end of the work shift or before eating, drinking, or smoking. Never wear clothes contaminated with dipropyl ketone home. Family members can be exposed.
- Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of dipropyl ketone should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of dipropyl ketone. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Dipropyl ketone is considered a class II combustible liquid (per OSHA 29 CFR 1910.106). It can react with strong oxidizers to cause a serious fire and explosion hazard. When involved in a fire, it can release acrid and irritating oxides of carbon. A boiling liquid expanding vapor explosion (BLEVE) is also a possibility. These characteristics require special consideration during any emergency involving a leak or spill of dipropyl ketone.

The proper disposal/destruction method for dipropyl ketone is to burn it in a chemical incinerator (with molten salt treatment) equipped with an afterburner and air scrubber.

Dipropyl ketone can enter the environment through manufacturing, unchecked discharge into effluents from industrial or municipal waste treatment plants, and through spills.

☠️ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dipropyl ketone. This chemical has a slight acute toxicity to aquatic life. No data are available on the short-term effects of dipropyl ketone on plants, birds, or land animals.

☼ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Dipropyl ketone has slight chronic toxicity in aquatic life. No data are available to evaluate the long-term effects of dipropyl ketone to plants, birds, or land animals.

◆ *Water Solubility*

Dipropyl ketone is insoluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

⌚ *Persistence in the Environment*

Dipropyl ketone is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of dipropyl ketone found in fish tissues is expected to be about the same as the average concentration of dipropyl ketone in water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dipropyl ketone should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately.

Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If dipropyl ketone should contact the water table, aquifer, or navigable waterway, time is of the essence. It is insoluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dipropyl ketone.

If dipropyl ketone is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers for disposal.
- ☑ Keep dipropyl ketone out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- ☑ It may be necessary to dispose of dipropyl ketone as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dipropyl ketone can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business prospects and contacts.

🚫 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Hazardous Polymerization | | Conditions to Avoid Explosive hydrogen gas may be formed when finely divided iron contacts moisture during crushing and milling operations. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Exothermic reaction above 392°F (200°C) with halocarbon vapors produces toxic hydrochloric acid and phosgene. Also, toxic aluminum fumes can be produced in fire. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? |
| Health Hazards INHALATION: Primarily a "nuisance dust." Inhaling finely divided particles may cause lung damage (Shaver's disease) and possibly lead to pneumoconiosis (more probable because of the silica content of emery). In general, dust inhalation may cause tightness and pain in chest, coughing, difficulty breathing. SKIN & EYES: Contact with the skin or eyes may cause irritation. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1-A & Z-3 | Target Organs? Respiratory system |
| Medical Conditions Generally Aggravated by Exposure Pre-existing lung disease or dysfunction may be aggravated by exposure to ammonium oxide dusts. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Remove person to fresh air and seek medical attention immediately. Begin rescue breathing if breathing has stopped and CPR if heart action has stopped. If conscious, give 1-2 glasses of water. Do NOT attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Collect spilled powdered materials in safest manner possible and deposit in sealed drum for disposal. | | | | |
| Preferred Waste Disposal Method No Citation. Check applicable federal, state, and/or local environmental regulations. | | | | |
| Precautions to be Taken in Handling and Storage Emery is a noncombustible solid. Store to avoid contact with strong acids and oxidizers. Store in tightly closed containers in cool, well-ventilated area. | | | | |
| Other Precautions and Warnings Avoid damage to containers. Emery is suitable for storage in general chemical storage areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) None required where adequate ventilation conditions exist. If airborne concentrations exceed the PEL, a dust/mist respirator is recommended. For high exposures, or if concentrations exceed the capacity of the respirator, use a self-contained breathing apparatus with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Rubber | | Eye Protection Chemical/Dust Goggles | | Other Protective Clothing Not Applicable |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

EMERYAl₂O₃CAS: 12415-34-8 (for emery)
CAS: 1302-74-5 (for corundum)**IDENTIFICATION AND TYPICAL USES**

Emery is a white crystalline sand-like powder with no odor. The mineral corundum is natural emery. Emery, ruby, and sapphire are impure crystalline varieties. The mixed mineral bauxite is a hydrated emery. It is used in many polishing and abrasive operations in the form of emery cloth, grinding wheels, and grinding belts. Fine emery is used primarily as a lens grinder in the gem-cutting process.

RISK ASSESSMENT: HEALTH***General Assessment***

The aluminas are generally considered nuisance dusts and under some conditions of human exposure may cause a minimal pulmonary nodular response. However, excessive *inhalation* of finely divided particles may lead to lung damage (Shaver's disease) characterized by scarred tissue ("pulmonary fibrosis") with shortness of breath, tightness and pain in chest, and cough. The condition can be fatal.

It should be noted that population studies of potentially exposed workers have shown minimal evidence of pulmonary fibrosis or pneumoconiosis. However, such diseases may develop more as a result of the silica content in emery. Also, animal experiments with emery have shown that the type of reaction in lung tissue varies with the form of alumina used and its particle size, the species of animal tested, and the route of administration. However, the data from both human and animal studies seem to indicate that alumina is efficiently eliminated from the lung and has a low degree of fibrogenicity.

This does not mean there is no health risk associated with emery. There is no way of estimating exact human response under all possible types of exposure conditions. Prudent risk management requires caution when working with or around emery.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to emery:

Skin: Irritation.

Eye: Severe eye irritation likely.

Lung: Can irritate the respiratory tract. In large doses it may cause pulmonary fibrosis.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to emery and can last for months or even years:

Cancer Hazards: According to the information presented in the references, emery has been tested and may lead to cancer in test animals. No data were found on its human carcinogenic capabilities.

Reproductive Hazard: According to the information presented in the references, emery has been tested and has not been shown to affect reproduction.

Other Chronic Effects: Repeated exposure to large amounts of emery dust may damage the lungs, leading to scarring of the tissue (pulmonary fibrosis), with shortness of breath and possible death.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with emery. The exact nature of its harmful capabilities is not clearly understood in the references. Therefore, it is recommended that it be handled with extreme care. If a less toxic material cannot be substituted for emery, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of emery release. While not always operationally feasible, isolating operations can reduce exposure.

Using respiratory protection and other personal protective equipment (PPE) is less effective than the engineering controls mentioned above, but is still advisable whenever working with or around emery. Under normal operating conditions of low exposure potential, a dust/mist respirator will suffice. However, for maximum protection in large concentrations or when the capacity of the dust/mist respirator is exceeded, personnel should wear a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical/dust goggles, safety glass with side shields, or a face shield should be worn to protect the eyes. To prevent hand and skin exposures, impervious rubber gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with emery.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where emery is used or stored.

If there has been a long history of high exposure, or if lung symptoms develop, the following medical tests are recommended:

- Chest X-ray.
- Pulmonary function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause lung cancer, emphysema, and a host of other medical problems, working with or around emery may aggravate these conditions further.

Other methods to reduce exposure to emery include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, then respiratory protection should be required.
- Always ensure that proper protective clothing is worn when using chemical substances. Never allow contaminated clothing to be taken home.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of emery should be communicated to all potentially exposed workers.

- Eye wash stations should be provided in the immediate work area for emergency use.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of emery. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where emery contacts incompatible commodities can result in violent reactions as well as the possible contamination of the surrounding environmental mediums (water, soil, and air).

Emery is considered a noncombustible solid. However, its dusts may form explosive mixtures in air. Also, because it is incompatible with strong oxidizers and strong acids, extreme caution is required in handling, storage, transportation, and disposal of emery. These characteristics also require special consideration during any emergency situation involving a leak or spill of emery. Should emery ever come into contact with incompatible substances either during use, transportation, storage, or disposal, dangerous reactions are possible.

Emery occurs naturally in the environment in the minerals bauxite, baerites, boehmite, corundum, diaspor, and gibbsite. It therefore occurs naturally in the aquatic environment but can also enter it through industrial discharges and/or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to emery.

Emery has slight acute toxicity to aquatic life, but its toxicity will be increased under alkaline conditions. Insufficient data are available to evaluate or predict the short-term toxic effects of emery to plants, birds, and terrestrial animals.

☪ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure to toxic chemicals. Emery has slight chronic toxicity to aquatic life, but this toxicity will increase under alkaline conditions. Insufficient data are available to evaluate or predict the long-term toxic effects of emery to plants, birds, or land animals.

◆ *Water Solubility*

Emery is slightly solubility in water. Concentrations of 1 milligram or less will mix with a liter of water.

⌚ *Persistence in the Environment*

Emery is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans. Emery will not accumulate in the edible tissues of aquatic life that are consumed by humans.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of emery into the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of emery should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If emery should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery

plan should be in place prior to any operations involving the use, transportation, storage, or disposal of emery.

If emery is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Do not allow exposure to incompatible materials.
- ☑ Collect powdered materials in the safest and most efficient manner possible. Do NOT dry sweep and avoid the generation of airborne dusts. Use a wet mop method or a vacuum equipped with a high efficiency particulate air (HEPA) filter. Materials should be placed in a sealed drum for disposal.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving emery can present a moderate threat to business operations. Although not likely, equipment and facilities may be lost or their use disrupted as a result of an incident involving emery which can significantly affect fiscal viability. Lawsuits that may result from personnel injury, illness, and/or death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Also, some studies indicate that emery may cause cancer in test animals. Always remember that whenever the terms "cancer" or "carcinogen" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered whenever developing public relations policies.

🛡️ *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures that focus on emergency response, disaster preparedness, and disaster recovery. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards | | | | |
| INHALATION: Breathing dusts can cause irritation of the nose and throat. Repeated contact will lead to toxic systemic effects. Initial symptoms include epileptic convulsions lasting several minutes. There may be respiratory depression, hypersalivation, frothing (from the nose and mouth), cardiac arrhythmia, deafness, kidney dysfunction, headache, dizziness, weakness in the legs, abdominal discomfort, nausea, vomiting, insomnia, agitation, and confusion. | | | | |
| ABSORPTION: Irritation. Solution can pass through intact skin causing systemic effects (see inhalation). | | | | |
| INGESTION: Nausea, vomiting, diarrhea, and systemic effects (see inhalation). Can be fatal. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | 5th Annual Report | Group 3 | 29 CFR 1910.1000 Table Z-1 | Central nervous system (CNS), liver. |
| Medical Conditions Generally Aggravated by Exposure Convulsive disorders (e.g., epilepsy) and liver disease may be aggravated by exposure to endrin. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of water. Do NOT scrub. Inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Contact poison control center. Unless advised otherwise, if victim is conscious, give 1-2 glasses of water. Due to potential for sudden seizures, do NOT induce vomiting. Do NOT give any oils by mouth. Seek medical attention immediately. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Remove all sources of ignition. Ventilate area of spill. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. Collect powdered materials with scoop or use a vacuum equipped with HEPA filter (do NOT generate dusts). Dispose of in sealed drums. | | | | |
| Preferred Waste Disposal Method | | | | |
| Chemical treatment by reductive chlorination, or burn in a chemical incinerator (with afterburner). | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store in tightly closed containers in cool, well ventilated area away from heat and incompatibilities. | | | | |
| Other Precautions and Warnings | | | | |
| Store in detached or external facility, if possible. Bulk storage is not recommended in plant. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) | | | | |
| Odor threshold is low and difficult to monitor. For exposures above 0.1 mg/m³, use a NIOSH-approved supplied air respirator or a SCBA with full facepiece operated in positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Rubber | | Chemical/Dust Goggles or Face Mask | | Protective Apron, Boots (avoid skin contact) |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ENDRIN

CAS: 72-20-8

**IDENTIFICATION AND TYPICAL USES**

Endrin is a colorless to white crystalline solid in its pure form. The technical grade appears as a tan crystalline solid or powder. It has a mild chemical odor. It was formerly used as an insecticide or pesticide to control insects, rodents, and birds. However, because of its persistence in the environment, its manufacture has been discontinued in the United States since 1986. It was commonly used in field crops (cotton, grains, etc.). Also used to control grasshoppers in non-cropland and to control voles and mice in orchards.

RISK ASSESSMENT: HEALTH**General Assessment**

Endrin is highly toxic to humans by all routes of exposure (*inhalation, ingestion, and skin absorption*). It is a questionable carcinogen in animals and in humans, with experimental teratogenic and mutagenic data also reported. This chemical is no longer manufactured in the United States and, therefore, exposure risk is thought to be relatively low. However, should human exposure ever occur, endrin can cause serious toxic and poisonous systemic effects up to and including death.

Endrin is a central nervous system stimulant. The initial symptom of exposure is the appearance of epileptic convulsions occurring up to 10 hours following an overexposure and lasting for several minutes.

Symptoms of exposure by both inhalation and skin contact (absorption) include respiratory depression with convulsions, hypersalivation, frothing from the nose and mouth, cardiac arrhythmia, deafness, renal dysfunction (kidney problems), and acidosis (a decrease in the alkaline balance in the blood and tissues).

Recovery is usually rapid but headache, dizziness, lethargy, weakness, and loss of appetite may persist. There may also be weakness in the limbs (primarily legs), abdominal discomfort, nausea, vomiting, insomnia, agitation and aggressive behavior, and mental confusion. Inhalation also causes irritation of the eyes, nose, and throat.

In addition to absorption and subsequent systemic effects, skin contact will result in moderate to severe irritation. Eye contact may also result in irritation. Ingestion causes nausea, vomiting, diarrhea, and systemic effects of inhalation and skin absorption.

Caution is warranted when inhalation and skin contact exposures are possible. Even though air levels may be within limits, personnel may be overexposed if endrin should contact the skin.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to endrin:

Skin: Liquid can pass through unbroken skin. Contact may cause irritation and rash. Symptoms of exposure include headache, nausea, abdominal pain, vomiting, and CNS stimulation.

Eye: Severe irritation.

Lung: Irritation of the nose and throat. Breathing vapors can cause cough, convulsions, and adverse effects on the liver.

CNS: A powerful central nervous system stimulant. Symptoms of exposure may include agitation, aggressiveness, excitement, tremors, convulsions, blurred vision, mental confusion, delirium, and irritability.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to endrin and can last for months or even years:

Cancer Hazards: Endrin may be a carcinogen in humans since it has been shown to cause liver cancer in animals.

Reproductive Hazard: There is some evidence that exposure to endrin cause damage to the developing fetus in test animals. Endrin may decrease fertility in males and females.

Other Chronic Effects: Endrin may damage the liver causing enlargement (hepatomegaly). It may also cause damage to the central nervous system (CNS) causing loss of appetite, fatigue, and malaise.

🔹 **Recommended Risk-Reduction Measures**

Endrin is no longer manufactured in the United States. Its use is no longer permitted. However, in the unlikely event that personnel should be occupationally exposed to endrin, the risks to human health can be severe. Personnel should avoid direct contact with endrin. If a less toxic material or compound cannot be substituted for endrin, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of endrin dust release. This may be practical in manufacturing operations, but is not feasible in application since it is used outdoors. While not always operationally possible, isolating operations involving endrin manufacturing can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around endrin. The PEL is extremely low (0.1 mg/m^3) and difficult to accurately monitor. At exposures above the PEL, an MSHA or NIOSH-approved self-contained breathing apparatus (SCBA) with full face-piece and pressure demand is recommended for the greatest possible respiratory protection. If a full face-piece is not available, then chemical goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, impervious gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with endrin.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and

other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where endrin is used or stored.

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- ☑ Liver and kidney function tests.
- ☑ Electroencephalogram (EEG).
- ☑ Blood endrin levels.
- ☑ Recommended anticonvulsants include pentobarbital, phenobarbital, and benzodiazepines. Administration of adrenergic amines should be avoided (may increase myocardial irritability).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
- ☑ Wash thoroughly immediately after exposure to endrin and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of endrin should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to endrin, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by endrin should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to endrin.
- ☑ Specific engineering controls are recommended by NIOSH. Refer to NIOSH Criteria Document: Occupational Exposure During the Manufacture

and Formulation of Pesticides (Publication Number 78-174)

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Because of its former use as an insecticide and pesticide, endrin may be present in the environment. The environment is also at risk of exposure during transportation, storage, disposal, or destruction of endrin. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where endrin contacts incompatible commodities can result in violent and even explosive reactions (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Endrin is considered a non-combustible solid. However, it was common practice to mix it with some flammable liquids such as benzene or xylene. Also, because it is incompatible with many common oxidizers, such as chlorine, extreme caution is required in handling, storage, transportation, and disposal of endrin. These characteristics also require special consideration during any emergency situation involving a leak or spill of endrin powder or dust.

Endrin use in the U.S. is no longer permitted. However, because of its once widespread, general usage in the past and its persistence in the environment, endrin may still enter the environment in agricultural run-off.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to endrin.

Endrin has high acute toxicity to aquatic life, land animals, and to birds. Insufficient data are available on the short-term effects of endrin to plants.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Endrin has high chronic toxicity to aquatic life, birds, and land animals. Insufficient data are available

to evaluate or predict the long-term effects of endrin to plants.

💧 Water Solubility

Endrin is insoluble in water. Concentrations of less than 1 milligram may not mix with a liter of water.

🕒 Persistence in the Environment

Endrin is highly persistent in the water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. It will persist in soil for extremely long periods (15 years or more). It can leach to ground water and absorb in terrestrial and aquatic sediments. About 75% of endrin will eventually end up in terrestrial soil; approximately 24% will end up in aquatic sediments; the remainder will end up in water or air.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of endrin found in fish tissues is expected to be considerably higher than the average concentration of endrin in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Although endrin is no longer manufactured or used in the United States and it is unlikely that it will be transported, stored, handled, or destroyed, environmental contamination is still possible. This is based upon endrin's extremely long persistence in the environment and the fact that some private enterprises may still have a supply of endrin in use on private croplands.

Storage of endrin should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Buildings or storage areas should be equipped with appropriate fire protection systems (alarms, sprinklers). Proper ventilation and protective equipment should be used while handling the powders or while preparing aqueous solutions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If endrin should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is only slightly soluble in water and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of endrin. If endrin is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Collect solids using a HEPA vacuum to avoid the generation of dusts.
- ☑ It may be necessary to dispose of endrin as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving endrin can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be a consideration when developing public relations policies.

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|---------------------------------|
| Characterization Chlorohydrin (Epoxy Resin) | RCRA Number U041 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Epichlorohydrin | Chemical Abstract Service (CAS) Number 106-89-8 | |
| DOT Hazard Class and Label Requirements Flammable Liquid | DOT Emergency Guide Code 30 | |
| DOT Identification Number UN 2023 | Chemical Formula C₃H₅ClO | |

Synonyms

1-Chloro-2,3-epoxypropane; 2-chloropropylene oxide; gamma-chloropropylene oxide; glycerol epichlorohydrin; alpha-epichlorohydrin; (chloromethyl)ethylene oxide.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|--|
| Epichlorohydrin: (derivation: By removing hydrogen chloride from dichlorohydrin). 1 ppm = 3.85 mg/m³ | PEL (skin): 2 ppm 8 mg/m³ STEL: Not Established | REL: Minimum Possible Exposure Possible Cancer Agent | 75 ppm | TLV (skin): 2 ppm 8 mg/m³ Suspected Human Carcinogen |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 242°F (116°C) Decomposes | Specific Gravity (H ₂ O = 1) 1.18 |
| Vapor Pressure (mm Hg) 13 at 68°F (20°C) | Molecular Weight (atomic weight) 92.5 |
| Vapor Density (Air = 1) 3.29 | Melting Point -54°F (-48°C) |

Solubility

Slightly soluble in water (7%). Miscible in most organic solvents.

Appearance and Odor

A colorless, mobile liquid with a slightly irritating, chloroform-like odor. Odor Threshold = 10 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) 93°F (34°C) closed cup | Explosive Limits in Air % by Volume LEL: 3.8% UEL: 21% |
| NFPA Classification Class 1C Flammable Liquid | Autoignition Temperature 772°F (411°C) |

Extinguishing Media

Alcohol foam is recommended. Also use carbon dioxide, dry chemical, or water spray.

Special Fire Fighting Procedures

Poisonous gases are emitted (including phosgene). Wear full protective clothing and self-contained breathing apparatus (SCBA). Remain clear of smoke, water fall-out and water run-off. Move containers from fire area if it can be done without risk. Cool exposed containers. Fight fire from distance, if possible.

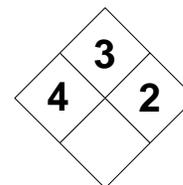

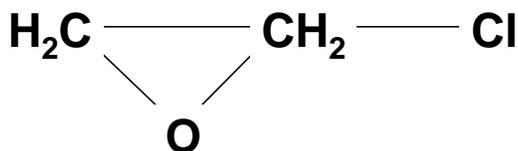

Unusual Fire and Explosion Hazards

Vapors form explosive mixtures in air. Vapors are heavier than air and may travel from some distance to an ignition source and flashback.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|---|--|--|
| Stability | | Conditions to Avoid Epichlorohydrin is a highly volatile and unstable liquid. Avoid contact with incompatible materials, heat, ignition sources, and even direct sunlight. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Reacts violently with liberation of heat with strong oxidizers (chlorine, bromine, fluorine), strong acids, (sulfuric, nitric), and chemically active metals (aluminum, caustics, chlorides or iron, aluminum, and zinc). | | |
| Hazardous Polymerization | | Conditions to Avoid Highly exothermic polymerization of epichlorohydrin can be expected to occur in contact with incompatible materials. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products At high temperatures, epichlorohydrin decomposes and may produce poisonous gases, including toxic hydrogen chloride, carbon dioxide, carbon monoxide, chlorine, and phosgene. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? |
| Health Hazards INHALATION: Irritation of the eyes, nose, and respiratory tract. May cause nausea, vomiting, abdominal pain and discomfort, headache, and pain in the area of the liver. There may be difficulty breathing, cyanosis, coughing, nasal and throat irritation, and chemical pneumonitis. High exposures can depress the central nervous system and lead to death. Pulmonary edema (fluid in the lungs) is also possible. There can be liver and kidney damage as well. ABSORPTION: Irritation and burns. Will pass through skin causing systemic effects (see inhalation). INGESTION: Tremor, somnolence, ataxia, and systemic effects (see inhalation). | | | | |
| Carcinogenicity | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2A | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Resp. sys., skin, eyes, CNS, liver, kidney, repro. sys. |
| Medical Conditions Generally Aggravated by Exposure Liver, kidney, lung, or nervous system disorders may be aggravated by exposure to epichlorohydrin. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes, seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with flooding amounts of water. <u>Inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 1-2 days for lung effects. <u>If swallowed:</u> Contact poison control center. Unless advised otherwise, if victim is conscious, give 1-2 glasses of water and induce vomiting repeatedly until vomit is clear. Seek medical attention immediately. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all sources of ignition. Ventilate area of spill. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. Absorb in vermiculite or other suitable material and dispose of in sealed drums. Do NOT release to sewers, storm drains, surface waters, or soils. | | | | |
| Preferred Waste Disposal Method Mix with vermiculite, caustic soda and slaked lime, wrap in paper and burn in chemical incinerator. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well ventilated area away from heat and incompatibilities. | | | | |
| Other Precautions and Warnings Prevent static sparks by grounding and bonding all containers. Treat "empty" containers as if full. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For any exposure to a suspected carcinogen, use a NIOSH-approved supplied air respirator operated in positive pressure mode, or a SCBA with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Rubber (test for adequacy) | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron, Boots (avoid skin contact) | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

EPICHLOROHYDRINC₃H₅ClO

CAS: 106-89-8

**IDENTIFICATION AND TYPICAL USES**

Epichlorohydrin is a colorless liquid with a slightly irritating chloroform-like odor. It is a major raw material for epoxy and phenoxy resins. It is also used in the manufacture of glycerol, adhesives, and castings, as a derivative in producing dyes, pharmaceuticals, surfactants, and plasticizers, in curing propylene-based rubber products, as a solvent for resins, gums, varnishes, and cellulose esters and ethers, and as a high wet-strength resin in the paper industry.

RISK ASSESSMENT: HEALTH**General Assessment**

Epichlorohydrin is highly toxic to humans by *inhalation* and *skin absorption*. If *ingestion* occurs, it can also result in extremely toxic systemic effects. It is a confirmed carcinogen, a suspected teratogen (causes reproductive effects), and a known mutagen (causes genetic changes). Symptoms of exposure through all routes can be delayed for several hours, creating a false sense of security with regard to health hazard risk.

Inhalation results in moderate to severe irritation of the eyes, nose, throat, and respiratory tract. High concentrations can cause depression of and even injury to the central nervous system (CNS), leading the death. It is a known sensitizer by inhalation and absorption. Prolonged exposures can injure the liver, kidney, lungs, and cause changes in lymphocytes (cells in the blood or lymph). Symptoms of exposure through inhalation and absorption can also include headache, nausea, vomiting, abdominal discomfort and pain in the liver region, difficulty breathing, cyanosis, coughing, followed by nasal irritation, and chemical pneumonitis or pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can be fatal.

In addition to absorption and subsequent systemic effects, skin and eye contact can produce severe burning in the area of contact, with blistering and deep pain occurring several hours later. There may also be allergic reactions (eczema or dermatitis) in some individuals.

Ingestion can produce tremors, somnolence, ataxia, and potentially serious damage to the liver and kidneys that may result in death.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to epichlorohydrin:

- Skin:** Liquid can pass through unbroken skin. Contact can cause severe irritation, burns, and deep-seated pain. Symptoms of exposure include headache, nausea, abdominal pain, vomiting, and CNS depression.
- Eye:** Severe irritation and burns that can lead to permanent damage to vision.
- Lung:** Irritation of the nose and throat. Breathing vapors can damage the lungs and cause chemical pneumonitis and even pulmonary edema (fluid in the lungs).
- CNS:** A central nervous system depressant. Symptoms include tremors, somnolence, ataxia, and possible death.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to epichlorohydrin and can last for months or even years:

Cancer Hazards: Epichlorohydrin is highly suspected to be a human carcinogen. There is some evidence in the references that exposure can cause lung cancers in

humans and it has been shown to cause stomach, liver, skin, and nasal cavity cancers in animals.

Reproductive Hazard: Exposure by all routes has led to impaired male fertility and/or spermatogenesis. It is unclear at this time whether this is a reversible effect. In animals, there is evidence of fetotoxic effects.

Other Chronic Effects: Long-term exposure may cause skin allergies and sensitization to develop, with red rash and itching. If this occurs, even low future exposures could cause a recurrence of symptoms. Repeated exposures could cause lung damage and also may affect the liver and kidneys. Lung allergy (asthma) with wheezing, cough, and chest tightness may develop.

🕒 **Recommended Risk-Reduction Measures**

Epichlorohydrin presents a serious health hazard risk. Personnel should avoid direct contact with epichlorohydrin. If a less toxic material or compound cannot be substituted for epichlorohydrin, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of epichlorohydrin release. While not always operationally possible, isolating operations involving epichlorohydrin manufacturing or use can also reduce exposure. Personnel must follow proper industrial hygiene and good housekeeping work practices. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around epichlorohydrin. The PEL is relatively low (5 ppm) and difficult to accurately monitor. At exposures above the PEL, an MSHA or NIOSH-approved powered air-supplied respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand are recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. Skin contact must not occur. To prevent hand and skin exposures, impervious gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with epichlorohydrin.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and

other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where epichlorohydrin is used or stored.

Before beginning initial assignments with this chemical and at regular intervals thereafter (e.g., annually), the following medical protocol are recommended:

- ☑ Lung function tests (establish initial baseline and compare thereafter).
- ☑ Liver and kidney function tests (establish initial baseline and compare thereafter).

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- ☑ Lung function tests.
- ☑ Exposure may cause renal or hepatic failure. Liver and kidney function tests are recommended. Monitor for serial liver enzymes for several days following exposure and urine should be tested for casts, protein, and abnormal cells.
- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately following exposure).
- ☑ Evaluation by a qualified allergist with careful evaluation of exposure history and special testing (may help diagnose allergies).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and other respiratory problems, personnel who smoke may show symptoms of exposure much quicker and more pronounced than those who do not. Prudent risk management requires careful consideration of *all* possible and potential exposure risk factors to ensure proper implementation of control measures and management of the exposure risk.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to epichlorohydrin and at the end of the work shift or before eating, drinking, or smoking.

- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of epichlorohydrin should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to epichlorohydrin, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by epichlorohydrin should change into clean clothes *before* leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to epichlorohydrin.
- ☑ Specific engineering controls are recommended by NIOSH. Refer to NIOSH Criteria Document: Epichlorohydrin (Publication Number 76-206).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of epichlorohydrin. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where epichlorohydrin contacts incompatible commodities can result in violent and even explosive reactions (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Epichlorohydrin is considered a class 1C flammable liquid (per OSHA 29 CFR 1910.106). Its relatively low flash point and high boiling point make it a moderate risk in the presence of an ignition source, heat, or flame. Also, because it is incompatible with many common oxidizers (such as chlorine, bromine, and fluorine), acids (such as hydrochloric, nitric, and sulfuric), solvents (forms explosive dichloroacetylene in contact with trichloroethylene), and aniline (reacts explosively), extreme caution is required in handling, storage, transportation, and disposal of epichlorohydrin. In fact, epichlorohydrin has been known to polymerize in the presence of strong acids, especially when hot. These characteristics also require special consideration during any emergency situation involving a leak or spill of epichlorohydrin.

The proper disposal method is to mix epichlorohydrin with vermiculite and with caustic soda and slaked lime. The resultant mixture is then wrapped in paper and burned in a chemical incinerator equipped with an afterburner and air scrubber.

Epichlorohydrin may enter the environment through industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to epichlorohydrin.

Epichlorohydrin has moderate acute toxicity to aquatic life. Insufficient data are available on the short-term effects of epichlorohydrin to plants, land animals, and birds.

☀ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Epichlorohydrin has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of epichlorohydrin to plants, birds, and land animals.

💧 *Water Solubility*

Epichlorohydrin is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Epichlorohydrin is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 90% of epichlorohydrin will eventually end up in water; the remainder will end up in the air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of epichlorohydrin found in fish tissues is expected to be about the same as the average concentration of epichlorohydrin in the water from which the fish was taken.

🔍 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of epichlorohydrin should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Storage facilities should be equipped with the proper fire protection equipment (sprinklers, alarms, extinguishers). Two-stage storage with water should be avoided since a slow exothermic reaction may result. Proper ventilation and protective equipment should be used while handling the powders or while preparing aqueous solutions. Non-sparking tools should be provided and used to ensure the prevention of ignition. Also, all equipment and containers used in shipping, receiving, or transferring should be electrically grounded and bonded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If epichlorohydrin should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is highly soluble in water and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of epichlorohydrin. If epichlorohydrin is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources and ventilate area of spill or leak.
- Absorb liquids in vermiculite or other compatible material and dispose of in sealed drums.

- It may be necessary to dispose of epichlorohydrin as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving epichlorohydrin can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be a consideration when developing public relations policies.

🔍 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Solubility

Only slightly soluble in water. More soluble in organic solvents.

Appearance and Odor

Colorless, odorless gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) -211°F (-153°C) closed cup | Explosive Limits in Air % by Volume LEL: 3% UEL: 12.5% |
| NFPA Classification Flammable Gas | Autoignition Temperature 959°F (515°C) |

Extinguishing Media

Stop flow of gas first (if possible). Use foam, carbon dioxide, dry chemical, or water spray on fire.

Special Fire Fighting Procedures

Ethane is an extremely flammable, very dangerous fire and explosion hazard. Poisonous gases are evolved from fire. Wear a self-contained breathing apparatus (SCBA) with full facepiece. Ensure ALL sources of escaping gas are controlled. Monitor area long after fire is extinguished. Move containers from fire area if it can be done without risk.

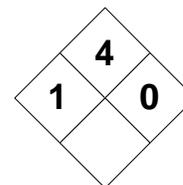

Unusual Fire and Explosion Hazards

Gas is explosive. Containers may explode in flame. Even if fire is extinguished, escaping gas can form explosive mixtures in air quickly and ignite without warning.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|--|--------------------|---|
| Stability | | Conditions to Avoid Ethane is normally stable in its closed containers, during routine operations (those that do not expose it to ignition sources). Avoid contact with heat, sparks, flame, lighted tobacco products, and steam lines. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Ethane is reactive in contact with chlorine or chlorine dioxide, other oxidizers, heat, sparks, and open flame. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethane is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products If involved in fire, ethane can produce toxic carbon monoxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: An asphyxiant gas. Initial symptoms are those of oxygen starvation. Feeling of "air hunger," diminished mental alertness, headache, dullness, shortness of breath, and an impairment in muscle coordination. Continued exposures lead to faulty judgment, depression of senses, rapid fatigue, unconsciousness, convulsions, coma, and death. SKIN & EYES: Contact with the compressed gas or refrigerated liquid can cause frostbite and burns. INGESTION: Not likely since ethane is a gas at normal working (room) temperatures. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Insufficient data | No | No | No | None Reported |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Immediately flush with large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Not likely to occur under normal or even emergency occupational conditions. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. If gas has not yet ignited, use a water spray to knock down vapors and direct them from ignition source. | | | | |
| Preferred Waste Disposal Method None specified in the references (incineration of a gas may be the only alternative). | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible materials or in the presence of heat since violent reactions or explosions can occur. Store in tightly closed pressurized containers in a cool, dark, well-ventilated area away from sunlight. Keep away from ignition sources such as fire, sparks, and flame. | | | | |
| Other Precautions and Warnings Bulk storage of ethane is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure limits have been established. Ethane is a simple asphyxiant. Do NOT use cartridge-type respirators (ineffective for this type of gas). Use a powered supplied-air respirator or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Insulated Rubber | | Eye Protection Goggles and/or Face Mask | | Other Protective Clothing Leather Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHANEC₂H₆

CAS: 74-84-0

**IDENTIFICATION AND TYPICAL USES**

Ethane is a colorless and odorless gas. It is used in the manufacture of chlorinated derivatives, as a minor ingredient in bottled fuel gas, in the petrochemical industry (as a source of ethylene and halogenated ethanes), and as a refrigerant.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethane is a simple asphyxiant gas. As such, its primary route of entry into the body is through *inhalation*. While it does not pose a significant physiological effect (i.e., no systemic poisoning or toxicity), it can displace oxygen levels to below that which is necessary to sustain life. Skin contact with the liquid can be destructive to tissues due to the extremely cold temperatures but absorption is not a likely exposure route. Since ethane usually exists as a gas at room temperatures, ingestion is not likely to occur either.

Inhalation of ethane gas can cause headache, dullness, shortness of breath, and the symptoms of asphyxiation. These include rapid respiration and a feeling of “air hunger” or air starvation followed by a decrease in mental alertness, and impaired muscular coordination. If exposure continues, there can be nausea, vomiting, prostration, unconsciousness, coma, and death.

Skin or eye contact with the vapor poses no serious threat. The vapors have not been shown to cause any physiological response. However, if the liquid should contact either the skin or the eyes, there can be serious irritation, burns, tissue damage, and frostbite.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethane:

Skin: Liquid threat only. Redness, pain, swelling, blisters, and severe frostbite.

Eye: Liquid threat only. Causes frostbite, redness, irritation, severe pain, and blurred vision.

Lung: Vapor is non-irritating and therefore poses no threat of damage to the lungs. However, in high concentrations, ethane can lead to symptoms of asphyxiation and oxygen deprivation up to and including death.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethane and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to ethane does not lead to carcinogenic effects (it is a simple asphyxiant).

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: None reported.

🔧 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with ethane. If another gas cannot be substituted for a ethane, then *engineering controls* are the most effective method of reducing exposures. The best protection is to separate operations and provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using equipment with explosion-proof designs and ensuring all metal containers and tools are electrically grounded and bonded can further reduce the potential for injury or damage. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with ethane. Air-purifying respirators (e.g., the cartridge-type or gas masks) cannot be used with ethane. These type respirators only purify the air and can do nothing to protect in oxygen deficient atmospheres. A powered air-supplied respirator operated in pressure demand or other positive pressure mode, or a self-

contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber or leather apron should be worn. To prevent hand and skin exposures with the liquid, thermal gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethane is used or stored.

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, consider installing automatic sensors that warn personnel of dropping oxygen levels and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Safety shower and eyewash stations should be readily available in work areas where ethane is used or stored.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethane should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or

small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Ethane is an extremely flammable and highly explosive gas. Its extremely low flash point and boiling point present a serious fire hazard. Also, since it can react violently in the presence of oxidizers, such as chlorine, ethane requires special consideration during any emergency involving a leak or release of ethane gas or liquid.

Ethane can enter the environment through industrial discharges, unchecked venting to air, or through spills of the liquid. Since liquids will most likely vaporize rapidly, water and soil contamination are possible but improbable.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethane. Insufficient data are available on the short-term effects of ethane on aquatic life, plants, birds, or land animals. However, as a relatively non-toxic, simple asphyxiant, it might be assumed that ecological toxicity will be relatively low.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the long-term effects of ethane to aquatic life, plants, birds, or land animals. However, as a relatively non-toxic, simple asphyxiant, it might be assumed that any chronic ecological toxicity will be relatively low.

💧 *Water Solubility*

Ethane is only slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

🕒 *Persistence in the Environment*

Ethane is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Ethane is not expected to accumulate in the tissues of fish.

🔍 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. When spills or leaks occur, it may be necessary to contact the local and/or state emergency response authorities. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethane. If ethane is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- Keep ethane out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).

- It may be necessary to dispose of ethane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔍 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|--|---|--|
| Ethanolamine (derivation: By reaction of ammonia with ethylene oxide to form mono, di, and tri-ethanolamines and separated by fractionation). 1 ppm = 2.54 mg/m³ | PEL (8-hour): 3 ppm 8 mg/m³ STEL: 6 ppm 15 mg/m³ | REL (10-hour): 3 ppm 8 mg/m³ STEL: 6 ppm 15 mg/m³ | 30 ppm | TLV: 3 ppm 8 mg/m³ STEL: 6 ppm 15 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 339°F (170°C) | Specific Gravity (H ₂ O = 1) 1.02 |
| Vapor Pressure (mm Hg) 0.4 at 69°F (20°C) | Molecular Weight 61.1 |
| Vapor Density (Air = 1) 2.1 | Melting Point 51°F (10°C) |

Solubility

Completely soluble in water. Soluble in alcohol and acetone.

Appearance and Odor

Colorless, viscous, hygroscopic liquid or solid (below 51°F) with an unpleasant, ammonia-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 185°F (85°C) closed cup | Explosive Limits in Air % by Volume LEL: 3.0% UEL: 23.5% |
| NFPA Classification Class IIIA Combustible Liquid | Autoignition Temperature 1436°F (780°C) |

Extinguishing Media

Use dry chemical, carbon dioxide, or "alcohol" foam. Do NOT use direct stream of water (may scatter or spread the fire).

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Move containers from fire area if it can be done safely. Use water spray to cool fire-exposed containers. Do not allow run-off from fire control methods to reach sewers or waterways.

Unusual Fire and Explosion Hazards

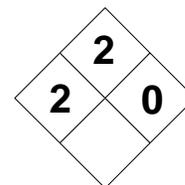

Moderate fire and explosion hazard. Vapors form explosive mixtures in air. Vapors are slightly heavier than air and can travel for great distances to an ignition source to flashback causing fire or explosion.

SECTION V - REACTIVITY DATA

| Stability | | Conditions to Avoid Ethanolamine is normally stable at room temperature in closed containers under normal conditions of storage and handling. Avoid contact with incompatible materials. Keep dry and away from heat and flame. | | |
|---|--|---|---------------------------------------|--|
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (chlorine, bromine, fluorine), strong acids (sulfuric, nitric). It will dissolve and strip some paints and varnishes. It will attack some forms of plastics, rubber, coatings, copper, and brass. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethanolamine is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating fumes and vapors are produced when ethanolamine is heated to decomposition. These include toxic oxides of nitrogen and carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |

| Health Hazards INHALATION: Vapors are irritating to the eyes, nose, and upper respiratory tract. It can also cause depression of the central nervous system (CNS) with symptoms of lethargy (drowsiness or indifference). The extremely unpleasant odor makes this an unlikely exposure route. SKIN & EYES: Moderately irritating to the skin causing redness and swelling. Severely irritating to the eyes causing redness and possible burns. INGESTION: May damage the gastrointestinal tract. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Eyes, skin, respiratory system, CNS |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Call the poison control center and seek medical attention immediately. Do NOT induce vomiting. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Neutralize residues or small spills with sodium bisulfite and flush to a drain with copious amounts of water. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method Mix with a flammable solvent and burn in a chemical incinerator (with afterburner and scrubber). | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dry well-ventilated area (preferably at 65-95°F/18-35°C). Protect containers from physical damage. Keep away from incompatible materials. Ground and bond metal containers and equipment when making transfers (prevent static sparks). | | | | |
| Other Precautions and Warnings Empty containers may still contain hazardous residues and should be handled accordingly. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Corrosive to lung tissue and mucus membranes. Use a supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves (not rubber) | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHANOLAMINE

CAS: 141-43-5

**IDENTIFICATION AND TYPICAL USES**

Ethanolamine is a colorless, viscous, hygroscopic liquid (or solid below 51°F) with an extremely unpleasant, ammonia-like odor. It is used as a dispersing agent for agricultural chemicals, in the synthesis of surface active agents, as a softening agent for hides, and in emulsifiers, polishes, and hair solutions.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethanolamine is moderately toxic by *ingestion* and skin contact (*absorption*) has been reported as a route of entry into the body. While *inhalation* is certainly a probable exposure risk, the extremely unpleasant odor of ethanolamine makes overexposure by inhalation an unlikely event. There is no information in the references on the carcinogenic or teratogenic properties of ethanolamine. However, human mutation data have been reported. Some scientists believe that mutagenic chemicals may have carcinogenic effects in the long-term. Additional study is required in this area. Lung, kidney, and liver injuries can also occur following prolonged or repeated exposures.

Inhalation of ethanolamine vapors causes irritation to the eyes, nose, throat, and upper respiratory tract. Excessive exposure to the vapor lead to depression of the central nervous system (CNS) with symptoms of lethargy (drowsiness, indifference).

Skin contact will cause moderate irritation with redness and swelling. Ethanolamine can be absorbed through the skin in toxic amounts. Eye contact results in severe irritation and may result in burns and tissue damage.

Ingestion can occur through careless working conditions, accidents, and, improper hygienic practices. It causes damage to the gastrointestinal tract and may lead to systemic poisoning.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethanolamine:

Skin: Mild to moderate irritation. May cause burns with redness and swelling. Absorption can also occur.

Eye: Severe irritation, inflammation, with possible damage to vision.

Lung: Inhalation causes irritation of the eyes, nose, and upper respiratory tract with distressed breathing, coughing, congestion, and tearing.

CNS: Depression of the central nervous system can occur with lethargic symptoms, fatigue, somnolence, and dizziness.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethanolamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, ethanolamine has not been adequately tested for its ability to cause cancer in test animals. Human mutation data have been reported. More research is required.

Reproductive Hazard: According to the information presented in the references, ethanolamine has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged exposures may lead to lung, liver, and/or kidney damage.

🛡 Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide

local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethanolamine. For relatively low, infrequent, or transient exposures, an organic vapor respirator equipped with a cartridge protecting against amines may suffice. For higher or prolonged exposure, a supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious chemical gloves should be worn. Caution should be used when selecting gloves. Ethanolamine will attack some forms of rubber. Glove manufacturers should be contacted for permeation studies before selecting a protective glove.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethanolamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethanolamine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Liver and kidney function tests.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ethanolamine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethanolamine should be communicated to all exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of ethanolamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethanolamine is considered a class IIIA combustible liquid (per OSHA 29 CFR 1910.106). While this means it poses a minimum fire risk by itself, mixture or contact with incompatible materials can cause fire or explosion. It can react with many common oxidizing materials and strong acids. It is corrosive to copper, brass, galvanized iron, and rubber. Its vapors can form explosive mixtures in air. These characteristics require special consideration during any emergency situation involving a leak or spill of ethanolamine. Should ethanolamine ever come into contact with incompatible substances either during use, transportation, or storage, violent reactions can occur.

Ethanolamine can enter the environment through its intended use as a dispersing agent for agricultural

chemicals, as well as through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethanolamine. Insufficient data are available to evaluate or predict the short-term effects of ethanolamine to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of ethanolamine to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ethanolamine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Ethanolamine is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Ethanolamine is not expected to accumulate in fish tissue.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react

properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethanolamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If ethanolamine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. Time is of the essence since it is highly soluble and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethanolamine. Ethanolamine may be disposed of by placing it in a chemical incinerator equipped with an afterburner and scrubber.

If ethanolamine is spilled or leaked, the following specific steps are recommended:

- ☑ Evacuate area and deny entry to those not involved in cleanup activities. Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Ventilate area of leak, remove ignition sources.
- ☑ Absorb liquids using vermiculite, dry earth, or sand and place in a sealed drum for disposal. Trace residues or small spills should be neutralized with sodium bisulfite and then flushed to a drain using copious amounts of water.
- ☑ It may be necessary to dispose of ethanolamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethanolamine can present a significant threat to business operations. The loss or damage of equipment or facilities can signifi-

cantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and respiratory tract. Exposures above 400 ppm may cause narcosis and headache. Systemic effects include olfactory changes, conjunctiva irritation, and pulmonary changes. It is irritating to the mucosa, particularly of the eyes, gums, and respiratory passages. Can also cause corneal clouding. SKIN & EYES: Will irritate the skin. May cause contact dermatitis. Eye contact may cause corneal damage with cloudy swelling, and fatty degeneration of the viscera. INGESTION: May cause headache, drowsiness, and unconsciousness. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system; skin; eyes, CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Call poison control center for advice. Give 1-2 glasses of milk or water. Do NOT induce vomiting unless advised otherwise. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire and flame away. If possible, automatically transfer liquids between containers. | | | | |
| Other Precautions and Warnings Bulk storage of ethyl acetate is not recommended. Ground and bond all metal containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Where potential exists for exposure over 400 ppm, use an MSHA/NIOSH-approved full facepiece respirator with an organic vapor cartridge. For high exposures, use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves (avoid rubber) | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Impermeable Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYL ACETATE

CAS: 141-78-6

**IDENTIFICATION AND TYPICAL USES**

Ethyl acetate is a colorless liquid with a characteristic, fruity, ether-like odor. It is used as a solvent for varnishes, lacquers, and nitrocellulose. It is also used in cleaning textiles, in the leather industry, and in the manufacture of artificial silk. It is found in some perfumes, is often used as an artificial fruit flavoring, and is used in photographic films and plates.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethyl acetate is a human poison by *inhalation* causing toxic systemic effects. It is mildly toxic by *ingestion*. Skin contact can produce localized effects but dermal absorption has not been reported. While its specific carcinogenic and teratogenic properties are unknown, mutation data in animal studies have been documented for ethyl acetate.

Inhalation of ethyl acetate vapors is not likely to occur under normal operating conditions. The extremely irritating properties of the vapor will cause personnel to vacate the area before toxic exposure levels occur. However, should an exposure occur by inhalation, it will likely result in irritation of the eyes, nose, throat, and upper respiratory tract, including the mucosa (particularly the eyes, gums, and respiratory passages). Inhalation can cause changes in the sense of smell (olfactory changes), conjunctiva irritation, and pulmonary changes. In high concentrations, there can be depression of the central nervous system with mild narcotic effects.

Skin contact results in the removal of the skin's natural protective oily layer on its surface with subsequent drying, cracking, and possible secondary infections and dermatitis. Eye contact can cause serious damage to the cornea with a possibility for permanent effects to vision.

Ingestion of ethyl acetate may cause headache, drowsiness, unconsciousness, and unspecified gastrointestinal effects.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl acetate:

Skin: Mild to moderate irritation. Will remove the skin's protective oily layer to cause drying, cracking, and possible secondary infection.

Eye: Severe irritation which can lead to injury and permanent damage if allowed to remain in contact with the eyes.

Lung: Irritation of the eyes, nose, throat and lungs (especially the mucus membranes). May cause changes in the sense of smell and in pulmonary function.

CNS: High concentrations can depress the central nervous system leading to narcoses and possible loss of consciousness.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethyl acetate and can last for months or even years:

Cancer Hazards: According to the references, ethyl acetate has not been adequately tested for its ability to cause cancer in test animals. However, mutation data have been reported. This does not mean that ethyl acetate is carcinogenic. It does mean that further research is required and caution is warranted in use, handling, and storage.

Reproduction: According to the references, ethyl acetate has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Very high or prolonged exposure may lead to chronic poisoning with congestion of the liver and kidneys. There may be anemia, leukocytosis (transient increase in the white blood cell count), and cloudy swelling and fatty degeneration of the viscera.

☉ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ethyl acetate. The best risk reduction measure is to use a less toxic chemical as a substitute for ethyl acetate. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyl acetate. For exposures over 400 ppm (8 hours), an MSHA/NIOSH-approved chemical respirator with an organic vapor cartridge should be used. For higher exposures, a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode or a supplied-air respirator with full facepiece operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Caution is warranted in glove selection since ethyl acetate will attack some rubber products. Glove manufacturers should be contacted to obtain permeation studies before gloves are selected.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl acetate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl acetate is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- Liver and kidney function tests.

- Lung function tests.
- Skin testing with dilute ethyl acetate to help diagnose allergy (performed by a qualified allergist).
- Complete blood count (CBC) with particular attention on leukocyte levels.

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ethyl acetate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl acetate should be communicated to all potentially exposed workers.
- Never eat, drink, or smoke in areas where ethyl acetate is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethyl acetate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Ethyl acetate is considered a class IB flammable liquid (according to OSHA 29 CFR 1910.106). Its low flash point and relatively low boiling point present a serious fire and explosion hazard concern. Also, because it is incompatible with a number of common materials, especially strong oxidizers and acids, contact can result in violent and explosive reactions. It can also form explosive mixtures in air and can ignite on contact with heat, fire, or sparks. These character-

istics require special consideration during any emergency situation involving a leak or spill of ethyl acetate.

The proper disposal/destruction method for ethyl acetate is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Ethyl acetate can enter the environment through unchecked industrial discharges into effluents and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl acetate. This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of ethyl acetate to plants, birds, or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Ethyl acetate has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of ethyl acetate to plants, birds, or land animals.

💧 *Water Solubility*

Ethyl acetate is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Ethyl acetate is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethyl acetate found in fish tissues is expected to be somewhat higher than the

average concentration of ethyl acetate in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl acetate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If ethyl acetate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl acetate. If ethyl acetate is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.
- Remove all ignition sources from area immediately.
- Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools. Avoid brass since ethyl acetate has been known to attack brass.
- It may be necessary to dispose of ethyl acetate as a hazardous waste. The responsible state agency or the regional office of the federal Environ-

mental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl acetate can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|---------------------------------|
| Characterization Aliphatic Ester | RCRA Number U113 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Ethyl acrylate, Inhibited | Chemical Abstract Service (CAS) Number 140-88-5 | |
| DOT Hazard Class and Label Requirements Flammable Liquid | DOT Emergency Guide Code 27 (Inhibited) | |
| DOT Identification Number UN 1917 | Chemical Formula CH₂:CHCOOC₂H₅ | |

Synonyms

Ethyl acrylate (inhibited); ethyl ester of acrylic acid; ethyl propenoate; acrylic acid ethyl ester.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|--|
| Ethyl acrylate (derivation: From ethylene cyanohydrin, ethyl alcohol, and dilute sulfuric acid; Oxo reaction of acetylene, carbon monoxide, and ethyl alcohol in the presence of nickel or cobalt catalyst). 1 ppm = 4.16 mg/m³ | PEL (skin): 25 ppm 100 mg/m³ STEL: Not Determined | REL: Lowest Possible Level Possible Human Carcinogen | 300 ppm | TLV: 5 ppm 20 mg/m³ 15 ppm (STEL) Suspected Human Carcinogen |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 211°F (99.6°C) | Specific Gravity (H ₂ O = 1) 0.92 |
| Vapor Pressure (mm Hg) 29 at 96°F (35.5°C) | Molecular Weight 100.1 |
| Vapor Density (Air = 1) 3.45 | Melting Point -98°F (-72°C) |

Solubility

Slightly soluble in water (2% at 20°C). Soluble in chloroform, alcohol, and ether.

Appearance and Odor

Clear, colorless liquid with a sharp, acrid odor. Odor Threshold = 0.0012 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) 48°F (9°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.4% UEL: 14% |
| NFPA Classification Class IB Flammable Liquid | Autoignition Temperature 721°F (383°C) |

Extinguishing Media

Dry chemical, alcohol foam, or carbon dioxide. Water may be ineffective and may spread fire.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Use blanketing effect with foam to smother large fires. Continue to cool containers with water after fire is extinguished. Move containers from fire area if it can be done without risk.

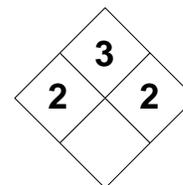

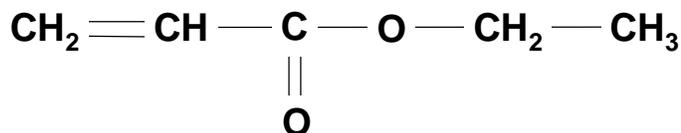

Unusual Fire and Explosion Hazards

Evacuate 2500 feet radius if fire becomes uncontrollable or container is exposed to direct flame. Vapors are heavier than air and may travel a distances to ignition source to flashback. Heat and/or an insufficient concentration of inhibitor can cause violent polymerization with the rupture of container.

| SECTION V - REACTIVITY DATA | | | | |
|---|-------------------------------------|---|-----------------------------------|---|
| Stability | | Conditions to Avoid Ethyl acrylate is kept stable under normal conditions of storage and operation with an inhibitor. Avoid contact with incompatible materials. Keep away from heat, flame, and other sources of ignition. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reacts violently in contact with oxidizers (peroxides, nitrates, perchlorates, chlorates, permanganates) polymerizers, strong alkalis (sodium hydroxide, potassium hydroxide), moisture, chlorosulfonic acid. | | |
| Hazardous Polymerization | | Conditions to Avoid Hazardous polymerization can occur if the inhibitor levels become low or if ethyl acrylate is exposed to heat, sparks, or open flames. It can react by itself in closed containers with explosive polymerization. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products When heated to decomposition, ethyl acrylate emits acrid and irritating fumes, including oxides of carbon (monoxide and dioxide). | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Severe irritation to the eyes, nose, throat, and respiratory system. Exposure can cause drowsiness, headache, vomiting, and nausea. Extreme exposures can cause the development of pulmonary edema (fluid in the lungs), which can be fatal. There may be dyspnea, cyanosis, convulsions, lachrymation, and laryngitis. | | | | |
| ABSORPTION: Severe irritation of the skin and eyes. Will pass through unbroken skin. May cause skin sensitization. Systemic effects include dyspnea, cyanosis, and convulsive movements. | | | | |
| INGESTION: Severe local irritation of the gastrointestinal tract and toxic degenerative changes of the cardiac (heart), hepatic (liver), renal (kidney, and splenic (spleen) tissues. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | 5th Annual Report | Group 2B | 29 CFR 1910.1000 Table Z-1 | Respiratory system; skin; eyes. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If swallowed: Seek medical attention immediately. Do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have extinguishing agent available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method | | | | |
| Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire and flame away. Outside building storage is recommended. | | | | |
| Other Precautions and Warnings | | | | |
| Bulk storage of ethyl acrylate is not recommended. Ground and bond all metal containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For exposures to suspected carcinogens, use a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Impervious Gloves | | Chemical Goggles or Face Mask | | Impermeable Apron or Protective Suit |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYL ACRYLATE

CAS: 140-88-5

**IDENTIFICATION AND TYPICAL USES**

Ethyl acrylate is a colorless liquid with an acrid odor. It is used in the manufacture of acrylic resins, acrylic fibers, textile and paper coatings, adhesives, and leather finish resins. It is also sometimes used as a flavoring agent.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethyl acrylate is toxic to humans by *inhalation*, *ingestion*, and by skin contact (*absorption*). It is a confirmed animal carcinogen and its carcinogenicity in humans is considered highly suspect by the National Toxicology Program (NTP). Prolonged exposures may lead to congestion of the lungs and changes in the heart, kidney, and liver.

Inhalation results in irritation of the mucus membranes of the eyes, nose, throat, and respiratory system. It can cause changes in the sense of smell and in pulmonary function. In addition, there may be symptoms such as lethargy, cyanosis, and convulsive movements. High concentrations can cause dizziness with dyspnea, nausea, headache, vomiting, and can lead to death as a result of chemical pneumonitis or pulmonary edema (fluid in the lungs). Symptoms of edema can be delayed up to 48 hours following exposure which may create a false sense of security with regard to health exposure risk.

Skin contact can cause serious localized irritation at the site of contact with marked erythema, edema, thickening, and vascular damage. There may be 1st degree burns on short exposures and 2nd degree burns on prolonged exposures. Repeated exposures in some individuals may develop sensitivity. It will pass through intact skin to cause toxic systemic effects.

Ingestion of ethyl acrylate causes irritation of the gastrointestinal tract with subsequent absorption

through the digestive process leading to toxic systemic effects (especially changes to liver tissues).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl acrylate:

- Skin:** Serious irritation and possible 1st or 2nd degree burns. There can be marked localized irritation, erythema, edema, thickening, and vascular damage at the site of contact. It will pass through intact skin to cause toxic systemic effects.
- Eye:** Severe irritation which can lead to injury, burns, painful irritation, and permanent damage if allowed to remain in contact with the eyes.
- Lung:** Irritation of the eyes, nose, throat and lungs (especially the mucus membranes). May cause changes in the sense of smell and in pulmonary function. Can lead to chemical pneumonitis and/or pulmonary edema (fluid in the lungs).
- CNS:** High concentrations may cause dizziness, headache, nausea, vomiting, dyspnea, lethargy, and convulsive movements.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethyl acrylate and can last for months or even years:

Cancer Hazards: According to the references, ethyl acrylate has been shown to cause cancer of the fore-stomach in test animals. Because of this and because of its ability to effect changes in the function of the liver, kidney, spleen, heart, and lungs, human carcinogenicity is considered highly suspect.

Reproduction: According to the references, ethyl acrylate has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Very high or prolonged exposure may lead to congestion of the lungs and degenerative changes in hepatic (liver), renal (kidney), cardiac (heart), and splenic (spleen) tissues. Prolonged contact may cause sensitization.

🕒 **Recommended Risk-Reduction Measures**

Because of its suspected human carcinogenicity, as well as its known ability to cause serious topical and systemic effects, personnel should avoid direct contact with ethyl acrylate. The best risk reduction measure is to use a less toxic chemical as a substitute for a ethyl acrylate. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyl acrylate. For any exposure to a suspected human carcinogen, a supplied-air respirator with full facepiece operated in positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted to obtain permeation studies before gloves are selected.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl acrylate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl acrylate is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), those persons having frequent or potentially high exposures should be given the following medical tests:

Lung function tests.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

Liver and kidney function tests.

Lung function tests.

Skin testing with dilute ethyl acrylate to help diagnose allergy (performed by a qualified allergist).

Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure).

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, smokers exposed to ethyl acrylate may develop symptoms much quicker and with greater intensity than non-smokers under identical exposure conditions. Prudent risk management requires careful consideration of *all* possible factors which may be causing the appearance of exposure symptoms.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to ethyl acrylate and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl acrylate should be communicated to all potentially exposed workers.

Never eat, drink, or smoke in areas where ethyl acrylate is used, handled or stored.

Work clothing contaminated with ethyl acrylate should never be worn home where family members can be exposed. It should be laundered only

by those who have been trained on the health risks associated with ethyl acrylate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethyl acrylate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethyl acrylate is considered a class IB flammable liquid (according to OSHA 29 CFR 1910.106). Its low flash point and relatively low boiling point present a serious fire and explosion hazard concern. Also, because it is incompatible with a number of common materials, especially strong oxidizers and acids, contact can result in violent and explosive reactions. It can also form explosive mixtures in air and can ignite on contact with heat, fire, or sparks. Heat can cause ethyl acrylate to react by itself. If this happens in a closed container, an explosion can occur. Ethyl acrylate usually contains an inhibitor such as hydroquinone or its methyl ether to prevent a self reaction. If the inhibitor is absent or present in too low a quantity, the explosive reaction may occur without the application of heat. These characteristics require special consideration during any emergency situation involving a leak or spill of ethyl acrylate.

Ethyl acrylate can enter the environment through unchecked industrial discharges into effluents and through spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl acrylate. This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of ethyl acrylate to plants, birds, or terrestrial animals.

☠* Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Ethyl acrylate has moderate chronic toxic-

ity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of ethyl acrylate to plants, birds, or land animals.

💧 Water Solubility

Ethyl acrylate is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

🕒 Persistence in the Environment

Ethyl acrylate is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 91% of ethyl acrylate will eventually end up in the air; the remainder will end up in water.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethyl acrylate found in fish tissues is expected to be about the same as the average concentration of ethyl acrylate in water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl acrylate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Equipment should be designed to meet explosion-proof standards.

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration

and replaced with clean soil. If ethyl acrylate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl acrylate. If ethyl acrylate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Ventilate area and remove ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools.
- ☑ It may be necessary to dispose of ethyl acrylate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl acrylate can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms “cancer” or “carcinogen” are used, public emotion, hysteria, and ignorance can run equally high. This should be carefully considered when constructing a public relations policy.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as

a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Give 1-2 glasses of water and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite or other). Ventilate area of spill. Have extinguishing agent available in case of fire. Store materials in DOT-approved containers. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire and flame away. Outside building or underground storage is recommended. | | | | |
| Other Precautions and Warnings Ground and bond all metal containers. Ensure Class 1, Group D electrical installations. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) For vapor exposures, use an organic vapor air-purifying respirator. Greater protection is obtained using a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Butyl Rubber Gloves | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Impermeable Apron or Protective Suit | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYL ALCOHOLCH₃CH₂OH

CAS: 64-17-5

**IDENTIFICATION AND TYPICAL USES**

Ethyl alcohol is a colorless or clear liquid with a weak, ethereal, vinous, or alcohol-like odor and bitter taste. It is primarily used as a solvent. It is an important industrial solvent for resins, lacquers, pharmaceuticals, toilet preparations, and cleaning agents. It is also used in the production of raw materials for cosmetics, perfumes, drugs, and plasticizers. It is a major component of antifreeze solutions and is also used as an additive in automobile fuel. Its most known application is in the making of alcoholic beverages.

RISK ASSESSMENT: HEALTH**General Assessment**

The toxicity of ethyl alcohol is much lower in comparison to methanol or propanol. Ethyl alcohol is primarily toxic to humans by *ingestion*. While inhalation of its vapors can produce some toxic effects, its ability to enhance the effects of other chemicals poses a greater health risk for inhalation. Skin contact can cause topical damage and absorption is, therefore, not likely. It should be noted that most manufacturers of ethyl alcohol for use in industrial applications will normally mix it with a denaturant (a substance added to make it undesirable to drink). These include gasoline, acetone, formaldehyde, or methyl alcohol. Therefore, industrial exposures resulting from ingestion are very unlikely.

Inhalation can cause irritation of the eyes, nose, throat, upper respiratory tract, and associated mucosa. There may be headache, nervousness, tremors, dizziness, tearing, fatigue, nausea, somnolence, and narcosis with stupor and loss of consciousness. There are no reports of cirrhosis occurring as a result of inhalation exposures. However, chronic exposure to ethyl alcohol vapors caused brain damage in mice. Vapor exposure can also increase the toxic effects of other chemicals being inhaled. Also, the toxicity of ethyl

alcohol is enhanced with the presence of compounds such as barbiturates, carbon monoxide, and methyl mercury.

Liquid contact with the eyes causes immediate burning and stinging with lachrymation and reflex closure of the lids. There may be injury to the corneal epithelium and possible hyperemia (excessive blood) of the conjunctiva. Skin contact results in drying and cracking which can lead to secondary infections and dermatitis.

Ingestion of ethyl alcohol is not likely to occur in the industrial environment. However, if it does, symptoms can include sleep disorders, hallucinations, distorted perceptions, ataxia, motor function changes, convulsions and tremors, coma, headaches, pulmonary changes, alteration of gastric secretions, menstrual cycle changes, glandular changes, nausea or vomiting, and decrease in body temperature.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl alcohol:

- Skin:** Causes dryness and cracking leading to dermatitis and possible infection.
- Eye:** Severe irritation with burning and stinging with possible damage to the cornea and conjunctiva.
- Lung:** Irritation of the eyes, nose, throat, and respiratory tract.
- CNS:** High concentrations can cause depression of the CNS with symptoms of sleepiness and lack of concentration.

☠ Chronic Health Effects

Risk Management for Hazardous Chemicals

The following chronic (long-term) health effects may occur at some time after exposure to ethyl alcohol and can last for months or even years:

Cancer Hazards: Ethyl alcohol is known to cause liver cancer in humans, primarily due to ingestion. Industrial exposures through ingestion are not likely but are certainly possible.

Reproduction: According to the references, ethyl alcohol can affect human reproduction by ingestion. It causes changes in the female fertility index. Effects on newborns include changes in the apgar score, neonatal measures or effects, and drug dependence.

Other Chronic Effects: Very high or prolonged exposure may result in mucous membrane irritation, headache, and depression of the CNS with symptoms of somnolence and lack of concentration. Prolonged skin contact can cause dermatitis.

Recommended Risk-Reduction Measures

Even though ethyl alcohol is a known carcinogen, this effect is primarily the result of ingesting large amounts of alcoholic beverages. Industrial exposures by this route are not likely to occur. The best risk reduction measure is to use a less toxic chemical as a substitute for a ethyl alcohol. However, based upon the fact that ethyl alcohol is one of the most widely used industrial solvents, substitution is usually not an alternative. Therefore, *engineering controls* are the most effective methods of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyl alcohol. For concentrations over the PEL (1000 ppm), an air-purifying respirator with an organic vapor cartridge will suffice. For higher exposures, a supplied-air respirator with full facepiece operated in positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These

may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl alcohol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl alcohol is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- Liver function tests.
- Skin testing with dilute ethyl alcohol to help diagnose allergy (performed by a qualified allergist).

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures. Also, since consuming large quantities of alcoholic beverages can lead to liver dysfunction and even cancer, persons with alcohol addiction who are exposed to ethyl alcohol on the job may develop symptoms much quicker and with greater intensity than those who do not drink under identical exposure conditions. Prudent risk management requires careful consideration of *all* possible factors which may be causing the appearance of exposure symptoms.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ethyl alcohol and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl alcohol should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethyl

Risk Management for Hazardous Chemicals

alcohol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethyl alcohol is considered a class IB flammable liquid (according to OSHA 29 CFR 1910.106). Its low flash point and relatively low boiling point present a serious fire and explosion hazard concern. Also, because it is incompatible with a number of common materials, especially strong oxidizers and many metal nitrates, contact can result in violent and explosive reactions. It can form explosive mixtures in air and can ignite on contact with heat, fire, or sparks. It will react and then explode in contact with acetic anhydride + sodium hydrogen sulfate. It also reacts violently with acetyl bromide (evolves hydrogen bromide). These characteristics require special consideration during any emergency situation involving a leak or spill of ethyl alcohol.

Ethyl alcohol can enter the environment through unchecked industrial discharges into effluents and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl alcohol. This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of ethyl alcohol to plants, birds, or terrestrial animals.

☞ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Ethyl alcohol has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of ethyl alcohol to plants, birds, or land animals.

💧 *Water Solubility*

Ethyl alcohol is highly soluble in water. Concentrations of 1000 milligrams and more can be expected to mix with a liter of water.

🕒 *Persistence in the Environment*

Ethyl alcohol is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 90% of ethyl alcohol will eventually end up in the air; the remainder will end up in water.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethyl alcohol found in fish tissues is expected to be about the same as the average concentration of ethyl alcohol in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl alcohol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Equipment should be designed to meet explosion-proof standards.

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ethyl alcohol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl alcohol. If ethyl alcohol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools.
- ☑ It may be necessary to dispose of ethyl alcohol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl alcohol can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Appearance and Odor
Colorless gas or a volatile, water-white liquid with an ammonia-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 0°F (-17°C) closed cup | Explosive Limits in Air % by Volume LEL: 3.5% UEL: 14% |
| NFPA Classification Flammable Gas or Class 1A Flammable Liquid | Autoignition Temperature 725°F (385°C) |

Extinguishing Media
Stop flow of gas first (if possible). If liquid, use foam, carbon dioxide, or dry chemical.

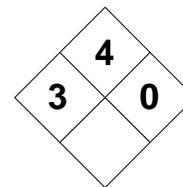

Special Fire Fighting Procedures
Ethylamine is an extremely flammable, very dangerous fire and explosion hazard. Poisonous gases are evolved from fire. Wear a self-contained breathing apparatus with full facepiece. Ensure ALL sources of escaping gas are controlled. Move containers from fire area if it can be done without risk. Water may be ineffective on fire. Keep cooling containers with water long after fire is out.

Unusual Fire and Explosion Hazards
Gas is explosive. Containers may explode in flame. Vapors are heavier than air and will travel for a great distance to an ignition source and flashback to cause fire or explosion.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|--|-------------------------------|-------------------------------|
| Stability | | Conditions to Avoid Ethylamine is normally stable in its closed containers, during routine operations (those that do not expose it to ignition sources). Avoid contact with heat, sparks, flame, and other sources of ignition. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizing materials, strong acids, which causes splattering, cellulose nitrate, and copper, tin, or zinc with moisture. Will strip and dissolve paint, most plastics, and will swell most rubber products. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethylamine is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products If involved in fire, ethylamine can produce toxic oxides of carbon and nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: Vapors are irritating to the eyes, skin, and respiratory tract. Causes pulmonary edema (fluid in the lungs), which is a medical emergency and can lead to death. There may also be blurred or hazy vision (temporary) resulting from damage to the corneal epithelium. SKIN & EYES: Contact with the compressed gas or liquid can cause frostbite and 1 st degree burns. INGESTION: Not likely since ethylamine is a gas at normal working (room) temperatures. If it occurs, there can be severe burns of the mouth and stomach that can be fatal. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Insufficient data | No | No | 29 CFR 1910.1000 Table Z-1 | Eyes, skin, respiratory tract |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures Eye contact: For frostbite, rinse with warm (104°F/40°C) water. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts warm (104°F/40°C) water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. Observe for 24-48 hours for lung effects (pulmonary edema). If swallowed: Contact poison control center. Unless advised otherwise, give 1-2 glasses of water to dilute. Do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. If gas has not yet ignited, use a water spray to knock down vapors and direct them from ignition source. | | | | |
| Preferred Waste Disposal Method None specified in the references (incineration of a gas may be the only alternative). | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible materials or in the presence of heat since violent reactions or explosions can occur. Store in tightly closed pressurized containers in a cool, dark, well-ventilated area away from sunlight. Keep away from ignition sources such as fire, sparks, and flame. | | | | |
| Other Precautions and Warnings Bulk storage of ethylamine is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures to the PEL, use a cartridge-type respirator. For higher exposures, use a powered supplied-air respirator or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Insulated Butyl Rubber | Eye Protection Goggles and/or Face Mask | Other Protective Clothing Leather or Butyl Rubber Apron | | |

ETHYLAMINE

CAS: 75-04-7

**IDENTIFICATION AND TYPICAL USES**

Ethylamine is a colorless gas with an ammonia odor. It can also appear as a water-white liquid. It is used in organic synthesis, in resin chemistry, in solvent extraction, in petroleum refining, a stabilizer for rubber latex, in detergents, and as an intermediate for dye-stuffs.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethylamine normally appears as a gas. As such, its primary route of entry into the body is through *inhalation*. Skin contact with the liquid can be destructive to tissues due to the extremely cold temperatures and irritating properties of ethylamine, but absorption is not a likely exposure route. Since ethylamine usually exists as a gas at room temperatures, ingestion is not likely to occur under normal conditions. It is not known if exposure to ethylamine will lead to carcinogenic, muta-genic, or teratogenic effects in humans or animals.

Inhalation of ethylamine vapors causes irritation of the eyes, nose, throat, and respiratory tract. Exposure can lead to pulmonary edema (fluid buildup in the lungs) which is a medical emergency and can be fatal. Symptoms of congestion, cough, phlegm, tightness and possibly pain in chest, and difficulty breathing may be delayed up to 48 hours thereby creating a false sense of security with regard to health hazard/exposure risk. There is also a possibility that exposure can cause blurred or hazy vision, apparently as a result of corneal epithelium disturbances.

Skin or eye contact with the vapor causes irritation. Liquid contact with either the skin or the eyes causes serious irritation and even first degree burns with subsequent tissue damage and frostbite.

Although ingestion is unlikely to occur under normal conditions (ethylamine is a gas at room tem-

perature), swallowing it will cause severe burns to the mouth and stomach and can lead to death.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylamine:

Skin: Redness, smarting, pain, possible dermatitis, first degree burns, and severe frostbite.

Eye: Causes frostbite, redness, irritation, severe pain, and blurred vision.

Lung: Vapor is seriously irritating and therefore poses a significant threat of damage to the lungs. Irritation can lead to pulmonary edema (fluid buildup in the lungs).

Other: Ethylamine solutions are strongly alkaline and can cause deep tissue destruction.

☹ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethylamine and can last for months or even years:

Cancer Hazards: According to information presented in the references, it is not known if exposure to ethylamine will lead to carcinogenic or mutagenic effects.

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: None reported.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with ethylamine. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to separate operations and provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using

Risk Management for Hazardous Chemicals

equipment with explosion-proof designs and ensuring all metal containers and tools are electrically grounded and bonded can further reduce the potential for injury or damage. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with ethylamine. For exposures above the PEL (10 ppm), use an MSHA/NIOSH-approved chemical cartridge respirator with a full facepiece and cartridges suitable for protection against amines. For higher or more frequent exposures, use a powered supplied-air respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber or leather apron should be worn. To prevent hand and skin exposures with the liquid, thermal gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethylamine is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- ☑ Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following additional tests may be helpful:

- ☑ Lung function tests (compare to baseline).
- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately following exposure).

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Prevent static sparks by electrically grounding and bonding all equipment used with or around ethylamine.

- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethylamine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Safety shower and eyewash stations should be readily available in work areas where ethylamine is used or stored.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylamine should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT***General Assessment***

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethylamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethylamine is an extremely flammable and highly explosive gas. As a liquid, it is considered a class 1A flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and boiling point present a serious fire hazard. Also, since it can react violently in the presence of oxidizers, such as chlorine, ethylamine requires special consideration during any emergency involving a leak or release of ethylamine gas or liquid.

Ethylamine can enter the environment through industrial discharges, unchecked venting to air, or through spills of the liquid.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylamine. Insufficient data are available on the short-term effects of ethylamine on aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility,

Risk Management for Hazardous Chemicals

and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the long-term effects of ethylamine to aquatic life, plants, birds, or land animals.

◆ **Water Solubility**

Ethylamine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ **Persistence in the Environment**

Ethylamine is slightly persistent in the aquatic environment with a half-life of 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. In moist soil, ethylamine should readily degrade with a half-life of 2 months. In dry soil, it should volatilize rapidly.

🌊 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Ethylamine is not expected to accumulate in the tissues of fish.

🚫 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ethylamine should contact the water table, aquifer, or navigable

waterway, time is of the essence. It is readily miscible in water and total containment and remediation may not be entirely possible. When such spills occur, it may be necessary to contact the local and/or state emergency response authorities. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylamine. If ethylamine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep ethylamine out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- ☑ It may be necessary to dispose of ethylamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylamine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🚫 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press.

Risk Management for Hazardous Chemicals
Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Hazard Class and Label Requirements Poison B | DOT Emergency Guide Code 57 | |
| DOT Identification Number UN 2272 | Chemical Formula C₂H₅NHC₆H₅ | |

Synonyms

n-Ethylaminobenzene; ethylaniline; n-ethylbenzenamine; n-ethylbenzenamino; ethylphenylamine.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| n-Ethylaniline (derivation: By heating aniline and ethyl alcohol in presence of sulfuric acid with subsequent distillation). Ingredients: n-Ethylaniline (CAS: 103-69-5): 97.5% n,n-Diethylaniline (CAS: 91-66-7): 2.0% Aniline (CAS: 62-53-3): .5% | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 400°F (204°C) | Specific Gravity (H ₂ O = 1) 0.9 |
| Vapor Pressure (mm Hg) <1 at 69°F (20°C) | Molecular Weight 121.2 |
| Vapor Density (Air = 1) 4.2 | Melting Point -83°F (-64°C) |

Solubility

Insoluble in water. Soluble in alcohol.

Appearance and Odor

Oily, colorless or pale yellow liquid which darkens to brown on exposure to light; aromatic, amine-like odor and burning taste.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) 185°F (85°C) opened cup | Explosive Limits in Air % by Volume LEL: 1.6% UEL: 9.5% |
| NFPA Classification Class IIIA Combustible Liquid | Autoignition Temperature Not Determined |

Extinguishing Media

Carbon dioxide, dry chemical, alcohol foam, water spray or fog.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool and remove from fire if possible. Poisonous gases are produced in fire.

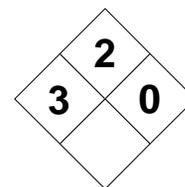

Unusual Fire and Explosion Hazards

Moderately flammable when exposed to heat. Containers may explode in fire. Firefighters should avoid contact with vapors produced during fire. Hypergolic reaction with red fuming nitric acid. Can react with oxidizers to cause fire or explosion.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|---|--------------------------------|---|
| Stability | | Conditions to Avoid <i>n</i> -Ethylaniline is considered stable in closed containers under normal conditions of temperature and pressure. Avoid contact with incompatible materials and keep away from heat or flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates), and strong acids (such as hydrochloric, sulfuric, and nitric). Reacts hypergolically with red fuming nitric acid. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of <i>n</i> -ethylaniline is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, <i>n</i> -ethylaniline can emit highly toxic/poisonous fumes of aniline and oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Causes anoxia due to the formation of methemoglobin. Symptoms: headache, dizziness, ataxia, and cyanosis. Overexposure may lead to death due to respiratory paralysis. ABSORPTION: Absorbs freely through intact skin. Symptoms include headache and cyanosis; overexposure can result in death. Skin contact with pure liquid can produce mild irritation. INGESTION: Unspecified effects resulting from ingestion. Liver damage is suspect. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory sys., eyes, skin, blood, kidney, liver. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis); Renal or liver disorders. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation</u> : Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed</u> : Seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method Dissolve in combustible solvent; burn in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage <i>n</i>-Ethylaniline is a combustible liquid. Store to avoid contact with strong oxidizers and acids, since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat. Ground and bond all containers prior to transferring liquids. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where <i>n</i>-ethylaniline is used, handled, or stored. Bulk storage of <i>n</i>-ethylaniline is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure limits have not been established. For best protection, use a supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust at site of chemical work. | | | | |
| Protective Gloves Natural Rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

N-ETHYLANILINEC₂H₅NHC₆H₅

CAS: 103-69-5

**IDENTIFICATION AND TYPICAL USES**

n-Ethylaniline is an oily, colorless or pale yellow liquid with characteristic odor and burning taste; color darkens to brown or tan upon exposure to air. *n*-Ethylaniline is an intermediate in chemical synthesis and, as an aniline compound, it is among one of the most important of the organic bases.

RISK ASSESSMENT: HEALTH**General Assessment**

n-Ethylaniline is moderately toxic through *inhalation*, *ingestion*, and *absorption* through the skin. While *n*-ethylaniline has not been adequately tested for its ability to cause cancer or for its effects on reproduction, it should be noted that aniline itself causes mutations (genetic changes) in living cells.

Toxic symptoms of *n*-ethylaniline exposure by all routes include headache, weakness, dizziness, ataxia, and cyanosis (blue tinting of the lips, skin, and nail beds due to oxygen deprivation). Cyanosis is due to the formation of methemoglobin which restricts the blood's oxygen carrying capabilities. Cyanosis occurs when the methemoglobin concentration is 15% or more. Blueness develops first in the lips, nose, and earlobes. At 40% concentration, there is weakness and dizziness. At up to 70% concentration, symptoms may include ataxia, dyspnea on mild exertion, and tachycardia. Coma may ensue at concentrations over 70%. Overexposure (between 85% and 90% concentrations) may lead to death from respiratory paralysis.

Contact with the pure liquid *n*-ethylaniline on the skin can produce moderate irritation, while the effect on the eyes can be quite severe.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to *n*-ethylaniline:

Skin: Irritation and possible color change around nails and fingers. Absorbs freely through the skin.

Eye: Severe irritation; may cause corneal damage.

Lung: Not known to be acutely irritating to lung tissue. However, overexposure can lead to death due to respiratory arrest.

Other: *n*-Ethylaniline affects the blood's ability to transport oxygen and high exposure can cause death. Symptoms include headaches, weakness, irritability, drowsiness, and shortness of breath.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to *n*-ethylaniline and can last for months or even years:

Cancer Hazards: *n*-Ethylaniline has not been adequately tested for its ability to cause cancer in test animals. Aniline, however, may cause mutations (genetic changes) in living cells. The data on its carcinogenicity are inconclusive.

Reproductive Hazard: There is no evidence to show that exposure to *n*-ethylaniline causes damage to the developing fetus. Aniline, however, may cause such effects (more study is required in this area).

Other Chronic Effects: Continuous exposure to small doses of *n*-ethylaniline may produce anemia, loss of energy, digestive disturbance, and headache. Repeated exposures may cause anemia and brownish staining of the eyes can occur.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with *n*-ethylaniline. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the

site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around *n*-ethylaniline. Since no exposure limits have been established, an air-purifying (cartridge-type) respirator may not provide adequate protection. A supplied-air respirator operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, natural rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with *n*-ethylaniline.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *n*-ethylaniline is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Methemoglobin tests.
- Urinalysis (for blood content).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to *n*-ethylaniline and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of *n*-ethylaniline should be communicated to all potentially exposed workers.

- Contaminated clothing (including shoes and undergarments) should never worn home where family members can be exposed. Work clothing should be laundered only by personnel who have been briefed on the hazards of *n*-ethylaniline.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to *n*-ethylaniline, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *n*-ethylaniline. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

n-Ethylaniline is considered a Class IIIA combustible liquid. Alone, its high flash point and autoignition temperature do not present a serious fire or explosion hazard. However, because it is incompatible with so very many other commodities, extreme caution is required in handling, storage, transportation, and disposal of *n*-ethylaniline. These characteristics also require special consideration during any emergency situation involving a leak or spill of *n*-ethylaniline. Should *n*-ethylaniline ever come into contact with incompatible substances such as oxidizers, acids, or alkalis either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for *n*-ethylaniline waste is to dissolve it in a combustible solvent and burn it in a chemical incinerator equipped with an afterburner and air scrubber. *n*-Ethylaniline can enter the environment through direct disposal and indirect use, such as industrial discharges and non-point sources from agricultural use.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *n*-ethylaniline. This chemical has high acute toxicity to aquatic life and moderate acute toxicity to birds. No data are available on the short-term effects of *n*-ethylaniline to aquatic life, plants, or land animals. However, aniline causes germination decrease, stunting and size decreases on numerous agricultural crops.

☛ **Chronic Ecological Effects**

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. No data are available on the long-term effects of *n*-ethylaniline to aquatic life, plants, birds, or land animals. However, aniline has high chronic toxicity in aquatic life.

💧 **Water Solubility**

n-Ethylaniline is insoluble in water. Concentrations of less than 1 milligram will not mix with a liter of water.

🕒 **Persistence in the Environment**

n-Ethylaniline is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of *n*-ethylaniline found in fish tissues is expected to be somewhat higher than the average concentration of *n*-ethylaniline in the water from which the fish was taken.

🛑 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and

rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *n*-ethylaniline should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If *n*-ethylaniline should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *n*-ethylaniline. If *n*-ethylaniline is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of *n*-ethylaniline as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving *n*-ethylaniline can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛑 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Stability | | Conditions to Avoid <i>o</i>-Ethylaniline is considered stable in closed containers under normal conditions of temperature and pressure. Avoid contact with incompatible materials and keep away from heat or flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates), and strong acids (such as hydrochloric, sulfuric, and nitric). Reacts hypergolically with red fuming nitric acid. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of <i>o</i>-ethylaniline is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, <i>o</i>-ethylaniline can emit highly toxic/poisonous fumes of aniline and oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Causes anoxia due to the formation of methemoglobin. Symptoms: headache, dizziness, ataxia, and cyanosis. Overexposure may lead to death due to respiratory paralysis. ABSORPTION: Absorbs freely through intact skin. Symptoms include headache and cyanosis; over-exposure can result in death. Skin contact with pure liquid can produce mild irritation. INGESTION: Unspecified effects resulting from ingestion. Liver damage is suspect. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Respiratory sys., eyes, skin, blood, kidney, liver. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis); Renal or liver disorders. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method Dissolve in combustible solvent; burn in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage <i>o</i>-Ethylaniline is a combustible liquid. Store to avoid contact with strong oxidizers and acids, since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat. Ground and bond all containers prior to transferring liquids. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where <i>o</i>-ethylaniline is used, handled, or stored. Bulk storage of <i>o</i>-ethylaniline is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure limits have not been established. For best protection, use a supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust at site of chemical work. | | | | |
| Protective Gloves Natural Rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

O-ETHYLANILINEC₂H₅NHC₆H₅

CAS: 578-54-1

**IDENTIFICATION AND TYPICAL USES**

o-Ethylaniline is an oily, colorless or pale yellow, red, or brown liquid with characteristic odor and burning taste. It is used as an intermediate for pharmaceuticals, dyestuffs, pesticides, and other products. It may also be used in chemical synthesis and, as an aniline compound, it is among one of the most important of the organic bases.

RISK ASSESSMENT: HEALTH**General Assessment**

o-Ethylaniline is moderately toxic through *inhalation*, *ingestion*, and *absorption* through the skin. While *o*-ethylaniline has not been adequately tested for its ability to cause cancer or for its effects on reproduction, it should be noted that aniline itself causes mutations (genetic changes) in living cells. Many scientists believe that mutagenic chemicals may also have carcinogenic capabilities in the long-term. However, the data in the references are conflicting and inconclusive in this regard.

Toxic symptoms of *o*-ethylaniline exposure by all routes include headache, weakness, dizziness, ataxia, and cyanosis (blue tinting of the lips, skin, and nail beds due to oxygen deprivation). Cyanosis is due to the formation of methemoglobin which restricts the blood's oxygen carrying capabilities. Cyanosis occurs when the methemoglobin concentration is 15% or more. Blueness develops first in the lips, nose, and earlobes. At 40% concentration, there is weakness and dizziness. At up to 70% concentration, symptoms may include ataxia, dyspnea on mild exertion, and tachycardia. Coma may ensue at concentrations over 70%. Overexposure (between 85% and 90% concentrations) may lead to death from respiratory paralysis.

Contact with the pure liquid *o*-ethylaniline on the skin can produce moderate irritation, while the effect on the eyes can be quite severe.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to *o*-ethylaniline:

Skin: Irritation and possible color change around nails and fingers. Absorbs freely through the skin.

Eye: Severe irritation; may cause corneal damage.

Lung: Not known to be acutely irritating to lung tissue. However, overexposure can lead to death due to respiratory arrest.

Other: *o*-Ethylaniline affects the blood's ability to transport oxygen and high exposure can cause death. Symptoms include headaches, weakness, irritability, drowsiness, and shortness of breath.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to *o*-ethylaniline and can last for months or even years:

Cancer Hazards: *o*-Ethylaniline has not been adequately tested for its ability to cause cancer in test animals. Aniline, however, may cause mutations (genetic changes) in living cells. The data on its carcinogenicity are inconclusive.

Reproductive Hazard: There is no evidence to show that exposure to *o*-ethylaniline causes damage to the developing fetus. Aniline, however, may cause such effects (more study is required in this area).

Other Chronic Effects: Continuous exposure to small doses of *o*-ethylaniline may produce anemia, loss of energy, digestive disturbance, and headache. Repeated exposures may cause anemia and brownish staining of the eyes can occur.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with *o*-ethylaniline. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around *o*-ethylaniline. Since no exposure limits have been established, an air-purifying (cartridge-type) respirator may not provide adequate protection. A supplied-air respirator operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, natural rubber gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with *o*-ethylaniline.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *o*-ethylaniline is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Methemoglobin tests.
- Urinalysis (for blood content).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to *o*-ethylaniline and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of *o*-ethylaniline should be communicated to all exposed workers.
- Contaminated clothing (including shoes and undergarments) should never worn home where family members can be exposed. Work clothing should be laundered only by personnel who have been briefed on the hazards of *o*-ethylaniline.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to *o*-ethylaniline, emergency shower facilities should also be provided in the immediate work area.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *o*-ethylaniline. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

o-Ethylaniline is considered a class IIIA combustible liquid. Alone, its high flash point and autoignition temperature do not present a serious fire or explosion hazard. However, because it is incompatible with so very many other commodities, extreme caution is required in handling, storage, transportation, and disposal of *o*-ethylaniline. These characteristics also require special consideration during any emergency situation involving a leak or spill of *o*-ethylaniline. Should *o*-ethylaniline ever come into contact with incompatible substances such as oxidizers, acids, or alkalis either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for *o*-ethylaniline waste is to dissolve it in a combustible solvent and burn it in a chemical incinerator equipped

with an afterburner and air scrubber. *o*-Ethylaniline can enter the environment through direct disposal and indirect use, such as industrial discharges and non-point sources from agricultural use.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *o*-ethylaniline. This chemical has high acute toxicity to aquatic life and moderate acute toxicity to birds. No data are available on the short-term effects of *o*-ethylaniline to aquatic life, plants, or land animals. However, aniline causes germination decrease, stunting and size decreases on numerous agricultural crops.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. No data are available on the long-term effects of *o*-ethylaniline to aquatic life, plants, birds, or land animals. However, aniline has high chronic toxicity in aquatic life.

💧 *Water Solubility*

o-Ethylaniline is insoluble in water. Concentrations of less than 1 milligram will not mix with a liter of water.

⌚ *Persistence in the Environment*

o-Ethylaniline is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of *o*-ethylaniline found in fish tissues is expected to be somewhat higher than the average concentration of *o*-ethylaniline in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *o*-ethylaniline should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If *o*-ethylaniline should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *o*-ethylaniline. If *o*-ethylaniline is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Wash area with detergent and water. Cover washed area with absorbent, sweep up, and place in sealed containers for disposal.
- It may be necessary to dispose of *o*-ethylaniline as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving *o*-ethylaniline can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may

result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Hazard Class and Label Requirements | Poison B | DOT Emergency Guide Code | 57 | | |
| DOT Identification Number | UN 2272 | Chemical Formula | C₂H₅NHC₆H₅ | | |

Synonyms

1-amino-4-ethylbenzene; 4-ethylaniline.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| p-Ethylaniline (derivation: By heating aniline and ethyl alcohol in presence of sulfuric acid with subsequent distillation). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|-------------------------|-----------------------------|---|----------------------|
| Boiling Point | 401°F (205°C) | Specific Gravity (H ₂ O = 1) | 0.963 |
| Vapor Pressure (mm Hg) | <1 at 69°F (20°C) | Molecular Weight | 121.2 |
| Vapor Density (Air = 1) | 4.2 | Melting Point | -87°F (-66°C) |

Solubility

Insoluble in water. Soluble in alcohol and ether.

Appearance and Odor

Oily, colorless or pale yellow liquid which darkens to brown on exposure to light; aromatic, amine-like odor and burning taste.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|--------------------------------------|-------------------------------------|----------------------------|
| Flash Point (method used) | 185°F (85°C) opened cup | Explosive Limits in Air % by Volume | LEL: 1.6% UEL: 9.5% |
| NFPA Classification | Class IIIA Combustible Liquid | Autoignition Temperature | Not Determined |

Extinguishing Media

Carbon dioxide, dry chemical, alcohol foam, water spray or fog.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool and remove from fire if possible. Poisonous gases are produced in fire.

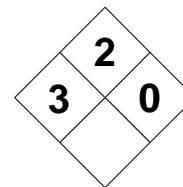

Unusual Fire and Explosion Hazards

Moderately flammable when exposed to heat. Containers may explode in fire. Firefighters should avoid contact with vapors produced during fire. Hypergolic reaction with red fuming nitric acid. Can react with oxidizers to cause fire or explosion.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|--|--|--|
| Stability | | Conditions to Avoid <i>p</i>-Ethylaniline is considered stable in closed containers under normal conditions of temperature and pressure. Avoid contact with incompatible materials and keep away from heat or flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates), and strong acids (such as hydrochloric, sulfuric, and nitric). Reacts hypergolically with red fuming nitric acid. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of <i>p</i>-ethylaniline is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, <i>p</i>-ethylaniline can emit highly toxic/poisonous fumes of aniline and oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Causes anoxia due to the formation of methemoglobin. Symptoms: headache, dizziness, ataxia, and cyanosis. Overexposure may lead to death due to respiratory paralysis. ABSORPTION: Absorbs freely through intact skin. Symptoms include headache and cyanosis; over-exposure can result in death. Skin contact with pure liquid can produce mild irritation. INGESTION: Unspecified effects resulting from ingestion. Liver damage is suspect. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Respiratory system, eyes, skin, blood, kidney, liver. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis); Renal or liver disorders. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method Dissolve in combustible solvent; burn in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage <i>p</i>-Ethylaniline is a combustible liquid. Store to avoid contact with strong oxidizers and acids, since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat. Ground and bond all containers prior to transferring liquids. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where <i>p</i>-Ethylaniline is used, handled, or stored. Bulk storage of <i>p</i>-Ethylaniline is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure limits have not been established. For best protection, use a supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust at site of chemical work. | | | | |
| Protective Gloves Natural Rubber | | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Rubber Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

P-ETHYLANILINEC₂H₅NHC₆H₅

CAS: 589-16-2

**IDENTIFICATION AND TYPICAL USES**

p-Ethylaniline is an oily, colorless or pale yellow liquid with characteristic odor and burning taste; color darkens to brown or tan upon exposure to air. *p*-Ethylaniline is an intermediate in chemical synthesis and, as an aniline compound, it is among one of the most important of the organic bases.

RISK ASSESSMENT: HEALTH**General Assessment**

p-Ethylaniline is moderately toxic through *inhalation*, *ingestion*, and *absorption* through the skin. While *p*-ethylaniline has not been adequately tested for its ability to cause cancer or for its effects on reproduction, it should be noted that aniline itself causes mutations (genetic changes) in living cells.

Toxic symptoms of *p*-ethylaniline exposure by all routes include headache, weakness, dizziness, ataxia, and cyanosis (blue tinting of the lips, skin, and nail beds due to oxygen deprivation). Cyanosis is due to the formation of methemoglobin which restricts the blood's oxygen carrying capabilities. Cyanosis occurs when the methemoglobin concentration is 15% or more. Blueness develops first in the lips, nose, and earlobes. At 40% concentration, there is weakness and dizziness. At up to 70% concentration, symptoms may include ataxia, dyspnea on mild exertion, and tachycardia. Coma may ensue at concentrations over 70%. Overexposure (between 85% and 90% concentrations) may lead to death from respiratory paralysis.

Contact with the pure liquid *p*-ethylaniline on the skin can produce moderate irritation, while the effect on the eyes can be quite severe.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to *p*-ethylaniline:

Skin: Irritation and possible color change around nails and fingers. Absorbs freely through the skin.

Eye: Severe irritation; may cause corneal damage.

Lung: Not known to be acutely irritating to lung tissue. However, overexposure can lead to death due to respiratory arrest.

Other: *p*-Ethylaniline affects the blood's ability to transport oxygen and high exposure can cause death. Symptoms include headaches, weakness, irritability, drowsiness, and shortness of breath.

☼ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to *p*-ethylaniline and can last for months or even years:

Cancer Hazards: *p*-Ethylaniline has not been adequately tested for its ability to cause cancer in test animals. Aniline, however, may cause mutations (genetic changes) in living cells. The data on its carcinogenicity are inconclusive.

Reproductive Hazard: There is no evidence to show that exposure to *p*-ethylaniline causes damage to the developing fetus. Aniline, however, may cause such effects (more study is required in this area).

Other Chronic Effects: Continuous exposure to small doses of *p*-ethylaniline may produce anemia, loss of energy, digestive disturbance, and headache. Repeated exposures may cause anemia and brownish staining of the eyes can occur.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with *p*-ethylaniline. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing

exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around *p*-ethylaniline. Since no exposure limits have been established, an air-purifying (cartridge-type) respirator may not provide adequate protection. A supplied-air respirator operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, natural rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with *p*-ethylaniline.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *p*-ethylaniline is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Methemoglobin tests.
- Urinalysis (for blood content).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to *p*-ethylaniline and at the end of the work shift or before eating, drinking, or smoking.

- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of *p*-ethylaniline should be communicated to all potentially exposed workers.
- Contaminated clothing (including shoes and undergarments) should never worn home where family members can be exposed. Work clothing should be laundered only by personnel who have been briefed on the hazards of *p*-ethylaniline.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to *p*-ethylaniline, emergency shower facilities should be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *p*-ethylaniline. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

p-Ethylaniline is considered a class IIIA combustible liquid. Alone, its high flash point and autoignition temperature do not present a serious fire or explosion hazard. However, because it is incompatible with so very many other commodities, extreme caution is required in handling, storage, transportation, and disposal of *p*-ethylaniline. These characteristics also require special consideration during any emergency situation involving a leak or spill of *p*-ethylaniline. Should *p*-ethylaniline ever come into contact with incompatible substances such as oxidizers, acids, or alkalis either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for *p*-ethylaniline waste is to dissolve it in a combustible solvent and burn it in a chemical incinerator equipped with an afterburner and air scrubber. *p*-Ethylaniline can enter the environment through direct disposal and indirect use, such as industrial discharges and non-point sources from agricultural use.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *p*-ethylaniline. This chemical has high acute toxicity to aquatic life and moderate acute toxicity to birds. No data are available on the short-term effects of *p*-ethylaniline to aquatic life, plants, or land animals. However, aniline causes germination decrease, stunting and size decreases on numerous agricultural crops.

☛ **Chronic Ecological Effects**

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. No data are available on the long-term effects of *p*-ethylaniline to aquatic life, plants, birds, or land animals. However, aniline has high chronic toxicity in aquatic life.

💧 **Water Solubility**

p-Ethylaniline is slightly soluble in water. Concentrations of 1 to 100 milligrams will not mix with a liter of water.

🕒 **Persistence in the Environment**

p-Ethylaniline is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of *p*-ethylaniline found in fish tissues is expected to be somewhat higher than the average concentration of *p*-ethylaniline in the water from which the fish was taken.

🛑 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and

rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *p*-ethylaniline should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If *p*-ethylaniline should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *p*-ethylaniline. If *p*-ethylaniline is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of *p*-ethylaniline as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving *p*-ethylaniline can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛑 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

ETHYL BENZENE

CAS: 100-41-4

**IDENTIFICATION AND TYPICAL USES**

Ethyl benzene is a clear, colorless liquid with a pungent, aromatic odor. It is used as a solvent, as an anti-knock agent in gasoline, and as an intermediate to produce styrene monomer and synthetic rubber.

RISK ASSESSMENT: HEALTH**General Assessment**

Industrial exposures to ethyl benzene itself are unlikely under normal operating conditions. This is because ethyl benzene is usually present in mixtures with other solvents. However, if exposure does occur, the health risks can be serious. Ethyl benzene is moderately toxic by *ingestion* and mildly toxic by *inhalation* and skin contact (*absorption*). While it is not listed by any sources as a carcinogen, human mutation data have been reported and it has caused teratogenic effects in laboratory test animals.

Inhalation of ethyl benzene vapors causes eye irritation with profuse watering of the eyes, nasal irritation, chest constriction, and vertigo. Symptoms worsen as vapor concentrations increase. As levels approach 5000 ppm, exposure becomes intolerable and causes nasal and eye irritation. There may be changes in sleeping patterns and changes in pulmonary function. Irritating properties may cause pulmonary edema (fluid buildup in the lungs), which is a medical emergency. Symptoms can be delayed up to 48 hours, thereby creating a false sense of security with regard to health hazard risk. Higher or prolonged concentrations will result central nervous system (CNS) effects with narcosis, cramps, lightheadedness, dizziness, and even death due to respiratory paralysis.

Contact with the skin causes drying, cracking, scaling, and even blistering. There may be 1st degree

burns on short exposures and 2nd degree burns on prolonged contact. Ethyl benzene will pass through unbroken skin to cause toxic systemic effects.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl benzene:

Skin: Irritation with potential for redness, blistering, and serious burning. Chemical will pass through intact skin to cause toxic systemic effects, including narcosis.

Eye: Severe irritation, burning, pain, and permanent damage possible.

Lung: Nose, throat, and respiratory tract irritation causing difficulty in breathing, possible pulmonary edema (fluid in lungs) on high exposure.

CNS: Narcosis, headaches, lightheadedness, dizziness, vertigo, coma, and death due to respiratory paralysis.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethyl benzene and can last for months or even years:

Cancer Hazards: Ethyl benzene has not been adequately tested for its ability to cause cancer in test animals. However, human mutation (genetic changes) data have been reported. Many scientists believe that mutagenic chemicals may have the ability to cause cancer in the long-term. Further research is required in this regard.

Reproductive Hazard: There is limited evidence that ethyl benzene is a teratogen in animals. Until further tests are performed, it should be treated as a possible human teratogen.

Other Chronic Effects: Repeated skin contact can cause chronic dryness and scaling of the skin's surface. Prolonged contact may cause blistering. Repeated inhalation of ethyl benzene vapors may result in liver damage and blood disorders, particularly leukopenia (deficiency in white blood cell count) and lymphocytosis (the formation of cysts containing lymph). This chemical has not been adequately evaluated to determine whether brain or other nerve damage could occur with repeated exposure. However, many other solvents and petroleum-based chemicals have been known to cause such damage. Effects include reduced memory and concentration, personality changes (irritability, withdrawal), fatigue, sleep disturbances, reduced coordination, and/or effects on the nerves supplying the internal organs (autonomic nerves) and/or nerves to the arms and legs with weakness and a feeling of "pins and needles."

🔹 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ethyl benzene. Occupational poisoning occurs most commonly by inhalation and absorption. If a less toxic material or compound cannot be substituted for ethyl benzene, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of ethyl benzene release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyl benzene. For exposure over the PEL (100 ppm), an MSHA/NIOSH-approved air-purifying respiratory with organic vapor cartridge(s) will suffice. For exposures to higher concentrations, or when the concentration is unknown, use a supplied air respirator with full facepiece and mask operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, polyvinylchloride or Viton gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These

may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl benzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl benzene is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests should be considered:

- ☑ Liver function tests.
- ☑ Lung function tests.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure).
- ☑ Urinalysis (mandelic acid in urine, 1.5 g/g of creatinine), sample at end of shift, last day of work-week. Also test for expired ethyl benzene in air for confirmation.
- ☑ Interview for brain effects, including recent changes in memory, mood, or concentration, headaches, malaise, and altered sleeping patterns. Consider cerebellar, autonomic, and peripheral nervous system evaluation. Positive and borderline cases should be referred for neuropsychological testing.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethyl benzene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl benzene should be communicated to all exposed and potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethyl benzene, emergency shower facilities should be provided.
- ☑ Workers whose clothing has been contaminated by ethyl benzene should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of ethyl benzene.
- ☑ Where possible, automatically transfer liquids containing ethyl benzene from drums or other containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethyl benzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Ethyl benzene is a moderately flammable liquid. Because of its low flash point and high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). It is a dangerous fire hazard and moderate explosion hazard when exposed to heat or flame. Caution is always required in handling, storage, transportation, and disposal of ethyl benzene. Emergency responders should be made aware of the presence of ethyl benzene at any emergency response situation.

Ethyl benzene can enter the environment from industrial effluents and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl benzene. Ethyl benzene has high acute toxicity to aquatic life. It has caused injury to various agricultural crops. Insufficient data are available to evaluate the short-term effects of ethyl benzene on birds or land animals.

🌿 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Ethyl benzene has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of ethyl benzene to plants, birds, or terrestrial animals.

💧 Water Solubility

Ethyl benzene is slightly to moderately soluble in water. Concentrations between 1 and 100 milligrams will mix with a liter of water.

⌚ Persistence in the Environment

Ethyl benzene is non-persistent in water (due to volatilization), with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.5% of ethyl benzene will eventually end up in air; the rest will end up in water.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethyl benzene found in fish tissues is expected to be somewhat higher than the average concentration of ethyl benzene in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ethyl benzene into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl benzene should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ethyl benzene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly to moderately soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl benzene.

For disposal, ethyl benzene may be burned in a chemical incinerator equipped with an afterburner and scrubber.

If ethyl benzene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Use non-sparking tools.
- Absorb liquids in vermiculite, sand, earth, or similar material and deposit in sealed drum.
- Ventilate area of spill or leak. Container should be removed to safer area if it can be done without increasing the risk.
- Use water spray to knock-down vapors.
- It may be necessary to dispose of ethyl benzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl benzene can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

U *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in

the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

ETHYL BROMIDECH₃CH₂Br

CAS: 74-96-4

**IDENTIFICATION AND TYPICAL USES**

Ethyl bromide is a colorless to yellow-colored liquid with a strong ether-like odor. It can also exist as a gas above 101°F (38°C). It is used as a refrigerant and an ethylating agent. It has uses as a solvent, and as a fruit and grain fumigant. It was formerly used as a topical anesthetic.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethyl bromide is a human poison. It is moderately toxic by *ingestion* and mildly toxic by *inhalation*. While absorption through the skin has not been known to occur, skin contact can cause localized damage to tissues. Ethyl bromide has been listed as a suspected human carcinogen by the National Toxicology Program (NTP). Physiologically, it is an anesthetic and narcotic. The primary human response to ethyl bromide is depression of the central nervous system (CNS).

Inhalation causes irritation of the lungs, marked congestion and fatty degeneration of the liver, kidneys, heart, and intestine tissues. Symptoms of exposure and CNS depression include drowsiness, slurred speech, lack of coordination, and possible loss of consciousness. Irritation to the eyes and respiratory system is also known to occur on inhalation. In fact, pulmonary edema (fluid buildup in the lungs) has been reported. This is a medical emergency that can be fatal. Symptoms of congestion, difficulty breathing, cough with phlegm, and chest pain may be delayed for up to 48 hours following exposure. This may create a false sense of security with regard to health risk. Other possible symptoms of exposure include liver

and kidney disease, cardiac arrhythmia, and cardiac arrest.

Skin contact may cause localized burning at site of contact with irritation and possible rash. Absorption is not known to occur. Eye contact can result in severe irritation to the cornea, with redness and swelling. Damage can be serious if not immediately flushed from eye surface.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl bromide:

- Skin:** Irritation with potential for redness, pain, and inflammation.
- Eye:** Severe irritation, burning, pain, and permanent damage possible.
- Lung:** Nose, throat, and respiratory tract irritation causing difficulty in breathing, possible pulmonary edema (fluid in lungs) on high exposure.
- CNS:** Narcosis, headaches, lightheadedness, dizziness, vertigo, coma, and death due to respiratory paralysis or cardiac arrest.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethyl bromide and can last for months or even years:

Cancer Hazards: According to the National Toxicology Program (NTP), there is sufficient evidence that exposure to ethyl bromide may cause cancer in test animals. Human data are lacking but human carcinogenicity is considered suspect. More research is re-

quired since the data in the references are inconclusive and conflicting in this regard.

Reproductive Hazard: According to information presented in the references, ethyl bromide has not been adequately tested for its ability to cause adverse reproductive effects in test animals.

Other Chronic Effects: Long-term exposure may lead to liver and kidney damage. Extremely irritating substances have been known to damage lung tissues. It is not known whether exposure to ethyl bromide will have this effect on humans.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ethyl bromide. Occupational poisoning occurs most commonly by inhalation. If a less toxic material or compound cannot be substituted for ethyl bromide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of ethyl bromide release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyl bromide. Caution should be exercised when selecting respiratory protection since it is not known if exposure to ethyl bromide will cause cancer in humans. For exposure over the PEL (200 ppm), an MSHA/NIOSH-approved air-purifying respiratory with organic vapor cartridge(s) will suffice. For exposures to higher concentrations, or when the concentration is unknown, use a supplied air respirator with full facepiece and mask operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl bromide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl bromide is used or stored.

If symptoms develop or overexposure is suspected, the following recommended medical tests should be considered:

- ☑ Liver and kidney function tests.
- ☑ Lung function tests.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking causes heart disease, emphysema, and other respiratory problems, smokers exposed to ethyl bromide may experience symptoms quicker and more pronounced than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible factors that may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethyl bromide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl bromide should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethyl bromide, emergency shower facilities should be provided.
- ☑ Workers whose clothing has been contaminated by ethyl bromide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of ethyl bromide.

- ☑ Where possible, automatically transfer liquids containing ethyl bromide from drums or other containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethyl bromide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Ethyl bromide is a moderately flammable liquid. Because of its low flash point and high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). It is a dangerous fire hazard and moderate explosion hazard when exposed to heat or flame. It is incompatible with strong oxidizers, such as chlorine, fluorine, and bromine, and many chemically-active metals, such as sodium, potassium, calcium, powdered aluminum, zinc, and magnesium. Caution is always required in handling, storage, transportation, and disposal of ethyl bromide. Emergency responders should be made aware of the presence of ethyl bromide at any emergency response situation.

Ethyl bromide can enter the environment from industrial effluents and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl bromide. Ethyl bromide has high acute toxicity to aquatic life. It has caused injury to various agricultural crops. Insufficient data are available to evaluate the short-term effects of ethyl bromide on birds or land animals.

☞ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Ethyl bromide has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of ethyl bromide to plants, birds, or terrestrial animals.

💧 Water Solubility

Ethyl bromide is slightly to moderately soluble in water. Concentrations between 1 and 100 milligrams will mix with a liter of water.

⌚ Persistence in the Environment

Ethyl bromide is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethyl bromide found in fish tissues is expected to be about the same as the average concentration of ethyl bromide in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ethyl bromide into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl bromide should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ethyl bromide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl bromide.

For disposal, ethyl bromide may be mixed with a combustible solvent and burned in a chemical incinerator equipped with an afterburner and scrubber.

If ethyl bromide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Use non-sparking tools.
- ☑ Absorb liquids in vermiculite, sand, earth, or similar material and deposit in sealed drum.
- ☑ Ventilate area of spill or leak. Container should be removed to safer area if it can be done without increasing the risk.
- ☑ Use water spray to knock-down vapors.
- ☑ It may be necessary to dispose of ethyl bromide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl bromide can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime terms such as “cancer” or “carcinogen” are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered whenever developing or implementing a public relations policy.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|--|
| Characterization Ketone | RCRA Number D001 | EPA Class Characteristic (I) Waste |
| DOT Proper Shipping Name Ketones, Liquid, N.O.S. | Chemical Abstract Service (CAS) Number 106-35-4 | |
| DOT Hazard Class and Label Requirements Flammable Liquid | DOT Emergency Guide Code 26 | |
| DOT Identification Number UN 1224 | Chemical Formula CH₃CH₂CO[CH₂]₃CH₃ | |

Synonyms

Butyl ethyl ketone; 3-heptanone; n-butyl ethyl ketone; ethyl n-butyl ketone; heptan-3-one.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|---|---|---|
| Ethyl n-butyl ketone (derivation: By catalytic dehydrogenation of 3-heptanol; by hydrogenation of the mixed alcohol condensation product of propionaldehyde and methyl ethyl ketone). May Contain Trace Impurities 1 ppm = 4.75 mg/m³ | PEL (8 hour): 50 ppm 230 mg/m³ STEL: Not Established | REL (10 hour): 50 ppm 230 mg/m³ STEL: Not Established | 1000 ppm | TLV: 50 ppm 234 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 298°F (148°C) | Specific Gravity (H ₂ O = 1) 0.82 |
| Vapor Pressure (mm Hg) 1.4 at 77°F (25°C) | Molecular Weight 114.2 |
| Vapor Density (Air = 1) 3.93 | Freezing Point -34°F (-37°C) |

Solubility

Nearly insoluble in cold water (1.0%). Soluble in hot water at 300°F (149°C), alcohol, and ether.

Appearance and Odor

Clear, colorless liquid with a powerful fruity odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) 115°F (46°C) opened cup | Explosive Limits in Air % by Volume LEL: 1.4% UEL: 8.8% |
| NFPA Classification Class II Combustible Liquid | Autoignition Temperature Not Determined |

Extinguishing Media

Carbon dioxide, dry chemical, alcohol foam, water spray.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Fight fire from a distance if possible. Keep fire-exposed containers cool with water spray. Using a solid stream of water may spread fire. If it can be done safely, move fire-exposed containers from fire area.

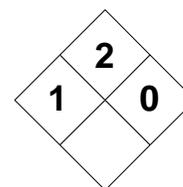

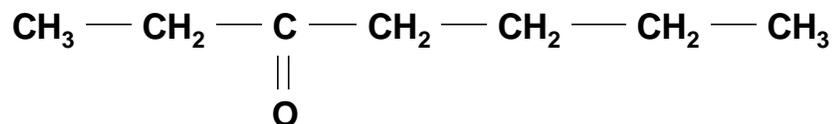

Unusual Fire and Explosion Hazards

Containers may explode in fire due to the buildup of internal pressures. BLEVE (boiling liquid expanding vapor explosion) is possible. Immediately evacuate if rising sound is heard from venting device or a noticeable discoloration is observed on the sides of the tank or storage vessel.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|---------------------------------------|---|
| Stability | | Conditions to Avoid Normally stable. Do not allow ethyl butyl ketone to come into contact with incompatible materials. Avoid contact with fire or high heat sources. Do not use in confined spaces. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with strong oxidizers (bromine, chlorine, fluorine), acetaldehyde, and perchloric acid. Also note that ketones + nitric acid and hydrogen peroxide form highly explosive solids or oils. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethyl butyl ketone is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, ethyl butyl ketone emits acrid, irritating smoke and fumes, including oxides of carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the conjunctiva of the eyes and mucosa of the nose and throat. Symptoms of CNS depression include dizziness, headache and unconsciousness. Neurotoxic effects to the peripheral nervous system may also occur. SKIN & EYES: Mild irritation on contact with the skin and eyes. Can lead to dermatitis in the long-term. INGESTION: Symptoms of gastrointestinal irritation with nausea and vomiting. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Respiratory system; skin; eyes; CNS. |
| Medical Conditions Generally Aggravated by Exposure Skin conditions (dermatitis) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Seek medical attention immediately. Give victim several glasses of water. Do NOT induce vomiting (possibility of liquid aspiration to lungs). Never try to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Restrict persons not wearing protective equipment from entering area of spill or leak until cleanup is complete. Ventilate area. Absorb liquid in dry sand or other material and deposit in sealed containers. Alert appropriate state or federal response agencies. | | | | |
| Preferred Waste Disposal Method Incineration (with afterburner and scrubber), molten metal salt destruction. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from fire, sparks, and flame. Use non-sparking tools on containers. Ground and bond metal containers during transfer operations. | | | | |
| Other Precautions and Warnings Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). Protect containers from physical damage. Dike around outside storage areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposures above 50 ppm: MSHA/NIOSH-approved full facepiece respirator with organic vapor cartridge. Greater protection is obtained from a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Solvent Resistant Butyl Rubber | Eye Protection Chemical Goggles and/or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYL BUTYL KETONE

CAS: 106-35-4

**IDENTIFICATION AND TYPICAL USES**

Ethyl butyl ketone is a colorless liquid with a powerful, fruity odor. It is used as a solvent for nitrocellulose and polyvinyl resins, and as an intermediate in organic synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethyl butyl ketone is mildly toxic to humans by *inhalation* and skin contact, although absorption is not likely. *Ingestion* is also a possible exposure route. There is relatively little human exposure data available in the references. However, based upon animals studies, the toxicity of ethyl butyl ketones appears to be relatively low. There are no reports in the references of carcinogenic, mutagenic, or teratogenic effects of this chemical in humans or animals.

Inhalation of ethyl butyl ketone vapors causes mild irritation to the skin, eyes, and mucous membranes of the respiratory tract with little evidence of toxic systemic effects at low concentrations. However, exposures to extremely high levels of vapor concentration can cause depression of the central nervous system (CNS) leading to symptoms of narcosis with headache, dizziness, nausea, loss of consciousness, and possible coma. Neurotoxic effects also appear to focus on the actions of the peripheral nervous system, apparently due to the metabolites of ethyl butyl ketone.

Skin contact will result in mild irritation. Prolonged exposures can lead to dryness, cracking, contact dermatitis, and a possibility for secondary infection at the point of contact. Eye contact causes mild irritation with very little potential for permanent injury or damage.

Ingestion of ethyl butyl ketone can produce gastrointestinal irritation, nausea, and vomiting.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl butyl ketone:

Skin: Mild irritation and possible dermatitis.

Eye: Mild irritation.

Lung: Irritation of the mucous membranes of the respiratory tract.

CNS: A mild narcotic compound. Inhalation of high concentrations of the vapor may cause dizziness, lightheadedness, and possible loss of consciousness.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethyl butyl ketone and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to ethyl butyl ketone has not been shown to cause carcinogenic effects.

Reproduction: There are no reports to support any claims of reproductive hazards in humans or animals.

Sensitivity: Repeated exposure to the skin may result in dermatitis.

🛑 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with ethyl butyl ketone. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory

protection is less effective than the controls mentioned above, but is still advisable whenever working with ethyl butyl ketone. For exposures to the PEL (50 ppm), use a NIOSH-approved, full facepiece organic vapor respirator. For higher or prolonged exposures, a supplied-air respirator with full facepiece operated in a positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. Natural rubber and polyvinylchloride (PVC) gloves will NOT protect against ketones. To prevent hand and skin exposures, butyl rubber gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl butyl ketone.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl butyl ketone is used or stored.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethyl butyl ketone and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of ethyl butyl ketone should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethyl butyl ketone. In almost every scenario, the threat of environmental exposure is contingent upon the proper

handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethyl butyl ketone is considered a Class II combustible liquid (per OSHA 29 CFR 1910.106). It can react with strong oxidizers to cause a serious fire and explosion hazard. It is also incompatible with acetaldehyde and perchloric acid. Contact with either will result in fire or explosion. When mixed with nitric acid and hydrogen peroxide, it will form solids or oils that are highly explosive. When involved in a fire, it can release acrid and irritating oxides of carbon. A boiling liquid expanding vapor explosion (BLEVE) is also a possibility. These characteristics require special consideration during any emergency involving a leak or spill of ethyl butyl ketone.

The proper disposal/destruction method for ethyl butyl ketone is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Waste treatment methods include steam stripping and high-temperature catalytic hydrogenation.

Ethyl butyl ketone can enter the environment through manufacturing, unchecked discharge into effluents from industrial or municipal waste treatment plants, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl butyl ketone. Insufficient data are available to evaluate or predict the short-term effects of ethyl butyl ketone on aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of ethyl butyl ketone on aquatic life, plants, birds, or land animals.

◆ *Water Solubility*

Ethyl butyl ketone is slightly soluble in water. Concentrations of less than 100 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Ethyl butyl ketone is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. There is no information in the references on the specific persistence percentages for this chemical in the various environmental mediums (air, soil, water).

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethyl butyl ketone found in fish tissues is expected to be about the same as the average concentration of ethyl butyl ketone in water from which the fish was taken.

🔧 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl butyl ketone should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ethyl butyl ketone should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl butyl ketone.

If ethyl butyl ketone is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ For large spills, dike area far ahead of spill to ensure total containment. Do not allow spilled materials or run-off to reach waterways.
- ☑ Keep ethyl butyl ketone out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- ☑ It may be necessary to dispose of ethyl butyl ketone as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl butyl ketone can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔧 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety, health, or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards | | | | |
| INHALATION: Causes depression of the central nervous system (CNS) with stupor, eye irritation, lack of coordination, abdominal cramps, anesthetic effects, unconsciousness, and cardiac arrest. May damage liver and kidneys. Vapors may cause irritation to the eyes, nose, and throat. | | | | |
| ABSORPTION: Irritation, redness and pain from frostbite to the skin. Eye contact may result in severe irritation and possible permanent damage due to frostbite. Will pass through intact skin. | | | | |
| INGESTION: Unspecified gastrointestinal effects. An unlikely exposure route, but still possible. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Questioned Animal | Yes | No | 29 CFR 1910.1000 Table Z-1 | Eyes, skin, respiratory sys., liver, kidney, CVS, CNS. |
| Medical Conditions Generally Aggravated by Exposure | | | | |
| None reported. However, liver, kidney, heart, and respiratory problems may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with tepid water (104°F), for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of warm water (104°F). Do NOT rub affected area or use dry heat. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Give conscious and alert person 1-2 glasses of water and induce vomiting. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Remove all ignition sources, wear SCBA respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Stop leak if it can be done without risk. Spilled liquids are likely to evaporate quickly. Absorb with vermiculite and place in sealed container. | | | | |
| Preferred Waste Disposal Method | | | | |
| Burn in chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store in tightly closed containers in cool, well ventilated location. Keep away from sources of heat. | | | | |
| Other Precautions and Warnings | | | | |
| Sources of ignition such as open flame or smoking, are prohibited where ethyl chloride is used or stored. Metal containers should be bonded and grounded. Empty cylinders contain residue, handle with care. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| Use an MSHA/NIOSH-approved air purifying respirator (cartridge type) or use a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Viton, Nitrile, or Butyl Rubber Gloves | | Chemical Goggles or Face Mask | | Protective Apron if Splash is Likely |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYL CHLORIDECH₃CH₂Cl

CAS: 75-00-3

**IDENTIFICATION AND TYPICAL USES**

Ethyl chloride is a colorless gas with a strong ether-like odor. It can also exist as a liquid below 54°F (12°C). It is used as a refrigerant, as a solvent, in the manufacture of tetraethyl lead, and as an alkylating agent. It is also used as a topical anesthetic.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethyl chloride is mildly toxic by *inhalation*. Although it is normally a gas at room temperature, it can also exist as a liquid at temperatures below 54°F (12°C) and, therefore, ethyl chloride can enter the body through *ingestion* of the liquid. The liquid is also known to pass through the skin (*absorption*) to cause toxic systemic effects. Skin contact with the liquid can cause localized tissue damage due to the extremely cold temperatures of the compressed or liquefied gas.

Inhalation is irritating to the eyes, nose, and mucosa of the respiratory tract. High concentrations of ethyl chloride causes depression of the central nervous system and cardiac arrhythmia. Subsequent symptoms include dizziness, lightheadedness, headache, stupor, drunkenness and inebriation, loss of coordination, abdominal cramps, unconsciousness, and possible cardiac arrest, liver, and kidney damage. It should be noted that such symptoms as inebriation and drunkenness can also lead to accidents. Personnel may injure themselves or others, or damage equipment and property, as a result of the intoxicating effects of exposure.

Aside from the absorption potential of ethyl chloride, skin contact can also produce allergic eczema, and severe tissue damage due to frostbite. Eye contact

will also cause serious injury to tissues as a result of the extremely cold temperatures of both the liquid and the compressed gas.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl chloride:

- Skin:** Irritation with potential for redness, pain, frostbite, and tissue damage. Possible allergic eczema can develop.
- Eye:** Severe irritation, burning (frostbite), pain, and smarting of the conjunctiva.
- Lung:** Nose, throat, and respiratory tract irritation. Absorption through the lungs is quick.
- CNS:** Headaches, lightheadedness, dizziness, inebriation, loss of coordination, stupor, and drunkenness. Death can occur due to cardiac arrhythmia and possible cardiac arrest.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethyl chloride and can last for months or even years:

Cancer Hazards: The National Institute for Occupational Safety and Health (NIOSH) considers ethyl chloride to be a carcinogen and the National Toxicology Program (NTP) has conducted studies indicated evidence that ethyl chloride is a tumorigenic agent. However, no carcinogenic designations have been assigned to this chemical. Further study and confirmation are required. It is recommended that users pro-

ceed with due caution until more is known about the carcinogenic properties of ethyl chloride.

Reproductive Hazard: According to information presented in the references, ethyl chloride has not been adequately tested for its ability to cause adverse reproductive effects in test animals.

Other Chronic Effects: Long-term exposure may lead to liver and kidney damage. Such damage has been demonstrated in animals and is possible, but not probable, in humans.

🕒 **Recommended Risk-Reduction Measures**

Exposure to ethyl chloride does not appear to pose a serious threat in the industrial environment since exposure to very high concentrations (13,000 - 40,000 ppm and higher) are required to cause toxic effects. However, exposure is still possible under certain operating conditions and during emergency situations. Personnel should therefore avoid direct contact with ethyl chloride. Occupational poisoning occurs most commonly by inhalation. If a less toxic material or compound cannot be substituted for ethyl chloride, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of ethyl chloride release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyl chloride. Caution should be exercised when selecting respiratory protection since it is not known if exposure to ethyl chloride will cause cancer in humans. For exposure over the PEL (1000 ppm), an MSHA/NIOSH-approved air-purifying respiratory with organic vapor cartridge(s) will suffice. For exposures to higher concentrations, or when the concentration is unknown, use a supplied air respirator with full facepiece and mask operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, nitrile, Viton, or butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be prac-

ticed whenever personnel are to work with ethyl chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl chloride is used or stored.

If symptoms develop or overexposure is suspected, the following recommended medical tests should be considered:

- ☑ Liver and kidney function tests.
- ☑ Special 24-hour electrocardiogram (EKG) using the Holter Monitor to evaluate for irregular heartbeat.
- ☑ Interview for brain effects, including recent changes in memory, mood (irritability, withdrawal), and concentration. Look for headaches, malaise, and altered sleeping patterns. Cerebellar, autonomic, and peripheral nervous system evaluation should be considered. Positive or borderline cases should be referred for further neuropsychological testing.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethyl chloride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl chloride should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethyl chloride, emergency shower facilities should also be provided in the immediate area.

- ☑ Workers whose clothing has been contaminated by ethyl chloride should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to ethyl chloride.
- ☑ Where possible, automatically transfer liquids containing ethyl chloride from drums or other containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Although ethyl chloride normally exists as a gas, it is usually shipped as a liquefied compressed gas. The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethyl chloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Ethyl chloride is very dangerous flammable liquid. Because of its low flash point and low boiling point, it is classified as a Class 1A flammable liquid or a flammable gas, depending on its state (per OSHA 29 CFR 1910.106). It is a serious fire hazard and moderate explosion hazard when exposed to heat or flame. It is incompatible with strong oxidizers, such as chlorine, fluorine, and bromine, and many chemically-active metals, such as sodium, potassium, calcium, powdered aluminum, zinc, and magnesium. Caution is always required in handling, storage, transportation, and disposal of ethyl chloride. Emergency responders should be made aware of the presence of ethyl chloride at any emergency response situation.

Ethyl chloride can enter the environment from industrial effluents and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl chloride.

Ethyl chloride has slight acute toxicity to aquatic life. It has caused respiration and germination increases in potatoes. No data are available on the short-term effects of ethyl chloride on birds or land animals.

☀ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Ethyl chloride has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of ethyl chloride to plants, birds, or terrestrial animals.

💧 Water Solubility

Ethyl chloride is moderately soluble in water. Concentrations between 1 and 1000 milligrams will mix with a liter of water.

⌚ Persistence in the Environment

Ethyl chloride is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.8% of ethyl chloride will eventually end up in air; the remainder will end up in water.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethyl chloride found in fish tissues is expected to be about the same as the average concentration of ethyl chloride in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ethyl chloride into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl chloride should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ethyl chloride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl chloride.

For disposal, ethyl chloride may be burned in a chemical incinerator equipped with an afterburner and scrubber to remove the haloacids. It should be noted that complete destruction by incineration is difficult unless a direct gas feed to the incinerator is used. These are normally available in permit-approved facilities only. Complete combustion is necessary to prevent the formation of phosgene gas.

If ethyl chloride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Use only non-sparking tools.
- ☑ If source of leak is a cylinder, attempt to shut off leak if it can be done without risk. If not, try to move cylinder to a safe place (outdoors) and allow to vent. If fire occurs, use water spray to knock down vapors and direct away from personnel. Absorb liquids in vermiculite, sand, earth, or similar material and deposit in sealed drum.
- ☑ Ventilate area of spill or leak and remove all ignition sources.
- ☑ It may be necessary to dispose of ethyl chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl chloride can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result

from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

ETHYL CHLOROFORMATE

CAS: 541-41-3

**IDENTIFICATION AND TYPICAL USES**

Ethyl chloroformate is a colorless, water-white liquid with an irritating odor. It is used in organic synthesis, as an intermediate in making diethyl carbonate, in flotation agents, polymers, and isocyanates.

RISK ASSESSMENT: HEALTH***General Assessment***

Ethyl chloroformate is a human poison by *inhalation*, *ingestion*, and skin *absorption*. Its carcinogenicity is questioned in animals, although human carcinogenicity studies have proven inconclusive in this regard. It has been confirmed that exposure to ethyl chloroformate can cause nasal cancers in some test animals (rats) by inhalation. A conservative approach to exposure risk management is recommended for ethyl chloroformate since the exact nature of its cancer risk is unresolved.

Inhalation of ethyl chloroformate vapors can cause irritation of the eyes, nose, throat, and respiratory tract with symptoms of burning sensation, coughing, sneezing, wheezing, laryngitis, severe lachrymation, headache, vomiting, nausea, shortness of breath. Higher concentrations may be fatal as a result of spasm, inflammation, and edema of the bronchi and larynx, chemical pneumonitis, or pulmonary edema (fluid in the lungs). Pulmonary edema can be delayed up to 48 hours following exposure, thereby creating a false sense of security with regard to health exposure risk. Repeated or long-term exposures may cause liver or kidney damage.

Skin contact results in serious burns and corrosive tissue destruction leading to permanent damage. Short exposures can cause 1st degree burns and longer exposures may result in 2nd degree burns. It may also cause skin sensitization. Eye contact with the vapor produces severe lachrymation (tearing) and the liquid will cause smarting, irritation, and painful burns with tis-

sue damage and possible loss of vision (depending upon the length of time the liquid remains in contact with the eye surface).

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl chloroformate:

Skin: Immediate irritation and burn on contact. Burns may be severe, leading to permanent damage to the skin.

Eye: Acid-type burns with possibility for permanent tissue damage.

Lung: Irritation of the respiratory tract. High level exposures can lead to death as a result of spasm or edema of the bronchi or larynx. Death can also result from chemical pneumonitis and/or pulmonary edema (fluid in the lungs).

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to ethyl chloroformate and can last for months or even years:

Cancer Hazards: There is limited evidence in the references that exposure to ethyl chloroformate may cause nasal cancer (positive studies with rats). Human carcinogenic research is limited and inconclusive.

Reproductive Hazard: According to information presented in the references, ethyl chloroformate has not been adequately tested for its ability to cause cancer in test animals.

Other Chronic Effects: Repeated exposures may damage the liver and kidneys. There are no data regarding any other possible or potential long-term (chronic) effects of exposure to ethyl chloroformate.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with ethyl chloroformate or any other chemical with suspected or unconfirmed human carcinogenic characteristics. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyl chloroformate. No exposure levels have been established for this substance. For any concentration, a supplied-air respirator operated in continuous flow or other positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl chloroformate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl chloroformate is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Lung function tests.
- Kidney and liver function tests.
- Consider chest X-ray after acute overexposure (may be negative if taken immediately following exposure as pulmonary edema may be delayed up to 48 hours).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, smokers exposed to ethyl

chloroformate may experience symptoms more quickly and more pronounced than non-smokers under the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible factors which may be causing the appearance of exposure symptoms among the work force.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ethyl chloroformate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl chloroformate should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethyl chloroformate, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of ethyl chloroformate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethyl chloroformate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethyl chloroformate is considered a Class 1A flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point make this chemical a serious fire and explosion

hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with a number of materials, including many common acids and oxidizers. Contact with either can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of ethyl chloroformate. Should ethyl chloroformate ever come into contact with incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is possible.

Ethyl chloroformate may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl chloroformate.

Insufficient data are available on the short-term effects of ethyl chloroformate exposure to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of ethyl chloroformate to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ethyl chloroformate decomposes in water to form toxic gases and fumes (including chloride fumes and phosgene gas).

🕒 *Persistence in the Environment*

Ethyl chloroformate is non-persistent in water. It will react rapidly and, therefore, will not persist in the aquatic environment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become con-

centrated in the tissues and internal organs of animals as well as humans.

Ethyl chloroformate will react rapidly in water and, therefore, will not accumulate in the edible tissues of aquatic organisms that are consumed by humans.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl chloroformate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If ethyl chloroformate should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl chloroformate. If ethyl chloroformate is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of leak.
- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- It may be necessary to dispose of ethyl chloroformate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl chloroformate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|--|------------------------------------|
| Characterization Gas | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name Ethylene, compressed or Ethylene, refrigerated liquid | Chemical Abstract Service (CAS) Number 74-85-1 | |
| DOT Hazard Class and Label Requirements Flammable Gas (both forms) | DOT Emergency Guide Code 22 | |
| DOT Identification Number UN 1038 (compressed gas); UN 1962 (liquid) | Chemical Formula C₂H₄ | |
| Synonyms Bicarburetted hydrogen; ethene; liquid ethylene; olefiant gas. | | |

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Ethylene (derivation from: By thermal cracking of hydrocarbon gases at temperatures between 800°-900°C; by dehydration of ethanol; or from synthesis gas with Ru as catalysts. Also found naturally in ripening fruit). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|---|
| Boiling Point -152°F (-102°C) | Specific Gravity (H ₂ O = 1) Not Found |
| Vapor Pressure (atmospheres) Gas | Molecular Weight 28.06 |
| Vapor Density (Air = 1) 0.98 | Freezing Point -272°F (-169°C) |

Solubility
Soluble in water, alcohol, and ether.

Appearance and Odor
A colorless gas with a sweet odor and taste.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) -213°F (-136°C) closed cup | Explosive Limits in Air % by Volume LEL: 3% UEL: 34% |
| NFPA Classification Flammable Gas | Autoignition Temperature 1009°F (543°C) |

Extinguishing Media
Stop flow of gas first (if possible). Use foam, carbon dioxide, dry chemical, or water spray on fire.

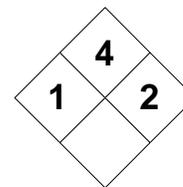

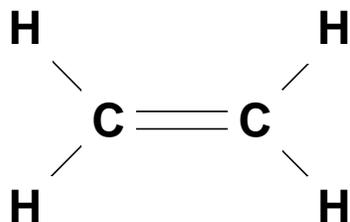

Special Fire Fighting Procedures
Ethylene is an extremely flammable, very dangerous fire and explosion hazard. Poisonous gases are evolved from fire. Wear a self-contained breathing apparatus (SCBA) with full facepiece. Ensure ALL sources of escaping gas are controlled. Monitor area for long after fire is extinguished. Move containers from fire area if it can be done without risk. Use water spray to knock down vapors.

Unusual Fire and Explosion Hazards
Gas is explosive. Containers may explode in flame. Even if fire is extinguished, escaping gas can form explosive mixtures in air quickly and ignite without warning.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|--|--------------------|---|
| Stability | | Conditions to Avoid Ethylene is normally stable in its closed containers, during routine operations (those that do not expose it to ignition sources). Avoid contact with heat, sparks, flame, lighted tobacco products, and steam lines. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) Ethylene is reactive in contact with chlorine or chlorine dioxide, other oxidizers, heat, sparks, and open flame. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethylene is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products If involved in fire, ethylene can produce toxic carbon monoxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: An asphyxiant gas. Initial symptoms are those of oxygen starvation. Feeling of "air hunger," diminished mental alertness, headache, dullness, shortness of breath, and an impairment in muscle coordination. Continued exposures lead to faulty judgment, depression of senses, rapid fatigue, unconsciousness, convulsions, coma, and death. SKIN & EYES: Contact with the compressed gas or refrigerated liquid can cause frostbite and burns. INGESTION: Not likely since ethylene is a gas at normal working (room) temperatures. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Insufficient data | No | No | No | None Reported |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Not likely to occur under normal or even emergency occupational conditions. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. If gas has not yet ignited, use a water spray to knock down vapors and direct them from ignition source. | | | | |
| Preferred Waste Disposal Method None specified in the references (incineration of a gas may be the only alternative). | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible materials or in the presence of heat since violent reactions or explosions can occur. Store in tightly closed pressurized containers in a cool, dark, well-ventilated area away from sunlight. Keep away from ignition sources such as fire, sparks, and flame. | | | | |
| Other Precautions and Warnings Bulk storage of ethylene is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) No exposure limits have been established. Ethylene is a simple asphyxiant. Do NOT use cartridge-type respirators (ineffective for this type of gas). Use a powered supplied-air respirator or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Insulated Rubber | | Eye Protection Goggles and/or Face Mask | | Other Protective Clothing Leather Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYLENEC₂H₄

CAS: 74-85-1

**IDENTIFICATION AND TYPICAL USES**

Ethylene is a colorless gas with a sweet odor and taste. While it can be produced synthetically, it occurs naturally in ripening fruit as a result of the dehydration of alcohol. It is found in illuminating gases and in petroleum gases. It is used in oxyethylene flame for welding and cutting metals, in the manufacture of polyethylene, polystyrene, and other plastics. It is also used in the manufacture of ethylene oxide and in orchard sprays to accelerate fruit ripening. It has even been used as an inhalation anesthetic.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethylene is a simple asphyxiant gas. As such, its primary route of entry into the body is through *inhalation*. It can displace oxygen levels to below that which is necessary to sustain life. At high concentrations, it is a narcotic and can cause anesthesia and unconsciousness. Skin contact with the liquid can be destructive to tissues due to the extremely cold temperatures but absorption is not a likely exposure route. Since ethylene usually exists as a gas at room temperatures, ingestion is not likely to occur either.

Inhalation of ethylene gas can cause headache, dullness, shortness of breath, and the symptoms of asphyxiation. These include rapid respiration and a feeling of “air hunger” or air starvation followed by a decrease in mental alertness, and impaired muscular coordination. If exposure continues, there can be narcosis, anesthesia, faulty judgment, depression of the senses, emotional instability, nausea, vomiting, prostration, unconsciousness, convulsions, coma, and death.

Skin or eye contact with the vapor poses no serious threat. The vapors have not been shown to cause

any physiological response. However, if the liquid should contact either the skin or the eyes, there can be serious irritation, burns, tissue damage, and frostbite.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylene:

Skin: Liquid threat only. Redness, pain, swelling, blisters, and severe frostbite.

Eye: Liquid threat only. Causes frostbite, redness, irritation, severe pain, and blurred vision.

Lung: Vapor is non-irritating and therefore poses no threat of damage to the lungs. However, in high concentrations, ethylene can lead to symptoms of asphyxiation and oxygen deprivation up to and including loss of consciousness and death.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethylene and can last for months or even years:

Cancer Hazards: There is insufficient evidence in the references to evaluate ethylene for its ability to cause cancer in animals. It is a simple asphyxiant.

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: Ethylene has not been tested for other chronic (long-term) health effects.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with ethylene. If another gas cannot be substituted for a ethylene,

then *engineering controls* are the most effective method of reducing exposures. The best protection is to separate operations and provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using equipment with explosion-proof designs and ensuring all metal containers and tools are electrically grounded and bonded can further reduce the potential for injury or damage. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with ethylene. Air-purifying respirators (e.g., the cartridge-type or gas masks) cannot be used with ethylene. These type respirators only purify the air and can do nothing to protect in oxygen deficient atmospheres. A powered supplied-air respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber or leather apron should be worn. To prevent hand and skin exposures with the liquid, thermal gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylene. Also, hot-work operations that use ethylene (welding, cutting, soldering) can present other health hazards, such as the generation of toxic carbon and metal oxide fumes. Administrative controls as well as engineering controls must consider the effects of working with ethylene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethylene is used or stored.

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, consider installing automatic sensors that warn personnel of dropping oxygen levels and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.

- ☑ Wash thoroughly immediately after exposure to ethylene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Safety shower and eyewash stations should be readily available in work areas where ethylene is used or stored.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylene should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethylene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Ethylene is an extremely flammable and highly explosive gas. Its extremely low flash point and boiling point present a serious fire hazard. It can react with ozone to form ethylene ozonide which is unstable and explodes on mechanical shock. Also, since it can react violently in the presence of oxidizers, such as chlorine, ethylene requires special consideration during any emergency involving a leak or release of ethylene gas or liquid.

Ethylene can enter the environment through industrial discharges, unchecked venting to air, or through spills of the liquid. Since liquids will most likely vaporize rapidly, water and soil contamination are possible but improbable.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylene.

Ethylene has slight acute toxicity to aquatic life. It has caused various types of injuries to a number of agricultural crops. Insufficient data are available on the acute (short-term) effects of ethylene on birds or terrestrial animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Ethylene has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of ethylene to plants, birds, or land animals.

◆ *Water Solubility*

Ethylene is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Ethylene is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.9% of ethylene will eventually end up in air; the rest will end up in the water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Ethylene is not expected to accumulate in the tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures.

Contaminated soils should be removed for incineration and replaced with clean soil. When spills or leaks occur, it may be necessary to contact the local and/or state emergency response authorities. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylene. If ethylene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep ethylene out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- ☑ It may be necessary to dispose of ethylene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed,

approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Extremely irritating to the mucosa of the upper respiratory tract. Vapors can cause severe irritation of the eyes, nose, throat, and skin at very low concentrations. May cause CNS depression, ataxia, loss of coordination, coma, and liver and kidney damage. Pulmonary edema (fluid in lungs) is also possible. Death can occur by respiratory paralysis. ABSORPTION: Can pass through unbroken skin, without immediate irritation, causing toxic systemic effects with action on the CNS. INGESTION: Causes nausea, headache, delirium, coma, and collapse. | | | | |
| Carcinogenicity | NTP Listed? No Evidence Human No Evidence Animal | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? CNS, resp. sys., kidneys, liver, digestive sys., CVS. |
| Medical Conditions Generally Aggravated by Exposure Liver diseases and central nervous system disorders may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Quickly remove contaminated clothing. Wash with large amounts of soap and water for a minimum of 15 minutes. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24- 48 hours for lung effects. If swallowed: Seek medical attention immediately. Give 1 to 2 glasses of milk or water. Do NOT induce vomiting or attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Absorb liquids in vermiculite or other material and deposit in sealed drums. | | | | |
| Preferred Waste Disposal Method Mix with a combustible solvent and burn in a chemical incinerator (with afterburner and scrubber). | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, well ventilated area away from heat. Protect containers from physical damage. | | | | |
| Other Precautions and Warnings Store to avoid contact with strong oxidizers since violent reactions can occur. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use a NIOSH/MSHA-approved air purifying respirator or a supplied air respirator, or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Butyl Rubber (or other non-permeable) | Eye Protection Chemical Goggles and Face Mask | | Other Protective Clothing Protective Uniform or Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYLENE CHLOROHYDRIN

CAS: 107-07-3

**IDENTIFICATION AND TYPICAL USES**

Ethylene chlorohydrin appears as a colorless, clear liquid with a faint odor of ether. It is used in the manufacture of insecticides, as a solvent for cellulose esters, in treating sweet potato plants before planting, and in making ethylene glycol and ethylene oxide. Exposure risks to this compound can occur when ethylene chlorohydrin is formed from ethylene oxide during sterilization of grain and spices, drugs, and surgical supplies.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethylene chlorohydrin is a severe acute poison by *inhalation*, *ingestion*, and *skin absorption*. There is no evidence that exposure to ethylene chlorohydrin causes cancer in test animals. However, mutation data have been reported and there is some indication that ethylene chlorohydrin causes teratogenic effects in test animals.

Inhalation of ethylene chlorohydrin vapors causes severe irritation to the mucous membranes of the eyes, nose, and throat. It causes central nervous system (CNS) and respiratory system depression and exerts biological effects on the cardiovascular system, liver, kidneys, and gastrointestinal tract, skin, and eyes. Pulmonary edema (fluid buildup in the lungs) can also occur. This is a medical emergency and can be fatal. Respiratory failure may result. Symptoms may be delayed up to 48 hours, creating a false sense of security with regard to exposure risk. Other symptoms include loss of coordination, confusion, vertigo, weakness, nausea, headache, delirium, vomiting, seizures, low blood pressure, collapse, and loss of consciousness. There is also a possibility that exposure will damage the liver and/or kidneys.

Skin contact results in no immediate indications of irritation or pain. However, it will be absorbed freely through the skin to cause toxic systemic effects similar

to that of inhalation (it is more toxic than ingestion). Prolonged contact may cause mild irritation to the skin and corneal burns to the eyes.

Ingestion causes nausea, headache, delirium, coma, and collapse. It can also cause symptoms similar to that of inhalation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylene chlorohydrin:

Skin: Mild irritation with rapid absorption through intact skin.

Eye: Possible cornea burns with recovery within 48 hours.

Lung: Severe irritation to respiratory tract causing shortness of breath and cough. High acute exposures can be fatal due to a buildup of fluid in the lungs (pulmonary edema).

CNS: Possible depression of the central nervous system causing a variety of toxic effects including loss of coordination and consciousness.

Other: Exposure can cause liver and/or kidney damage. There may also be adverse effects on the cardiovascular system (CVS).

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethylene chlorohydrin and can last for months or even years:

Cancer Hazards: There is insufficient evidence in the references to indicate that exposure to ethylene chlorohydrin causes cancer in test animals. However, limited data suggests that it is a mutagen (causes cell changes) in animals. Some scientists believe that such

chemicals may cause cancer in the long-term. More research is required in this area of study.

Reproductive Hazard: According to the references, there is limited evidence that ethylene chlorohydrin has the ability to adversely affect reproduction in experimental test animals.

Other Chronic Effects: Repeated low-dose exposures may damage the liver and kidneys. Prolonged exposure may depress the CNS and the respiratory system.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ethylene chlorohydrin. If a less toxic material or compound cannot be substituted for ethylene chlorohydrin, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of ethylene chlorohydrin release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around ethylene chlorohydrin. Air purifying respirators may provide some protection at low or infrequent exposures. For the best protection, an MSHA/NIOSH-approved supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended methods of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, rubber or other non-permeable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylene chlorohydrin.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where ethylene chlorohydrin is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical test is recommended:

- Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following may be useful:

- Liver, kidney, and lung function tests.
- Consider chest X-ray after acute exposure (may be negative if taken immediately after exposure, as indications of pulmonary edema may be delayed).
- Urinalysis to look for increase in red blood cells, albumin, and casts (a mass of plastic-like matter formed by diseased organs and discharged from the body).
- Evaluation of the central nervous system by a qualified neurologist for evidence of CNS depression or other indications of exposure effects.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other respiratory ailments, any exposure to ethylene chlorohydrin can result in quicker and more devastating symptoms. Smokers should therefore avoid unprotected contact with this chemical. Prudent risk management requires proper consideration of *all* possible factors that may be causing the appearance of exposure symptoms among workers.

Other methods to reduce exposure include:

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ethylene chlorohydrin and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylene chlorohydrin should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethylene chlorohydrin, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by ethylene chlorohydrin should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to ethylene chlorohydrin.

RISK ASSESSMENT: ENVIRONMENT *General Assessment*

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethylene chlorohydrin. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Ethylene chlorohydrin is class IIIA combustible liquid. It will support combustion as well as intensify any fire. It is incompatible with oxidizers and caution is always required in handling, storage, transportation, and disposal of ethylene chlorohydrin. When heated to decomposition it emits very acrid and irritating smoke and fumes, including toxic hydrogen chloride and phosgene. In the presence of water or steam, it will produce toxic and corrosive fumes. Emergency responders should be made aware of the presence of ethylene chlorohydrin at any emergency response situation.

Ethylene chlorohydrin may enter the environment through industrial effluents and discharges, and through spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylene chlorohydrin.

Insufficient data are available to evaluate or predict the acute (short-term) effects of ethylene chlorohydrin to aquatic life, plants, birds, or land animals.

Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the chronic (long-term) effects of ethylene chlorohydrin on aquatic life, plants, birds, or land animals.

Water Solubility

Ethylene chlorohydrin highly is soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

Persistence in the Environment

There is no information in the references concerning the persistence of ethylene chlorohydrin in the environment (air, water, or soil).

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The references do not address the bioaccumulation capabilities of ethylene chlorohydrin in the edible tissues of aquatic organisms.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ethylene chlorohydrin into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylene chlorohydrin should be segregated from other chemicals to minimize the risk of cross-contamination. Ethylene chlorohydrin must be stored to avoid contact with strong oxidizers, such as chlorine and bromine, since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If ethylene chlorohydrin should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and total remediation may or may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylene chlorohydrin.

To dispose of ethylene chlorohydrin, it should be mixed with a combustible solvent and burned in a chemical incinerator equipped with an afterburner and a scrubber.

If ethylene chlorohydrin is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Absorb spilled liquids with vermiculite, dry sand, or a similar material and deposit in sealed drum for disposal. Use only non-sparking tools.
- ☑ Ventilate area and remove ignition sources.
- ☑ It may be necessary to dispose of ethylene chlorohydrin as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylene chlorohydrin can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Ethylenediamine (derivation: Catalytic reaction of ethylene dichloride and ammonia. Nickel or copper catalysts are normally used in the process. Also, may be derived by catalytic animation of monoethanolamine). 1 ppm = 2.50 mg/m³ | PEL (8-hour): 10 ppm 25 mg/m³ STEL: Not Established | REL (10-hour): 10 ppm 25 mg/m³ STEL: Not Established | 1000 ppm | TLV: 10 ppm 25 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 244°F (118°C) | Specific Gravity (H ₂ O = 1) 0.91 |
| Vapor Pressure (mm Hg) 10.7 at 69°F (20°C) | Molecular Weight 60.1 |
| Vapor Density (Air = 1) 2.07 | Melting Point 47°F (8.3°C) |

Solubility

Soluble in water and alcohol, slightly soluble in ether. Insoluble in benzene (unless dried first).

Appearance and Odor

Colorless, viscous liquid (or solid below 47°F) with an unpleasant, ammonia-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 93°F (34°C) closed cup | Explosive Limits in Air % by Volume LEL: 2.5% (at 212°F) UEL: 12% (at 212°F) |
| NFPA Classification Class IC Flammable Liquid | Autoignition Temperature 716°F (380°C) |

Extinguishing Media

Use dry chemical, carbon dioxide, "alcohol-resistant" foam, or water spray. Do NOT use direct stream of water (may scatter or spread the fire).

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Move containers from fire area if it can be done safely. Use water spray to cool fire-exposed containers. Do not allow run-off from fire control methods to reach sewers or waterways.

Unusual Fire and Explosion Hazards

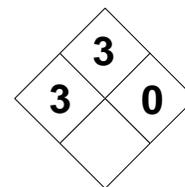

Moderate fire and explosion hazard. Vapors form explosive mixtures in air. Vapors are slightly heavier than air and can travel for great distances to an ignition source to flashback causing fire or explosion.

SECTION V - REACTIVITY DATA

| | | | | |
|---|--|--|--|--|
| Stability | | Conditions to Avoid Ethylenediamine is normally stable. It does absorb carbon dioxide from air to form a nonvolatile carbonate. Avoid contact with incompatible materials. Keep dry and away from heat and flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Corrosive to metals. Incompatible with strong oxidizers, strong acids, carbon tetrachloride and other chlorinated compounds, carbon disulfide, acrylonitrile, epichlorohydrin, oleum, nitromethane, vinyl acetate. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethylenediamine is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating fumes and vapors are produced when ethylenediamine is heated to decomposition. These include toxic oxides of nitrogen and carbon, as well as ammonia. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Coughing, wheezing, laryngitis, shortness of breath, headache, nausea and vomiting, dizziness, abdominal cramps. Death can occur due to spasm, inflammation and edema of the larynx and bronchi, chemical pneumonia, or pulmonary edema (fluid in lungs). Possible allergic sensitization (asthma) may develop. Liver or kidney damage possible. ABSORPTION: Skin contact may cause dermatitis with irritation. Eye contact may cause swelling (painless) of the cornea epithelium causing visual disturbances. Will pass through skin. INGESTION: May damage the gastrointestinal tract and cause toxic systemic effects. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, resp. sys., CNS, liver, kidney, spleen. |
| Medical Conditions Generally Aggravated by Exposure Skin (dermatitis), respiratory (asthma), or kidney problems may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Quickly remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If <u>swallowed:</u> Call the poison control center and seek medical attention immediately. Do NOT induce vomiting. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other absorbent and deposit in sealed drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Neutralize residues or small spills with sodium bicarbonate or soda ash and flush to a drain with copious amounts of water. | | | | |
| Preferred Waste Disposal Method Large amounts: Collect and atomize in a combustion chamber with an effluent gas cleaning device. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dry well-ventilated area (preferably above 50°F/18°C). Protect containers from physical damage. Use explosion proof (Class 1, Group D) electrical equipment. Ground and bond metal containers and equipment when making transfers (prevent static sparks). | | | | |
| Other Precautions and Warnings Empty containers may still contain hazardous residues and should be handled accordingly. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low concentrations (<250 ppm), use a chemical cartridge respirator. A supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode provide greater protection. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber or Teflon Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYLENEDIAMINE

CAS: 107-15-3

**IDENTIFICATION AND TYPICAL USES**

Ethylenediamine is a colorless, viscous liquid (or solid below 47°F) with an extremely unpleasant, ammonia-like odor. It is used as a stabilizer for latex rubber, as an emulsifier, as an inhibitor in antifreeze solutions, and in textile lubricants. It is also used as a solvent for albumin, shellac, sulfur, and other substances.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethylenediamine is an irritant poison in humans and is toxic by *inhalation*, *ingestion*, and skin contact (*absorption*). The extremely unpleasant odor of ethylenediamine makes overexposure by inhalation an uncommon event since personnel will not usually tolerate moderate or high vapor concentrations. There is no information in the references on the carcinogenic or teratogenic properties of ethylenediamine. However, mutation data have been reported. Some scientists believe that mutagenic chemicals may have carcinogenic effects in the long-term. Additional study is required in this area. Lung, kidney, and liver injuries can also occur following prolonged or repeated exposures.

Inhalation of ethylenediamine vapors causes severe and corrosive irritation to the eyes, nose, throat, and upper respiratory tract. Excessive exposure to the vapor leads to neurotoxic effects on the central nervous system (CNS) due to its ability to inhibit neuronal firing. Symptoms of exposure include coughing, wheezing, laryngitis, shortness of breath, nausea and vomiting, dizziness, allergic sensitization (asthma), and abdominal cramps. Liver, lung, and/or kidney damage may occur. Exposure to ethylenediamine may be fatal as a result on spasms and inflammation with edema of the larynx and bronchi. Chemical pneumonia and/or pulmonary edema (fluid in the lungs) are also possible, and each can lead to death. Symptoms

of pulmonary edema may be delayed up to 48 hours creating a false sense of security with regard to exposure risk.

Ethylenediamine is a severe skin irritant, producing sensitization, blistering, and 2nd degree burns on prolonged contact. Because ethylenediamine tends to be fat soluble, it can be easily absorbed through the skin in toxic amounts. Eye contact results in severe irritation and may cause painless swelling of the corneal epithelium causing the appearance of “halos” around lights. Eye contact may also cause burns and tissue damage.

Ingestion can occur through careless working conditions, accidents, and improper hygienic practices. It causes damage to the gastrointestinal tract and may lead to systemic poisoning.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylenediamine:

Skin: Severe, burning irritation. If not removed immediately, absorption through intact skin can also occur.

Eye: Irritation, inflammation, redness, and swelling with damage to vision possible if the chemical is not removed immediately.

Lung: Inhalation causes irritation of the eyes, nose, and upper respiratory tract with distressed breathing, coughing, congestion, and tearing.

CNS: Action on the peripheral nervous system causing headache, nausea, dizziness, and interference or disruption in neuronal firing with subsequent paresthesia of the peripheral nerves.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethylenediamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, ethylenediamine has not been adequately tested for its ability to cause cancer in test animals. Mutation data have been reported, but human results are conflicting and inconclusive. More research is required.

Reproductive Hazard: According to the information presented in the references, ethylenediamine has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged exposures may lead to lung, liver, and/or kidney damage. Ethylenediamine is an allergen and may cause sensitization resulting in asthma and/or dermatitis (depending on the route of prolonged exposure).

☛ **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethylenediamine. For relatively low, infrequent, or transient exposures, an organic vapor respirator equipped with a cartridge protecting against amines may suffice. For higher or prolonged exposure, a supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylenediamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethylenediamine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

Lung function tests.

Liver and kidney function tests.

Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure since indication of pulmonary edema may be delayed).

Evaluation by a qualified allergist, with careful consideration of exposure symptoms and special testing (may help diagnose allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking causes heart disease, emphysema, and other respiratory disorders, and can decrease the time between first exposure and the onset of respiratory symptoms, smokers exposed to ethylenediamine may experience symptoms much quicker and more pronounced than non-smokers under the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible factors which may be causing the appearance of symptoms in the work force.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to ethylenediamine and at the end of the work shift or before eating, drinking, or smoking.

- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylenediamine should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of ethylenediamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethylenediamine is considered a Class IC flammable liquid (per OSHA 29 CFR 1910.106). This means it poses a serious fire risk by itself or in contact with incompatible materials (can cause fire or explosion). It can react with many common oxidizing materials and strong acids. It is corrosive to copper, brass, galvanized iron, and many other metals compounds. Its vapors can form explosive mixtures in air. These characteristics require special consideration during any emergency situation involving a leak or spill of ethylenediamine. Should ethylenediamine ever come into contact with incompatible substances either during use, transportation, or storage, violent reactions can occur.

Ethylenediamine can enter the environment through its intended use as a fungicide, as well as through industrial discharges and spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylenediamine. Ethylenediamine has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of ethylenediamine on plants, birds, or land animals.

☠ Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Ethylenediamine has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of ethylenediamine on plants, birds, or land animals.

💧 Water Solubility

Ethylenediamine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ Persistence in the Environment

Ethylenediamine is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethylenediamine found in fish tissues is expected to be about the same as the average concentration of ethylenediamine in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylenediamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.). Electrical equipment in storage areas should be rated for Class 1, Group D environments.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous

materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If ethylenediamine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. Time is of the essence since it is highly soluble and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylenediamine.

For disposal of small quantities, add the ethylenediamine to a layer of sodium bisulfate in a large evaporating dish and spray with water. Neutralize and then flush to the sanitary sewer. Large amounts should be collected and atomized in a combustion chamber equipped with an effluent gas cleaning device.

If ethylenediamine is spilled or leaked, the following specific steps are recommended:

- Evacuate area and deny entry to those not involved in cleanup activities. Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Ventilate area and remove all ignition sources.
- Absorb liquids using vermiculite, dry earth, or sand and place in a sealed drum for disposal. Trace residues or small spills should be neutralized with sodium bicarbonate or soda ash and then flushed to a drain using copious amounts of water.
- It may be necessary to dispose of ethylenediamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylenediamine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental dam-

age can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

ETHYLENE DIBROMIDEBrCH₂CH₂Br

CAS: 106-93-4

**IDENTIFICATION AND TYPICAL USES**

Ethylene dibromide is a colorless, heavy, viscous liquid with a sweet, pleasant, chloroform-like odor. It can also exist as a solid below 50°F (10°C). It is widely used as a fumigant for grains. Because of its carcinogenic properties, this use is under constant review. It is also used as a scavenger of lead in leaded gasoline (antiknock agent), as a solvent, in paints, varnish, and finish removers, in metal degreasing, in soaps and scouring agents, in ore flotation, in water purifying preparations, and in organic synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethylene dibromide is moderately toxic by *inhalation*. The liquid is also known to pass through the skin (*absorption*) to cause toxic systemic effects. Although unlikely under normal operating conditions, *ingestion* is also a possible exposure route. This chemical is known to cause cancer in test animals (skin and lung tumors) and this effect is suspected to occur in humans as well. Human mutation data have been reported. In addition, ethylene dibromide has been shown to adversely affect reproduction in test animals.

Inhalation is irritating to the eyes, nose, and mucosa of the respiratory tract. High concentrations of ethylene dibromide cause depression of the central nervous system. Subsequent symptoms include dizziness, lightheadedness, headache, loss of appetite and subsequent weight loss, abdominal pain with progression to major organ system damage (primarily the liver and kidneys), unconsciousness, and death due to liver and kidney damage (necrosis). Other symptoms include general weakness and fatigue, drowsiness, nausea and vomiting, diarrhea, chest pains, cough, and

shortness of breath. Irritation to lung tissues can lead to a dangerous buildup of fluids in the lungs (pulmonary edema), which is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours creating a false sense of security with regard to health risk.

Skin contact can produce severe localized irritation and blistering with vesicles. Absorption will occur rapidly causing an increase in toxicity. If coupled with inhalation, the systemic effects can be quite severe. Eye contact will also cause irritation to the conjunctiva and surrounding tissues.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylene dibromide:

Skin: Irritation with potential for redness, pain, smarting, burns, blistering with vesicles, and tissue damage.

Eye: Irritation and smarting of the conjunctiva. No evidence of permanent damage.

Lung: Irritation of the mucous membranes of the nose, throat, and respiratory tract causing coughing, chest pains, difficulty in breathing, and possible pulmonary edema.

CNS: Depression of the central nervous system with symptoms of headaches, lightheadedness, dizziness, nausea, vomiting, diarrhea, loss of appetite and weight.

Other: High exposures can lead to rapid progressive damage to the kidneys, liver, heart, and lungs which can lead to death.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethylene dibromide and can last for months or even years:

Cancer Hazards: According to the references, several agencies consider ethylene dibromide to be a potential or suspect human carcinogen. These include the IARC, the NTP, and the ACGIH. Human mutation data have also been reported.

Reproductive Hazard: According to information presented in the references, ethylene dibromide is a possible teratogen in humans and has been shown to adversely affect reproduction in test animals. It may damage the reproductive system causing abnormal sperm in males and decreased fertility in females.

Other Chronic Effects: Exposure will irritate the lungs. If pulmonary edema does not develop, there may be bronchitis with cough, phlegm, and/or shortness of breath. Long-term exposure may lead to liver and kidney damage.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ethylene dibromide. Occupational poisoning occurs most commonly by inhalation and skin absorption. If a less toxic material or compound cannot be substituted for ethylene dibromide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of ethylene dibromide release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethylene dibromide. Caution should be exercised when selecting respiratory protection since it is not known if exposure to ethylene dibromide will cause cancer in humans. For exposure over the PEL (20 ppm), an MSHA/NIOSH-approved air-purifying respiratory with organic vapor cartridge(s) may suffice. However, for the best protection against a *possible carcinogen*, especially when the concentration is unknown, use a supplied air respirator with full facepiece and mask operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylene dibromide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethylene dibromide is used or stored.

Before beginning employment with ethylene dibromide and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

Liver and kidney function tests (establish baseline).

Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following tests should be considered:

Liver and kidney function tests.

Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to the delayed effects of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory problems, smokers may be effected more rapidly and with more pronounced symptoms than non-smokers. In addition, those who are taking the drug Disulfiram (antabuse) and are exposed to ethylene dibromide at work may experience more severe toxic effects. Prudent risk management requires careful consideration of *all* risk factors that might be causing the appearance of symptoms in the work force.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

- ☑ Wash thoroughly immediately after exposure to ethylene dibromide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylene dibromide should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethylene dibromide, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by ethylene dibromide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to ethylene dibromide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Although ethylene dibromide normally exists as a gas, it is usually shipped as a liquefied compressed gas. The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethylene dibromide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Ethylene dibromide is a non-flammable liquid. However, it can react violently in the presence of chemically-active metals such as sodium, potassium, calcium, and strong oxidizing agents. In contact with water or moisture in the presence of heat or light it can produce toxic hydrogen bromide. Caution is always required in handling, storage, transportation, and disposal of ethylene dibromide. Emergency responders should be made aware of the presence of ethylene dibromide at any emergency response situation.

Ethylene dibromide can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylene dibromide.

Ethylene dibromide has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of ethylene dibromide on plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Ethylene dibromide has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of ethylene dibromide to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Ethylene dibromide is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Ethylene dibromide is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 91.6% of ethylene dibromide will eventually end up in air; the remainder will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethylene dibromide found in fish tissues is expected to be about the same as the average concentration of ethylene dibromide in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ethylene dibromide into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their con-

tents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylene dibromide should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Safety and handling equipment should be selected carefully since ethylene dibromide attacks certain forms of plastics and resins that can be found in some pipes, pumps, and respirators. Contaminated soils should be removed for incineration and replaced with clean soil. If ethylene dibromide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylene dibromide.

For disposal, ethylene dibromide may be burned in a chemical incinerator equipped with an afterburner and scrubber.

If ethylene dibromide is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill until cleanup is complete.
- Absorb liquids in vermiculite, sand, earth, or similar material and deposit in sealed drum.
- Ventilate area of spill or leak.
- It may be necessary to dispose of ethylene dibromide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylene dibromide can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will re-

quire a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered when developing or implementing any public relation policies.

● *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: Respiratory irritation, intoxication, narcotic and anesthetic effects, vomiting, dizziness, depression, diarrhea, CNS depression, eye irritation, corneal opacity, ulceration of the respiratory tract, somnolence, cyanosis, pulmonary edema, coma, and death. The liver, kidneys, heart, adrenal glands, and skin may all be adversely affected. ABSORPTION: Irritation, de-fatting, and burning (1st or 2nd degree). Eye contact may result in severe irritation and possible permanent damage. Will pass through intact skin. INGESTION: Ingestion of the liquid can cause death. | | | | |
| Carcinogenicity Suspected Human Confirmed Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2A | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, respiratory system, liver, kidney, CVS, and CNS. |
| Medical Conditions Generally Aggravated by Exposure Those on anticoagulants may show increased bleeding; those on insulin may show high blood sugars. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes shut. Flush immediately with water for 15 minutes minimum, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If swallowed: Seek medical attention immediately. Induce vomiting in conscious and alert person. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources, wear SCBA respiratory protection. Restrict those not wearing protective equipment who are not involved in cleanup from entering area. Absorb with vermiculite and place in sealed container. Use non-sparking tools. Flush residues with water (keep away from sewers). | | | | |
| Preferred Waste Disposal Method Burn in chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well ventilated location. Keep away from sources of heat. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where ethylene dichloride is used or stored. Metal containers should be bonded and grounded. Empty cylinders contain residue, handle with care. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use an MSHA/NIOSH-approved air purifying respirator (cartridge type) or use a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Rubber Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron if Splash is Likely | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYLENE DICHLORIDE

CAS: 107-06-2

**IDENTIFICATION AND TYPICAL USES**

Ethylene dichloride is a colorless liquid with a sweet, pleasant, chloroform-like odor. It decomposes slowly, becomes acidic and darkens in color. It is used in the manufacture of acetyl cellulose and vinyl chloride, in paint removers, as a fumigant, as a degreaser, as a wetting and penetration agent, as an intermediate for pharmaceuticals, and as a solvent for oils, fats, waxes, gums, resins, and rubber.

RISK ASSESSMENT: HEALTH***General Assessment***

Ethylene dichloride is moderately toxic by *inhalation*. The liquid is also known to pass through the skin (*absorption*) to cause toxic systemic effects, and it is considered a dangerous, life-threatening human poison by *ingestion*. This chemical is known to cause cancer in test animals (fore-stomach, mammary glands, and circulatory system) and this effect is suspected to occur in humans as well. Human mutation data have been reported. In addition, ethylene dichloride has been shown to adversely affect reproduction in test animals. The systemic effects from overexposure can be seen in the liver, kidneys, digestive tract, blood, lungs, adrenal glands, and in the central nervous system.

Inhalation is irritating to the eyes, nose, and mucosa of the respiratory tract and may produce ulceration of the mucous membrane. High concentrations of ethylene dichloride causes depression of the central nervous system (CNS). Symptoms include dizziness, intoxication, narcotic and anesthetic effects, lightheadedness, headache, somnolence, cyanosis, unconsciousness, coma, and death.

This chemical poses a significant hepatotoxic (injurious to the liver) threat. Irritation to lung tissues can lead to a dangerous buildup of fluids in the lungs (pulmonary edema), which is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours creating a false sense of security with regard to health risk.

Skin contact can produce severe localized irritation, burns, de-fatting of the surface leading to possible cracking, drying, and secondary infections. Absorption will occur rapidly causing an increase in toxicity. If coupled with inhalation, the systemic effects can be quite severe. Eye contact will also cause irritation and, if not removed immediately, injury (corneal opacity).

Ingestion of ethylene dichloride can result in death. A fatal dose in humans may range between 30 and 50 milliliters.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylene dichloride:

- Skin:** Irritation with potential for redness, pain, burns, and tissue damage.
- Eye:** Irritation and smarting of the conjunctiva. Can cause clouding of the cornea (corneal opacity).
- Lung:** Irritation of the mucous membranes of the nose, throat, and respiratory tract causing possible ulceration, coughing, chest pains, difficulty breathing, and pulmonary edema.
- CNS:** Depression with headaches, lightheadedness, dizziness, nausea, vomiting, diarrhea, narcotic and anesthetic effects.

☯ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to ethylene dichloride and can last for months or even years:

Cancer Hazards: According to the references, ethylene dichloride is a confirmed animal carcinogen and several agencies consider ethylene dichloride to be a potential or suspect human carcinogen. These include the IARC (International Association for Research on Cancer), the NTP (National Toxicology Program), and the NCI (National Cancer Institute). It has caused cancer of the lung, digestive system (fore-stomach), skin, mammary glands, and circulatory system in animals. Human mutation data have also been reported.

Reproductive Hazard: According to information presented in the references, ethylene dichloride is a possible teratogen in humans and has been shown to adversely affect reproduction in test animals. Animal testing has shown reproductive failure and fetal abortion. There may also be an increased risk to nursing infants of exposed mothers.

Other Chronic Effects: Prolonged exposure will cause injuries to the liver and kidneys, with weight loss, decreased blood pressure, jaundice, difficult urination, or anemia.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with ethylene dichloride. Occupational poisoning occurs most commonly by inhalation and skin absorption. If a less toxic material or compound cannot be substituted for ethylene dichloride, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of ethylene dichloride release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethylene dichloride. Caution should be exercised when selecting respiratory protection since it is not known if exposure to ethylene dichloride will cause cancer in humans. For exposure over the PEL (50 ppm), an MSHA/NIOSH-approved air-purifying respirator with organic vapor cartridge(s) may suffice. However, for the best protection against a *possible carcinogen*, especially when the concentration is unknown, use a supplied air respirator with full facepiece and mask operated in positive pressure

mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylene dichloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethylene dichloride is used or stored.

Before beginning employment with ethylene dichloride and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Liver and kidney function tests (establish baseline).
- Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following tests should be considered:

- Liver and kidney function tests.
- Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to the delayed effects of pulmonary edema).
- Lung function tests (compare to baseline).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory problems, smokers may be affected more rapidly and with more pronounced symptoms than non-smokers. Prudent risk management requires careful consideration of *all* risk factors that might be causing the appearance of symptoms in the work force.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not feasible, then respiratory protection should be provided and its use mandatory.

- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethylene dichloride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylene dichloride should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethylene dichloride, emergency shower facilities should also be provided in the immediate work area.
- ☑ Workers whose clothing has been contaminated by ethylene dichloride should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to ethylene dichloride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Although ethylene dichloride normally exists as a gas, it is usually shipped as a liquefied compressed gas. The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethylene dichloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Ethylene dichloride is very dangerous flammable liquid. Because of its low flash point and low boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). It is a serious fire hazard and moderate explosion hazard when exposed to heat or flame. It can also react violently in the presence of chemically-active metals such as sodium, potassium, calcium, and strong oxidizing agents. Caution is always required in handling, storage, transportation, and disposal of ethylene dichloride. Emergency responders should be made aware of the presence of ethylene dichloride at any emergency response situation.

Ethylene dichloride can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylene dichloride.

Insufficient data are available to evaluate the short-term effects of ethylene dichloride on aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of ethylene dichloride to aquatic life, plants, birds, or terrestrial animals.

💧 *Water Solubility*

Ethylene dichloride is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Ethylene dichloride is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethylene dichloride found in fish tissues is expected to be about the same as the average concentration of ethylene dichloride in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ethylene dichloride into the environment. Labels on all containers, trucks, and rail cars must meet

DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylene dichloride should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If ethylene dichloride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylene dichloride.

For disposal, ethylene dichloride may be burned in a chemical incinerator equipped with an afterburner and scrubber.

If ethylene dichloride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill until cleanup is complete.
- ☑ Absorb liquids in vermiculite, sand, earth, or similar material and deposit in sealed drum.
- ☑ Remove ignition sources and ventilate area of spill or leak.
- ☑ It may be necessary to dispose of ethylene dichloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylene dichloride can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media at-

tention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered when developing any public relation policies.

🔊 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. If swallowed: Seek medical attention immediately. Unless told otherwise, give a conscious victim 1-2 glasses of water and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb large spills in vermiculite or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method Burn in chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Use only non-sparking tools to open and close containers. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where ethylene glycol is used, handled, or stored. Heat may cause containers to build up pressure and explode. Containers must be grounded and bonded during transfer. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) For low exposures, uses a chemical cartridge respirator. Otherwise, use an MSHA/NIOSH-approved supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Nitrile Rubber or Neoprene | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYLENE GLYCOLHOCH₂CH₂OH

CAS: 107-21-1

**IDENTIFICATION AND TYPICAL USES**

Ethylene glycol is a clear, colorless, hygroscopic, syrupy, odorless liquid with a bittersweet taste. It is used primarily as an antifreeze in heating and cooling systems (automobile radiators and as a coolant for aircraft engines). It is also used in the manufacture of hydraulic brake fluids, as a solvent for paints, plastics, and inks, as a softening agent for cellophane, and in the manufacture of plasticizers, elastomers, alkyd resins, and in synthetic fibers and waxes.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethylene glycol is a dangerous human poison by *ingestion* and is moderately toxic by *inhalation*. It will also pass through unbroken skin (*absorption*); however reports of toxic systemic effects by this route of exposure are lacking in the references. There are no reports in the references to indicate that exposure causes cancer in humans or animals. However, human mutation data (genetic changes) have been reported and many scientists believe that such chemicals may pose a carcinogenic threat in the long-term. Data are conflicting and inconsistent in this regard. It has been shown to cause teratogenic effects (damage to the developing fetus) in animal studies.

Inhalation is rare because of this chemical's low vapor pressure. However, when it is heated or misted, it presents a significant health hazard risk. There will be some initial irritation of the eyes, nose, and throat followed by lachrymation, feeling of intoxication or "drunkenness" (inebriation), burning cough, headache, nystagmus (rapid eye movements), and coma.

Skin and eye contact may produce mild to moderate irritation on contact and may cause an allergic reaction and rash. It will pass through unbroken skin, but its ability to produce toxic systemic effects by this route has not been confirmed.

On ingestion, ethylene glycol poses a serious poison threat. Initial symptoms are stimulation or excitement, followed by depression of the central nervous system (CNS). Symptoms include nystagmus, partial or complete paralysis of the eye muscles, swelling and protrusion of the eyes from their sockets, appearance of a "blind spot" in visual range, depressed reflexes, and convulsions. Symptoms can progress to include cardiovascular and pulmonary system effects, mild hypertension, tachycardia (rapid heartbeat), tachypnea (rapid respiration), and systemic capillary damage. Finally, death may occur due to kidney complications leading to necrosis and renal failure (24-72 hours post-ingestion). Other effects can include acidosis and meningoencephalitis (inflammation of the brain and meninges).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylene glycol:

- Skin:** Some irritation at site of contact. Allergic rash may develop. Absorption is possible.
- Eye:** Mild irritation (liquid only).
- Lung:** Nose and throat irritation. Produces intoxicating effects and may cause lung effects.
- CNS:** Stimulation and depression with symptoms of dizziness, headache, lightheadedness, nausea, vomiting, and coma.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethylene glycol and can last for months or even years:

Cancer Hazards: According to information presented in the references, ethylene glycol has not been ade-

quately tested for its ability to cause cancer in animals. Some studies indicate that it causes mutations in humans, while others are inconclusive in this regard.

Reproductive Hazard: According to information presented in the references, ethylene glycol may be a teratogen in humans since it has been shown to be a teratogen in animals. It may cause damage to the developing fetus.

Other Chronic Effects: Repeated or high exposures may cause kidney damage and/or the development of kidney stones. Brain damage may also occur. Skin allergy can develop in the long-term. If this happens, even small future exposures can cause recurrence of symptoms (rash and itching).

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ethylene glycol. This chemical is a dangerous human poison by two exposure routes (inhalation and ingestion). If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethylene glycol. Chemical cartridge respirators may provide adequate protection up to the PEL. However, the best protection is provided by a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylene glycol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where ethylene glycol is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney function tests.
- ☑ Urine oxalate level. Urinalysis may show low specific gravity, proteinuria, pyuria, cylinduria, hematuria, calcium oxide, and hippuric crystals.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Sodium bicarbonate may be used intravenously to treat acidosis. Ethanol may be used in antedotal treatment. However, blood glucose levels must be monitored for hypoglycemia. A diuretic, such as mannitol, can be infused to help in the prevention of brain edema and hemodialysis (to remove ethylene glycol from circulation).

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Where possible, automatically pump liquid ethylene glycol from drums to process containers.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethylene glycol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylene glycol should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethylene glycol, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered only by personnel who have been properly trained on the hazards of exposure to ethylene glycol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethylene glycol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethylene glycol is considered a Class IIIB combustible liquid (per OSHA 29 CFR 1910.106). Under normal operating conditions, it presents a mild fire hazard. However, when heated or misted, it becomes a serious fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with many common peroxides and other oxidizers and contact can cause fire or explosion. It will ignite on contact with chromium trioxide, potassium permanganate, and sodium peroxide. Therefore, special consideration is required during any emergency situation involving a leak or spill of ethylene glycol. Should ethylene glycol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal method for ethylene glycol is to burn it in a chemical incinerator equipped with an afterburner and scrubber.

Ethylene glycol may enter the environment through industrial discharges, municipal waste treatment plant discharges, agricultural runoff or disposal, or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylene glycol.

Ethylene glycol has moderate acute toxicity to aquatic life. It has caused chromosomal damage to agricultural crops. Insufficient data are available on the short-term effects of ethylene glycol exposure to birds or land animals.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed

animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Ethylene glycol has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of ethylene glycol exposure on birds, plants, or land animals.

💧 Water Solubility

Ethylene glycol is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ Persistence in the Environment

Ethylene glycol is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of ethylene glycol will eventually end up in water.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethylene glycol found in fish tissue is expected to be about the same as the average concentration of ethylene glycol in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylene glycol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using

non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If ethylene glycol should contact the water table, aquifer, or navigable waterway, cleanup should be started immediately. It is highly soluble in water and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylene glycol. If ethylene glycol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of ethylene glycol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylene glycol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYLENE GLYCOL DINITRATE

CAS: 628-96-6

**IDENTIFICATION AND TYPICAL USES**

Ethylene glycol dinitrate is a colorless to yellow, oily, odorless liquid. It is used as an explosive ingredient (60-80%) in dynamite along with nitroglycerin (40-20%). It is mixed with nitroglycerin to lower its melting point and to reduce the hazards associated with frozen dynamite.

RISK ASSESSMENT: HEALTH***General Assessment***

Ethylene glycol dinitrate is very poisonous and highly toxic by *inhalation*, *ingestion*, and *skin absorption* (i.e., it will also pass through unbroken skin). There are no reports in the references to indicate that exposure causes cancer in humans or animals. There is no evidence of teratogenicity or mutagenicity caused by exposure to this chemical.

Effects of exposure by all routes include vasodilatation (expansion of the blood vessel walls), decrease in blood pressure (hypotension), intense and throbbing headaches (caused by cerebral vasodilatation); flushed skin (especially the face), dizziness, nausea, vomiting, abdominal pain, heart palpitations and persistent tachycardia (rapid heartbeat), methemoglobinemia, angina, delirium, depression of the central nervous system, diastolic hypertension, and a reduction in pulse pressure. Death due to cardiac arrest is also possible. In animals, exposure also resulted in anemia and liver and kidney damage.

Skin and eye contact may produce mild to moderate irritation on contact. As stated above, it will pass through unbroken skin to cause toxic systemic effects.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylene glycol dinitrate:

Skin: Some irritation at site of contact. Absorption very likely to occur.

Eye: Mild irritation.

Lung: Nose and throat irritation. Absorption through lungs is rapid and toxic systemic effects can be severe.

CNS: Depression with symptoms of dizziness, headache, nausea, and vomiting.

CVS: Numerous adverse actions on the cardiovascular system with effects on blood pressure, blood vessels, and heart function (beat, pulse, and pressure).

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to ethylene glycol dinitrate and can last for months or even years:

Cancer Hazards: According to information presented in the references, ethylene glycol dinitrate has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, ethylene glycol dinitrate has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated or high exposures may cause kidney or liver damage.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with ethylene glycol dinitrate. This chemical is a dangerous human poison by all exposure routes (inhalation, absorption, and ingestion). If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose opera-

tions and/or provide explosion-proof, local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethylene glycol dinitrate. Chemical cartridge respirators may provide adequate protection up to the permissible exposure ceiling. However, this level is extremely low (0.2 ppm) and the best protection may be provided by a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylene glycol dinitrate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethylene glycol dinitrate is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney function tests.
- ☑ Evaluation by a qualified neurologist for central nervous system effects.
- ☑ Electrocardiogram (EKG).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Where possible, automatically pump liquid ethylene glycol dinitrate from storage drums or containers to process containers.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.

- ☑ Wash thoroughly immediately after exposure to ethylene glycol dinitrate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylene glycol dinitrate should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethylene glycol dinitrate, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered only by personnel who have been properly trained on the hazards of exposure to ethylene glycol dinitrate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethylene glycol dinitrate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethylene glycol dinitrate is considered an explosive liquid. Under normal operating conditions, it presents a dangerous explosion hazard. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with many substances, especially acids and alkalis, and contact can cause fire or explosion. It will even react explosively by itself if an ignition source is introduced. Therefore, special consideration is required during any emergency situation involving a leak or spill of ethylene glycol dinitrate. Should ethylene glycol dinitrate ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Ethylene glycol dinitrate may enter the environment through industrial discharges, municipal waste treatment plant discharges, or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylene glycol dinitrate.

Insufficient data are available to evaluate or predict the short-term effects of ethylene glycol dinitrate exposure to aquatic life, plants, birds, or land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of ethylene glycol dinitrate exposure to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ethylene glycol dinitrate is insoluble in water. Concentrations of less than 1 milligram will not mix with a liter of water.

⌚ *Persistence in the Environment*

Ethylene glycol dinitrate is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The data are insufficient to evaluate or predict the concentration of ethylene glycol dinitrate that may be found in edible fish tissue.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylene glycol dinitrate should be segregated from incompatible chemicals to minimize the

risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be carefully removed and replaced with clean soil. If ethylene glycol dinitrate should contact the water table, aquifer, or navigable waterway, cleanup should be started immediately. It is insoluble in water and total containment and remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan, with consideration for explosive commodities, should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylene glycol dinitrate. If ethylene glycol dinitrate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Neutralize spilled liquids by mixing with sodium bisulfate. Mixture should be collected using non-sparking tools and placed in sealed containers.
- ☑ It may be necessary to dispose of ethylene glycol dinitrate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylene glycol dinitrate can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination/destruction will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Ethylene glycol monoethyl ether (derivation: By reaction of ethylene oxide and ethanol). 1 ppm = 3.7 mg/m³ | PEL (skin): 200 ppm 740 mg/m³ STEL: Not Established | REL (skin): 0.5 ppm 1.8 mg/m³ STEL: Not Established | 6000 ppm | TLV (skin): 5 ppm 18.50 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 275°F (135°C) | Specific Gravity (H ₂ O = 1) 0.931 |
| Vapor Pressure (mm Hg) 6.2 at 69°F (20°C) | Molecular Weight 90.14 |
| Vapor Density (Air = 1) 3.10 | Melting Point -94°F (-70°C) |

Solubility

Soluble in water, alcohol, acetone, ether, liquid esters, and hydrocarbons.

Appearance and Odor

Colorless liquid with a sweet, pleasant, ether-like odor and slightly bitter taste.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 111°F (44°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.7% at 200°F (93°C) UEL: 15.6% |
| NFPA Classification Class II Combustible Liquid | Autoignition Temperature 455°F (235°C) |

Extinguishing Media

Use dry chemical, carbon dioxide, water spray, fog, or alcohol-resistant foam.

Special Fire Fighting Procedures

Acrid and irritating fumes and smoke are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Use water spray to cool fire-exposed containers. Fight fire from distance if possible. Move containers from fire area if it can be done safely. Exercise extreme caution when moving containers. Stay clear of ends of tanks and vessels.

Unusual Fire and Explosion Hazards

A combustible liquid. A moderate fire hazard when exposed to heat, sparks, or open flame. Boiling liquid expanding vapor explosion (BLEVE) is possible. Immediately withdraw if rising sound is heard from venting device or fire is causing discoloration on sides of tank. Stay clear one-half mile.

SECTION V - REACTIVITY DATA

| | | |
|---------------------------------|----------------------------|--|
| Stability | | Conditions to Avoid Ethylene glycol monoethyl ether will form highly explosive peroxides when exposed to air (this will NOT occur if it is mixed in solution). Avoid contact with incompatible materials. Keep away from heat and flame. |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (such as chlorine, bromine, fluorine, and, especially hydrogen peroxide), and other oxidizing agents. |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethylene glycol monoethyl ether is not expected to occur. |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Acrid and irritated gases and fumes are produced when ethylene glycol monoethyl ether is involved in fire, including toxic oxides of carbon. |

SECTION VI - HEALTH HAZARD DATA

| | | | |
|---|--------------------------|--|--|
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | |
| INHALATION: Causes dizziness and cyanosis. High concentrations can lead to potentially fatal pulmonary edema (fluid in the lungs), albuminuria (excess albumin proteins in urine), hyperbilirubinemia (excess bilirubin in blood), leukopenia (low white cells), hematuria (blood in urine), oligospermia (low sperm count), unconsciousness, gynecological disorders, fetal abnormalities, possible anemia, and liver or kidney damage. | | | |
| ABSORPTION: Repeated or heavy contact will pass through unbroken skin to cause toxic systemic effects. Eye contact causes irritation to the cornea and conjunctiva. | | | |
| INGESTION: Cyanosis, pulmonary edema, tonic-clonic seizures, unconsciousness, acidosis. | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 |
| Target Organs? CNS, respiratory system, skin. | | | |

Medical Conditions Generally Aggravated by Exposure
Pre-existing disorders of the CNS, reproductive system, and the blood may be aggravated by exposure.

Emergency and First-aid Procedures
Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. **Skin contact:** Remove all contaminated clothing. Immediately wash area with large amounts of soap and water to prevent absorption. Seek medical assistance. For **inhalation:** Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If **swallowed:** Call the poison control center and seek medical attention immediately. Unless advised otherwise, give a conscious and alert person 1-2 glasses of water or milk, then induce vomiting (within 30 minutes).

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled
Evacuate area of spill and remove all ignition sources. Remove leaking containers to a safe place (outdoors), if it can be done without risk. Absorb liquids with vermiculite or other material and place in sealed drum for disposal. Use non-sparking tools. Use water spray to flush spills away from exposures and dilute to nonflammable mixtures (keep out of sewers and away from waterways).

Preferred Waste Disposal Method
Burn in a chemical incinerator equipped with an afterburner and scrubber.

Precautions to be Taken in Handling and Storage
Do not store ethylene glycol monoethyl ether in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, dry, well-ventilated area away from ignition sources.

Other Precautions and Warnings
Use non-sparking tools and electrically ground and bond all containers, especially during transfer.

SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT

Respiratory Protection (*specify type*)
Use an air-purifying respirator or a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus with operated in pressure demand mode.

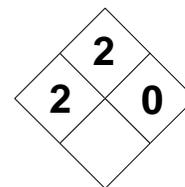

Ventilation
Local exhaust or general mechanical systems recommended.

| | | |

|--|--|--|

Work/Hygiene Practices
Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals.

ETHYLENE GLYCOL MONOETHYL ETHER

CAS: 110-80-5

**IDENTIFICATION AND TYPICAL USES**

Ethylene glycol monoethyl ether (EGEE) is a colorless liquid with a mild, pleasant (sweet), ether-like odor and a slightly bitter taste. It is used as a solvent for nitrocellulose and natural and synthetic resins, as an anti-icing additive in aviation fuels, as a chemical intermediate for 2-ethoxyethyl acetate, in lacquers, in the dyeing and printing of textiles, in varnish removers, cleaning solutions, in products for treating leather goods, and as an emulsion stabilizer.

RISK ASSESSMENT: HEALTH**General Assessment**

EGEE is mildly to moderately toxic by *ingestion*, *inhalation*, and *absorption* through the skin. There is no information in the references on the carcinogenic or mutagenic properties of EGEE. However, it poses a serious teratogenic threat to humans (both male and female) and exposure must therefore be kept to the lowest possible levels.

Inhalation can cause some (mild) irritation of the eyes, nose, throat, and the mucosa of the upper respiratory tract. Inhalation and skin absorption can lead to serious systemic effects. Symptoms include dizziness and cyanosis (bluish color of the lips and appendages). Exposure to high concentrations can cause a number of life-threatening illnesses and disorders. These include pulmonary edema (fluid buildup in the lungs) with symptoms of cough with phlegm, pain in chest, and difficulty breathing. These symptoms may be delayed up to 48 hours creating a false sense of security with regard to health risk. Exposure can also lead to albuminuria (excessive levels of albumin protein in urine), hyperbilirubinemia (excessive levels of bilirubin in blood), oligospermia (low sperm count), loss of consciousness, and a number of varied gynecological disorders and possible fetal abnormalities.

In addition, animal studies have shown a potential for reversible liver and kidney changes, lesions of the

liver, kidney, pituitary gland, spleen, and testis, enlargement of the spleen, gastrointestinal hemorrhages, and blood disorders (e.g., anemia, leukopenia, and hematuria).

Ingestion can cause unspecified gastrointestinal effects, cyanosis, pulmonary edema, tonic-clonic seizures, acetone odor on breath, acidosis, and unconsciousness.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to EGEE:

Skin: Mild irritation with absorption through the skin (if contact is prolonged) causing toxic systemic effects.

Eye: Irritation of the cornea and conjunctiva.

Lung: Mild irritation of the mucosa of the nose, throat, and upper respiratory tract. Can cause a number of toxic systemic effects with symptoms of headaches, lightheadedness, weakness, and CNS depression.

Other: Ingestion can cause the same symptoms as inhalation. Adverse action on the central nervous system is likely on high acute exposures (may cause seizures and loss of consciousness).

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to EGEE and can last for months or even years:

Cancer Hazards: According to the information presented in the references, EGEE has not been shown to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, EGEE is a known teratogen, especially at high concentrations. Male sperm count reductions have been reported and female gynecological

ological effects have been documented. It may also cause birth defects, primarily involving the heart and skeletal system.

Other Chronic Effects: Low, repeated exposures may lead to damage to the liver and kidneys. There may be albuminuria and hyperbilirubinemia resulting from long-term exposures.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around EGEE. For low exposures up to or over the PEL (200 ppm), use a NIOSH-approved organic vapor respirator with full facepiece. For the best protection, especially at high exposures or during emergency situations, use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode, or a supplied-air respirator operated in pressure demand or continuous flow mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. Skin contact must be avoided. To prevent hand and skin exposures, butyl rubber gloves should be worn. Natural rubber, polyvinylchloride, or polyvinyl alcohol gloves are not appropriate. Glove manufacturers should be contacted and permeation studies obtained *before* making final glove selection.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with EGEE.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where EGEE is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Urinalysis (check for albuminuria and hematuria).
- ☑ Complete blood count.

- ☑ Liver and kidney function tests.
- ☑ Lung function tests.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to the delayed development of pulmonary edema).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, exposure to EGEE can have a more pronounced effect on smokers than on non-smokers exposed to the same levels. Prudent risk assessment and management requires consideration of *all* possible risk factors when exposure symptoms appear in the workforce.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of liquids from storage containers to process containers is recommended.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to EGEE and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of EGEE should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during use, transportation, storage, disposal, or destruction of EGEE. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills,

large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

EGEE is considered a Class II combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of EGEE. Should EGEE ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine, chlorine dioxide, and peroxides) either during use, transportation, or storage, violent reaction can occur.

Wastes should be considered for recovery, reclamation, or recycling rather than land-fill disposal. Destruction in a chemical incinerator equipped with an afterburner and scrubber is also acceptable.

EGEE can enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to EGEE. Insufficient data are available to evaluate or predict the acute (short-term) effects of EGEE to aquatic life, plants, birds, or land animals.

☞ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term (chronic) effects of EGEE to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

EGEE is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

EGEE is highly persistent in the aquatic environment with a half-life of 200 days and more. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It is highly mobile in both water and soil and undergoes aerobic biodegeneration.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of EGEE found in fish tissues is expected to be somewhat higher than the average concentration found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of EGEE should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. All containers used in shipping or transfer operations must be electrically grounded to prevent static sparks. Buildings should be properly constructed for storage of hazardous chemicals (fire suppression equipment, alarms, separation). Personnel should be trained on the hazards associated with the storage of hazardous chemicals.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If EGEE should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. It is highly soluble in water and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of EGEE.

If EGEE is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.

- ☑ Ventilate area and remove all ignition sources.
- ☑ Collect liquid using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of EGEE as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving EGEE can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term “reproductive hazard” is used, public hysteria, emotion, and ignorance can run equally high. This should be carefully considered during the development of public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CRC PRESS/LEWIS PUBLISHERS DISCLAIMER: THE INFORMATION AND RECOMMENDATIONS PRESENTED HEREIN ARE BASED ON SOURCES BELIEVED TO BE RELIABLE. CRC MAKES NO REPRESENTATION ON ITS COMPLETENESS OR ACCURACY. IT IS THE RESPONSIBILITY OF THE USER TO DETERMINE THE CHEMICAL'S SUITABILITY FOR ITS INTENDED USE, THE CHEMICAL'S SAFE USE, AND THE CHEMICAL'S PROPER DISPOSAL. NO REPRESENTATIONS AND/OR WARRANTIES, EITHER EXPRESSED OR IMPLIED, OF THE MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR OF ANY OTHER NATURE, ARE MADE WITH RESPECT TO THE INFORMATION PROVIDED IN THIS MSDS OR TO THE CHEMICAL TO WHICH INFORMATION MAY REFER. CRC NEITHER ASSUMES NOR AUTHORIZES ANY OTHER PERSON TO ASSUME FOR IT, ANY OTHER ADDITIONAL RESPONSIBILITY OR LIABILITY FOR THE USE OF, OR RELIANCE UPON, THIS INFORMATION.

HAZARD WARNING INFORMATION

| HEALTH | FIRE | REACTIVE | OTHER | DEGREE OF HAZARD | COLOR CODING | OTHER CODES |
|----------|----------|----------|-------|---|---|---|
| 2 | 2 | 0 | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|--|--|------------------------------------|
| Characterization Glycol Ether | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name Ethylene Glycol Monomethyl Ether | Chemical Abstract Service (CAS) Number 109-86-4 | |
| DOT Hazard Class and Label Requirements Combustible Liquid | DOT Emergency Guide Code 55 | |
| DOT Identification Number UN 1188 | Chemical Formula C₃H₈O₂ | |
| Synonyms 2-Methoxyethanol; Methyl Cellosolve; Dowanol EM; EGME; glycol methyl ether; methyl glycol; methyl oxitol; ethylene glycol methyl ether; Poly-Solve EM | | |

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|--|
| Ethylene glycol monomethyl ether (derivation: By reaction of ethylene oxide and ethanol). 1 ppm = 3.2 mg/m³ | PEL (skin): 25 ppm 80 mg/m³ STEL: Not Established | REL: Lowest Feasible Concentration | Not Determined | TLV (skin): 5 ppm 16 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 255°F (124°C) | Specific Gravity (H ₂ O = 1) 0.966 |
| Vapor Pressure (mm Hg) 6 at 69°F (20°C) | Molecular Weight 76.11 |
| Vapor Density (Air = 1) 2.64 | Melting Point -121°F (-85°C) |

Solubility

Miscible with water, alcohol, acetone, ether, liquid esters, and hydrocarbons.

Appearance and Odor

Colorless liquid with a mild, agreeable odor. Odor Threshold = 0.4 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) 107°F (41°C) closed cup | Explosive Limits in Air % by Volume LEL: 2.5% UEL: 14% |
| NFPA Classification Class II Combustible Liquid | Autoignition Temperature 545°F (285°C) |

Extinguishing Media

Use dry chemical, carbon dioxide, water spray, fog, or alcohol-resistant foam (smothering effect).

Special Fire Fighting Procedures

Acrid and irritating fumes and smoke are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Use water spray to cool fire-exposed containers. Fight fire from distance if possible. Move containers from fire area if it can be done safely.

Unusual Fire and Explosion Hazards

A combustible liquid. A moderate fire hazard when exposed to heat, sparks, or open flame. Reaction with oxidizers forms explosive peroxides that are heat and shock sensitive. Vapors are heavier than air and can travel for great distances to an ignition source to flashback and cause fire or explosion.

SECTION V - REACTIVITY DATA

| | | |
|---------------------------------|----------------------------|---|
| Stability | | Conditions to Avoid Ethylene glycol monomethyl ether will form highly explosive peroxides when exposed to air (this will NOT occur if it is mixed in solution). Avoid contact with incompatible materials. Keep away from heat and flame. |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (such as chlorine, bromine, fluorine, and, especially hydrogen peroxide), and other oxidizing agents. |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethylene glycol monomethyl ether is not expected to occur. |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Acrid and irritated gases and fumes are produced when ethylene glycol monomethyl ether is involved in fire, including toxic oxides of carbon. |

SECTION VI - HEALTH HAZARD DATA

| | | | |
|-----------------------------------|-------------------------|--------------------------------|------------------------|
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X |
|-----------------------------------|-------------------------|--------------------------------|------------------------|

Health Hazards

INHALATION: A teratogen. Also causes systemic poisoning with anemia, macrocytosis (enlarged red blood cells), other blood changes, conjunctivitis, blurred vision, irritation of the respiratory tract with dyspnea and coughing), nausea, vomiting, headache, and depression of the central nervous system (CNS) causing slurred speech, lethargy, confusion, tremors, disorientation, ataxia, and stupor. May cause hematuria, proteinuria, testicular atrophy, and birth defects. Kidney damage is also possible on long-term exposures.

ABSORPTION: Will pass through unbroken skin to cause same toxic systemic effects as inhalation. Eye contact causes irritation to the cornea and conjunctiva.

INGESTION: Macrocytotic anemia, anesthesia, and many of the systemic effects of inhalation.

| | | | | |
|--|--------------------------|--|--|---|
| Carcinogenicity No Evidence Human No Evidence Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Skin, eyes, blood, CNS, kidneys. |
|--|--------------------------|--|--|---|

Medical Conditions Generally Aggravated by Exposure

Pre-existing disorders of the CNS, reproductive system, and the blood may be aggravated by exposure.

Emergency and First-aid Procedures

Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. **Skin contact:** Remove all contaminated clothing. Immediately wash area with large amounts of soap and water to prevent absorption. Seek medical assistance. For **inhalation:** Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If **swallowed:** Call the poison control center and seek medical attention immediately. Unless advised otherwise, give a conscious and alert person 3-4 glasses of water, then induce vomiting (best if within 30 minutes).

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled

Evacuate area of spill and remove all ignition sources. Remove leaking containers to a safe place (outdoors), if it can be done without risk. Absorb liquids with vermiculite or other material and place in sealed drum for disposal. Use non-sparking tools. Use water spray to flush spills away from exposures and dilute to nonflammable mixtures (keep out of sewers and away from waterways).

Preferred Waste Disposal Method

Burn in a chemical incinerator equipped with an afterburner and scrubber.

Precautions to be Taken in Handling and Storage

Do not store ethylene glycol monomethyl ether in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, dry, well-ventilated area away from ignition sources.

Other Precautions and Warnings

Use non-sparking tools and electrically ground and bond all containers, especially during transfer.

SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT

Respiratory Protection (*specify type*)

Use an air-purifying respirator or a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus with operated in pressure demand mode.

Ventilation

Local exhaust or general mechanical systems recommended.

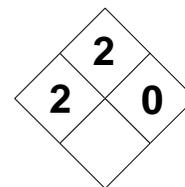

| | | |
|---|--|--|
| Protective Gloves Buna-N or Neoprene Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Clothing or Apron |
|---|--|--|

Work/Hygiene Practices

Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals.

ETHYLENE GLYCOL MONOMETHYL ETHER

CAS: 109-86-4

**IDENTIFICATION AND TYPICAL USES**

Ethylene glycol monomethyl ether (EGME) is a colorless liquid with a mild, agreeable odor. It is primarily used as a solvent for cellulose acetate, certain synthetic and natural resins, and dyes. Also used in jet fuel dicing agents, sealing and moisture-proofing cellophane, as a perfume fixative, and in dyeing leather. It is used in nail polishes, varnishes, lacquers, and enamels.

RISK ASSESSMENT: HEALTH**General Assessment**

EGME is mildly to moderately toxic by *ingestion*, *inhalation*, and *absorption* through the skin. There is no information in the references on the carcinogenic properties of EGME. However, mutation data have been reported and it is known to pose a serious teratogenic threat to humans (both male and female) and exposure must therefore be kept to the lowest possible levels. It is a systemic poison with target effects on the blood and the central nervous system (CNS).

Inhalation can cause some (mild) irritation of the eyes, nose, throat, and the mucosa of the upper respiratory tract with coughing and dyspnea (difficulty breathing). Inhalation and skin absorption can lead to serious systemic effects. Symptoms include conjunctivitis, blurred vision, nausea, vomiting, headache, and depression of the CNS causing stupor, slurred speech, weakness, drowsiness, lethargy, confusion, disorientation, tremors, and ataxia. Exposure can also lead to hematuria (blood in the urine) and proteinuria (protein in the urine) due to the chemical's damaging effects on the kidneys. High exposures can lead to testicular atrophy and birth defects.

Ingestion can cause unspecified gastrointestinal effects, anesthesia and other narcotic effects, macrocytotic anemia with macrocytosis (enlargement of the red blood cells), and possible death.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to EGME:

Skin: Mild irritation with absorption through the skin (if contact is prolonged) causing toxic systemic effects.

Eye: Irritation of the cornea and conjunctiva. May cause blurred vision.

Lung: Mild irritation of the mucosa of the nose, throat, and upper respiratory tract. Can cause a number of toxic systemic effects with symptoms of headaches, lightheadedness, weakness, and CNS depression.

Other: Ingestion can cause the same symptoms as inhalation. Adverse action on the central nervous system is likely on high acute exposures (may cause seizures and loss of consciousness). Serious blood effects and kidney damage also possible.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to EGME and can last for months or even years:

Cancer Hazards: According to the information presented in the references, EGME has not been shown to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, EGME is a known teratogen, especially at high concentrations. It causes testicular atrophy and may lead to birth defects (developmental abnormalities in the urogenital and musculoskeletal systems).

Other Chronic Effects: Low, repeated exposures may lead to damage to the kidneys, blood disturbances, chronic fatigue and sleepiness, and chronic CNS depression leading to personality changes.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around EGME. For low exposures up to or over the PEL (25 ppm), use a NIOSH-approved organic vapor respirator with full facepiece. For the best protection, especially at high exposures or during emergency situations, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode, or a supplied-air respirator operated in pressure demand or continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. Skin contact must be avoided. To prevent hand and skin exposures, butyl rubber gloves should be worn. Buna-N or neoprene rubber should provide appropriate protection. Contact glove manufacturers to obtain permeation studies *before* making glove selection.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with EGME.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where EGME is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Urinalysis (check for proteinuria and hematuria).
- ☑ Complete blood count (check for macrocytosis).
- ☑ Kidney function tests.
- ☑ Evaluation of the central nervous system by a qualified neurologist to check for personality changes (moodiness, irritability, sleep pattern changes, stupor, fatigue, weakness).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of liquids from storage containers to process containers is recommended.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to EGME and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of EGME should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during use, transportation, storage, disposal, or destruction of EGME. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

EGME is considered a Class II combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of EGME. Should EGME ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine, chlorine dioxide, and peroxides) either during use, transportation, or storage, violent reaction can occur. Prolonged contact with air can cause the formation of dangerous peroxides which are both shock and heat sensitive.

Wastes should be considered for recovery, reclamation, or recycling rather than land-fill disposal. Destruction in a chemical incinerator equipped with an afterburner and scrubber is also acceptable.

EGME can enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to EGME. Insufficient data are available to evaluate or predict the acute (short-term) effects of EGME to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term (chronic) effects of EGME to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

EGME is highly soluble in water. Concentrations of 1000 milligrams and more will easily mix with a liter of water.

⌚ *Persistence in the Environment*

EGME is highly persistent in the aquatic environment with a half-life of 200 days and more. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of EGME found in fish tissues is expected to be somewhat higher than the average concentration found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of EGME should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. All containers used in shipping or transfer operations must be electrically grounded to prevent static sparks. Buildings should be properly constructed for storage of hazardous chemicals (fire suppression equipment, alarms, separation). Electrical equipment should be designed to meet explosion-proof criteria.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If EGME should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. It is highly soluble in water and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of EGME. If EGME is spilled or leaked, the following specific steps are recommended:

- Ventilate area and remove all ignition sources.
- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Absorb using vermiculite, dry earth, or sand and place in a sealed drum for disposal.
- It may be necessary to dispose of EGME as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving EGME can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "reproductive hazard" is used, public hysteria, emotion, and ignorance can run equally high. This should be carefully considered during the development of public relations policies.

🕒 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|---|---|
| Characterization Aliphatic Amine | RCRA Number P054 | EPA Class Acute Hazardous Waste |
| DOT Proper Shipping Name Ethyleneimine, Inhibited | Chemical Abstract Service (CAS) Number 151-56-4 | |
| DOT Hazard Class and Label Requirements Flammable Liquid and Poison | DOT Emergency Guide Code 30 | |
| DOT Identification Number UN 1185 | Chemical Formula C₂H₅N | |

Synonyms

Dimethyleneimine; aminothylene; azirane; aziridine; ethyleneimine; ethylimine.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Ethyleneimine (derivation: From ethyl chloride and ammonia by use of an acid acceptor; by treating 2-chloroethylamine hydrochloride with sodium hydroxide). 1 ppm = 1.79 mg/m³ | PEL (8-hour): 0.5 ppm 1 mg/m³ STEL: Not Established | REL: Lowest Possible Level Possible Cancer Agent | 100 ppm | TLV (8-hour): 0.5 ppm 1 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 131°F (55°C) | Specific Gravity (H ₂ O = 1) 0.83 |
| Vapor Pressure (mm Hg) 160 at 69°F (20°C) | Molecular Weight 43.1 |
| Vapor Density (Air = 1) 1.5 | Melting Point -97°F (-71.5°C) |

Solubility

Completely soluble in water. Soluble in most organic solvents.

Appearance and Odor

Clear, colorless liquid with an intense, fishy, ammonia-like odor. Odor Threshold = (ranges) 1.3 - 2 ppm in air.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 12°F (-11°C) closed cup | Explosive Limits in Air % by Volume LEL: 3.3% UEL: 54.8% |
| NFPA Classification Class IB Flammable Liquid | Autoignition Temperature 612°F (322°C) |

Extinguishing Media

Use dry chemical, carbon dioxide, alcohol foam, or water spray. Cool exposed container with water.

Special Fire Fighting Procedures

Use full protective clothing and self-contained breathing apparatus (SCBA). Fight fire from distance if possible. Move containers from fire area if it can be done without risk.

Unusual Fire and Explosion Hazards

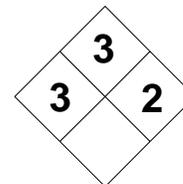

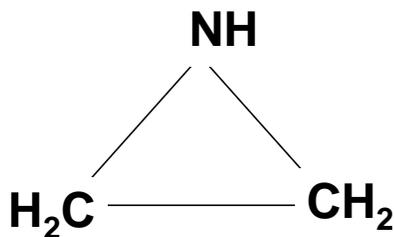

Containers may explode in fire due to buildup of excessive internal pressures. Do not attempt to extinguish fire unless liquid flow can be stopped first. Aqueous solutions are flammable unless diluted extensively. This chemical presents a vapor explosion hazard indoors, outdoors, and in sewers.

SECTION V - REACTIVITY DATA

| | | | | |
|---|--|---|--|---|
| Stability | | Conditions to Avoid Ethyleneimine can be kept stable in closed containers containing a lump of caustic sodium hydroxide (NaOH) to inhibit polymerization. Avoid contact with incompatible materials. Keep away from heat. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reacts with acetic anhydride, acrolein, allyl chloride, carbon disulfide, chlorine, epichlorohydrin, glyoxal, oleum, β-propiolactone, silver, sodium hypochlorite, vinyl acetate, and acids. | | |
| Hazardous Polymerization | | Conditions to Avoid Will polymerize explosively in the presence of acids. Can also polymerize if there is an insufficient concentration of inhibitor, at elevated temperatures, or in contact with a catalyst. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products Toxic and irritating fumes and vapors are produced when ethyleneimine is heated to decomposition. These include oxides of carbon and nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Symptoms of nausea, coughing, shortness of breath and difficulty breathing, severe irritation of the nose, throat, and lungs. May cause pulmonary edema (fluid buildup in the lungs) and kidney damage. May also cause degenerative changes in the heart. ABSORPTION: A skin sensitizer. Will pass through intact skin to cause toxic systemic effects similar to those of inhalation. Causes opaque cornea, keratoconus and necrosis of the cornea. INGESTION: Severe pain with vomiting, diarrhea, collapse, breathing difficulties, and chest pain. | | | | |
| Carcinogenicity Suspected Human Suspected Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, lungs, resp. sys., kidneys, repro., CNS. |
| Medical Conditions Generally Aggravated by Exposure Liver, kidney, and pulmonary diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If <u>swallowed:</u> Call the poison control center and seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water or milk. Do NOT induce vomiting. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Neutralize with sand and soda ash at a ratio of 9 to 1. Collect materials using non-sparking tools and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store ethyleneimine in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Protect containers from physical damage and provide shade from radiant heat (including direct sunlight). | | | | |
| Other Precautions and Warnings Recommend explosion-proof design for bulk storage facilities. Electrically ground and bond equipment, especially during transfer operations. Detached facility storage is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposures, use an organic vapor respirator. Otherwise, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Butyl Rubber Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYLENEIMINEC₂H₅N

CAS: 151-56-4

**IDENTIFICATION AND TYPICAL USES**

Ethyleneimine is a colorless or clear liquid with a strong, fishy, ammonia-like odor. It is used in the manufacture of triethylenemelamine in the paper industry and as a flocculation agent in the clarification of effluents. It is also an intermediate and monomer for fuel-oil and lubricant refining. It is used in ion exchange, in protective coatings, in the manufacture of pharmaceuticals, adhesives, as a polymer stabilizer, and in surfactants. Alkyl-substituted forms (known as alkyl aziranes) are used as intermediates and for microbial control.

RISK ASSESSMENT: HEALTH***General Assessment***

Ethyleneimine is a severe irritant and is corrosive on contact with human tissue. It is extremely toxic by all routes of exposure (*inhalation, ingestion, and by skin absorption*). There is sufficient evidence in the references to indicate that exposure to ethyleneimine poses a significant cancer risk. Animal carcinogenicity is considered highly suspect. Human mutation data have also been reported and it is suggested that this chemical should be treated as though it were a human carcinogen. There is also sufficient evidence to indicate that this chemical causes teratogenic effects in test animals.

Inhalation will result in irritation of the mucosa, especially in the nose, throat, and upper respiratory tract. The toxic effects of exposure include dizziness, headache, congestion, coughing, nausea, vomiting (may be delayed), severe chest pains, difficulty or labored breathing, hemorrhaging, kidney damage, proteinuria (excessive protein content in urine), increased BUN (blood urea nitrogen), and delayed lung injury or pulmonary edema (fluid buildup in the lungs), which

is a medical emergency and can be fatal. Symptoms of pulmonary edema can be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk. There is also some evidence to indicate that high exposures may cause severe tissue degeneration of the heart.

Skin contact with the liquid can cause severe irritation with a possibility for 1st and even 2nd degree burns on prolonged contact. Eye contact can result in permanent corneal injury, conjunctival scarring, and permanent damage or loss of vision. Vapor can cause foggy vision, keratoconus, and cornea necrosis.

Ingestion causes vomiting, dizziness, headache, nausea and vomiting (possibly delayed), possible scarring of the esophagus, and pulmonary edema. It may also lead to liver and heart injuries (confirmed in animals studies only).

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyleneimine:

Skin: Irritation, inflammation, redness, possible blistering, serious burns, and tissue damage. May cause necrosis and vesiculation.

Eye: Severe irritation, inflammation, with possible damage to the cornea and loss of vision. Vapor can cause foggy vision, the appearance of halos around lights, and inflammation and scarring of conjunctival tissues.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs) which is a medical emergency and can be fatal.

Other: Animal studies have shown a degeneration of heart tissue and liver damage on high exposures to amines. It is not known if these effects will occur in humans.

☼ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to ethyleneimine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, ethyleneimine may cause cancer in humans since there is sufficient evidence to show that it will cause cancer (lung and liver) in animals. Human mutation (genetic changes) data have also been reported.

Reproductive Hazard: According to the information presented in the references, ethyleneimine may cause reproductive toxicity, indicating specific developmental abnormalities in the central nervous system, eyes, and ears.

Other Chronic Effects: Low, chronic exposures may cause corneal damage, foggy vision, and irritation of the lungs, bronchi, and throat. There is also a possibility that chronic exposures may cause injury to the heart and liver. However, the data are inconclusive in this regard.

🕒 **Recommended Risk-Reduction Measures**

Ethyleneimine is a suspected human carcinogen. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyleneimine. For relatively low, infrequent, or transient exposures, an organic vapor respirator may suffice. For higher or prolonged exposure, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious chemical gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyleneimine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyleneimine is used or stored. OSHA 20 CFR 1910.1012 (“Ethyleneimine”) contains specific administrative and engineering controls that are required whenever using this chemical.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

Lung function tests.

Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed development of pulmonary edema).

Complete blood count and blood gases (check BUN levels).

For oral exposures, evaluate for esophageal burns.

Evaluation by a qualified allergist, including careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers under the same conditions of exposure. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids

from storage containers to process containers using non-sparking tools.

- ☑ A marked, regulated control area must be established wherever ethyleneimine is used, handled, or stored (refer to OSHA 29 CFR 1910.1012 for specific control measures).
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethyleneimine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyleneimine should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of ethyleneimine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethyleneimine is considered a Class IB flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and its relatively low boiling point make it a serious and dangerous fire and explosion risk. It can react with many common acids and many oxidizers to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of ethyleneimine. Should ethyleneimine ever come into contact with these incompatible substances either during use, transportation, or storage, violent reactions can occur.

Ethyleneimine can enter the environment through industrial discharges, municipal waste treatment discharges, and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyleneimine.

This chemical has moderate acute toxicity to aquatic life. It has caused germination decrease, sterility increase, and mutation increases in various crops. Insufficient data are available to evaluate or predict the short-term effects of ethyleneimine to birds or land animals.

☀ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Ethyleneimine has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of ethyleneimine to plants, birds, or land animals.

💧 *Water Solubility*

Ethyleneimine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Ethyleneimine is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 93% of ethyleneimine will eventually end up in the water; the rest will end up in the air. It is not expected to accumulate in aquatic sediments or terrestrial soils.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethyleneimine found in fish tissues is expected to be about the same as the average concentration of ethyleneimine in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or

spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyleneimine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.). Explosion-proof design is highly recommended for all storage facilities and operational equipment.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ethyleneimine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyleneimine. If ethyleneimine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work
- ☑ Ventilate area and remove all ignition sources.
- ☑ Neutralize with a 9 to 1 solution of soda ash and sand and place in a sealed drum for disposal. Use non-sparking tools during cleanup.
- ☑ Use water spray to disperse vapors and dilute spills to non-flammable mixtures. Flush spills away from exposures. Dispose of accordingly.
- ☑ It may be necessary to dispose of ethyleneimine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyleneimine can present a significant threat to business operations. The loss or damage of equipment or facilities can sig-

nificantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," carcinogen," or reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This requires careful consideration during the development of any public relations policy.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

ETHYLENE OXIDEC₂H₄O

CAS: 75-21-8

**IDENTIFICATION AND TYPICAL USES**

Ethylene oxide appears as a colorless gas (or liquid below 51°F) with an ether-like odor. It is one of the 25 most produced chemicals in the United States. It is used widely as a sterilization agent and as a fumigant. It is also used as a propellant, as a petroleum demulsifier, to accelerate the maturing of tobacco leaves, in the production of explosives, in the manufacture of ethylene glycol, polyethylene oxide, glycol ethers, crown ethers, ethanolamines, and other derivatives, and in organic synthesis. Also investigated for use as an agent to improve the durability of wood.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethylene oxide is a severe irritant as well as toxic, carcinogenic, mutagenic, and teratogenic compound. As a gas, it can enter the body through *inhalation*. However, it can also exist as a liquid (below 51°F) and, therefore, *absorption* through intact skin and even *ingestion* are also possible exposure routes.

Inhalation of ethylene oxide can cause severe irritation to the eyes, nose, throat, and respiratory system. Symptoms can be delayed for 1 to 5 hours and may include headache, nausea, vomiting, dyspnea (difficult breathing), diarrhea, cyanosis (bluish discoloration of the lips, fingers, and toes), olfactory changes (numbing of the sense of smell making detection more difficult), and possible CNS depression with drowsiness, weakness, loss of coordination, memory impairment, peripheral neuropathy, convulsions, coma, and death. Lung irritation can be quite severe and may lead to pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can be fatal. The symptoms of pulmonary edema can be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk.

Skin contact with pure anhydrous ethylene oxide has very little noticeable effect on dry skin. However, contact with solutions cause characteristic burns due to frostbite resulting from evaporative cooling. Also, the liquid solution will cause edema (fluid-filled) blistering of the surface of the skin with redness and dryness. Healing takes approximately three weeks and may leave a residual discoloration (usually brown) on the skin's surface. Ethylene oxide will pass through intact skin to cause toxic systemic effects. If inhalation has also occurred, the compounded effects may be quite severe (life threatening). Eye contact causes irritation, watering, inflammation of the lids, chemical burns to the cornea, and (possibly) severe lesions.

Although ingestion is not likely under normal operating conditions (ethylene oxide is normally a gas), the liquid may be swallowed under conditions of emergency or other unplanned circumstance. If swallowed, symptoms of systemic toxicity similar to that of inhalation may result.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylene oxide:

- Skin:** Severe irritation with localized tissue damage and possible burns. Can be absorbed through intact skin to cause toxic systemic effects.
- Eye:** Severe conjunctival irritation and possible damage to the cornea and loss of vision.
- Lung:** Severe irritation to respiratory tract causing shortness of breath and cough. High acute exposures can be fatal due to a buildup of fluid in the lungs (pulmonary edema).
- CNS:** Possible depression of the central nervous system causing a variety of toxic effects in-

cluding loss of coordination and consciousness.

Other: Ingestion will result in gastritis and possible damage to the digestive tract. Kidney damage may also occur as a result of high/acute over-exposures.

Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethylene oxide and can last for months or even years:

Cancer Hazards: Ethylene oxide may be a cancer causing agent in humans since it has been shown to cause a number of cancers in animals, including brain, liver, gastrointestinal, and blood cancers (leukemia). It is a mutagen (causes cell changes) in animals.

Reproductive Hazard: According to the references, ethylene oxide has been shown to cause serious teratogenic effects. Laboratory tests on animals indicate that exposure could cause fetal deaths, specific development abnormalities, and paternal effects related to testes and sperm ducts. There are reports of birth defects caused by exposure to ethylene oxide and, there is evidence of increased spontaneous abortions in hospital workers.

Other Chronic Effects: Repeated low-dose exposures can cause olfactory changes (numbing of the sense of smell), memory impairment, peripheral neuropathy (sensory and reflex loss and nerve changes in the extremities), which may resolve in 1-7 months. There may be alkylated hemoglobin, systemic sensitization, increased possibility of leukemia and other cancers.

Recommended Risk-Reduction Measures

It is very possible that exposure to ethylene oxide may lead to the development of cancer in humans. Personnel should, therefore, avoid direct contact with ethylene oxide. If a less toxic material or compound cannot be substituted for ethylene oxide, then *engineering controls* are the most effective method of reducing exposure risk. OSHA has established a standard (29 CFR 1910.1047) to specifically regulate ethylene oxide. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of ethylene oxide release. A regulated and controlled work area must be established wherever ethylene oxide is used, handled, or stored. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is

still required whenever working with or around ethylene oxide. Exposure levels are extremely low (1 ppm) and difficult to accurately monitor. Since the odor threshold is very high (430 to 500 ppm or higher) and, since ethylene oxide will also numb the sense of smell, personnel will not have adequate warning of hazardous exposures. Therefore, for the best protection at any exposure level, a MSHA/NIOSH-approved supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode will provide the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, polyvinylchloride gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylene oxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per OSHA 29 CFR 1910.1047 and 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where ethylene oxide is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical test is recommended:

Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

Liver, kidney, and lung function tests.

Consider chest X-ray after acute exposure (may be negative if taken immediately following exposure due to delayed development of pulmonary edema).

Complete blood count.

Evaluation by a qualified allergist, including careful consideration of exposure history and special tests (may help diagnose skin allergy).

Examination and evaluation of the reproductive system.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, since smoking

can cause heart disease as well as lung cancer, emphysema, and other respiratory ailments, any exposure to ethylene oxide can result in quicker and more devastating symptoms. Smokers should therefore avoid unprotected contact with this chemical. Prudent risk management requires proper consideration of *all* possible factors that may be causing the appearance of exposure symptoms among workers.

Other methods to reduce exposure include:

- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethylene oxide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylene oxide should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethylene oxide, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by ethylene oxide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to ethylene oxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethylene oxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Ethylene oxide is flammable gas and, when in the liquid state, a Class IA combustible liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and low boiling point together with the fact that it has a very wide flammability range (between 3 and 100% in air), create a dangerous fire and explosion risk. It is incompatible with oxidizers, acids, alkalis, and the

chlorides of many metals. Caution is always required in handling, storage, transportation, and disposal of ethylene oxide. When heated to decomposition it emits very acrid and irritating smoke and fumes. Emergency responders should be made aware of the presence of ethylene oxide at any emergency response situation. A boiling liquid expanding vapor explosion (BLEVE) is extremely possible if a tank or rail car containing ethylene oxide is involved in fire.

Ethylene oxide may enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylene oxide.

Ethylene oxide has moderate acute toxicity to aquatic life. Various rose varieties have shown delayed maturation, wilting, and size decrease from exposure to ethylene oxide. Insufficient data are available to evaluate or predict the acute (short-term) effects of ethylene oxide on birds or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Ethylene oxide has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate the chronic (long-term) effects of ethylene oxide on plants, birds, or land animals.

💧 *Water Solubility*

Ethylene oxide is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Ethylene oxide is slightly persistent in the aquatic environment, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe con-

taminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethylene oxide found in fish tissues is expected to be about the same as the average concentration of ethylene oxide in the water from which the fish was taken.

🕒 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ethylene oxide into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylene oxide should be segregated from other chemicals to minimize the risk of cross-contamination. Ethylene oxide must be stored to avoid contact with strong oxidizers, such as chlorine and bromine, since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat. If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If ethylene oxide should contact the water table, aquifer, or navigable waterway, time is of the essence. Its specific solubility in water has not been established and total remediation may or may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylene oxide.

If ethylene oxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Dilute small spills with water to form non-flammable mixtures. Absorb spilled liquids with vermiculite or a similar material and deposit in sealed drum for disposal. Use non-sparking tools.

- ☑ Ventilate area and remove ignition sources.
- ☑ If source if leak is a cylinder, attempt to stop flow. If this cannot be done or cylinder is damaged, remove to safe place outdoors and allow to vent until empty.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylene oxide can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," or "carcinogen" are used, public emotion, hysteria, and ignorance can run equally high. This requires careful consideration during the development of public relations policies.

🕒 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and lungs. High exposure may cause sweating, nausea, shortness of breath, and increased heart rate and blood pressure. May also cause pulmonary edema (a dangerous buildup of fluid in the lungs). Low, repeated exposures may lead to enlarged thyroid (goiter), and altered thyroid function. A teratogen. ABSORPTION: Causes burns and irritation to the skin and eyes. Will pass through intact skin, thereby increasing the effects of other exposures (inhalation or ingestion). INGESTION: Its bitter taste prevents ingestion of acutely toxic amounts. | | | | |
| Carcinogenicity Suspected Human Confirmed Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2B | OSHA Regulated? Not Listed | Target Organs? Eyes, skin, thyroid, resp. system, repro. sys., liver. |
| Medical Conditions Generally Aggravated by Exposure Thyroid ailments and disorders may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Not likely. Call the poison control center and seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water. Never give an unconscious or convulsing person anything by mouth. DOCTOR: Examination of thyroid is suggested. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in safest manner possible and deposit in DOT-approved drum. Do NOT generate dusts. Use vacuum equipped with HEPA filter instead. Ventilate area. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method Decompose to less hazardous ethylene urea by adding sodium hypochlorite solution. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, well-ventilated area. Protect containers from physical damage and shield from direct sunlight or other ultraviolet light sources. | | | | |
| Other Precautions and Warnings Personnel should be trained on proper handling and storage prior to working with ethylene thiourea. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure limits have been established. This chemical is a known teratogen and a suspected carcinogen. Use an MSHA/NIOSH-approved supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYLENE THIOUREAC₃H₆N₂S

CAS: 96-45-7

**IDENTIFICATION AND TYPICAL USES**

Ethylene thiourea is a white to pale-green, crystalline solid with a faint, amine-like (fishy) odor. It is used extensively as a vulcanization accelerator for curing polychloroprene (Neoprene®) and other elastomers. It is also used in electroplating baths, intermediate for antioxidants, insecticides, fungicides, dyes, pharmaceuticals, and synthetic resins.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethylene thiourea is human poison by *inhalation*, *ingestion*, and by skin contact (*absorption*). It is known to cause cancer in laboratory test animals (liver, thyroid, and lymphatic system tumors) and its carcinogenic potential in humans is highly suspect. It is also a known teratogen (causes birth defects) and may cause other adverse effects on the human reproductive system.

Inhalation of the dusts or, if mixed in aqueous solution, the vapors or mists, can cause irritation to the eyes, nose, throat, bronchial tubes, and lungs. This could cause soreness, hoarseness, cough, and phlegm. High exposure may cause sweating, nausea, increased heart rate, and blood pressure. It can cause a dangerous buildup of fluid in the lungs, a condition known as pulmonary edema, which is a medical emergency and can be fatal. Symptoms of difficulty breathing, tightness in chest, coughing, and congestion may be delayed up to 48 hours following exposure thereby creating a false sense of security with regard to health exposure risk. Low or repeated exposures can cause enlarged thyroid (goiter) and changes in thyroid function.

Skin contact will result in irritation. Ethylene thiourea will pass through the skin to cause toxic systemic effects. If coupled with other exposure routes

(inhalation or ingestion), absorption can increase the toxic effects to dangerous levels.

Ingestion is not very likely since the bitter taste of ethylene thiourea will prevent ingestion of acutely toxic amounts. However, ingestion is still a possible exposure route. It can lead to a reduction of thyroid gland activity and result in symptoms such as a yellowish or ivory complexion, thickening and drying of the skin, an enlarged tongue, and dry, brittle hair.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylene thiourea:

Skin: Localized irritation at sight of contact. Will readily absorb through skin to cause toxic systemic effects.

Eye: Irritation and possible inflammation.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs) with cough, phlegm, dyspnea, nausea, and sweating.

Other: A related chemical (Ziram) causes brain swelling, hemorrhage, muscle weakness, and liver and kidney effects. It is not known whether ethylene thiourea can cause these changes.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethylene thiourea and can last for months or even years:

Cancer Hazards: According to the information presented in the references, ethylene thiourea has been shown to cause cancers of the liver, thyroid, and lymphatic system in test animals. Its ability to cause cancer in humans is highly suspect.

Reproductive Hazard: According to the information presented in the references, ethylene thiourea has been shown to cause teratogenic effects in tests animals and it is thought to be a human teratogen as well.

Other Chronic Effects: Chronic ingestion of small quantities can cause a reduction of thyroid gland activity with symptoms of yellowish or ivory-colored skin, thickening of the skin, and enlarged tongue, and dry, brittle hair. A related chemical (maneb), an agricultural fungicide, can cause tremors, weakness, poor coordination, and other nerve effects. It is not known if ethylene thiourea will cause these effects.

🕒 Recommended Risk-Reduction Measures

Ethylene thiourea is a probable human carcinogen and a known teratogen. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethylene thiourea. No exposure levels have been established for this chemical. This does not mean that respiratory protection is not necessary. In fact, with ethylene thiourea, the opposite is true. It may pose a cancer and reproductive hazard and, therefore, *no* exposure level should be tolerated. A supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious chemical gloves should be worn. Contact glove manufacturers and obtain permeation studies *before* selecting gloves.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylene thiourea.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where ethylene thiourea is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to the delayed development of pulmonary edema).
- Thyroid function tests.
- Examination of the nervous system.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart diseases, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
- Wash thoroughly immediately after exposure to ethylene thiourea and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylene thiourea should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.
- Specific engineering controls are required for ethylene thiourea. Refer to NIOSH Current In-

telligence Bulletin Number 22, Publication Number 78-144 ("Ethylene Thiourea").

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of ethylene thiourea. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethylene thiourea is considered a combustible solid. It can react with acrolein and can decompose into ethylene urea if reacted with alkaline hypochlorite or exposed to ultraviolet radiation in the presence of a sensitizer such as acetone or riboflavin. These characteristics require special consideration during any emergency situation involving a leak or spill of ethylene thiourea.

Ethylene thiourea can enter the environment through industrial discharges and spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylene thiourea.

This chemical has moderate acute toxicity to aquatic life and to land animals. At concentrations of 100 ppm, ethylene thiourea had no effect on the size of wheat plants. Insufficient data are available to evaluate or predict the short-term effects of ethylene thiourea on birds.

☞ Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Ethylene thiourea has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of ethylene thiourea to plants, birds, or land animals.

💧 Water Solubility

Ethylene thiourea is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ Persistence in the Environment

Ethylene thiourea is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of ethylene thiourea will end up in water.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ethylene thiourea found in fish tissues is expected to be about the same as the average concentration of ethylene thiourea in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylene thiourea should be segregated from incompatible chemicals and shielded from radiant heat to minimize the risk of cross-contamination, contact, or reaction.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ethylene thiourea should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylene thiourea. If ethylene thiourea is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Collect powdered materials in safest manner possible using a vacuum and HEPA filter and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of ethylene thiourea as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylene thiourea can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," and "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This should be carefully considered whenever developing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|---|---|---|
| Ethyl ether: (derivation: By the action of sulfuric acid on ethanol or ethylene followed by distillation). 1 ppm = 3.08 mg/m³ | PEL (8-hour): 400 ppm 1200 mg/m³ STEL: 500 ppm 1500 mg/m³ | REL: Not Established STEL: Not Established | 1900 ppm | TLV: 400 ppm 1200 mg/m³ STEL: 500 ppm 1500 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|-------------------------|---------------------------|---|------------------------|
| Boiling Point | 94°F (34°C) | Specific Gravity (H ₂ O = 1) | 0.71 |
| Vapor Pressure (mm Hg) | 440 at 77°F (25°C) | Molecular Weight (atomic weight) | 74.1 |
| Vapor Density (Air = 1) | 2.55 | Melting Point | -177°F (-116°C) |

Solubility
Slightly soluble in water (8%). Soluble in alcohol, chloroform, benzene, solvent naphtha, and oils.

Appearance and Odor
A clear, colorless, mobile, water-white, extremely volatile liquid with a strong, sweet, aromatic odor and burning sweet taste.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|----------------------------------|-------------------------------------|-----------------|
| Flash Point (method used) | -49°F (-45°C) closed cup | Explosive Limits in Air % by Volume | |
| | | LEL: 1.85% | UEL: 36% |
| NFPA Classification | Class IA Flammable Liquid | Autoignition Temperature | |
| | | 356°F (180°C) | |

Extinguishing Media
Dry chemical, alcohol foam, or carbon dioxide. Use water spray to keep fire-exposed containers cool.

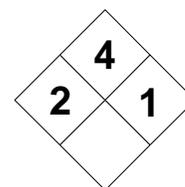

Special Fire Fighting Procedures
Wear full protective clothing and self-contained breathing apparatus (SCBA). Move container from fire area if it can be done without risk. Use water spray to flush spills from ignition sources and to knock down vapors that have not yet ignited. Treat as a gas fire; use blanketing effect to smother flames.

Unusual Fire and Explosion Hazards
Containers may explode in fire. Presents a vapor explosion hazard indoors, outdoors, and in sewers.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|--|--|---|
| Stability | | Conditions to Avoid Ethyl ether is NOT stable under normal conditions of handing and storage. It can form unstable peroxides if exposed to air and sunlight for prolonged periods of time. Peroxide can explode if distilled or heated. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Incompatible with strong oxidizers, peroxides, permanganates, acids, anhydrides, metallic hydrides, air, liquid oxygen, and nitrates. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethyl ether is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, ethyl ether emits acrid smoke and fumes, including toxic oxides of carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? |
| Health Hazards INHALATION: Causes headache, nausea, vomiting, loss of consciousness, and at high concentrations, death. Depression of the central nervous system (CNS) causing anesthesia, exhaustion, loss of appetite, sleepiness, dizziness, excitation, anorexia, giddiness, narcotic effects. ABSORPTION: An eye and skin irritant. Can pass through unbroken skin causing toxic systemic effects. May cause skin burns and eye irritation (smarting). INGESTION: Not likely. The liquid evaporates rapidly and makes ingestion an unlikely exposure route. | | | | |
| Carcinogenicity Unknown Human No Evidence Animal | NTP Listed? No | IARC Cancer Review Group? Not Listed But Reviewed | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Skin, eyes, respiratory system, CNS, blood, liver. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: No serious hazard since evaporation is quick. Prolonged contact may cause drying, cracking, or burning. Contaminated clothing should be removed (fire hazard). Wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Not very likely. Seek medical attention immediately. Unless advised otherwise, give several glasses of water. Do not induce vomiting because of danger of aspiration (breathing the liquid into the lungs). Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA). Restrict those not wearing protective equipment and who are not involved in cleanup from area. Avoid skin contact. Ventilate area of spill and remove ignition sources. Absorb liquids in vermiculite, collect with non-sparking tools, and deposit in sealed drum. | | | | |
| Preferred Waste Disposal Method Mix with a higher-boiling solvent and burn in chemical incinerator with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed (air-tight), metal containers in a cool, dry, well-ventilated area away from heat and incompatible materials. Control inventories. Protect containers from physical damage. | | | | |
| Other Precautions and Warnings Before using bulk material, test small quantity to ascertain quality and peroxide content. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use a NIOSH-approved air-purifying respirator for low levels. Best protection is obtained using a supplied-air respirator or a SCBA with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Polyvinyl | | Eye Protection Chemical Goggles and Face Mask | | Other Protective Clothing Protective Uniform or Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYL ETHER

CAS: 60-29-7

**IDENTIFICATION AND TYPICAL USES**

Ethyl ether appears as a clear, colorless, volatile, mobile, water-white liquid with a characteristic, sweet, pungent, aromatic odor and bittersweet taste. It is used as a solvent for fats, oils, waxes, gums, perfumes, and nitrocellulose. It is also used in the making of gun powder, as an anesthetic, and in organic synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethyl ether is a narcotic substance and is considered mildly to moderately toxic by *inhalation* and skin *absorption*. Although unlikely under normal operating conditions, *ingestion* may also be an exposure route. There are no reports to indicate that this chemical poses a carcinogenic or teratogenic effect in humans. However, mutation (genetic changes) data have been reported in animals. It is not known whether it will cause this effect in humans.

Inhalation of ethyl ether vapors causes anesthetic effects because of the chemical's ability to quickly and effectively depress the central nervous system. Symptoms of exposure include exhaustion, loss of appetite, sleepiness, dizziness, headache, giddiness, excitation, nausea, vomiting, anorexia, loss of consciousness, possible seizures and convulsions, psychic disturbances, and death due to respiratory arrest. There may also be an occurrence of polycythemia, a condition characterized by an abnormal increase in circulatory red blood cells. Exposure can cause irritation of the eyes, nose, throat, and respiratory system with subsequent changes (numbing) of the sense of smell.

Skin contact with the liquid poses no serious threat because ethyl ether will evaporate rather quickly. However, if allowed to remain in contact (in wet clothing, for example) for extended periods, there can be drying, cracking, even some burning of the

skin's surface. The chemical will also pass through unbroken skin to cause toxic systemic effects similar to that caused by inhalation. The vapors will cause irritation and slight smarting of the eyes.

Ingestion is not likely since the liquid will evaporate so quickly leaving very little time for ingestion to occur. However, it is a remote possibility and the symptoms of inhalation can be expected to occur on ingestion of ethyl ether.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl ether:

- Skin:** Mild irritation with drying, cracking, secondary infection, and possible burns. On prolonged exposure, can be absorbed through intact skin causing toxic systemic effects.
- Eye:** Irritation and smarting of eye tissues and associated skin surfaces (lids).
- Lung:** Irritation to respiratory tract causing cough and sore throat. May also cause olfactory changes (numbing of the sense of smell). Absorption through inhalation causes anesthetic effects and narcosis (deep unconsciousness).
- CNS:** Rapid depression of the central nervous system causing a variety of toxic effects including loss of coordination and consciousness, and even death due to respiratory arrest.
- Other:** May cause an abnormal increase in red blood cells of the circulatory system (polycythemia).

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethyl ether and can last for months or even years:

Cancer Hazards: There is no evidence in the references that exposure to ethyl ether causes cancer in animals or humans. However, mutation data have been reported in test animals. Some scientists believe that mutagenic chemicals may pose a cancer risk in the long-term. Additional research is required in this area of study before any conclusions can be made.

Reproductive Hazard: According to the references, ethyl ether has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated low-dose exposures can cause anorexia, chronic fatigue or exhaustion, persistent headache, drowsiness, dizziness, excitation, and psychic disturbances due to its depression of the CNS.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ethyl ether. If a less toxic material or compound cannot be substituted for ethyl ether, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of ethyl ether release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around ethyl ether. For exposures to the PEL (400 ppm), an air purifying respirator should provide adequate protection. For high exposures or when the concentration is unknown, an MSHA/NIOSH-approved supplied air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode are the recommended methods of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, polyvinyl or other non-permeable gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* selecting gloves.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl ether.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication) prior to the first assignment in an area where ethyl ether is used or stored.

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Liver, kidney, and lung function tests.
- ☑ Evaluation of the central nervous system.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethyl ether and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl ether should be communicated to all exposed or potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethyl ether, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by ethyl ether should change into clean clothes before leaving work. Contaminated work clothing presents a serious fire hazard and should be laundered only by individuals who have been informed of the hazards of exposure to ethyl ether.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethyl ether. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (primarily air, but water and soil contamination can also occur).

Ethyl ether is Class IA flammable liquid (per OSHA 29 CFR 1910.106). This presents a very dangerous fire and explosion hazard. Its vapors are heavier than air and can travel for some distance to an

ignition source to flashback and cause fire or explosion. It can form explosive peroxides if distilled to near dryness or heated to 212°F (100°C). It is incompatible with many oxidizers and acids and caution is always required in handling, storage, transportation, and disposal of ethyl ether. When heated to decomposition it emits very acrid and irritating smoke and fumes. Emergency responders should be made aware of the presence of ethyl ether at any emergency response situation.

Ethyl ether may enter the environment through industrial effluents and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl ether. Insufficient data are available to evaluate or predict the acute (short-term) effects of ethyl ether to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the chronic (long-term) effects of ethyl ether on aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ethyl ether is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Ethyl ether is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 100% of ethyl ether will eventually end up in air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become con-

centrated in the tissues and internal organs of animals as well as humans.

The references do not address the bioaccumulation capabilities of ethyl ether in aquatic organisms. However, considering the extremely volatile nature of this chemical, bioaccumulation may not be possible.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ethyl ether into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl ether should be segregated from other chemicals to minimize the risk of cross-contamination. Ethyl ether must be stored to avoid contact with strong oxidizers, such as chlorine and bromine, since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat, including sunlight.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If ethyl ether should contact the water table, aquifer, or navigable waterway, time is of the essence. Its rapid evaporation may make total remediation impossible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl ether.

Ethyl ether may be disposed of by mixing with an excess of a higher-boiling solvent and then burning in a chemical incinerator equipped with an afterburner and scrubber. If ethyl ether is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Absorb spilled liquids with vermiculite, dry sand, or a similar material and deposit in sealed drum for disposal. Use non-sparking tools!

- ☑ Ventilate area and remove all ignition sources.
- ☑ It may be necessary to dispose of ethyl ether as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl ether can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Irritation of the eyes, nose, and respiratory tract. Irritation of the eyes and mucous membranes may persist for hours. Inhalation of high concentrations may cause pulmonary edema (fluid in the lungs) and CNS depression with deep narcosis. Death can occur due to circulatory system or respiratory system failure. SKIN & EYE: Vapors or liquid will irritate the eyes. The liquid will irritate the skin (redness, blistering). INGESTION: Irritation of the mouth and possible esophageal burns, unconsciousness and death. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system; skin; eyes, CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Call poison control center for advice. Give 1-2 glasses of water. Do NOT induce vomiting unless advised otherwise. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire and flame away. If possible, automatically transfer liquids between containers. | | | | |
| Other Precautions and Warnings Bulk storage of ethyl formate is not recommended. Ground and bond all metal containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Where potential exists for exposure over 100 ppm, use an MSHA/NIOSH-approved full facepiece respirator with an organic vapor cartridge. For high exposures, or when exposure levels are unknown (as in emergency response), use a supplied air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber or Viton | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Impermeable Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYL FORMATECH₃CH₂OCHO

CAS: 109-94-4

**IDENTIFICATION AND TYPICAL USES**

Ethyl formate is a colorless liquid with a characteristic, fruity odor and slightly bitter taste. It is used as a solvent for cellulose nitrate and acetate, as an acetone substitute, in organic synthesis, as a flavoring agent for lemonades and essences, and as a fungicide and larvicide for cereals, dry fruits, tobacco, and other similar products.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethyl formate is toxic by *inhalation* causing a variety of systemic effects. It is mildly toxic by *ingestion*. Skin contact can produce localized effects but absorption has not been reported. While its specific carcinogenic and mutagenic properties are unknown, mutation data have been reported.

Inhalation of ethyl formate vapors causes irritation of the respiratory tract and difficulty breathing. Irritation of the mucosa can last for several hours following the last exposure to ethyl formate. Inhalation of high concentrations can cause pulmonary edema, a dangerous buildup of fluid in the lungs, which can be fatal. Indications of pulmonary edema may be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk. Varying degrees of central nervous system (CNS) depression is also possible with symptoms of narcosis (deep unconsciousness) and death due to respiratory system or circulatory system failure.

Skin and eye contact can result in mild to moderate irritation. No reports of permanent damage have been recorded in the references.

Ingestion of ethyl formate may cause a variety of toxic effects, including somnolence (sleepiness or excessive drowsiness), narcosis, gastritis, dyspnea (difficulty breathing), irritation of the mouth and

stomach with possible esophageal burns. If not treated promptly, there may be unconsciousness and death.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl formate:

Skin: Mild to moderate irritation.

Eye: Mild to moderate irritation.

Lung: Irritation of the eyes, nose, throat and lungs (especially the mucus membranes). May cause pulmonary edema (fluid in the lungs).

CNS: High concentrations can depress the central nervous system leading to narcosis and possible loss of consciousness and even death.

Other: Ingestion can cause a serious irritation of the mouth and stomach with a possibility of esophageal burns, unconsciousness, and death.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethyl formate and can last for months or even years:

Cancer Hazards: According to the references, ethyl formate has not been adequately tested for its ability to cause cancer in test animals. However, mutation data have been reported. This does not mean that ethyl formate is carcinogenic. It does mean that further research is required and caution is warranted in use, handling, and storage until further information is known about ethyl formate.

Reproduction: According to the references, ethyl formate has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: None reported.

🚫 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with ethyl formate. The best risk reduction measure is to use a less toxic chemical as a substitute for a ethyl formate. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also help reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyl formate. For exposures over 100 ppm (8 hours), an MSHA/NIOSH-approved chemical respirator with an organic vapor cartridge should be used. For higher exposures, or when concentration levels are not known (as in emergency response), a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode or a supplied-air respirator with full facepiece operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious butyl rubber, Viton, or chlorinated polyethylene gloves should be used. Glove manufacturers should be contacted to obtain permeation studies before gloves are selected.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl formate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl formate is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- Lung function tests.
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to the delayed development of pulmonary edema).
- Complete evaluation of the central nervous system.

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart diseases, emphysema, and a variety of other respiratory disorders, smokers exposed to ethyl formate may experience symptoms much more rapidly and more pronounced than non-smokers under the same conditions of exposure. Prudent risk management requires the accurate assessment and consideration of *all* possible factors that may be causing the appearance of exposure symptoms in the work force.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ethyl formate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl formate should be communicated to all potentially exposed workers.
- Never eat, drink, or smoke in areas where ethyl formate is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethyl formate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Ethyl formate is considered a Class IB flammable liquid (according to OSHA 29 CFR 1910.106). Its low flash point and relatively low boiling point present a serious fire and explosion hazard concern. Also, because it is incompatible with a number of common materials, especially strong oxidizers and acids, con-

tact can result in violent and explosive reactions. It can also form explosive mixtures in air and can ignite on contact with heat, fire, or sparks. These characteristics require special consideration during any emergency situation involving a leak or spill of ethyl formate.

The proper disposal/destruction method for ethyl formate is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

Ethyl formate can enter the environment through unchecked industrial discharges into effluents and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl formate. This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of ethyl formate to plants, birds, or terrestrial animals.

☞ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of ethyl formate to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ethyl formate is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water. However, it will gradually decompose to form ethanol and formic acid.

⌚ *Persistence in the Environment*

Ethyl formate is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Since ethyl formate will decompose in water, it is not expected to be absorbed by aquatic sediments or terrestrial soils.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe con-

taminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Since ethyl formate will decompose in water, it is not expected to accumulate in fish tissues.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl formate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If ethyl formate should contact the water table, aquifer, or navigable waterway, time is of the essence. It will slowly decompose in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl formate. If ethyl formate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove all ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools!
- ☑ It may be necessary to dispose of ethyl formate as a hazardous waste. The responsible state agency or the regional office of the federal Environ-

mental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl formate can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

2-ETHYLHEXANOLC₈H₁₈O

CAS: 104-76-7

**IDENTIFICATION AND TYPICAL USES**

2-Ethylhexanol is a clear, colorless, liquid with a sweet, agreeable, characteristic floral (rose-like) odor. It is used as a plasticizer for polyvinylchloride (PVC) resins, as a de-foaming agent, a wetting agent, in organic synthesis, as a solvent mix for nitrocellulose, in paints, lacquers, baking finishes, in cotton refinement and textile finishing compounds, in inks, rubber, paper, lubricants, photography, and in the dry cleaning industry.

RISK ASSESSMENT: HEALTH**General Assessment**

2-Ethylhexanol is relatively non-toxic to humans at room temperature (due to its low vapor pressure). However, when heated or misted it can present mild to moderate toxicity by *inhalation*. It can also pass through intact skin (*absorption*), although seldom in toxic amounts from a single exposure. Its carcinogenicity in humans is not known but it has been shown to cause mutations in animal studies. Experimental teratogenic data have also been reported in animal tests.

Inhalation causes irritation to the eyes and respiratory tract. In high concentrations, exposure may cause depression of the central nervous system (CNS) resulting in headache, muscle weakness, nausea, giddiness, and ataxia (loss of muscle control or coordination).

Skin and eye contact may produce mild irritation on contact. It may cause redness and sensitization on prolonged contact. It will pass through unbroken skin to cause toxic systemic effects primarily associated with CNS depression. Repeated dermal exposures have resulted in liver and kidney damage in test animals.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to 2-ethylhexanol:

Skin: Mild irritation with redness and possible sensitization. Will pass through unbroken skin.

Eye: Mild to moderate irritation and pain (smarting).

Lung: Nose and throat irritation. Produces intoxicating effects and may cause lung effects as well.

CNS: Serious depression of the CNS at high exposures. Can lead to loss of consciousness.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to 2-ethylhexanol and can last for months or even years:

Cancer Hazards: According to information presented in the references, 2-ethylhexanol has not been adequately tested for its ability to cause cancer in animals. Some studies indicate that it causes mutations in animals, while others are inconclusive in this regard.

Reproductive Hazard: According to information presented in the references, 2-ethylhexanol has produced an increase in the mortality of the offspring of test animals (mice). The teratogenicity of 2-ethylhexanol in humans has not been adequately studied.

Other Chronic Effects: Prolonged skin contact may cause drying, cracking, and chapping of the affected area. Repeated or long-term exposures to 2-ethylhexanol may affect the liver and kidneys.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with 2-ethylhexanol. The exact nature of the toxicity of this chemical is not entirely understood in the references.

Therefore, prudent risk management requires it be treated as though it posed a significant health risk in the event of overexposure. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 2-ethylhexanol. No exposure levels have been established for this chemical. This does not mean that exposure is without risk. A supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 2-ethylhexanol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 2-ethylhexanol is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Kidney and liver function tests.
- Evaluation of central nervous system function.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
- Wash thoroughly immediately after exposure to 2-ethylhexanol and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 2-ethylhexanol should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 2-ethylhexanol, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of 2-ethylhexanol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 2-ethylhexanol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

2-Ethylhexanol is considered a Class IIIA combustible liquid (per OSHA 29 CFR 1910.106). While this presents a moderate fire hazard, it can react violently in contact with incompatible materials and is an explosion hazard in vapor form. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with common oxidizers and contact can cause fire or explosion. It will ignite on contact with chromium trioxide. Therefore, special consideration is required during any emergency situation involving a leak or spill of 2-ethylhexanol. Should 2-ethylhexanol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is possible.

The proper disposal method for 2-ethylhexanol is to burn it in a chemical incinerator equipped with an afterburner and scrubber.

2-Ethylhexanol may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 2-ethylhexanol.

Insufficient data are available on the short-term effects of 2-ethylhexanol exposure to aquatic life, birds, plants, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of 2-ethylhexanol exposure to aquatic life, birds, plants, or land animals.

💧 *Water Solubility*

2-Ethylhexanol is nearly insoluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

🕒 *Persistence in the Environment*

2-Ethylhexanol is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 2-ethylhexanol found in fish tissue is expected to be about the same as the average concentration of 2-ethylhexanol in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 2-ethylhexanol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 2-ethylhexanol should contact the water table, aquifer, or navigable waterway, cleanup should be started immediately. It is only slightly soluble in water and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 2-ethylhexanol.

If 2-ethylhexanol is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area is opened for normal work.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- It may be necessary to dispose of 2-ethylhexanol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 2-ethylhexanol can present a significant threat to business operations. The loss or damage of equipment or facilities can sig-

Risk Management for Hazardous Chemicals

nificantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term “reproductive hazard” is used, public emotion, hysteria, and ignorance can run equally high. This requires careful consideration during the development of any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Irritating to the eyes, nose, throat and respiratory system causing cough, dyspnea, headache, nausea, vomiting, olfactory and taste changes, chemical pneumonia, confusion, and possible liver, kidney, and bone marrow effects. Animal studies showed testicular atrophy and lesions (no evidence in humans). ABSORPTION: Smarting and reddening of the skin. Absorption is likely, causing toxic systemic effects. INGESTION: Nausea, vomiting, and irritation of the entire digestive system. | | | | |
| Carcinogenicity No Evidence Human No Evidence Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? Not Listed | Target Organs? Eyes, skin, resp. sys., CNS, liver, kidneys, urogenital sys., bone marrow. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. If swallowed: Seek medical attention immediately. Give conscious and alert person 1-2 glasses of water. Do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb in vermiculite, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame under a nitrogen purge. Prevent physical damage to containers. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where ethylidene norbornene is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) For exposures above the PEL, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYLIDENE NORBORNENEC₉H₁₂

CAS: 16219-75-3

**IDENTIFICATION AND TYPICAL USES**

Ethylidene norbornene is a colorless to white liquid with a strong, turpentine-like odor. It is a cyclic olefin hydrocarbon related to pinene and is used as the third monomer in EPDM elastomers.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethylidene norbornene is moderately toxic by *ingestion* and mildly toxic by *inhalation*. It will also pass through unbroken skin (*absorption*) to cause toxic systemic effects. Its carcinogenicity in humans is not known but is questioned in some animal studies. It has been shown to cause changes in the reproductive system of experimental animals. Human teratogenicity is suspected but not confirmed.

Inhalation of ethylidene norbornene can cause irritation to the eyes, nose, throat, and respiratory system causing cough, dyspnea, nausea, vomiting, and possible chemical pneumonia. The latter occurs mainly from the aspiration of vomitus into the lungs. High concentrations may depress the central nervous system (CNS) causing symptoms of headache, nausea, and confusion. There may be changes in the senses of smell and taste. In animals studies, there have been reports of testicular atrophy, liver lesions, kidney injury, urogenital injury, and bone marrow effects. Although no such toxicity has been reported in humans, caution is still warranted with regard to health exposure risk.

Skin contact causes smarting and reddening of the skin. Absorption will occur if liquid remains in contact with the skin for prolonged periods. If absorption and inhalation occur simultaneously, the compounded effects can be quite severe (possibly life-threatening). Eye contact causes irritation and inflammation of the conjunctival tissues. If not removed immediately, more serious damage may occur.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylidene norbornene:

Skin: Smarting and reddening. Will pass through intact skin to cause toxic systemic effects.

Eye: Irritation and inflammation.

Lung: Nose and throat irritation. Causes coughing, dyspnea, nausea, and vomiting.

CNS: Possible depression causing headache and confusion.

Other: Ingestion may produce nausea, vomiting, and severe irritation of the entire digestive tract.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethylidene norbornene and can last for months or even years:

Cancer Hazards: According to information presented in the references, ethylidene norbornene has not been adequately tested for its ability to cause cancer in animals.

Reproductive Hazard: According to information presented in the references, ethylidene norbornene may have the ability to adversely affect reproduction in animals. It has caused testicular atrophy and other urogenital injuries. The teratogenicity of ethylidene norbornene in humans has not been adequately studied.

Other Chronic Effects: Causes adverse effects to the kidneys, liver, and testes in laboratory animals. Humans data in this regard are insufficient to draw accurate conclusions.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with ethylidene norbornene. The exact nature of the toxicity of this chemical is not entirely understood in the references. Therefore, prudent risk management requires it be treated as though it posed a significant health risk in the event of overexposure. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethylidene norbornene. For exposures above the OSHA ceiling of 5 ppm, a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted to obtain permeation studies *before* glove selection has been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylidene norbornene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethylidene norbornene is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Kidney and liver function tests.
- Neurological examination.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release.

If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ethylidene norbornene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylidene norbornene should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethylidene norbornene, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of ethylidene norbornene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethylidene norbornene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethylidene norbornene is considered a Class II combustible liquid (per OSHA 29 CFR 1910.106). It presents a moderate fire and explosion hazard risk, especially in contact with oxygen. These characteristics require extreme caution in handling, storage, transportation, and disposal. Therefore, special consideration is required during any emergency situation involving a leak or spill of ethylidene norbornene. Should ethylidene norbornene ever come into contact with oxygen during use, transportation, storage, or disposal, explosion and fire are extremely possible.

Ethylidene norbornene may enter the environment through industrial discharges into the effluent and through spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylidene norbornene.

Insufficient data are available on the short-term effects of ethylidene norbornene exposure to aquatic life, birds, plants, or land animals.

Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of ethylidene norbornene exposure to aquatic life, birds, plants, or land animals.

Water Solubility

The solubility of ethylidene norbornene has not been clearly established.

Persistence in the Environment

The persistence of ethylidene norbornene in the environment could not be determined in the references.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

No information on the bioaccumulation of ethylidene norbornene could be found in the references.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylidene norbornene should be segregated from oxygen to minimize the risk of cross-contamination or contact. A nitrogen purge is recommended and 100 ppm of *tert*-butyl catechol is often used as a stabilizer. Buildings designated for storage should be equipped with appropriate fire protection

systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ethylidene norbornene should contact the water table, aquifer, or navigable waterway, cleanup should be started immediately. Its specific solubility could not be determined and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylidene norbornene. If ethylidene norbornene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- It may be necessary to dispose of ethylidene norbornene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylidene norbornene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that whenever the term "reproductive hazard" is used, public emotion, ignorance, and hysteria can run equally high. This must be carefully considered when developing any public relation policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

At high concentrations, causes narcosis with drowsiness, dizziness, restlessness, loss of muscle control, skeletal muscle paralysis. Cyanosis, respiratory depression, coma, and death. May produce changes in smell and taste. SKIN & EYES: Irritation of the eyes (conjunctiva) and skin from liquid contact. INGESTION: Moderately toxic. May cause toxic systemic effects similar to that of inhalation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Skin, eyes, liver, kidneys, CNS, blood, resp. system |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Wash with large amounts of water for a minimum of 15 minutes. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Give 100% humidified supplemental O₂ with assisted ventilation. Transfer to medical facility. If swallowed: Seek medical attention immediately. Give 1-2 glasses of water, do NOT induce vomiting. Do NOT attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Use water spray to knock down vapors. Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Absorb in sand or other material and dispose of in sealed drums. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dry, well ventilated area away from heat (including direct sunlight). Protect containers from physical damage. Inspect containers regularly. | | | | |
| Other Precautions and Warnings Ethyl mercaptan must be stored to avoid contact with strong oxidizers since violent reactions can occur. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL is low and difficult to monitor. Air-purifying respirators may suffice but best protection is provided by a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | Eye Protection Chemical Goggles and Face Mask | Other Protective Clothing Protective Uniform or Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYL MERCAPTANCH₃CH₂SH

CAS: 75-08-1

**IDENTIFICATION AND TYPICAL USES**

Ethyl mercaptan appears as a colorless liquid (or a gas above 95°F) with an extremely strong, penetrating, pungent, characteristic, disagreeable, “skunk-like,” or garlic, or leek-like odor. It can be manufactured synthetically, but also occurs naturally in certain vegetables like cabbage, as a result of vinous fermentation, and in illuminating gas, “sour” natural gas from wells, coal tar, and various petroleum distillates. It is used as an intermediate in the manufacture of insecticides, plastics and antioxidants, and as an additive to natural gas, butane, liquefied petroleum gas, and propane to give odor.

RISK ASSESSMENT: HEALTH**General Assessment**

Very little data are available in the references on the human toxicity of ethyl mercaptan. It is believed to present moderate toxicity by *ingestion* and *inhalation*. There is insufficient data on the carcinogenicity, mutagenicity, and teratogenicity of this compound in humans.

Inhalation may cause disturbances to the central nervous system (CNS) with headache, fatigue, narcosis, drowsiness, and dizziness. Animal studies confirm additional CNS effects with restlessness, loss of muscular coordination, skeletal muscle paralysis, severe to mild cyanosis, kidney and liver damage, respiratory depression, coma, and death. There can also be irritation of the eyes, nose, throat, and respiratory system and changes to the senses of smell and taste. Animal studies have also produced cardiovascular disorders and depression of the hematopoietic system.

Skin contact may produce no significant or apparent irritation on brief exposure. However, prolonged or repeated contact may cause mild to severe irritation.

Ingestion may result in unspecified gastrointestinal and respiratory effects. Systemic poisoning is extremely possible with symptoms similar to that of inhalation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl mercaptan:

Skin: Mild to moderate irritation on prolonged exposure to the liquid.

Eye: Mild to severe conjunctival irritation in contact with the liquid or vapor.

Lung: Severe irritation to respiratory tract. Absorption through the respiration process appears to cause a variety of adverse effects to the central nervous system.

CNS: A depressant of the central nervous system causing a variety of toxic effects including drowsiness, coma, and death.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethyl mercaptan and can last for months or even years:

Cancer Hazards: There is little human data on the effects of long-term exposure to ethyl mercaptan. There are no reports of carcinogenic or mutagenic occurrences in humans or test animals resulting from exposure to ethyl mercaptan.

Reproductive Hazard: There are no reports to substantiate claims of teratogenicity resulting from exposure to ethyl mercaptan.

Other Chronic Effects: Chronic exposures may produce changes in taste and smell. Animal studies have

shown disorders of the cardiovascular system and depression of the hematopoietic (blood-forming) system.

🕒 **Recommended Risk-Reduction Measures**

Information on the specific human toxicity of ethyl mercaptan is limited in the references. Personnel should avoid direct contact with ethyl mercaptan. If a less toxic material or compound cannot be substituted for ethyl mercaptan, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of ethyl mercaptan release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around ethyl mercaptan. The OSHA permissible exposure ceiling for this chemical is relatively low (10 ppm) and the specific human toxicity is not clear. An air-purifying respirator may suffice for low-level exposures. However, best protection is provided using an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. Skin contact must be avoided. To prevent hand and skin exposures, rubber or other non-permeable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl mercaptan.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where ethyl mercaptan is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical test is recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Liver, kidney, and lung function tests.
- Complete evaluation of the central nervous system.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ethyl mercaptan and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl mercaptan should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ethyl mercaptan, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by ethyl mercaptan should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to ethyl mercaptan.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ethyl mercaptan. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Ethyl mercaptan is Class IA flammable liquid (per OSHA 29 CFR 1910.106). It is extremely volatile and presents a serious risk of fire and/or explosion. It will form dangerous (explosive) mixtures in air. It is incompatible with oxidizers and reacts violently with calcium hypochlorite on contact. Therefore, caution is always required in handling, storage, transportation, and disposal of ethyl mercaptan. When heated to decomposition it emits very acrid and irritating smoke and fumes of sulfur oxides. Emergency responders,

hazardous materials personnel, and firefighters should be made aware of the presence of ethyl mercaptan at any emergency response situation.

Ethyl mercaptan may enter the environment through industrial effluents and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl mercaptan.

This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the acute (short-term) effects of ethyl mercaptan to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the chronic (long-term) effects of ethyl mercaptan on aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ethyl mercaptan is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Ethyl mercaptan is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Insufficient data are available to evaluate or predict the bioaccumulation characteristics of ethyl mercaptan in the edible tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ethyl mercaptan into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl mercaptan should be segregated from other chemicals to minimize the risk of cross-contamination. Ethyl mercaptan must be stored to avoid contact with strong oxidizers, such as chlorine and bromine, since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat and direct sunlight.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If ethyl mercaptan should contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble in water and total remediation may or may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl mercaptan.

If ethyl mercaptan is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact and use only non-sparking tools.
- ☑ Absorb spilled liquids with vermiculite, dry sand, or a similar material and deposit in sealed drum for disposal.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ It may be necessary to dispose of ethyl mercaptan as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS *General Assessment*

Accidents or mishaps involving ethyl mercaptan can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Use full protective clothing and self-contained breathing apparatus (SCBA). Fight fire from maximum distance if possible. Move containers from fire area if it can be done without risk. Otherwise, use water spray to cool sides of exposed containers. Do NOT release runoff from fire control methods to sewers or waterways.

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Do not attempt to extinguish fire unless liquid flow can be stopped first. Aqueous solutions are flammable unless diluted extensively. This chemical presents a vapor explosion hazard indoors, outdoors, and in sewers.

SECTION V - REACTIVITY DATA

| | | |
|---------------------------------|----------------------------|--|
| Stability | | Conditions to Avoid Ethylmorpholine is stable at room temperature in closed containers under normal conditions of handling and storage. Avoid contact with incompatible materials. Keep away from heat and ignition sources. |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reacts with strong oxidizers (such as chlorine, fluorine, and bromine), and strong acids (including nitric, sulfuric, and hydrochloric). |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethylmorpholine is not expected to occur. |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating fumes and vapors are produced when ethylmorpholine is heated to decomposition. These include oxides of carbon and nitrogen, and ammonia gas. |

SECTION VI - HEALTH HAZARD DATA

| | | | |
|-----------------------------------|-------------------------|--------------------------------|------------------------|
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X |
|-----------------------------------|-------------------------|--------------------------------|------------------------|

Health Hazards

INHALATION: Symptoms of respiratory tract irritation (also, eyes, nose, and throat) and drowsiness. There may be olfactory fatigue, corneal edema (eye swelling) with “halos” appearing around lights, and blurred vision or blue-gray vision.

ABSORPTION: Minor irritation on contact. Will pass through intact skin to cause toxic systemic effects similar to those of inhalation.

INGESTION: May cause gastrointestinal tract irritation.

| | | | | |
|---|-------------|---------------------------|---------------------------------------|--|
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Eyes, skin, respiratory system. |

Medical Conditions Generally Aggravated by Exposure

Chronic respiratory system problems and/or eye disorders may be affected.

Emergency and First-aid Procedures

Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. **Skin contact:** Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. **Seek medical assistance. For inhalation:** Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. **If swallowed:** Call the poison control center and seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water to dilute. Do NOT induce vomiting. Never attempt to give an unconscious or convulsing person anything by mouth.

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled

Use water spray to dilute spill to non-flammable mixture. Absorb in vermiculite or other material, collect using non-sparking tools, and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area.

Preferred Waste Disposal Method

Incinerate in a combustible chamber equipped with an appropriate effluent gas cleaning device.

Precautions to be Taken in Handling and Storage

Do not store ethylmorpholine in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool (below room temperature), well-ventilated area. Protect containers from physical damage. Storage under an inert atmosphere (such as nitrogen) is highly recommended.

Other Precautions and Warnings

Recommend explosion proof design for bulk storage facilities. Electrically ground and bond equipment, especially during transfer operations. Detached facility storage is recommended.

SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT

Respiratory Protection (*specify type*)

For low exposures, use an organic vapor respirator. Otherwise, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode.

Ventilation

Local exhaust or general mechanical systems recommended.

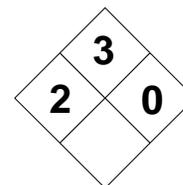

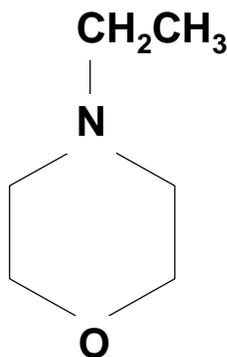

| | | |
|--|--|--|
| Protective Gloves Impervious Butyl Rubber Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron |
|--|--|--|

Work/Hygiene Practices

Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals.

ETHYLMORPHOLINE

CAS: 100-74-3

**IDENTIFICATION AND TYPICAL USES**

Ethylmorpholine is a colorless or clear liquid with a strong, ammonia-like odor. It is used as an intermediate for dyestuffs and in pharmaceuticals; in rubber accelerators and emulsifying agents; as a solvent for dyes resins, and oils; and as a catalyst in making polyurethane foams.

RISK ASSESSMENT: HEALTH**General Assessment**

Ethylmorpholine is a mildly toxic compound by *inhalation*, *ingestion*, and by skin *absorption*. Its primary health risk is due its irritating properties and the fact that exposure can occur simultaneously by more than one route. When this occurs, it compounds the health effects of exposure. Its carcinogenicity, teratogenicity, or mutagenicity have not been established. Ethylmorpholine is primarily a skin and eye irritant.

Inhalation causes irritation of the eyes, nose, throat, and respiratory tract. Inhalation may cause olfactory fatigue making exposure awareness difficult. It causes corneal edema (swelling of the eyes), visual disturbances, including blurred vision, blue-gray vision, and/or colored halos appearing around lights.

Ethylmorpholine is a skin irritant and prolonged contact may cause a rash to develop. It will pass through intact skin to cause toxic systemic effects. Skin absorption can compound the effects of exposure by other routes (e.g., inhalation).

Ingestion of this compound causes irritation of the mouth and esophagus as well as other unspecified gastrointestinal effects. Ethylmorpholine is considered a poison.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethylmorpholine:

Skin: Irritation with possible redness and rash. It will pass through intact skin.

Eye: Severe irritation, swelling (corneal edema), with blurred vision, blue-gray vision, and colored halos appearing around lights.

Lung: Irritation causing coughing and/or shortness of breath. May cause olfactory changes (numbing of the sense of smell).

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethylmorpholine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, ethylmorpholine has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, ethylmorpholine has not been adequately tested for its ability to adversely affect reproduction in test animals.

Sensitivity: Prolonged skin contact to low levels may result in chronic skin rash.

🛡 Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical re-

lease. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethylmorpholine. For relatively low, infrequent, or transient exposures, an organic vapor respirator may suffice. For higher or prolonged exposure, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethylmorpholine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethylmorpholine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- ☑ Lung function tests (establish a baseline).
- ☑ Visual acuity testing (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests (compare to baseline).
- ☑ Visual acuity testing (compare to baseline).
- ☑ Evaluation by a qualified allergist, including careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart diseases, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent

risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ethylmorpholine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethylmorpholine should be communicated to all potentially exposed workers.
- ☑ Work clothing contaminated with ethylmorpholine should never be worn home where family members can be exposed. Also, clothing soaked with ethylmorpholine presents a serious fire hazard. Contaminated clothing should be laundered by personnel who have been briefed on the hazards of exposure to ethylmorpholine.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of ethylmorpholine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethylmorpholine is considered a Class IC flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and its boiling point make it a serious and dangerous fire and explosion risk. It can react with many common acids and many oxidizers to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of ethylmorpholine. Should ethylmorpholine ever come into contact with these incompatible substances either during use, transportation, or storage, violent reactions can occur.

Ethylmorpholine can enter the environment through industrial discharges, municipal waste treatment discharges, and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethylmorpholine.

Insufficient data are available to evaluate or predict the short-term effects of ethylmorpholine to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of ethylmorpholine to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ethylmorpholine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Insufficient data are available to evaluate or predict the ability of ethylmorpholine to persist in the environmental mediums.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become con-

centrated in the tissues and internal organs of animals as well as humans.

There is no data available on the bioaccumulation characteristics of ethylmorpholine.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethylmorpholine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.). Explosion proof design is highly recommended for all storage facility and operational equipment.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If ethylmorpholine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. It is highly soluble in water and total containment may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethylmorpholine. If ethylmorpholine is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.
- Remove all ignition sources.
- Use water spray to disperse vapors and dilute spills to non-flammable mixtures. Flush spills away from exposures. Dispose of accordingly (do not allow runoff to enter sewers or waterways. Absorb liquids with vermiculite and deposit in sealed drums for disposal.

- ☑ It may be necessary to dispose of ethylmorpholine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethylmorpholine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

ETHYL NITRITE

CAS: 109-95-5

**IDENTIFICATION AND TYPICAL USES**

Ethyl nitrite is a colorless or yellowish, clear liquid with a characteristic, sweet, rum-like odor and fruity taste. It is no longer produced commercially in the United States. It is used in preparing spirit nitrous ether, as a chemical intermediate, in organic reactions, and for synthetic flavorings.

RISK ASSESSMENT: HEALTH***General Assessment***

Ethyl nitrite is a mildly toxic compound by *inhalation* and *ingestion*. Although it is a skin irritant and can be corrosive, skin absorption has not been reported. There are no reports on its carcinogenicity, mutagenicity, or teratogenicity.

Inhalation causes irritation of the eyes, nose, throat, and respiratory tract. Inhalation may cause headache, tachycardia (rapid pulse rate), hypotension (lowered blood pressure), methemoglobinemia (lack of oxygen-carrying capacity of the blood due to the formation of methemoglobin from the oxygen-carrying pigment, hemoglobin) causing cyanosis (bluish discoloration of the skin), respiratory depression, and loss of consciousness.

Skin contact produces irritation and possible burns. Ingestion of this compound causes irritation with unspecified gastrointestinal effects. Ethyl nitrite is considered a poison.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl nitrite:

Skin: Irritation with possible burns, redness, blistering, and rash.

Eye: Severe irritation with redness and burns.

Lung: Irritation of the respiratory tract and lung tissues resulting in cough and congestion.

Other: Acute overexposure may cause rapid pulse, low blood pressure, methemoglobinemia, and loss of consciousness.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethyl nitrite and can last for months or even years:

Cancer Hazards: According to the information presented in the references, ethyl nitrite has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, ethyl nitrite has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Prolonged exposure may cause chronic methemoglobinemia (decrease in oxygen-carrying capability of the blood).

🛡 Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyl nitrite. No exposure levels have been established for this chemical.

However, this does not mean that exposure to ethyl nitrite is without risk. For the best possible protection, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl nitrite.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl nitrite is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Complete blood count and blood gas tests.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart diseases, emphysema, numerous other respiratory disorders, and interfere with the blood's oxygen-carrying capabilities, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- Always ensure that proper protective clothing is worn when using chemical substances.

- Wash thoroughly immediately after exposure to ethyl nitrite and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl nitrite should be communicated to all potentially exposed workers.
- Work clothing contaminated with ethyl nitrite should never be worn home where family members can be exposed. Also, clothing soaked with ethyl nitrite presents a serious fire hazard. Contaminated clothing should be laundered by personnel who have been briefed on the hazards of exposure to ethyl nitrite.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of ethyl nitrite. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethyl nitrite is considered a Class IA flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point and autoignition temperature make it a serious and dangerous fire and explosion risk. Its vapors are heavier than air and can travel for some distance to an ignition source to flashback and cause a fire or explosion. It can react with many common acids and many oxidizers to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of ethyl nitrite. Should ethyl nitrite ever come into contact with these incompatible substances either during use, transportation, or storage, violent reactions can occur.

Ethyl nitrite can enter the environment through industrial discharges, municipal waste treatment discharges, and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl nitrite.

Insufficient data are available to evaluate or predict the short-term effects of ethyl nitrite to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of ethyl nitrite to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ethyl nitrite is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Insufficient data are available to evaluate or predict the ability of ethyl nitrite to persist in the environmental mediums.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

There is no data available on the bioaccumulation characteristics of ethyl nitrite.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl nitrite should be segregated from incompatible chemicals to minimize the risk of cross-

contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.). Explosion proof design is highly recommended for all storage facility and operational equipment.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If ethyl nitrite should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. It is highly soluble in water and total containment may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl nitrite. If ethyl nitrite is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.
- Remove all ignition sources.
- Use water spray to disperse vapors and dilute spills to non-flammable mixtures. Flush spills away from exposures. Dispose of accordingly (do not allow runoff to enter sewers or waterways). Absorb liquids with vermiculite and deposit in sealed drums for disposal.
- It may be necessary to dispose of ethyl nitrite as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl nitrite can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention sur-

rounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| 2 | 2 | 0 | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|--|--|------------------------------------|
| Characterization Ester | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name Tetraethyl Silicate | Chemical Abstract Service (CAS) Number 78-10-4 | |
| DOT Hazard Class and Label Requirements Combustible Liquid | DOT Emergency Guide Code 29 | |
| DOT Identification Number UN 1292 | Chemical Formula (C₂H₅)₄SiO₄ | |

Synonyms

Ethyl orthosilicate; ethyl silicate (condensed); tetraethoxysilane; tetraethyl orthosilicate (TEOS); tetratethyl silicate; silicic acid tetraethyl ester.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|--|---|--|
| Ethyl silicate (derivation: From absolute alcohol and silicon tetrachloride). 1 ppm = 8.66 mg/m³ | PEL: 100 ppm 850 mg/m³ STEL: Not Established | REL: 10 ppm 85 mg/m³ STEL: Not Established | 700 ppm | TLV: 10 ppm 85 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 336°F (169°C) | Specific Gravity (H ₂ O = 1) 0.93 |
| Vapor Pressure (mm Hg) 1at 63°F (17°C) | Molecular Weight 208.3 |
| Vapor Density (Air = 1) 7.22 | Melting Point -107°F (-77°C) |

Solubility

Decomposes in water (hydrolyzed to an adhesive form of silica). Miscible with alcohol.

Appearance and Odor

Colorless liquid with a mild, sweet, alcohol-like odor. Odor Threshold = 85 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 99°F (37°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.3% UEL: 23% |
| NFPA Classification Class IA Flammable Liquid | Autoignition Temperature Not Determined |

Extinguishing Media

Use foams, carbon dioxide, water spray, or dry chemical.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Use full protective clothing and self-contained breathing apparatus (SCBA). Fight fire from maximum distance if possible. Move containers from fire area if it can be done without risk. Do NOT release runoff from fire control methods to sewers or waterways.

Unusual Fire and Explosion Hazards

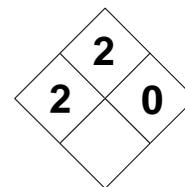

Ethyl silicate can form potentially explosive mixtures in air (note its wide flammability range). Vapors are heavier than air and can travel for some distance to an ignition source and flashback to cause fire or explosion. This chemical presents a vapor explosion hazard indoors, outdoors, and in sewers.

SECTION V - REACTIVITY DATA

| | | | | |
|--|----------------------------|--|--|---|
| Stability | | Conditions to Avoid Ethyl silicate is normally stable at room temperature in closed containers under normal storage and handling conditions. Avoid contact with incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reacts dangerously with strong oxidizers (such as chlorine, bromine, and fluorine), and will decompose to form a silicone adhesive (a milky-white mass) on contact with water. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethyl silicate is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating fumes and vapors are produced when ethyl silicate is heated to decomposition. These include oxides of carbon (dioxide and monoxide) and various silicon compounds. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Symptoms of eyes, nose, and respiratory tract irritation and may cause pulmonary, liver, and kidney damage. There could be shortness of breath, wheezing, and coughing. It is narcotic in high concentrations causing tremors and other unspecified effects. Exposure may also cause anemia and pulmonary edema (fluid in lungs). SKIN & EYES: Irritation on skin contact. Will cause contact dermatitis and redness. Severe irritation to the eyes causing tearing, redness, and swelling. INGESTION: May cause gastrointestinal tract irritation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, liver, kidneys, respiratory system, blood. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts water (15 minutes). Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 48 hours for lung effects. If swallowed: Give 1-2 glasses of water and induce vomiting until vomitus is clear. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Use self-contained breathing apparatus (SCBA). Absorb in vermiculite or other suitable material, collect using non-sparking tools, and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store ethyl silicate in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Protect containers from physical damage away from heat. Automatic transfer of liquids between containers is recommended. | | | | |
| Other Precautions and Warnings Recommend explosion proof design for bulk storage facilities. Electrically ground and bond equipment, especially during transfer operations. Detached facility storage is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposure, use an air-purifying respirator. For higher or frequent exposure, use a supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYL SILICATE

CAS: 78-10-4

**IDENTIFICATION AND TYPICAL USES**

Ethyl silicate is a colorless liquid with a mild, sweet, characteristic, alcohol-like odor. It is used for weatherproofing and acid-proofing cements, mortar, refractory bricks, and other molded objects. Also used in the manufacture of heat-resistant paints, chemical resistant paints, protective coatings for industrial buildings and castings, in lacquers, as a bonding agent, and an intermediate. It has also been used to harden stone (to prevent decay and disintegration).

RISK ASSESSMENT: HEALTH**General Assessment**

Ethyl silicate is a mildly toxic compound by *inhalation* and *ingestion*. Although it is a severe skin and eye irritant, skin absorption has not been reported. There are no reports on its carcinogenicity, mutagenicity, or teratogenicity.

Inhalation causes irritation of the eyes, nose, throat, and mucosa of the upper respiratory tract. Inhalation may cause headache, anemia, shortness of breath (dyspnea), tearing (lachrymation), coughing, and wheezing. It is considered narcotic in high concentrations causing tremors, unsteadiness, loss of consciousness, and other unspecified effects. Liver, kidney, and pulmonary damage is possible. Acute overexposure can result in the buildup of fluid in the lungs, a condition known as pulmonary edema. This is a medical emergency and can lead to death. Symptoms may be delayed up to 48 hours, creating a false sense of security with regard to health exposure risk.

Skin contact produces severe irritation, redness, drying, cracking, and possible contact dermatitis. Eye contact can cause severe irritation with redness, burning, and tearing. Ingestion nausea, vomiting, and cramps. Narcosis is also possible at high concentrations or frequent ingestion.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl silicate:

Skin: Irritation with possible burns, redness, and contact dermatitis. Causes drying and cracking that may lead to secondary infection.

Eye: Severe irritation with redness and tearing.

Lung: Irritation of the respiratory tract and lung tissues resulting in coughing, wheezing, and congestion. May cause pulmonary edema.

Other: Acute overexposure may cause narcotic effects (tremor, unsteadiness, loss of consciousness) and may cause anemia.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ethyl silicate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, ethyl silicate has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, ethyl silicate has not been adequately tested for its ability to adversely affect reproduction in test animals.

🚫 Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyl silicate. For low or infrequent exposures above the PEL (100 ppm), an air purifying respirator is suggested. For the best possible protection, however, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ethyl silicate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl silicate is used or stored.

Toxicity data on human health effects are limited in the references. However, with symptoms of narcosis, dyspnea, wheezing, and anemia, animal studies have shown lung, kidney, and liver effects.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to the delayed development of pulmonary edema).
- Evaluation by a qualified allergist with consideration of exposure history and special testing (may help diagnose skin allergy).
- Liver and kidney function tests.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart diseases, emphysema, numerous other respiratory disorders, and interfere with the blood's oxygen-carrying capabilities,

smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ethyl silicate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl silicate should be communicated to all potentially exposed workers.
- Work clothing contaminated with ethyl silicate should never be worn home where family members can be exposed. Also, clothing soaked with ethyl silicate presents a serious fire hazard. Contaminated clothing should be laundered by personnel who have been briefed on the hazards of exposure to ethyl silicate.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided in the immediate area.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of ethyl silicate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethyl silicate is considered a Class IC flammable liquid (per OSHA 29 CFR 1910.106). Its low flash point and moderate boiling point temperatures make it a dangerous fire and explosion risk. Its vapors are heavier than air and can travel for some distance to an ignition source to flashback and cause a fire or explosion. It can react with many common oxidizers to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of ethyl silicate. Should ethyl silicate ever come into contact with these incompatible substances either during use, transportation, or storage, violent reactions can occur.

Ethyl silicate can enter the environment through industrial discharges, municipal waste treatment discharges, and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl silicate.

Insufficient data are available to evaluate or predict the short-term effects of ethyl silicate to aquatic life, plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of ethyl silicate to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ethyl silicate decomposes in water (hydrolyzes to an adhesive form of silica).

⌚ *Persistence in the Environment*

Insufficient data are available to evaluate or predict the ability of ethyl silicate to persist in the environmental mediums.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat con-

taminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

There is no data available on the bioaccumulation characteristics of ethyl silicate.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl silicate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.). Explosion proof design is highly recommended for all storage facility and operational equipment.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If ethyl silicate should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. It slowly decomposes in water and total containment may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl silicate. If ethyl silicate is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.
- Remove all ignition sources.
- Absorb liquids with vermiculite and deposit in sealed drums for disposal.
- It may be necessary to dispose of ethyl silicate as a hazardous waste. The responsible state agency or the regional office of the federal Environ-

mental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ethyl silicate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Hazard Class and Label Requirements Flammable Liquid | DOT Emergency Guide Code No Citation | |
| DOT Identification Number UN 1196 | Chemical Formula C₂H₅Cl₃Si | |

Synonyms

Ethylsilicon trichloride; trichloroethylsilane; trichloroethylsilicane; ethyl silicon trichloride.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Ethyl trichlorosilane (derivation: By reaction of ethylene and trichlorosilane in the presence of a peroxide catalyst). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 208°F (99°C) | Specific Gravity (H ₂ O = 1) 1.24 |
| Vapor Pressure (mm Hg) Not Found | Molecular Weight 163.51 |
| Vapor Density (Air = 1) 5.6 | Melting Point -158°F (-106°C) |

Solubility

Insoluble in water (decomposes). Soluble in benzene, ether, heptane, and perchloroethylene. Decomposes in alcohol.

Appearance and Odor

Colorless liquid with an acrid, irritating odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) 64°F (18°C) opened cup | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Class IB Flammable Liquid | Autoignition Temperature Not Determined |

Extinguishing Media

Use dry chemical, carbon dioxide, regular foam or fog. Use water spray to cool fire-exposed containers.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Use full protective clothing and self-contained breathing apparatus (SCBA). Fight fire from maximum distance if possible. Move containers from fire area if it can be done without risk. Do NOT release runoff from fire control methods to sewers or waterways.

Unusual Fire and Explosion Hazards

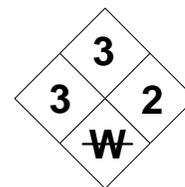

Containers may explode in fire due to excessive internal pressures caused by intense heat. Boiling liquid expanding vapor explosion (BLEVE) is likely. Immediately withdraw if rising sound is heard from venting device or there is tank discoloration due to fire. Vapors are heavier than air and can flashback.

SECTION V - REACTIVITY DATA

| Stability | | Conditions to Avoid Ethyl trichlorosilane is normally stable at room temperatures in closed containers under normal conditions of storage and handling. Avoid ignition and heat sources, water, and contact with incompatible materials. | | |
|--|--|--|------------------------------|---|
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reacts with water to release hydrochloric acid. It is also incompatible with oxidizing materials (chlorine, fluorine) and may explode on contact with some bases. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of ethyl trichlorosilane is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating fumes and vapors are produced when ethyl trichlorosilane is heated to decomposition. These include carbon dioxide, chloride, and phosgene fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the eyes, nose, and throat. Severely irritant and corrosive. Causes serious dyspnea (difficulty breathing) with swelling of the larynx. There may be serious eye and lung injury. Destruction of red blood cells is also a possibility. SKIN & EYES: Vapor and liquid can irritate skin and eyes. Liquid causes severe burns, possibly even 2nd and 3rd degree. Eye contact causes tearing, irritation, pain, and corneal damage. INGESTION: Corrosive to mouth, throat, esophagus, and digestive tract. Causes abdominal pain, intense thirst, difficulty swallowing, nausea, vomiting, shock, rapid pulse, and collapse of the circulatory system and death. Possible kidney failure, lesions on the liver and heart. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Eyes, skin, respiratory system, CVS. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts water (15 minutes). Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and administer 100% humidified oxygen. Transfer to medical facility. If swallowed: Contact poison control center and seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water. Do NOT induce vomiting. Never give an unconscious or convulsing victim anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Use water spray to disperse vapors (do not spray directly on spilled materials). Neutralize spill with crushed limestone, collect using non-sparking tools, and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, well-ventilated area. Protect containers from physical damage away from heat. Automatic transfer of liquids between containers is recommended. | | | | |
| Other Precautions and Warnings Recommend explosion proof design for bulk storage facilities. Electrically ground and bond equipment, especially during transfer operations. Detached facility storage is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure level not established. Recommend using an MSHA/NIOSH-approved supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ETHYL TRICHLOROSILANE

CAS: 115-21-9

**IDENTIFICATION AND TYPICAL USES**

Ethyl trichlorosilane is a clear, colorless liquid with an acrid odor. It is used primarily as an intermediate for silicones.

RISK ASSESSMENT: HEALTH***General Assessment***

Ethyl trichlorosilane is a highly toxic and extremely dangerous corrosive compound. It is destructive to skin tissue on contact and can pose a serious health hazard risk through *inhalation* and *ingestion*. Its carcinogenic, mutagenic, and teratogenic potential has not been adequately studied. However, because of the extremely corrosive and tissue-destroying capability of ethyl trichlorosilane, extreme caution is warranted when handling or using this material.

Inhalation causes moderate to severe irritation of the eyes, nose, and throat. It causes serious dyspnea (difficulty in breathing) with swelling of the larynx. Vapor exposure may lead to serious eye and lung injury. It is also possible that exposure will cause red blood cell destruction. Because of their extremely corrosive nature, vapors are not tolerable even at low concentrations.

Skin contact with vapors or liquids can cause severe irritation and even 2nd and 3rd degree burns. Eye contact causes irritation, pain, tearing, and corneal damage and scars.

Ingestion poses serious, even life-threatening risks. There may be corrosion of the mucous membranes in the mouth, throat, and esophagus. There will be abdominal pain, difficulty in swallowing, nausea and vomiting, intense thirst, shock with cold skin, tachycardia (rapid pulse), shallow respiration, and possible circulatory system collapse, and death. Prior to death, circulatory collapse can cause kidney failure and the development of lesions on the liver and heart.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to ethyl trichlorosilane:

Skin: Severe irritation with deep painful burns, redness, blistering, and rash.

Eye: Severe irritation with redness and burns. Corneal damage is likely on short contact.

Lung: Irritation of the respiratory tract and lung tissues resulting in possible injury.

Other: Acute overexposure, especially by ingestion, may cause rapid pulse, blood pressure changes, and circulatory system collapse.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to ethyl trichlorosilane and can last for months or even years:

Cancer Hazards: According to the information presented in the references, ethyl trichlorosilane has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, ethyl trichlorosilane has not been adequately tested for its ability to adversely affect reproduction in test animals.

🚫 *Recommended Risk-Reduction Measures*

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ethyl trichlorosilane. No exposure levels have been established for this chemical. However, this does not mean that exposure to ethyl trichlorosilane is without risk. For the best possible protection, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious butyl rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around ethyl trichlorosilane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ethyl trichlorosilane is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Complete blood count.
- Lung function tests.
- Consider chest X-ray after acute overexposure.
- Liver and kidney function tests.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart diseases, emphysema, numerous other respiratory disorders, and interfere with the blood's oxygen-carrying capabilities, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release.

If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ethyl trichlorosilane and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ethyl trichlorosilane should be communicated to all potentially exposed workers.
- Work clothing contaminated with ethyl trichlorosilane should never be worn home where family members can be exposed. Also, clothing soaked with ethyl trichlorosilane presents a serious fire hazard. Contaminated clothing should be laundered by personnel who have been briefed on the hazards of exposure to ethyl trichlorosilane.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of ethyl trichlorosilane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ethyl trichlorosilane is considered a class IB flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point and autoignition temperature make it a serious and dangerous fire and explosion risk. Its vapors are heavier than air and can travel for some distance to an ignition source to flashback and cause a fire or explosion. It can react with many oxidizers to cause a fire or explosion. It will react with water to form hydrochloric acid. These characteristics require special consid-

eration during any emergency situation involving a leak or spill of ethyl trichlorosilane. Should this chemical ever come into contact with incompatible substances either during use, transportation, or storage, violent reactions can occur.

Ethyl trichlorosilane can enter the environment through industrial discharges, municipal waste treatment discharges, and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ethyl trichlorosilane.

Insufficient data are available to evaluate or predict the short-term effects of ethyl trichlorosilane to aquatic life, plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of ethyl trichlorosilane to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ethyl trichlorosilane decomposes in water to release hydrogen chloride gas.

⌚ *Persistence in the Environment*

Insufficient data are available to evaluate or predict the ability of ethyl trichlorosilane to persist in the environmental mediums.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

There is no data available on the bioaccumulation characteristics of ethyl trichlorosilane.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or

spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ethyl trichlorosilane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.). Explosion proof design is highly recommended for all storage facility and operational equipment.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If ethyl trichlorosilane should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. It decomposes to hydrogen chloride gas and total containment may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ethyl trichlorosilane. If ethyl trichlorosilane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Stop leak if it can be done without risk. Use water spray to disperse vapors but do not allow water to directly contact spilled materials. Neutralize with crushed limestone, soda ash, or lime. Absorb small spills with vermiculite and deposit in sealed drums for disposal.
- ☑ It may be necessary to dispose of ethyl trichlorosilane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS *General Assessment*

Accidents or mishaps involving ethyl trichlorosilane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Extinguishing Media

Use agent suitable to surrounding fire. Fenthion itself will not burn.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Structural fire-fighting equipment is permeable and may not provide sufficient protection. Move containers from fire area if it can be done without risk. Cool exposed containers with water spray.

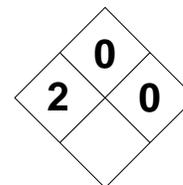

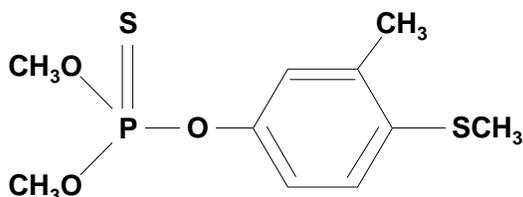

Unusual Fire and Explosion Hazards

None reported.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|--|--|--|
| Stability | | Conditions to Avoid Fenthion is thermally stable up to 410°F (210°C) and is resistant to light. Avoid contact with incompatible materials, and exposure to heat. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with oxidizers, and alkalis. Will react when exposed to excessive heat. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of fenthion is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products At high temperatures, fenthion decomposes and may produce poisonous gases, including oxides of sulfur and phosphorus. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: Symptoms of exposure include nausea and vomiting, abdominal pain, diarrhea, dizziness, fatigue, blurred vision, lachrymation (tearing), twitching and loss of muscle coordination, speech disturbances (slurring), confusion, labored breathing, convulsions, coma, and death from respiratory paralysis. There may also be tightness in chest, runny nose, and the development of pulmonary edema (fluid in the lungs). ABSORPTION: Will pass through skin and cause many of the same symptoms as inhalation. INGESTION: Causes the same systemic effects as inhalation. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? 29 CFR 1910.1000 Table Z-1-A | Target Organs? Respiratory system, CNS, CVS. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, persons with existing lung dysfunction may experience effects quicker. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. For inhalation: Remove the person from exposure. Maintain an open airway. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Call poison control center for advice. Unless advised otherwise, give 1-2 glasses of water and induce vomiting or perform gastric lavage. Never give anything by mouth to an unconscious or convulsing person. DOCTOR: The primary antidote is atropine. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Restrict those not involved in cleanup from entering area. Cleanup crew must avoid exposure by using appropriate personal protective equipment. Absorb any liquids in vermiculite or absorbent and deposit in sealed drum. Damp mop residue with a dilute alkaline solution. Ventilate area of spill. | | | | |
| Preferred Waste Disposal Method Hydrolyze with excess calcium oxide or sodium hydroxide; or, pack in 17H epoxy-lined drum and dispose of at EPA waste site; or, burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers free from moisture. Keep in cool (below 86°F/30°C), well-ventilated area. | | | | |
| Other Precautions and Warnings Keep away from heat, strong alkalis, or oxidizers. Use numerous small containers rather than large ones. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |

FENTHIONC₁₀H₁₅O₃PS₂

CAS: 55-38-9

**IDENTIFICATION AND TYPICAL USES**

Fenthion is a colorless to tan or brown liquid with a slight, garlic-like odor. It is used as an acaricide (for mite control) and an insecticide primarily for use in controlling mosquitoes. It is also used as a chemical intermediate for pharmaceuticals.

RISK ASSESSMENT: HEALTH**General Assessment**

Fenthion is a poison by *ingestion, inhalation,* and skin contact (*absorption*). It is moderately toxic to humans through all routes of exposure. Its carcinogenicity and teratogenicity have been tested and the results are inconclusive. Human mutagenic and tumorigenic data have been reported. It is known to inhibit the development of cholinesterase (an important enzyme for proper nerve function in muscle contraction and blood vessel dilation).

Symptoms from *all* routes of exposure appear to focus on action to the central nervous system. These include nausea and vomiting with abdominal cramps and pain, diarrhea, dizziness, fatigue, blurred vision, miosis, tearing (lachrymation), muscular twitching and loss of coordination, slurring of speech, confusion, salivation, headache, giddiness, vertigo, weakness, rhinitis, labored breathing (dyspnea), convulsions, coma, and death, usually from respiratory paralysis.

In addition, inhalation has been reported to cause tightness in chest, runny nose, and pulmonary edema (fluid in the lungs). The development of pulmonary edema can be delayed up to 48 hours creating a false sense of security with regard to health exposure risk.

Ingestion has been shown to cause additional symptoms of hypermotility, rapid pulse (tachycardia), vomiting, and diarrhea.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to fenthion:

Skin: No reported effects.

Eye: Possible local irritation.

Lung: Irritation of the nose and throat. High exposures may cause a delayed buildup of pulmonary edema (fluid in the lungs), which is a medical emergency and can be fatal.

CNS: Numerous effects resulting from exposure including dizziness, giddiness, blurred vision, fatigue, muscular twitching, confusion, vertigo, weakness, convulsions, and coma. Death may occur from respiratory paralysis.

Other: A cholinesterase inhibitor causing interference with nerve function and other important systemic operations.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to fenthion and can last for months or even years:

Cancer Hazards: Fenthion may be a mutagen (causes genetic changes). Such chemicals may have a cancer risk and there is limited evidence that fenthion does cause cancer in some test animals. Human carcinogenicity is unknown at this time.

Reproductive Hazard: There is some evidence that exposure to fenthion causes damage to the developing fetus in test animals. Human effects are unknown.

Other Chronic Effects: Fenthion may cause chronic cholinesterase depression. However, the data are inconclusive in this regard. Further study is required.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with fenthion. If a less toxic material or compound cannot be substituted for fenthion, then *engineering controls* are the most effective method of reducing exposures. While not feasible for outdoor operations, the best protection in manufacturing and production is to enclose operations and/or provide local exhaust ventilation at the site of fenthion release. While not always operationally possible, isolating operations involving fenthion manufacturing can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around fenthion. For low or infrequent exposures, an MSHA/NIOSH-approved respirator equipped with a pesticide cartridge may be adequate. However, the permissible exposure level (0.2 mg/m³) is extremely low and difficult to monitor. The best protection is obtained using a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, polyvinylchloride gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with fenthion.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where fenthion is used or stored.

Before beginning employment and regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Lung function tests (establish baseline).
- Determine baseline cholinesterase levels.

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- Complete neurological evaluation.
- Lung function tests (compare to baseline).
- Cholinesterase level test. Personnel showing a 25% decrease should be prevented from using fenthion.
- Consider chest X-ray after acute over exposure (may be negative if taken immediately after expo-

sure due to delayed development of pulmonary edema).

- If visual disturbances are presented, recommend using a 0.15 to 1% solution of atropine sulfate distilled in the eye.
- Cholinesterase reactivation agents, such as Toxogonin, may be effective treatment.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers may be effected more quickly and with more pronounced symptoms than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* factors which may be causing the development of exposure symptoms in the work force.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to fenthion and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. When taken for use outdoors, proper labeling and warning information should be sent with it. In addition, as part of an on-going education and training program, all information on the health and safety hazards of fenthion should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to fenthion, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by fenthion should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to fenthion.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Because of its use as an insecticide and pesticide, fenthion can be present in the environment at any given time and at a variety of levels. The environment is also at risk of exposure during transportation, storage, disposal, or destruction of fenthion. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where fenthion contacts incompatible commodities can result in the possible contamination of the surrounding environmental mediums (water, soil, and air).

Fenthion is considered a non-combustible solid. However, it is incompatible with alkalis and oxidizers and contact can cause violent reactions. Also, if involved in a fire, it will emit toxic oxides of sulfur and phosphorus. These characteristics require special consideration during any emergency situation involving a leak or spill of fenthion.

Fenthion can enter the environment from industrial and municipal discharges, through agricultural run-off, and from spills. Also, as an insecticide and pesticide, it will also be present in the environment as a result of its intended use.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to fenthion. Fenthion has moderate acute toxicity to aquatic life and birds. No data are available on the short-term effects of fenthion to plants and land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Fenthion has moderate chronic toxicity to aquatic life. No data are available to evaluate or predict the long-term effects of fenthion to plants, birds, or land animals.

💧 *Water Solubility*

Fenthion is very slightly soluble (practically insoluble) in water. Concentrations of less than 1 milligram will mix with a liter of water.

⌚ *Persistence in the Environment*

Fenthion is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 97% of fenthion will eventually end up in water; approximately 1.5% will end up in terrestrial soil and aquatic sediments. Hydrolysis is quicker in warm water containing large quantities of microorganisms.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of fenthion found in fish tissues is expected to be somewhat higher than the average concentration of fenthion in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of fenthion dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of fenthion should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Proper ventilation and protective equipment should be used while handling or using fenthion.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If fenthion should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is only slightly soluble in water and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of fenthion. If

fenthion powder is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Absorb liquids in vermiculite or other material and place in sealed drum for disposal or reclamation. Damp mop any residue with a dilute alkaline solution.
- ☑ It may be necessary to dispose of fenthion as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving fenthion can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

FERBAM[(CH₃)₂NCSS]₃Fe

CAS: 14484-64-1

**IDENTIFICATION AND TYPICAL USES**

Ferbam is a dark brown or black, odorless solid. It may be mixed in solution and used as a spray. Used as a fungicide to control scab and rust diseases.

RISK ASSESSMENT: HEALTH**General Assessment**

Ferbam is an irritant by *inhalation* and is considered moderately toxic by *ingestion*. Skin contact also presents a contact hazard. Its carcinogenicity and teratogenicity are not clearly understood in the references. Animal mutagenic and tumorigenic data have been reported.

Inhalation causes irritation of the eyes, nose, throat, and respiratory tract. There is some indication that exposure can cause central nervous system (CNS) depression in test animals and it is expected that severe exposure may have this effect in humans. Symptoms may include drowsiness, headache, fatigue, and other unspecified effects.

Skin contact is irritating and may cause contact dermatitis in some individuals. Eye contact can cause irritation and, if not removed immediately, inflammation and redness. Ingestion causes gastrointestinal irritation and other related effects (possible nausea, stomach cramps, vomiting).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ferbam:

Skin: Irritation, rash, and possible dermatitis in some individuals.

Eye: Irritation and inflammation.

Lung: Irritation of the nose, throat, and lungs.

CNS: A CNS depressant in test animals. Numerous effects resulting from exposure may include dizziness, fatigue, muscular twitching, confusion, vertigo, weakness, convulsions, and coma.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ferbam and can last for months or even years:

Cancer Hazards: Ferbam may be a mutagen (causes genetic changes). Such chemicals may have a cancer risk and there is limited evidence that ferbam does cause cancer in some test animals. Human carcinogenicity is unknown at this time.

Reproductive Hazard: There is some evidence that exposure to ferbam cause damage to the developing fetus in test animals. Human teratogenicity is unknown.

Other Chronic Effects: Long-term exposures may lead to chronic dermatitis in some individuals.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with ferbam. If a less toxic material or compound cannot be substituted for ferbam, then *engineering controls* are the most effective method of reducing exposures. While not feasible for outdoor operations, the best protection in manufacturing and production is to enclose operations and/or provide local exhaust ventilation at the site of ferbam release. While not always operationally possible, isolating operations involving ferbam manufacturing can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ferbam. For low or infrequent exposures over the PEL (15 mg/m³ for total dusts or 5 mg/m³ for respirable

fraction), an organic vapor respirator equipped with a dust/mist pre-filter may be adequate. For higher exposures or when the exposure level is unknown (as in an emergency, for example), the best protection is obtained using a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, polyvinylchloride gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ferbam.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ferbam is used or stored.

Before beginning employment and regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- Lung function tests (compare to baseline).
- Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers may be effected more quickly and with more pronounced symptoms than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* factors which may be causing the development of exposure symptoms in the work force.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ferbam and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. When taken for use outdoors, proper labeling and warning information should be sent with it. In addition, as part of an ongoing education and training program, all information on the health and safety hazards of ferbam should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ferbam, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by ferbam should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to ferbam.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Because of its use as a fungicide, ferbam can be present in the environment at any given time and at a variety of levels. However, the environment is also at risk of exposure during transportation, storage, disposal, or destruction of ferbam. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where ferbam contacts incompatible commodities can result in the possible contamination of the surrounding environmental mediums (water, soil, and air).

Ferbam is considered a combustible solid and will also support the combustion of other combustible materials in a fire. In powdered form, it can form an explosive mixture in air. It is incompatible with oxidizers, such as chlorine, bromine, and fluorine, and contact can cause violent reactions. Also, if involved in a fire, it will emit toxic oxides of sulfur and nitrogen oxides and carbon monoxide. These characteristics require special consideration during any emergency situation involving a leak or spill of ferbam.

Ferbam can enter the environment from industrial and municipal discharges, through agricultural run-off, and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ferbam.

Insufficient data are available to evaluate or predict the short-term (acute) effects of ferbam to aquatic life, birds, plants, and land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term (chronic) effects of ferbam to aquatic life, birds, plants, and land animals.

💧 *Water Solubility*

Ferbam is nearly insoluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

🕒 *Persistence in the Environment*

Ferbam is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

There is no information on the bioaccumulation properties of ferbam in the edible tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ferbam dusts or powders into the environment. The correct use labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ferbam should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Proper ventilation and protective equipment should be used while handling or using ferbam.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If ferbam should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is nearly insoluble in water and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ferbam. If ferbam powder is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in safest and most convenient manner possible. Do NOT dry sweep (generates dusts). Use vacuum equipped with a high-efficiency particulate air filter instead. Damp mop residue. Absorb any liquid spills containing ferbam solution in vermiculite or other material and place in sealed drum for disposal or reclamation.
- ☑ It may be necessary to dispose of ferbam as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ferbam can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits as well as a loss of current and future business potential.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and mucous membrane of the respiratory tract. There may be death due to glottis spasms and/or suffocation. Can cause chemical pneumonitis and pulmonary edema (fluid in the lungs) which can cause death. SKIN & EYES: Contact with the eyes can cause localized discoloration (brown) of the conjunctiva along with irritation and pain. Skin contact causes irritation and destruction of tissue. INGESTION: Irritation of the mouth and stomach with abdominal pain, vomiting, nausea, diarrhea, rapid and weak pulse, low blood pressure, cyanosis, secondary shock, and coma. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1-A | Target Organs? Respiratory system, eyes, skin, kidneys, liver. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Rinse area with sodium bicarbonate. | | | | |
| Preferred Waste Disposal Method Precipitate as the sulfide, adjust the pH to neutral, filter insolubles, and dispose as hazardous waste. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from incompatibles. Protect against physical damage. Discard solutions that become cloudy. Store small quantities in polyethylene bottles. Keep tightly closed. If polyethylene is not available, use glass and refrigerate. The solution may leach alkali from the glass and form a yellow ferric oxide precipitate. | | | | |
| Other Precautions and Warnings Store large quantities in rubber-lined steel tanks or fiberglass reinforced polyester tanks. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures below the PEL, use a full mask respirator with organic vapor cartridge. For all other exposures, use supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Polycarbonate or Butyl Rubber | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FERRIC CHLORIDE SOLUTIONFeCl₃

CAS: 7705-08-0

**IDENTIFICATION AND TYPICAL USES**

Ferric chloride solution is a greenish-black liquid with a slight hydrochloric acid odor. It is used primarily in the treatment of sewage and industrial wastes. It is also used as an etching agent for engraving, in photography, and in printed circuitry. It is a condensation catalyst in Friedel-Crafts reactions; a mordant, an oxidizing, chlorinating, and condensing agent; a disinfectant; a pigment; a feed additive; and is used in water purification.

RISK ASSESSMENT: HEALTH**General Assessment**

Exposure to ferric chloride solution is possible through *inhalation* of its vapors or by direct *ingestion* of the liquid. The latter presents the most serious risks to human health. While skin absorption has not been reported, skin contact can result in localized irritation and should be avoided. There are no data on its carcinogenic or teratogenic properties. Mutation data (causes genetic changes) have been reported in test animals. This does not mean that it will cause the same reaction in humans. More study is required in this regard.

Inhalation can cause headache and nausea with irritation to the eyes, nose, and throat. Inhalation of vapors can be fatal as a result of spasm of the glottis and suffocation. High-level exposures may lead to chemical pneumonia and pulmonary edema (fluid in the lungs) which can also be fatal. Development of pulmonary edema may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk.

Skin and eye contact is irritating. Prolonged contact with the eyes can cause a brownish discoloration of the conjunctiva.

Ingestion of ferric chloride solution will cause moderate to severe irritation of the mouth and stomach. Symptoms may appear up to an hour after inges-

tion and include abdominal pain and discomfort, vomiting and nausea, diarrhea, weak and rapid pulse, hypotension (decreased blood pressure), cyanosis (bluish discoloration of the fingers, toes, lips, and skin surface due to lack of oxygen in blood), secondary shock, and coma. The exact type and degree of these symptoms are largely dependent upon the percentage of ferric chloride solution contained in the swallowed solution.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ferric chloride solution:

Skin: Localized surface irritation.

Eye: Severe irritation; may cause brownish discoloration of the conjunctival tissues.

Lung: Irritation of the nose, throat, and lungs following exposure. Pulmonary edema is possible (24 to 48 hours following a high exposure).

Other: Ingestion can cause a variety of gastrointestinal and systemic effects up to and including loss of consciousness and even death.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ferric chloride solution and can last for months or even years:

Cancer Hazards: Ferric chloride solution may cause mutations (genetic changes) in living cells. There are no data on its carcinogenicity.

Reproductive Hazard: According to the information available in the references, ferric chloride solution has not been adequately tested for its ability to adversely affect the reproductive process in test animals.

Other Chronic Effects: There are no reports on chronic effects resulting from exposure to ferric chloride solution in humans or in test animals.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ferric chloride solution. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ferric chloride solution. The permissible exposure level (PEL) for this chemical is extremely low (1 mg/m^3) and difficult to monitor. An air purifying respirator may suffice. However, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode would provide optimum respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber or polycarbonate gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ferric chloride solution.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ferric chloride solution is used or stored.

For those personnel with frequent or potentially high exposure (half the PEL or greater), the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- ☑ Lung function tests.
- ☑ Consider chest X-ray after acute overexposure (results may be negative if taken immediately after exposure due to delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, symptoms of exposure to ferric chloride solution may be more pronounced in smokers than in non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible exposure factors.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ferric chloride solution and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ferric chloride solution should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ferric chloride solution, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of ferric chloride solution.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ferric chloride solution. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ferric chloride solution is considered a non-combustible liquid. However, it is corrosive to many metals and can react vigorously with allyl chloride, potassium, ethylene oxide, nylon, alkalis, and many oxidizers and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of ferric chloride solution. Should ferric chloride solution ever come into contact with these incompatible either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for ferric chloride solution waste is to precipitate as sulfide, adjust the pH to neutral, filter the insoluble materials and dispose of at a hazardous waste site. Excess sulfide is destroyed using sodium hypochlorite and neutralized before flushing to drain.

Ferric chloride solution can enter the environment mainly through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ferric chloride.

There is insufficient evidence to evaluate or predict the short-term effects of ferric chloride solution to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

There is insufficient evidence to evaluate or predict the long-term effects of ferric chloride solution to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ferric chloride solution is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Ferric chloride solution is highly persistent in water, with a half-life of more than 200 days. The half-life

of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ferric chloride found in fish tissues is expected to be about the same as the average concentration of ferric chloride in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ferric chloride solution should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Small quantities can be stored in polyethylene bottles. If polyethylene is not available, then glass bottles will suffice but they must be refrigerated. The solution may leach alkali from the glass to form a yellow ferric oxide precipitate. Large quantities should be kept in rubber-lined steel tanks or fiberglass reinforced polyester tanks.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ferric chloride solution should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ferric chloride solution. If ferric chloride solution is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Neutralize with agricultural lime or crushed limestone if landfill disposal is being considered. Rinse area with sodium bicarbonate or soda ash solution. Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of ferric chloride solution as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ferric chloride solution can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any safety or emergency response procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Ferric chloride anhydrous (derivation: By the action of chlorine on ferrous sulfate or chloride). | PEL: 1 mg(Fe)/m³ (soluble iron salts) STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: 1 mg(Fe)/m³ (soluble iron salts) STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|---|
| Boiling Point 606°F (319°C) | Specific Gravity (H ₂ O = 1) 2.8 |
| Vapor Pressure (mm Hg) 40 at 69°F (20°C) | Molecular Weight 162.2 |
| Vapor Density (Air = 1) 5.6 | Melting Point 558°F (292°C) |

Solubility

Soluble in water, alcohol, acetone, ether, and glycerol. Slightly soluble in carbon disulfide.

Appearance and Odor

Black-to-brown solid hexagonal leaflets or plates, turning red to green when exposed to light. Odorless.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Non-Combustible | Explosive Limits in Air % by Volume LEL: Not Applicable UEL: Not Applicable |
| NFPA Classification Non-Combustible Solid | Autoignition Temperature Non-Combustible |

Extinguishing Media

Use extinguishing media suitable to surrounding fire. Ferric chloride is non-combustible.

Special Fire Fighting Procedures

Toxic and poisonous gases and fumes are produced in fire. Structural fire-fighting clothing may not provide adequate protection. Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Very hygroscopic, prevent water used in fire-fighting activities from contacting material.

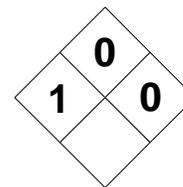

Unusual Fire and Explosion Hazards

Irritating hydrogen chloride fumes and other gases are formed in fires. Firefighters should avoid contact with vapors produced during fire.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|--|---|--|
| Stability | | Conditions to Avoid Ferric chloride is normally stable in closed (airtight) containers under normal conditions of storage and handling. Avoid contact with incompatible materials and heat. Keep cool and dry. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Keep away water, moisture, and steam (may soften the solid and eventually dissolve it). Incompatible with allyl chloride, potassium, sodium, ethylene oxide, nylon, alkalis, and most oxidizers. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, ferric chloride (anhydrous) is not expected to undergo hazardous polymerization. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, ferric chloride can emit highly toxic/poisonous gases, including ferrous chloride and chloride gas. Solutions can emit toxic hydrogen chloride gas. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Irritation of the eyes, nose, throat, and mucous membrane of the respiratory tract. There may death due to glottis spasms and/or suffocation. Can cause chemical pneumonitis and pulmonary edema (fluid in the lungs) which can cause death. | | | | |
| SKIN & EYES: Contact with the eyes can cause localized discoloration (brown) of the conjunctiva along with irritation and pain. Skin contact with dusts or solution causes irritation. | | | | |
| INGESTION: Irritation of the mouth and stomach with abdominal pain, vomiting of blood, nausea, diarrhea, rapid & weak pulse, low blood pressure, cyanosis, secondary shock, and coma. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1-A | Respiratory system, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Collect dusts in safest manner possible and deposit in sealed containers. Do NOT dry sweep, use HEPA vacuum instead. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method | | | | |
| No Citation. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store in tightly closed containers in cool, well-ventilated area away from incompatibles. Protect against physical damage. Keep away from all forms of water (moisture, steam) since ferric chloride will almost completely dissolve in water. Keep storage facilities airtight to prevent condensation inside containers. | | | | |
| Other Precautions and Warnings | | | | |
| Test drums containing ferric chloride for hydrogen chloride gas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For exposures below the PEL, use a full mask respirator with dust pre-filter. For all other exposures, use supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a full face-piece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Polycarbonate or Butyl Rubber | | Chemical/Dust Goggles or Face Mask | | Rubber Apron |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FERRIC CHLORIDE ANHYDROUSCl₃Fe

CAS: 7705-08-0

**IDENTIFICATION AND TYPICAL USES**

Ferric chloride (anhydrous) appears as black-to-brown hexagonal leaflets or plates that may turn red by transmitted light or green by reflected light. There is no distinguishable odor as a solid. When mixed in solution, it may have a slight hydrochloric acid odor. It is used in photography, in the manufacture of other iron salts, as a catalyst in organic synthesis reactions, as an oxidizing agent in dye manufacturing, in the chlorination of silver and copper ores, and in purifying factory effluents and deodorizing sewage. It should not be confused with ferric chloride solution or ferrous chloride.

RISK ASSESSMENT: HEALTH***General Assessment***

Exposure to ferric chloride is possible through *inhalation* of its dusts or by direct *ingestion* of the solid material. The latter presents the most serious risks to human health. While skin absorption has not been reported, skin contact can result in localized irritation and should be avoided. There are no data on its carcinogenic or teratogenic properties. Mutation data (causes genetic changes) have been reported in test animals. This does not mean that it will cause the same reaction in humans. More study is required in this regard.

Inhalation of dusts can cause headache and nausea with irritation to the eyes, nose, and throat. Inhalation of vapors can be fatal as a result of spasm of the glottis and suffocation. High-level exposures to solutions containing ferric chloride may lead to chemical pneumonia and pulmonary edema (fluid in the lungs) which can also be fatal. Development of pulmonary edema may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk.

Skin contact is irritating and is aggravated by the presence of moisture (sweat). Prolonged contact with

the eyes can cause irritation and a possible brownish discoloration of the conjunctiva.

Ingestion of ferric chloride will cause moderate to severe irritation of the mouth and stomach. Symptoms may appear up to an hour after ingestion and include abdominal pain and discomfort, vomiting of blood, nausea, diarrhea, weak and rapid pulse, hypotension (decreased blood pressure), cyanosis (bluish discoloration of the fingers, toes, lips, and skin surface due to lack of oxygen in blood), shock, and coma.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to ferric chloride:

Skin: Localized surface irritation.

Eye: Severe irritation; may cause brownish discoloration of the conjunctival tissues.

Lung: Irritation of the nose, throat, and lungs following exposure. Pulmonary edema is possible (24 to 48 hours following a high exposure to ferric oxide solution).

Other: Ingestion can cause a variety of gastrointestinal and systemic effects up to and including loss of consciousness and even death. Excessive intake of ferric chloride may cause an increased accumulation of iron in body organs and systems such as the liver, spleen, and lymphatic system.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to ferric chloride and can last for months or even years:

Cancer Hazards: Ferric chloride anhydrous may cause mutations (genetic changes) in living cells. There are no data on its carcinogenicity.

Reproductive Hazard: According to the information available in the references, ferric chloride anhydrous has not been adequately tested for its ability to adversely affect the reproductive process in test animals.

Other Chronic Effects: Pulmonary changes (spotting and blotching of the lungs) may occur from long-term exposure to ferric chloride dusts.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ferric chloride. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ferric chloride. The permissible exposure level (PEL) for this chemical is extremely low (1 mg/m^3) and difficult to monitor. An air purifying respirator with a dust pre-filter may suffice. However, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full face-piece operated in pressure demand mode would provide optimum respiratory protection. If a full face-piece is not available, then chemical goggles should be worn to protect the eyes. Whenever a dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber or polycarbonate gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ferric chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ferric chloride is used or stored.

For those personnel with frequent or potentially high exposure (half the PEL or greater), the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- Lung function tests.

- Consider chest X-ray after acute overexposure (results may be negative if taken immediately after exposure due to delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, symptoms of exposure to ferric chloride anhydrous may be more pronounced in smokers than in non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible exposure factors.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ferric chloride anhydrous and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ferric chloride anhydrous should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ferric chloride, emergency shower facilities should also be provided in the immediate work area.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of ferric chloride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ferric chloride. In almost every scenario, the threat of envi-

ronmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ferric chloride is considered a non-combustible solid. However, it is corrosive to many metals (especially in solution) and can react vigorously with allyl chloride, potassium, ethylene oxide, nylon, alkalis, and many oxidizers and contact can cause fire or explosion. In contact with water it will nearly dissolve completely. It may emit toxic hydrogen chloride gas in the process. These characteristics require special consideration during any emergency situation involving a leak or spill of ferric chloride. Should ferric chloride ever come into contact with these incompatible either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Ferric chloride can enter the environment mainly through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ferric chloride.

There is insufficient evidence to evaluate or predict the short-term effects of ferric chloride to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

There is insufficient evidence to evaluate or predict the long-term effects of ferric chloride to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ferric chloride is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water. It will be dissolved completely in contact with water or moisture.

🕒 *Persistence in the Environment*

Ferric chloride is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is

the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ferric chloride found in fish tissues is expected to be much lower than the average concentration of ferric chloride in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ferric chloride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Exposure to any form of water (moisture, steam) can soften the material and may eventually dissolve ferric chloride.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ferric chloride should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ferric chloride. If ferric chloride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Collect solid materials in safest and most efficient manner possible. Do NOT dry sweep (generates airborne dusts). Use vacuum

equipped with high efficiency particulate air (HEPA) filter instead. Absorbed spilled solutions in vermiculite or other material and deposit in sealed containers.

- ☑ It may be necessary to dispose of ferric chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ferric chloride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any safety or emergency response procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

FERRIC NITRATEFe(NO₃)₃•9H₂O

CAS: 10421-48-4

**IDENTIFICATION AND TYPICAL USES**

Ferric nitrate appears as pale violet or grayish-white, deliquescent crystals. It is used as a dyeing mordant for buffs and blacks and in weighting silk, in tanning, as a corrosion inhibitor, and in analytical chemistry.

RISK ASSESSMENT: HEALTH***General Assessment***

Ferric nitrate is a human poison via *ingestion* and *inhalation*. It is also a strong irritant to the eyes and skin. Symptoms of inhalation include nose and throat irritation, bronchial tube inflammation causing cough and phlegm.

The most severe cases of poisoning from ferric nitrate exposure are those resulting from ingestion. The initial effects from soluble ferric compounds are those of severe gastrointestinal irritation, including nausea, vomiting and diarrhea that may be accompanied by abdominal colic, and excessive salivation. There may also be dryness, a sense of constriction of the mouth and throat, and a metallic taste. Systemic effects follow and may include repeated and often bloody vomiting; diarrhea with water and probably tar-colored feces indicating the presence of blood; dehydration, headache; fatigue and weakness; shock with pale and clammy skin; rapid and weak pulse; low blood pressure; and possible progression to acidosis, liver injury, and possible death.

Rarely, inorganic nitrates may be converted to nitrates by nitrate-reducing bacteria in the digestive tract, resulting in methemoglobinemia.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to ferric nitrate:

Skin: Severe irritation and burns, redness, and pain.

Eye: Severe irritation, redness, and pain.

Lung: Respiratory tract irritation causing cough, labored breathing, and phlegm discharge.

Other: Ingestion can cause a systemic reaction with symptoms leading to potentially fatal shock.

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to ferric nitrate and can last for months or even years:

Cancer Hazards: According to the references, ferric nitrate has not been tested for its ability to cause cancer in animals.

Reproductive Hazard: According to the references, ferric nitrate has not been tested for its ability to affect reproduction.

Other Chronic Effects: Repeated, low-level ingestion may cause a progressive weakening or degeneration of the liver.

🛡️ *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with ferric nitrate dusts, powders, or solutions. If a less toxic material or compound cannot be substituted for ferric nitrate, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of ferric nitrate dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ferric nitrate. A supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode are recommended for the greatest possible respiratory protection, especially when exposure levels are unknown (as in an emergency). However, for low or infrequent exposure, an

MSHA/NIOSH-approved full facepiece respirator with a high efficiency particulate air (HEPA) filter may be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ferric nitrate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ferric nitrate is used or stored.

Before beginning employment working with ferric nitrate, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

- Lung function test.
- Liver function test.

If symptoms develop or overexposure is suspected, the following additional tests and procedures are recommended:

- Complete blood count (CBC).
- Monitor electrolytes, blood sugar, serum iron, and iron binding (TIBC).
- Consider abdominal X-ray.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ferric nitrate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of ferric nitrate should be communicated to all potentially exposed workers.

- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ferric nitrate, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by ferric nitrate should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to ferric nitrate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ferric nitrate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where ferric nitrate contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ferric nitrate is an oxidizer. By itself, it will not burn. However, it readily facilitates the combustion of other materials. It can therefore present a moderate fire and explosion hazard. Also, because it is incompatible so many commonly encountered materials such as wood and paper, as well as other commodities, extreme caution is required in handling, storage, transportation, and disposal of ferric nitrate. These characteristics also require special consideration during any emergency situation involving a leak or spill of ferric nitrate powder or dust. Should ferric nitrate ever come into contact with incompatible substances (such as combustible materials, aluminum, or acetylene gas) either during use, transportation, storage, or disposal, violent and even explosive reactions are possible.

Ferric nitrate enter the environment from industrial and municipal waste treatment plant discharges and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ferric nitrate. Iron and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of iron or its salts to plants, birds, or land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Iron and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of iron or its salts to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Most of the iron salts are either highly or moderately soluble in water. Concentrations of 1 to 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Ferric nitrate is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of ferric nitrate persistence in the aquatic or terrestrial environments.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ferric nitrate found in fish tissues is expected to be about the same as the average concentration of ferric nitrate in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of ferric nitrate dusts or powders into the environment. The correct use of DOT labeling (per the

MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ferric nitrate should be segregated from incompatible chemicals and materials to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ferric nitrate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ferric nitrate. If ferric nitrate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using clean shovel for small spills, depositing materials in clean container. For larger spills, use a vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of ferric nitrate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ferric nitrate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage

can also result in a loss of profits and loss of current as well as future business.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.
