Cover design: Jonathan Pennell
Manufacturing: Sheri Schwartz

LIMITED WARRANTY

CRC Press warrants the physical CD-ROM enclosed herein to be free of defects in materials and workmanship for a period of thirty days from the date of purchase. If within the warranty period CRC Press receives written notification of defects in materials or workmanship, and such notification is determined by CRC Press to be correct, CRC Press will replace the defective CD-ROM.

The entire and exclusive liability and remedy for breach of this Limited Warranty shall be limited to replacement of the defective CD-ROM and shall not include or extend to any claim for or right to cover any other damages, including but not limited to, loss of profit, data, or use of the software, or special, incidental, or consequential damages or other similar claims, even if CRC Press has been specifically advised of the possibility of such damages. In no event will the liability of CRC Press for any damages to you or any other person ever exceed the lower suggested list price or actual price paid for the software, regardless of any form of the claim.

CRC Press specifically disclaims all other warranties, express or implied, including but not limited to, any implied warranty of merchantability or fitness for a particular purpose. Specifically, CRC Press makes no representation or warranty that the software is fit for any particular purpose and any implied warranty of merchantability is limited to the thirty-day duration of the Limited Warranty covering the physical CD-ROM only (and not the software) and is otherwise expressly and specifically disclaimed.

Since some states do not allow the exclusion of incidental or consequential damages, or the limitation on how long an implied warranty lasts, some of the above may not apply to you.

Library of Congress Cataloging-in-Publication Data

Vincoli, Jeffrey W.

Risk management for hazardous chemicals / Jeffrey W. Vincoli.

p. cm.

Includes bibliographical references and index.

ISBN 1-56670-200-3

1. Hazardous substances--Safety measures--Handbooks, manuals, etc.

2. Hazardous substances--Risk assessment--Handbooks, manuals, etc.

Synonyms

Ethanal; acetic aldehyde; ethylaldehyde; methyl formaldehyde.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Acetaldehyde (derivation: From oxidation of ethylene; vapor phase oxidation of ethanol, propane and butane; catalytic reaction of acetylene and water). 1 ppm = 1.83 mg/m³ | PEL: 100 ppm 180 mg/m³ STEL: 150 ppm 270 mg/m³ | REL: Not Established Possible Cancer Agent | 10,000 ppm | TLV: 100 ppm 180 mg/m³ STEL: 150 ppm 270 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|-------------------------|---------------------------|---|------------------------|
| Boiling Point | 69°F (20°C) | Specific Gravity (H ₂ O = 1) | 0.79 |
| Vapor Pressure (mm Hg) | 740 at 69°F (20°C) | Molecular Weight | 44.06 |
| Vapor Density (Air = 1) | 1.52 | Freezing Point | -190°F (-123°C) |

Solubility

Miscible (also with ether, benzene, gasoline, solvent naphtha, toluene, xylene, turpentine, and acetone).

Appearance and Odor

Colorless liquid or fuming gas (above 69°F) with a pungent, fruity odor. Odor Threshold = 0.21 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|----------------------------------|-------------------------------------|
| Flash Point (method used) | Explosive Limits in Air % by Volume |
| -36°F (-57°C) closed cup | LEL: 4.0% UEL: 60% |
| NFPA Classification | Autoignition Temperature |
| Class 1A Flammable Liquid | 347°F (175°C) |

Extinguishing Media

Carbon dioxide, dry chemical, water mist, or fog.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Heat will build pressure and may rupture closed storage containers. Keep fire-exposed containers cool with water spray. Vapors are heavier than air; they may travel a distance to cause fire.

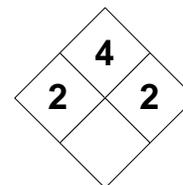

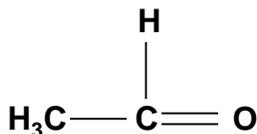

Unusual Fire and Explosion Hazards

Prolonged contact with air may cause formation of peroxides which may explode and burst containers; easily undergoes polymerization. Poisonous gases are produced in fire.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|--|--|--|
| Stability | | Conditions to Avoid Dangerous fire hazard when exposed to heat and flame; can react vigorously with oxidizing materials. Forms heat-sensitive explosive peroxides on contact with air. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, acids, bases, alcohols, ammonia and amines, phenols, ketones, hydrogen cyanide, hydrogen sulfide, acid anhydrides, and halogens. | | |
| Hazardous Polymerization | | Conditions to Avoid Contact with mineral acids (H₂SO₄, HCL, H₃PO₄) will form paraldehyde, which is toxic to humans and animals. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, acetaldehyde emits acrid, irritating smoke and fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Eye, nose, and throat irritant. Produces narcotic effects. Headache, sore throat, and paralysis of the respiratory system. High exposures can cause pulmonary edema. ABSORPTION: Skin contact can result in irritating rash or burning feeling. Can cause severe eye burns leading to permanent damage. Can result in sensitization following repeated contact. INGESTION: Central nervous system (CNS) depression. Toxic to liver and kidney. | | | | |
| Carcinogenicity Suspected Human Confirmed Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2B | OSHA Regulated? 29 CFR 1910.1000 (Table Z-1) | Target Organs? Respiratory system; skin; eyes; kidneys |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (asthma); Renal function abnormalities; Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 30 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Medical observation is recommended for 24 to 48 hours after inhalation exposure (pulmonary edema). If <u>swallowed</u>, seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Incineration. | | | | |
| Precautions to be Taken in Handling and Storage Acetaldehyde is highly volatile. Do not store with incompatible chemicals. Store in tightly closed containers in a cool, dark, well-ventilated area. Keep fire and flame away. Use non-sparking tools to open or close containers. Ground and bond all metal containers during transfer operations. | | | | |
| Other Precautions and Warnings Bulk storage of acetaldehyde is not recommended. Nitrogen or other inert gas should be used as an "inert blanket" over liquid acetaldehyde in storage containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposures below 100 ppm: MSHA/NIOSH approved full-facepiece respirator with organic vapor cartridge. Exposure above 100 ppm: Self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ACETALDEHYDECH₃CHO

CAS: 75-07-0

**IDENTIFICATION AND TYPICAL USES**

Acetaldehyde is a colorless liquid or gas with a strong fruity odor. It is used in the production of acetic acid, acetic anhydride, cellulose acetate, synthetic pyridine derivatives, pentaerythritol, terphthalic acid, and many other raw materials. It is also used in the production of perfumes, polyester resins, and dyes, and as a food preservative and flavoring agent. It is also used in silvering mirrors and in hardening gelatin fibers.

RISK ASSESSMENT: HEALTH**General Assessment**

Acetaldehyde is carcinogenic in experimental animals and is considered to be a probable human carcinogen. It is a mutagen and a suspected teratogen. Mutagens may have a cancer risk. All contact with this chemical should be reduced to the lowest possible level. Human exposure to acetaldehyde can occur through three routes of entry into the body: *inhalation*, *absorption*, and *ingestion*. Each presents a moderate level of toxicity. Absorption through the skin and direct ingestion can result in the development of conjunctivitis (inflammation of the conjunctiva tissue of the eye), central nervous system depression, eye and skin burns, and dermatitis. Large doses can be fatal. Because its metabolic structure is closely linked to that of ethanol (alcohol), exposure can result in an intoxication effect similar to that of chronic ethanol intoxication. Inhalation can result in eye, nose, and throat irritation and will produce narcotic effects. At higher concentrations, individuals may experience headache, sore throat, and, if exposure continues, paralysis of the respiratory muscles. Prolonged exposures can cause a rise in blood pressure and a decrease in red and white blood cells.

Acetaldehyde can bind to liver protein and hemoglobin. This binding probably results in an alteration of the biological functions of protein and hemoglobin, thereby contributing to the toxicity of acetaldehyde. At ambient temperatures, acetaldehyde easily polym-

erizes on exposure to mineral acids such as hydrochloric acid (HCL) to form toxic paraldehyde, which can cause respiratory depression and cardiovascular collapse. At lower temperatures, acetaldehyde can polymerize to form metaldehyde, which is toxic to the liver, kidney, and intestines.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to acetaldehyde:

- Skin:** Irritation and rash or burning sensation on contact.
- Eye:** Burns leading to permanent damage.
- Lung:** Irritation causing coughing and/or shortness of breath. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema), which is a medical emergency.
- CNS:** Inhalation of high concentrations of the vapor may cause sleepiness, dizziness, loss of consciousness, or death.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to acetaldehyde and can last for months or even years:

Cancer Hazards: Acetaldehyde causes mutations (genetic changes). Such chemicals may have a cancer or reproductive risk. There is limited evidence that acetaldehyde causes cancer in animals. Acetaldehyde may be a teratogen in humans since it has been shown to cause birth defects in animals.

Sensitivity: Exposure to the skin may result in allergy (sensitization). If such an allergy develops, very low future exposure can result in skin irritation and rash. Repeated exposure can cause chronic irritation of the eyes and lungs. It is not known if lung damage will occur over prolonged periods of exposure.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with acetaldehyde. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around acetaldehyde. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with acetaldehyde.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where acetaldehyde is used or stored.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to acetaldehyde and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of acetaldehyde should be communicated to all potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where acetaldehyde is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of acetaldehyde. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Acetaldehyde is considered a highly flammable liquid. Because of its low flash point and low boiling point, it is classified as a Class 1A flammable liquid (per OSHA 29 CFR 1910.106). Its low auto-ignition temperature and low flash point, together with its high vapor pressure make it a dangerous fire and explosion hazard. It is also susceptible to forming peroxide, which is highly unstable and can catch fire or explode with little provocation. These characteristics require special consideration during any emergency situation involving a leak or spill of acetaldehyde. Should acetaldehyde ever come into contact with incompatible substances such as oxidizers, acids, bases, alcohols, ammonia, phenols, or ketones either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible. The proper disposal/destruction method for acetaldehyde is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Acetaldehyde can enter the environment through manufacturing, unchecked discharge into effluents, and through spills.

☠ **Acute Ecological Effects**

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to acetaldehyde. This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of acetaldehyde to terrestrial animals.

🌱 **Chronic Ecological Effects**

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Acetaldehyde has high chronic toxicity in aquatic life. No data are available on the long-term effects of acetaldehyde to plants, birds, or land animals.

◆ **Water Solubility**

Acetaldehyde is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ **Persistence in the Environment**

Acetaldehyde is moderately persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Approximately 73% of acetaldehyde will eventually end up in air; the rest will end up in water.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of acetaldehyde found in fish tissues is expected to be about the same as the average concentration of acetaldehyde in water from which the fish was taken.

🛡️ **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of acetaldehyde should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If acetaldehyde should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely pos-

sible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of acetaldehyde. If acetaldehyde is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak can not be stopped in place, remove leaking cylinder to a safe place in the open air and repair or allow cylinder to empty.
- ☑ Keep acetaldehyde out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- ☑ It may be necessary to dispose of acetaldehyde as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving acetaldehyde can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in

the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| | | C₃H₆CO | | | |

Synonyms

Dimethylketone; 2-propanone; pyroacetic acid; pyroacetic ether; methyl ketone.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|--|---|--|
| Acetone (derivation: From oxidation of cumene; dehydrogenation or oxidation of isopropyl alcohol with metallic catalyst; vapor phase oxidation of butane; by-product of synthetic glycerol production). 1 ppm = 2.42 mg/m³ | PEL: 1000 ppm 2400 mg/m³ STEL: 1000 ppm 2400 mg/m³ | REL (10 hour): 245 ppm 590 mg/m³ STEL: Not Established | 20,000 ppm | TLV: 750 ppm 1815 mg/m³ STEL: 1000 ppm 2400 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|-------------------------|---------------------------|---|---------------|
| Boiling Point | 133°F (56°C) | Specific Gravity (H ₂ O = 1) | 0.79 |
| Vapor Pressure (mm Hg) | 180 at 69°F (20°C) | Molecular Weight | 58.08 |
| Vapor Density (Air = 1) | 2.00 | Freezing Point | -140°F |

Solubility

Miscible (also miscible with alcohol, ether, and chloroform).

Appearance and Odor

Colorless liquid with a fragrant, mint-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|----------------------------------|-------------------------------------|-----------------------------|
| Flash Point (method used) | 1.4°F (-17°C) closed cup | Explosive Limits in Air % by Volume | LEL: 2.5% UEL: 12.8% |
| NFPA Classification | Class 1B Flammable Liquid | Autoignition Temperature | 869°F (465°C) |

Extinguishing Media

Carbon dioxide, dry chemical, alcohol foam.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Heat will build pressure and may rupture closed storage containers. Fight fire from a distance if possible. Keep fire-exposed containers cool with water spray. Vapors are heavier than air; they may travel a distance to flashback and cause fire.

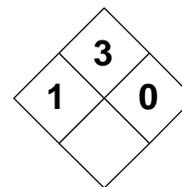

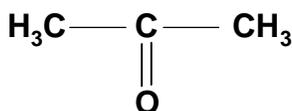

Unusual Fire and Explosion Hazards

Explodes when mixed with nitric-sulfuric acid mixture in narrow container. Violent explosion may occur when mixed with permonosulfuric acid. Poisonous gases are produced in fire.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|--|---|
| Stability | | Conditions to Avoid Do not allow acetone to come into contact with any of the incompatible chemicals listed below. Avoid contact with fire or high heat sources. Acetone is highly volatile. Do not use in confined spaces. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Nitric-sulfuric acid mixtures, oxidizers, acids, chromium trioxide, sulfuric acid-potassium dichromate; chloroform and a base (caustic soda); hydrogen peroxide; nitrosyl perchlorate; sodium hypobromate. | | |
| Hazardous Polymerization | | Conditions to Avoid Working in confined spaces or closed, poorly ventilated areas with acetone; combining with acids or oxidizers. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, acetone emits acrid, irritating smoke and fumes. Reacts to form explosive peroxide products with 2-methyl-1,3-butadiene, hydrogen peroxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| <p>INHALATION: Eye, nose, and throat irritant. Produces narcotic effects. Headache, nausea, dizziness, muscle weakness, loss of coordinated speech, drowsiness, dryness in the mouth.</p> <p>ABSORPTION: Skin contact can result in irritating rash or burning feeling. Can cause severe eye burns leading to permanent damage. Can result in sensitization following repeated contact.</p> <p>INGESTION: Headache, dizziness, dermatitis, stupor, vomiting, and possibly coma.</p> | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 (Table Z-1) | Target Organs? Respiratory system; skin; eyes; CNS. |
| Medical Conditions Generally Aggravated by Exposure | | | | |
| Respiratory function impairments (asthma, etc.); Nervous disorders; Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures | | | | |
| <p>Eye contact: Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed, seek medical attention immediately. Never try to give an unconscious person anything by mouth.</p> | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Remove all ignition sources. Restrict persons not wearing protective equipment from entering area of spill or leak until clean-up is complete. Ventilate area. Absorb liquid in dry sand or other material and deposit in sealed containers. Alert appropriate state or federal response agencies. | | | | |
| Preferred Waste Disposal Method | | | | |
| Incineration (with afterburner and scrubber). | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Acetone is highly volatile. Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from fire, sparks, and flame. Use non-sparking tools on containers. Ground and bond metal containers during transfer operations. | | | | |
| Other Precautions and Warnings | | | | |
| Bulk storage of acetone is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| Exposures above 250ppm: MSHA/NIOSH approved full-facepiece respirator with organic vapor cartridge. Greater protection is obtained from a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Solvent Resistant Butyl Rubber | Eye Protection Chemical Goggles and/or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ACETONEC₂H₆CO

CAS: 67-64-1

**IDENTIFICATION AND TYPICAL USES**

Acetone is a colorless liquid with a sweet, fragrant, mint-like odor. It is used in the manufacture of a large number of compounds, such as acetic acid, chloroform, methyl oxide, and methyl isobutyl ketone. It is also used in the manufacture of rayon, photographic films, and explosives. As a common solvent, it is found in paint and varnish removers, and for purifying paraffins. It is used as a spinning solvent to clean and dry parts of precision equipment. It is used in specification testing of vulcanized rubber products. Acetone is also used as a chemical intermediate in the production of pharmaceuticals and plastic or resin materials. Acetone is also used in the production of drugs of abuse.

RISK ASSESSMENT: HEALTH**General Assessment**

While no carcinogenic or mutagenic effects in humans have been reported, human exposure to acetone can result in harmful effects. Such exposures can occur in three ways: *inhalation*, *absorption*, and *ingestion*. Each presents a low-to-moderate level of toxicity. The acute toxicity in test animals was found to be low. Reports of human exposures show a need for some concern.

Inhalation of acetone vapors in high concentrations (above 10,000 ppm) produces dryness of the mouth and throat, dizziness, nausea, uncoordinated movements, loss of coordinated speech, drowsiness, and in extreme cases, coma. Human systemic effects from inhalation include changes in brain wave signatures (EEG), changes in carbohydrate metabolism, nasal effects, conjunctiva irritation, respiratory system effects, weakness, and vomiting.

Ingestion can result in vomiting, stupor, shallow respiration, and possibly coma. Systemic effects include kidney damage and metabolic changes. Skin or eye contact produces severe irritation and possibly damage (to eyes).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to acetone:

- Skin:** Irritation/rash or burning sensation on contact.
- Eye:** Burns which can lead to permanent damage.
- Lung:** Irritation causing coughing and/or shortness of breath. Higher exposures can cause drowsiness, headache, and, possibly, coma.
- CNS:** Inhalation of high concentrations of the vapor may cause dizziness, lightheadedness, and possible loss of consciousness.

💧 Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to acetone and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to acetone does not currently lead to carcinogenic or mutagenic effects. There are no reports to support any claims of reproductive hazards.

Sensitivity: Exposure to the skin may result in allergy (sensitization). If allergy develops, very low future exposure can result in skin irritation and rash. Repeated exposure can cause chronic irritation of the eyes and lungs.

Other Chronic Effects: High exposures over time may damage the liver and kidneys. Long-term exposures can also cause chronic nose and throat irritation.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with acetone. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release.

While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with acetone. A NIOSH-approved, full-facepiece organic vapor respirator is sufficient for low exposures. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with acetone.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where acetone is used or stored.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to acetone and at the end of the work shift or before eating, drinking, or smoking. Never wear clothes contaminated with acetone at home. Family members can be exposed.
- ☑ Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of acetone should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of acetone. In almost every scenario, the threat of environmental

exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Acetone is considered a highly flammable liquid. Because of its low flash point and relatively high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). Its low auto-ignition temperature and low flash point, together with its high vapor pressure make it a dangerous fire and explosion hazard. It is also incompatible with a number of commodities. Potentially explosive reactions can occur if acetone is mixed or comes into contact with oxidizers and/or acids. These characteristics require special consideration during any emergency involving a leak or spill of acetone.

The proper disposal/destruction method for acetone is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

Acetone can enter the environment through manufacturing, unchecked discharge into effluents from industrial or municipal waste treatment plants, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to acetone. This chemical has a slight acute toxicity to aquatic life. Acetone has caused membrane damage, size decrease, and germination decrease in various agricultural and ornamental crops. No data are available on the short-term effects of acetone on birds or land animals.

🌱* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Acetone has slight chronic toxicity in aquatic life. No data are available to evaluate the long-term effects of acetone to plants, birds, or land animals.

💧 *Water Solubility*

Acetone is highly soluble in water. Concentrations of up to a 1000 milligrams and possibly more will readily mix with a liter of water.

Persistence in the Environment

Acetone is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 50% of acetone will eventually end up in air; the rest will end up in water.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of acetone found in fish tissues is expected to be about the same as the average concentration of acetone in water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of acetone should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If acetone should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of acetone. If acetone is

spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- Keep acetone out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- It may be necessary to dispose of acetone as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving acetone can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures that deal with or address safety and health issues. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| | | X | X | X |
| Health Hazards | | | | |
| INHALATION: At high concentrations (400-500 ppm) causes asphyxia, nausea, vomiting, and tightness of chest. At lower concentrations (100 ppm), only slight adverse effect may be noted. | | | | |
| ABSORPTION: Skin contact can result in irritating rash. Can cause severe eye burns and/or irritation. Can result in sensitization following repeated contact. | | | | |
| INGESTION: Convulsions, nausea or vomiting, metabolic acidosis, gastrointestinal pain, stupor. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Human: Not tested Animal: Possible | 5th Annual Report | No | 29 CFR 1910.1000 (Table Z-1) | Kidney, liver, CNS, lungs, skin, eyes, CVS. |
| Medical Conditions Generally Aggravated by Exposure | | | | |
| Respiratory impairments, (asthma); Renal function abnormalities; Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Acetonitrile can cause fatal cyanide poisoning. If swallowed, seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by SARA III, if applicable. | | | | |
| Preferred Waste Disposal Method | | | | |
| Incineration (with after burner and scrubber). | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Acetonitrile is highly volatile. Store to avoid contact with strong oxidizers (chlorine, bromine, and fluorine). Store in tightly closed containers in cool, well-ventilated area away from heat. Drums used for storage should be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. | | | | |
| Other Precautions and Warnings | | | | |
| Bulk storage of acetonitrile is not recommended. Prior to working with acetonitrile, personnel should be trained on its proper handling and storage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For low exposures (below 100 ppm), NIOSH approved full-facepiece respirator with organic vapor cartridge. Exposures above 100 ppm: Self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |

ACETONITRILECH₃CN

CAS: 75-05-8

**IDENTIFICATION AND TYPICAL USES**

Acetonitrile is a colorless liquid with an ether-like odor. It is used as a solvent and in the making of pharmaceuticals. It is used for polymers, spinning fibers, casting and molding plastics, and HPLC analyses. It is used for extraction of butadiene and other olefins from hydrocarbon streams; in dyeing and coating textiles; in the photographic industry; in the extraction and refining of copper; and as a stabilizer for chlorinated solvents. It occurs in coal tar and forms as a by-product when acrylonitrile is manufactured. It is also used as an extractant for animal and vegetable oils and in the perfume industry.

RISK ASSESSMENT: HEALTH**General Assessment**

Acetonitrile causes headache, dizziness, and nausea. At extremely high concentrations, it can cause convulsions, coma, and death. No data exist on the chemical's carcinogenicity in humans. At high concentrations (above 500 ppm) for extended periods, there appears to be some effect on the liver and kidneys, as well as some pulmonary distress. Extremely high concentrations (above 5000 ppm) produce some teratogenic effects in experimental animals.

The toxic effects of acetonitrile are attributed to the metabolic release of cyanide, which in turn acts by inhibiting cytochrome oxidase and thus impairs cellular respiration.

Human exposure to acetonitrile can occur through three routes of entry into the body: *inhalation*, *absorption*, and *ingestion*. The toxicity of acetonitrile to human and test animals is considerably lower than that of other nitriles. However, at high concentrations, acetonitrile can produce severe adverse effects. The target organs are the kidney, liver, central nervous system (CNS), lungs, cardiovascular system (CVS), skin, and eyes. In humans, inhalation of acetonitrile vapors can result in asphyxia, nausea, vomiting, and tightness

of the chest. These effects will most likely manifest at several hours exposure to concentrations above 400 ppm. Lower concentrations result in only slight adverse effect. It is excreted in the urine as a cyanate. The blood cyanide concentration does not always show any significant increase in cyanide at low exposure concentrations. Ingestion of acetonitrile results in gastrointestinal pain, nausea, vomiting, stupor, convulsion, and weakness. These effects may become highly marked in humans from ingestion of 40-50 ml. Large doses can be fatal. Skin contact results in absorption and systemic effects. Severe eye irritation is likely.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to acetonitrile. (Note: Exposure can cause fatal cyanide poisoning. Symptoms of flushing of face, chest tightness, nausea, and vomiting, weakness, and shortness of breath may lead to death. These reactions may begin hours after an overexposure).

Skin: Irritation/rash on contact (contact dermatitis).

Eye: Severe irritation, conjunctivitis, damage.

Lung: Irritation of the nose, throat, and lungs following exposure.

CNS: Inhalation of high concentrations of the vapor may cause sleepiness, dizziness, loss of consciousness, or death.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to acetonitrile and can last for months or even years:

Cancer Hazards: According to information presented in the references, acetonitrile has not been adequately tested for its ability to cause cancer in test animals. Chronic effects of high exposures have not been documented in humans studies.

Reproductive Hazard: According to the references, acetonitrile has not been significantly tested for its ability to adversely affect reproduction. However, at high concentrations (5000-8000 ppm), some disorders were shown in axial skeletal development of hamsters.

Other Chronic Effects: Repeated exposures may affect the thyroid gland, causing enlargement. High exposures may damage the nervous system, liver, and kidneys. Very irritating substances may effect the lungs. It is not known whether acetonitrile causes permanent lung damage.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with acetonitrile. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around acetonitrile. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with acetonitrile.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where acetonitrile is used or stored.

Medical testing of personnel with frequent or potentially high exposure (half the PEL or greater), should be offered before beginning work and at regular intervals thereafter (e.g., annually). These tests should include:

- Lung function (pulmonary function) test.

If symptoms develop or overexposure is suspected, the following tests may be useful:

- Blood cyanide test and/or urine thiocyanate test (currently, a blood cyanide level over 0.1 mg/l or urine thiocyanate over 20 mg/l indicates overexposure).
- Maintain close medical surveillance. Slow release of cyanide from absorbed acetonitrile may cause delayed symptoms.
- Liver and kidney function tests.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to acetonitrile and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of acetonitrile should be communicated to all exposed or potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of acetonitrile. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Acetonitrile is considered a highly flammable liquid and a poison. Because of its low flash point and high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). Acetonitrile vapors form explosive mixtures in air. It reacts with strong oxidizers and acids, liberating heat along with pressure increase. Thus, contact with either under closed conditions can cause explosion. Metals, such as lithium, react exothermically with acetonitrile at ambient temperatures. These characteristics require special consideration during any emergency situation involving a leak or spill of acetonitrile. Should acetonitrile ever

come into contact with incompatible substances such as oxidizers, acids, oleum, chlorosulfonic acid, perchlorates, nitrating agents, indium, dinitrogen tetroxide, or N-fluoro compounds either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for acetonitrile is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Acetonitrile can enter the environment through manufacturing effluents, municipal waste treatment discharges, and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to acetonitrile.

This chemical has slight acute toxicity to aquatic life. No data are available on the short-term effects of acetonitrile to plants or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Acetonitrile has slight chronic toxicity in aquatic life. No data are available on the long-term effects of acetonitrile to plants, birds, or land animals.

💧 *Water Solubility*

Acetonitrile is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Acetonitrile is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 21% of acetonitrile will eventually end up in air; 79% will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contami-

nated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of acetonitrile found in fish tissues is expected to be about the same as the average concentration of acetonitrile in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of acetonitrile should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If acetonitrile should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of acetonitrile. If acetonitrile is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.

- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep acetonitrile out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- ☑ It may be necessary to dispose of acetonitrile as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving acetonitrile can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly effect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Synonyms 2-Propenal; 2-propen-1-one; allyl aldehyde; acrylaldehyde; acraldehyde; ethylene aldehyde; aqualin; biocide. | | |

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| Acrolein (derivation: Oxidation of allyl alcohol or propylene; by heating glycerol with magnesium sulfate; from propylene with bismuth-phosphorous-molybdenum catalyst). 1 ppm = 2.33 mg/m³ | PEL: 0.1 ppm 0.25 mg/m³ STEL: 0.3 ppm 0.80 mg/m³ | REL: 0.1 ppm 0.25 mg/m³ STEL: 0.3 ppm 0.80 mg/m³ | 2 ppm | TLV: 0.1 ppm 0.25 mg/m³ STEL: 0.3 ppm 0.80 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 127°F (53°C) | Specific Gravity (H ₂ O = 1) 0.84 |
| Vapor Pressure (mm Hg) 210 at 69°F (20°C) | Molecular Weight 56.07 |
| Vapor Density (Air = 1) 1.94 | Freezing Point -126°F |

Solubility

Moderately soluble in water (40%); readily mixes with alcohol and ether.

Appearance and Odor

Colorless or yellowish liquid with a piercing, disagreeable odor. Odor threshold = 0.16 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) -15°F (-18°C) open cup | Explosive Limits in Air % by Volume LEL: 2.8% UEL: 31% |
| NFPA Classification Class 1B Flammable Liquid | Autoignition Temperature 455°F (235°C) |

Extinguishing Media

Carbon dioxide, dry chemical, "alcohol" foam.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Dangerous fire hazard. Use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire. Vapors are heavier than air; flashback is likely.

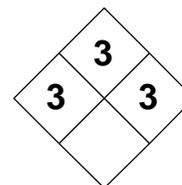

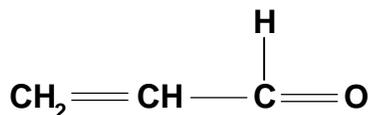

Unusual Fire and Explosion Hazards

Can react vigorously with oxidizing materials. Dangerous fire hazard when exposed to heat, flame, or oxidizers. An explosion hazard as well. Containers may explode in fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------|---|---|--|
| Stability | | Conditions to Avoid Do not use storage containers consisting of copper, zinc, or polyethylene materials as violent reaction may occur. It is unstable at elevated temperatures. Closed containers may rupture violently. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Strong oxidizers; alkaline substances such as caustic soda, amines, or ammonia. Also avoid contact with SO₂, metal salts, oxidants (light and heat), weak acid conditions, thiourea, or dimethylamine. | | |
| Hazardous Polymerization | | Conditions to Avoid Violent polymerization on contact with strong acid, strong base. Self-polymerizes at high temperatures. Polymerizes readily unless inhibited. May form shock-sensitive peroxides over time. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products Heat is liberated during polymerization. Highly toxic and irritating fumes are emitted during polymerization. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Lacrimation, delayed hypersensitivity with multiple organ involvement, and respiratory system damage. Strong nasal irritant. Severe irritant to eyes. ABSORPTION: Skin contact can result in irritating or burning rash. Can cause severe eye burns and/or irritation. Can also result in chronic respiratory disease and delayed pulmonary edema. INGESTION: If ingested, may cause acute gastrointestinal pain with pulmonary congestion. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | NSC 8819 | Group 3 | 29 CFR 1910.1000 (Table Z-1) | Eyes, respiratory system, skin, heart |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis); heart/hypertension conditions; Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 30 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Acrolein can cause pulmonary edema (fluid in the lungs), a medical emergency, hours after exposure. If swallowed, seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Controlled Incineration (with after burner and scrubber). Biodegradation using dilute NaOH. | | | | |
| Precautions to be Taken in Handling and Storage Acrolein is volatile. Store to avoid contact with strong oxidizers such as chlorine, bromine, and fluorine. Store in tightly closed containers in cool, well-ventilated area away from heat. Drums used for storage should be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. | | | | |
| Other Precautions and Warnings Bulk storage is not recommended. Personnel should be trained on proper handling and storage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures over 0.1 ppm, use MSHA/NIOSH supplied-air, full-facepiece operated in positive pressure mode or with a full facepiece, hood, or helmet in the continuous flow mode. Or, use a self-contained breathing apparatus (SCBA) in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems to ensure vapor concentration below OSHA PEL. | | | | |
| Protective Gloves Neoprene or Butyl Rubber | | Eye Protection Chemical Goggles and Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ACROLEINC₂H₃CHO

CAS: 107-02-8

**IDENTIFICATION AND TYPICAL USES**

Acrolein is a colorless or yellow liquid with a disagreeable, choking odor. It is used in the manufacture of pharmaceuticals, perfumes, food supplements, and resins; as a warning agent in methyl chloride refrigerating systems; as an anti-microbial agent to prevent the growth of microbe against plugging and corrosion; to control the aquatic weed and algae; in slime control in paper manufacturing; as a tissue fixative; and in leather tanning.

RISK ASSESSMENT: HEALTH***General Assessment***

Acrolein is a highly toxic poison compound that can severely damage the eyes and respiratory system and cause burns to the skin on contact. Ingestion can lead to acute gastrointestinal pain with pulmonary congestion.

At extremely high concentrations, *inhalation* of its vapors may cause tracheobronchitis and pulmonary edema. Exposure to concentrations as low as 0.25 ppm for as little as 5 minutes can irritate mucous membranes in humans. Fatalities can occur with exposures as low as 10 ppm. This violent effect usually prevents chronic toxicity (i.e., prolonged exposures usually prove fatal thereby eliminating nearly all potential for chronic effects through inhalation). Acrolein can be easily *absorbed* through the skin. Dermal contact may lead to chronic pulmonary edema. Prolonged or repeated skin contact usually produces irritation, burns, and sometimes sensitization. Eye splashes cause corneal damage, palpebral edema, blepharoconjunctivitis, and fibrous or purulent discharge. No data exist on the chemical's carcinogenicity in humans. However, one of its potential metabolites, glycidaldehyde, is considered to be carcinogenic. Acrolein has been found to be mutagenic to bacteria and some human mutagenic effects have been reported. It is a questionable carcinogen in both animals and humans.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to Acrolein:

- Skin:** Irritation/rash upon contact with skin (contact dermatitis).
- Eye:** Severe irritation, burn, permanent damage.
- Lung:** Irritation of the nose, throat, and lungs following exposure. Can cause coughing or shortness of breath. Higher exposures may lead to pulmonary edema, which can be fatal.
- CNS:** Inhalation of high concentrations of the vapor may cause dizziness, nausea, headaches, and, at higher concentrations, loss of consciousness, or death.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to acrolein and can last for months or even years:

Cancer Hazards: According to the references, insufficient data exist to determine the human carcinogenicity of acrolein. However, acrolein is a known mutagen and mutagens may have a cancer risk. Also, one of its known metabolites, glycidaldehyde, is considered to be carcinogenic. The chronic effects of high exposures to acrolein have not been documented in humans because long-term exposures generally prove to be fatal.

Reproductive Hazard: According to the references, there is insufficient evidence to evaluate acrolein for its ability to cause reproductive damage.

Other Chronic Effects: Acrolein may cause a skin allergy. If an allergy develops (sensitization), very low future exposures can cause itching and skin rash. Long-term exposure can cause drying and cracking of skin. Permanent lung damage can occur after a high exposure or repeated low exposures.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with acrolein. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around acrolein. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with acrolein.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where acrolein is used or stored.

Medical testing of personnel with frequent or potentially high exposure (half the PEL or greater), should be offered before beginning work and at regular intervals thereafter. These tests should include:

- ☑ Lung function test.

If symptoms develop or overexposure is suspected, the following tests may be useful:

- ☑ Evaluation by a qualified allergist, including careful exposure history and special testing.
- ☑ Maintain close medical surveillance. Pulmonary edema may result 24 to 48 hours following high exposures. A chest X-ray should be considered after acute overexposure (may be negative if taken immediately after exposure).

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to acrolein and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of acrolein should be communicated to all potentially exposed workers.

It should be noted that *mixed exposures* can significantly increase the effect of the chemical's reaction in humans. Because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, and two of the target organs of acrolein are the heart and lungs, smokers may react more severely/quickly to acrolein exposures than the non-smoker exposed to the same levels.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of acrolein. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Acrolein is considered a highly flammable liquid and a poison. Because of its low flash point and high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). Acrolein vapors form explosive mixtures in air. It reacts with strong oxidizers and acids, liberating heat along with pressure increase. Thus, contact with either under closed conditions can cause explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of acrolein.

Should acrolein ever come into contact with incompatible substances such as strong oxidizers or acids, weak acid conditions (nitrous fumes, sulfur dioxide, carbon dioxide), thiourea, or dimethylamine either during use, transportation, or storage, an extremely violent reaction may result.

The proper disposal/destruction method for acrolein is by controlled burning in an incinerator equipped with an afterburner and air scrubber. Acrolein is used commonly as an herbicide for the con-

trol of weeds in irrigation canals. It can enter the environment through its main use as an aquatic herbicide or by spills. Because of its widespread use, it occurs in the environment in both air and water. After formaldehyde, it is the second most abundant aldehyde, constituting 5% of total aldehydes in air.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to acrolein. This chemical has high acute toxicity to water plants and may be expected to adversely effect land plants. It has high acute toxicity to birds and moderate acute toxicity to land animals. A concentration of 55 ppb may be toxic to aquatic life in fresh and salt water fish. Acrolein is reported to be more toxic to aquatic life than are phenol, chloro- and nitrophenols, aniline, and *o*-xylene.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Acrolein has high chronic toxicity in aquatic life. A concentration as low as 21 ppb may produce chronic toxicity in fresh water aquatic life. No data are available on the long-term effects of acrolein to plants, birds, or land animals.

💧 *Water Solubility*

Acrolein is moderately soluble in water. Concentrations of between 1 and 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Acrolein is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 77% of acrolein will eventually end up in air; the rest will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contami-

nated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of acrolein found in fish tissues is expected to be somewhat higher than the average concentration of acrolein in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of acrolein should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Acrolein should be stored under an inert atmosphere below 100°F (38°C). Steel, ceramic, glass, Teflon, silicone rubber, and containers with baked phenolic coatings are suitable for storage.

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Clean-up should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If acrolein should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of acrolein.

If acrolein is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources from area. Use only non-sparking tools during cleanup operations
- Ventilate area of spill or leak.

- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep acrolein out of a confined space, such as a sewer, because of the possibility of explosion.
- ☑ It may be necessary to dispose of acrolein as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving acrolein can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly effect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| May Occur X | Will Not Occur | Hazardous Decomposition or By-products When heated to decomposition, acrylamide emits highly toxic fumes of NO_x. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Nervous system effects, including numbness and weakness in the hands and feet, loss of balance, slurred speech, and heavy sweating. These changes may be permanent. ABSORPTION: Skin contact can result in irritating rash. Can cause severe eye burns and/or irritation. Readily absorbed through unbroken skin. A highly toxic poison through absorption. INGESTION: Central nervous system disorders; thyroid function, muscular weakness. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | No | Group 2B | 29 CFR 1910.1000 (Table Z-1) | Lungs, eyes, skin, CNS, thyroid, reproductive sys. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Hypertension; Skin conditions; Reproductive disorders. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed, seek medical attention immediately. Time onset of symptoms may be delayed 1-24 months, depending on exposure route and degree). | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient way possible and deposit in sealed containers. Have water source available in case of fire. Restrict those not involved in clean-up from entering area. Notify appropriate authorities, as required by SARA III, if applicable. | | | | |
| Preferred Waste Disposal Method Incineration (with after burner and scrubber). | | | | |
| Precautions to be Taken in Handling and Storage Acrylamide is a combustible solid. Store to avoid contact with strong oxidizers such as chlorine, dioxide and bromine since violent reactions occur. Store in tightly closed containers in cool, well-ventilated area away from heat. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where acrylamide is used, handled, or stored. Prior to working with acrylamide, personnel should be trained on its proper handling and storage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) When potential for exposures above 0.3 mg/m³ exist, use a MSHA/NIOSH approved supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a full face piece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Neoprene | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ACRYLAMIDEC₃H₅NO

CAS: 79-06-1

**IDENTIFICATION AND TYPICAL USES**

Acrylamide is a colorless-to-white, crystalline solid material. Its uses include waterproofing; as a soil stabilizer; in the production of polymers used in paper manufacturing and flocculating processes; in grout used to repair leaking sewer pipes; and as an additive to enhance oil recovery. It is also used in the synthesis of dyes; as a cross-linking agent; in the making of adhesives; in sewage and waste treatment; and in permanent-press fabrics.

RISK ASSESSMENT: HEALTH**General Assessment**

Exposure to acrylamide results in neurological effects through systemic exposures and skin and mucous membrane irritation from local exposures. It is a confirmed carcinogen in animals and is suspected of having carcinogenic potential in humans as well. Exposure can occur by inhalation, skin absorption, and ingestion. In industry, most common route of entry is absorption, followed by inhalation, then ingestion. Known exposures in humans have resulted in symptoms which indicate involvement of the central, peripheral, and autonomic nervous systems.

Inhalation effects to the central nervous system include symptoms of intoxication such as confusion; disorientation; and hallucinations. Other symptoms include abnormal fatigue, memory difficulties, and dizziness. The effects on the peripheral nervous system include muscle weakness; numbness in feet, hands, lower legs, and lower arms; stupor; and difficulties in walking and standing. Autonomic effects include excessive sweating and difficulties in defecation. Acute exposures seem to affect the central nervous system while repeated, long-term exposures effect the peripheral nervous system.

Most exposures occur through skin *absorption*. Symptoms include local irritation and blistering. The

skin on the palms of the hands and heels of the feet may begin to peel in conjunction with a blue coloring of the hands and feet.

Time of symptom onset may vary from one to 24 months to as much as 8 years. In the work place, acrylamide is an extremely dangerous poison because it can be absorbed through unbroken skin.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to acrylamide:

- Skin: Irritation/rash or burning feeling upon contact with skin. Possible dermatitis.
- Eye: Severe irritation; may cause burns.
- Lung: Irritation of the nose, throat, and lungs following exposure.
- CNS: Inhalation of acrylamide powders may cause sleepiness, dizziness, weakness, stupor, fatigue.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to acrylamide and can last for months or even years:

Cancer Hazards: Acrylamide is a known carcinogen in experimental animals. Its carcinogenicity is considered suspect in humans. It may cause skin tumors and also tumors of the lung.

Reproductive Hazard: There is some evidence to show that exposure to acrylamide causes damage to the testes (male reproductive glands) in laboratory animals.

Other Chronic Effects: Acrylamide can cause damage to the central nervous system, peripheral nervous system, and autonomic nervous system. There may be permanent symptoms such as tingling of the hands and feet following long-term exposures.

☉ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with acrylamide. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around acrylamide. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, neoprene or butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with acrylamide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where acrylamide is used or stored.

Medical testing of personnel with frequent or potentially high exposure (half the PEL or greater or significant skin contact), should be offered before beginning work and at regular intervals thereafter. These tests should include:

- ☑ Examination of the nervous systems. Nerve conduction tests should be considered.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
- ☑ Wash thoroughly immediately after exposure to acrylamide and at the end of the work shift or before eating, drinking, or smoking.

- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of acrylamide should be communicated to all exposed or potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of acrylamide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Acrylamide is considered a combustible solid and a poison. It is incompatible with strong oxidizing agents and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of acrylamide. Should acrylamide ever come into contact with incompatible substances such as chlorine dioxide or bromine either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for acrylamide is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Acrylamide can enter the environment mainly through the effluents of industrial process, and spills.

☠ **Acute Ecological Effects**

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to acrylamide. This chemical has moderate acute toxicity to aquatic life. No data are available on the short-term effects of acrylamide to plants, birds, or land animals.

☪* **Chronic Ecological Effects**

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Acrylamide has moderate chronic toxicity in aquatic life. No data are available on the long-term effects of acrylamide to plants, birds, or land animals.

◆ **Water Solubility**

Acrylamide is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ **Persistence in the Environment**

Acrylamide is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 95% of acrylamide will eventually end up in water; the remainder will end up in air.

🌊 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of acrylamide found in fish tissues is expected to be about the same as the average concentration of acrylamide in water from which the fish was taken.

🔧 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of acrylamide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Clean-up should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and

replaced with clean soil. If acrylamide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of acrylamide.

If acrylamide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Collect powdered material in the most convenient manner possible and deposit in sealed containers. Use non-sparking tools.
- ☑ It may be necessary to dispose of acrylamide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving acrylamide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly effect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔧 **Recommended Controls for Risk-Reduction**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any safety, health, or environmental procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| 3 | 2 | 2 | ACID | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|--|--|---------------------------------|
| Characterization Acid, Carboxylic | RCRA Number U008 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Acrylic Acid | Chemical Abstract Service (CAS) Number 79-10-7 | |
| DOT Hazard Class and Label Requirements Corrosive; Corrosive, Flammable Liquid | DOT Emergency Guide Code 29 | |
| DOT Identification Number UN 2218 | Chemical Formula C₃H₄O₂ | |

Synonyms

Acroleic acid; propenoic acid; glacial acrylic acid; ethylenecarboxylic acid; vinylformic acid.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Acrylic acid (derivation: Through the condensation of ethylene oxide with hydrocyanic acid followed by reaction with sulfuric acid at 320°F; acetylene, CO, and water, with nickel catalyst). 1 ppm = 3.00 mg/m³ | PEL (skin): 10 ppm 30 mg/m³ STEL: Not Established | REL (skin): 2 ppm 6 mg/m³ STEL: Not Established | Not Established | TLV (skin): 2 ppm 6 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 286°F (141°C) | Specific Gravity (H ₂ O = 1) 1.05 |
| Vapor Pressure (mm Hg) 3 at 69°F (20°C) | Molecular Weight 72.10 |
| Vapor Density (Air = 1) 2.45 | Melting Point 55°F (13°C) |

Solubility

Very miscible. Also miscible with benzene, chloroform, alcohol, ether, acetone, and organic solvents.

Appearance and Odor

Colorless liquid with an acrid odor. Odor threshold = <1 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 130°F (54°C) closed cup | Explosive Limits in Air % by Volume LEL: 2.4% UEL: 8% |
| NFPA Classification Class II Combustible Liquid | Autoignition Temperature 774°F (360°C) |

Extinguishing Media

Carbon dioxide, dry chemical, water spray or foam.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Use water spray to flush and dilute a spill and to disperse the vapors. Also, use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire.

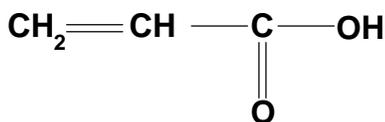

Unusual Fire and Explosion Hazards

Potentially explosive reaction with strong oxidizing compounds, especially at elevated temperatures. Containers may explode in fire. Firefighters should avoid contact with vapors produced during fire.

| SECTION V - REACTIVITY DATA | | | | |
|---|--------------------------|--|---|--|
| Stability | | Conditions to Avoid Reacts with strong oxidizers. Contact in a closed container can cause rupture of the container. A serious fire hazard when exposed to heat or flame. It is corrosive to many materials. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, amines, alkalis, ammonium hydroxide, chlorosulfonic acid, oleum, ethylene diamine, ethyleneimine, 2-aminoethanol. Reactions to amines, imines, and oleum are exothermic, not violent. | | |
| Hazardous Polymerization | | Conditions to Avoid In the presence of a catalyst or at an elevated temperature, polymerization rate may accelerate, causing an explosion. Acrylic acid may readily polymerize at room temperatures. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products When heated to decomposition, acrylic acid can emit highly toxic/poisonous gases. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Extremely irritating to the eyes, nose, throat, and respiratory system. Inhaled vapors may be absorbed in the gastrointestinal tract. ABSORPTION: Skin contact can result in burns. Can cause severe eye burns and/or irritation. Absorbed acrylic acid is rapidly metabolized as a short chain fatty acid. Possible skin sensitizer. INGESTION: Poisonous by ingestion. An experimental teratogen. Questionable carcinogenic effects. | | | | |
| Carcinogenicity Questioned Human Suspected Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? No Specific Listing | Target Organs? Respiratory system, eyes, skin, kidneys, liver. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis); Renal or liver disorders. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed,</u> seek medical attention. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by SARA III, if applicable. | | | | |
| Preferred Waste Disposal Method Incineration (with after burner and scrubber). | | | | |
| Precautions to be Taken in Handling and Storage Acrylic acid is a combustible liquid. Avoid contact with strong oxidizers such as chlorine since violent reactions occur. Store in tightly closed containers in cool, well-ventilated area away from heat. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where acrylic acid is used, handled, or stored. Storing acrylic acid at temperatures at or below 57°F (13.9°C), the explosion hazard is significantly reduced. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) When potential for exposures above 10 ppm exist, use a MSHA/NIOSH approved supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a full facepiece operated in pressure demand or other positive pressure mode. Use half-mask respirator with acid cartridge for low or transient exposures (cartridge should be designed to protect against acid vapor or mist). | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Acid resistant synthetic rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ACRYLIC ACID

CAS: 79-10-7

**IDENTIFICATION AND TYPICAL USES**

Acrylic acid is a colorless liquid with an acrid odor. It serves as a building block for the synthesis of other chemicals. It is produced by oxidation of acrolein or hydrolysis of acrylonitrile. It is used in the manufacture of plastics; in paints, polishes, and adhesives; and as coatings on leather.

RISK ASSESSMENT: HEALTH**General Assessment**

Exposure to acrylic acid is possible through *inhalation* of its vapors and by *ingestion*. Also, the gastrointestinal tract appears to be the site of *absorption* of inhaled acrylic acid vapors. In addition, acrylic acid is very irritating to and readily penetrates the skin.

Inhalation of its vapors can irritate the nose and throat as well as the lungs. It is a serious eye hazard. Splashing into the eyes can cause damage and loss of vision. Experimental animals (rats) have shown the effects of exposure to include nasal discharge, weight loss, lethargy, and kidney congestion. High exposures (excess of 4000 ppm for 4 hours) has proven to be lethal in laboratory experiments with test animals.

Laboratory testing of oral exposures were inconclusive. Although no significant embryotoxicity or teratogenicity could be documented, teratogenic studies in animals are still suspected (animal testing is limited, difficult to quantify, and lack conclusive evidence of teratogenicity). It is still recommended that acrylic acid be treated as a questionable teratogen until further studies verify otherwise.

High, excessive, or long-term exposures may damage the kidneys and lungs. Repeated or high exposure to the skin may cause an allergic reaction in some individuals (sensitization). Once sensitized, even very small future exposures to acrylic acid liquid on the skin's surface can result in a recurrence of symptoms, which include rash and inflammation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to acrylic acid:

Skin: Irritation/rash or burning feeling on contact.

Eye: Severe irritation; may cause burns and damage.

Lung: Irritation of the nose, throat, and lungs following exposure.

CNS: Inconclusive (possible lethargy, weight loss).

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to acrylic acid and can last for months or even years:

Cancer Hazards: Acrylic acid is a questionable carcinogen in experimental animals. Its carcinogenicity in humans may be suspect, but the data are inconclusive.

Reproductive Hazard: There is limited evidence to show that exposure to acrylic acid causes teratogenic effects in laboratory animals.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with acrylic acid. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around acrylic acid. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available,

then chemical goggles should be worn to protect the eyes. For low concentrations (below 10 ppm), an acid gas cartridge respirator (equipped with a mist/vapor filter) is acceptable protection. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with acrylic acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where acrylic acid is used or stored. Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to acrylic acid and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of acrylic acid should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of acrylic acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Acrylic acid is considered a combustible liquid. It is also corrosive to many materials. It is incompatible

with oxidizing agents and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of acrylic acid.

Should acrylic acid ever come into contact with incompatible substances such as oxidizers, amines, alkalis, ammonium hydroxide, chlorosulfonic acid, oleum, ethylene diamine, or ethyleneimine either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for acrylic acid waste is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

Acrylic acid can enter the environment mainly in industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to acrylic acid.

This chemical has slight acute toxicity to aquatic life and high toxicity to birds. Insufficient data are available on the short-term effects of acrylic acid exposure to plants or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Acrylic acid has slight chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of acrylic acid to plants, birds, or land animals.

◆ *Water Solubility*

Acrylic acid is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Acrylic acid is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Approximately 90% of acrylic acid will eventually end up in water; the remainder will end up in air.

🌀 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of acrylic acid found in fish tissues is expected to be about the same as the average concentration of acrylic acid in the water from which the fish was taken.

🌀 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of acrylic acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Clean-up should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If acrylic acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of acrylic acid. If acrylic acid is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until clean-up is complete.
- Remove all ignition sources.

- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- It may be necessary to dispose of acrylic acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving acrylic acid can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🌀 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Vapor Density (Air = 1) 1.83 | Freezing Point -116°F (-83°C) |

Solubility

Partially soluble (7%) in water (readily miscible with most organic solvents).

Appearance and Odor

Clear, colorless or slightly yellowish, mobile liquid with a faint, mild odor. Odor threshold = 17 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) 30°F (-1°C) closed cup | Explosive Limits in Air % by Volume LEL: 3.0% UEL: 17% |
| NFPA Classification Class 1B Flammable Liquid | Autoignition Temperature 898°F (481°C) |

Extinguishing Media

Carbon dioxide, dry chemical, alcohol foam.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Heat will build pressure and may rupture closed storage containers. Keep fire-exposed containers cool with water spray. Vapors are heavier than air, they may travel a distance to cause fire or explosion due to flashback phenomenon.

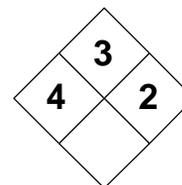

Unusual Fire and Explosion Hazards

Dilute solutions are also flammable. Vapors form explosive mixtures in air. Violent rupture of glass containers can occur due to polymerization. Poisonous gases are produced in fire.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|--|--|--|
| Stability | | Conditions to Avoid Dangerous fire hazard when exposed to heat and flame. Avoid contact with incompatible materials. When mixed with bromine, acrylonitrile can explode. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Reactions can occur with strong oxidizers, strong bases, strong acids, ammonia, amines, and copper and its alloys can be violent. Lithium reacts exothermically. | | |
| Hazardous Polymerization | | Conditions to Avoid Contact with mineral acids (H₂SO₄, HCL, H₃PO₄) will form paraldehyde, which is toxic to humans and animals. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products Polymerizes violently in presence of concentrated alkali or at elevated temperature. It undergoes photochemical polymerization, liberating heat. Violent rupture of glass containers can occur. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Asphyxia, headache, chest pains, shortness of breath, lightheadedness, coughing, and the peeling of skin from lips and hands. High concentrations can result in symptoms such as somnolence (sleepiness), diarrhea, nausea, and vomiting. ABSORPTION: Headache, lightheadedness, sneezing, weakness, nausea, and vomiting. Severe intoxication can result in loss of consciousness, convulsions, respiratory arrest, and death. Acrylonitrile is a skin irritant. It may cause blistering after a few hours. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Confirmed Human Confirmed Animal | 5th Annual Report | Group 2A | 29 CFR 1910.1045 | Respiratory tract; liver; skin; eyes; CNS; kidneys. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments, (asthma); Renal function abnormalities; Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 30 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Medical observation for 24 to 48 hours after inhalation exposure (pulmonary edema). If swallowed, seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Place materials in DOT-approved containers. Restrict those not involved in clean-up from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Acrylonitrile is highly volatile. Do not store with incompatible chemicals. Store in tightly closed containers in a cool, dark, well-ventilated area. Keep fire and flame away. Use non-sparking tools to open or close containers. Ground and bond all metal containers during transfer operations. | | | | |
| Other Precautions and Warnings If exposed to heat or light, uninhibited acrylonitrile can react violently by itself, leading to an explosion of closed containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At any exposure level: Self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Neoprene Rubber | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ACRYLONITRILEC₂H₃CN

CAS: 107-13-1

**IDENTIFICATION AND TYPICAL USES**

Acrylonitrile is a clear, colorless or slightly yellowish mobile liquid with a faint, mild odor. It is used in the production of acrylic fibers, resins, nitrile rubber, and surface coatings; as an intermediate in the production of pharmaceuticals and dyes; as a polymer modifier; and as a pesticide fumigant for stored grains.

RISK ASSESSMENT: HEALTH***General Assessment***

Acrylonitrile is carcinogenic in experimental animals and is considered to be a probable human carcinogen. Acrylonitrile is a mutagen. All contact with this chemical should be reduced to the lowest possible level. Human exposure to acrylonitrile can occur through two primary routes of entry into the body: *inhalation*, and *absorption*. Each present a moderate level of toxicity. Acrylonitrile is readily absorbed through the respiratory tract, the gastrointestinal tract, and through unbroken skin. Absorption through the skin can result in toxic symptoms such as headache, lightheadedness, sneezing, weakness, nausea, and vomiting. In humans, many symptoms are non-specific but appear to be related to the central nervous system (CNS), the respiratory tract, gastrointestinal tract, and the skin.

Inhalation of this compound can cause asphyxia, headache, mild to severe chest pains, shortness of breath, lightheadedness, and coughing. Severe intoxication can cause loss of consciousness, respiratory arrest, convulsions, and death. There is also evidence to show that acrylonitrile can cause congestion in all types of organs and damage to the kidneys, CNS, lungs, and liver.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to acrylonitrile:

Skin: Severe irritation and blistering a few hours after exposure.

Eye: Burns leading to permanent damage.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema), which is a medical emergency.

CNS: Inhalation of high concentrations of the vapor may cause sleepiness, dizziness, loss of consciousness, or death. Lower exposures can cause weakness, headache, confusion, nausea, vomiting, and can also lead to death.

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to acrylonitrile and can last for months or even years:

Cancer Hazards: Acrylonitrile causes mutations (genetic changes). There is strong evidence that acrylonitrile causes cancer (of the lung and large intestines) in humans. It has been shown to cause brain and stomach cancer in animals.

Reproductive Hazard: There is no evidence that acrylonitrile adversely affects reproduction.

Other Chronic Effects: Exposure may cause the thyroid gland to enlarge and interfere with normal thyroid function. Repeated exposure can irritate the nasal membranes causing discharge, nose bleeds, and sores inside the nose. Very irritating substances, such as acrylonitrile, may effect the lungs. It is not known whether chronic exposure to acrylonitrile will damage the lungs since such exposures usually prove fatal.

🛡️ *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with acrylonitrile. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best pro-

tection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around acrylonitrile. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, neoprene rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with acrylonitrile.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where acrylonitrile is used or stored.

Medical testing of personnel should be performed before the first exposure and at least annually thereafter. As per OSHA requirements, these tests must be provided by the employer and include:

- Complete physical examination.
- Chest X-ray.
- Stool test for blood (employees over 40).

In addition, for those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular intervals thereafter:

- Urine thiocyanate levels.
- Lung function (pulmonary function) tests.

If symptoms develop or overexposure is suspected, the following additional tests may be useful:

- Blood cyanide level.
- Thyroid function test.
- Consider chest X-ray after acute overexposure.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage

are not a substitute for controlling exposure. Antidotes following exposure to cyanides include:

- Administration of 4-dimethylaminophenol plus sodium thiosulfate shows some protection only after oral intake (ineffective against inhalation).
- Cystein and *N*-acetyl cystein are somewhat effective in combating cyanide poisoning.

Other methods to reduce exposure include:

- Use amyl nitrate capsules as antidote if symptoms develop.
- Employees should be trained regularly in emergency measures for cyanide poisoning and in CPR.
- A cyanide antidote kit must be rapidly available and ingredients replaced every 1-2 years to ensure freshness.
- Medical personnel trained in treatment of cyanide poisoning should be quickly available
- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to acrylonitrile and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of acrylonitrile should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of acrylonitrile. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Acrylonitrile is considered a highly flammable liquid. Because of its low flash point and high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). It is also a dangerous fire and explosion hazard, highly reactive, and it polymerizes easily. These characteristics require special consideration during any emergency situation involving a leak or spill of acrylonitrile. Should acrylonitrile ever come into contact with incompatible substances such as oxidizers, acids, bases, bromine, and amines either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible. The proper disposal/destruction method for acrylonitrile is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Acrylonitrile can enter the environment through industrial effluents, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to acrylonitrile.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of acrylonitrile to plants, animals, or birds.

🌱 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Acrylonitrile has high chronic toxicity in aquatic life. No data are available on the long-term effects of acrylonitrile to plants, birds, or land animals.

💧 *Water Solubility*

Acrylonitrile is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Acrylonitrile is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 63% of acrylonitrile will eventually end up in air; the rest will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of acrylonitrile found in fish tissues is expected to be somewhat higher than the average concentration of acrylonitrile in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of acrylonitrile should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Clean-up should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If acrylonitrile should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of acrylonitrile. If acrylonitrile is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of spill or leak.

- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak can not be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep acrylonitrile out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- ☑ It may be necessary to dispose of acrylonitrile as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving acrylonitrile can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly effect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|--|---|
| Characterization Pesticide; Insecticide | RCRA Number P004 | EPA Class Acute Hazardous Waste |
| DOT Proper Shipping Name Aldrin | Chemical Abstract Service (CAS) Number 309-00-2 | |
| DOT Hazard Class and Label Requirements Poison B; ORM-A | DOT Emergency Guide Code 55 | |
| DOT Identification Number UN 2761; NA 2762 | Chemical Formula C₁₂H₈Cl₆ | |

Synonyms

1,4:5,8 Dimethanonaphthalene; 1,2,3,4,10,10-Hexachloro-1,4,4A,5,8,8A-Hexahydro; Octalene; Aldrex; Aldrite; exodimethanonaphthalene

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|---|---|--|
| Aldrin | PEL: 0.25 mg/m³ (skin) | REL: 0.15 mg/m³ (skin) Suspected Human Carcinogen | 25 mg/m³ | TLV: 0.25 mg/m³ (skin) |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point Decomposes | Specific Gravity (H ₂ O = 1) 1.60 |
| Vapor Pressure (mm Hg) 7.5 x 10⁻⁵ at 69°F (20°C) | Molecular Weight 364.9 |
| Vapor Density (Air = 1) N/A | Freezing Point N/A (melts at 219°F) |

Solubility

Insoluble in water (0.003%); readily miscible with most organic solvents, aromatics, esters, ketones, paraffins, and halogenated solvents.

Appearance and Odor

Colorless to dark tan or brown solid crystals with a mild chemical odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Noncombustible Solid | Autoignition Temperature Not Applicable |

Extinguishing Media

A noncombustible solid. Extinguish fire using an agent suitable for the type of surrounding fire.

Special Fire Fighting Procedures

Since poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA).

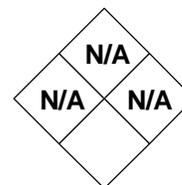

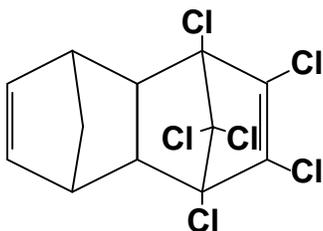

Unusual Fire and Explosion Hazards

Containers may explode in fire due to build-up of excessive internal pressures. Exercise extreme caution when attempting to move or relocate containers that may have been exposed to high heat. Aldrin is an acute hazardous waste; by-products of fire fighting operations may have to be handled as acutely hazardous as well.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|--|--|--|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials. Although not a flammable material itself, commercial solutions of Aldrin may contain flammable or combustible liquids as additives. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Concentrated mineral acids (sulfuric, hydrochloric, nitric); active metals; acid catalysts; acid oxidizing agents (chlorine); phenols, and reactive metals (sodium, potassium, magnesium). | | |
| Hazardous Polymerization | | Conditions to Avoid Contact with mineral acids (H₂SO₄, HCL, H₃PO₄) will form paraldehyde, which is toxic to humans and animals. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Poisonous gases are produced when aldrin is involved in fire. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Entry route by inhalation possible when working in dusty or dust-generating conditions. Symptoms can be as those described below or absorption and ingestion. ABSORPTION: Headache, dizziness, nausea, vomiting, tremor, ataxia, convulsions, CNS depression, respiratory failure, and may cause renal damage. May cause skin allergy. INGESTION: May cause liver and lung damage, including cancer (data inconclusive in humans); tremors; nausea; vomiting. An experimental teratogen. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | 5th Annual Report | Group 3 | 29 CFR 1910.1000 Table Z-1 (skin) | CNS, liver, kidneys, skin, possible thyroid, adrenal. |
| Medical Conditions Generally Aggravated by Exposure Renal and/or liver function problems; Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact</u>: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Medical observation is recommended for 24 to 48 hours after inhalation exposure (pulmonary edema). If <u>swallowed</u>, seek medical attention immediately. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in the most convenient (safe) way possible and deposit in DOT-approved drum. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by SARA III, if applicable. | | | | |
| Preferred Waste Disposal Method Chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Do not store aldrin in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, dark, well-ventilated area. Personnel working with aldrin should be trained on its proper handling and storage <i>prior</i> to being assigned to such responsibilities. | | | | |
| Other Precautions and Warnings Bulk storage of aldrin is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At any exposure level: Use a MSHA/NIOSH-approved air-supplied respirator with full facepiece set in positive pressure mode or use a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Rubber or Latex | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ALDRINC₁₂H₈Cl₆

CAS: 309-00-2

**IDENTIFICATION AND TYPICAL USES**

Aldrin is a colorless or sometimes tan to dark brown solid crystal. It has had extensive use as an insecticide. However, its use has been sharply curtailed partially on the basis of its persistence in the environment and bio-concentration in the food chain. It is no longer available for use as an insecticide in the United States and, therefore, much of the data on aldrin are dated.

nausea, malaise, and muscular twitching at high doses (above the PEL).

Eye: Possible irritation.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems.

CNS: Dizziness, headaches, nausea, vomiting, muscle jerks, severe seizures, and death.

RISK ASSESSMENT: HEALTH**General Assessment**

Aldrin is highly toxic to humans and animals. It is carcinogenic in experimental animals and may cause cancer in humans as well; however, the data are inconclusive. Human mutagenic data has been reported. All contact with this chemical should be reduced to the lowest possible level. Human exposure to aldrin can occur through two primary routes of entry into the body: *ingestion* and *absorption* (although *inhalation* is always a possible, especially when working in extremely dusty conditions). Each of the two primary routes present a moderate to high level of toxicity. Aldrin appears to be absorbed through the skin in significant amounts, particular on a chronic basis. Absorption through the skin can result in toxic symptoms such as headache, dizziness, nausea, vomiting, myoclonic jerks of the limbs (muscle twitching), clonic and tonic convulsions, malaise, and sometimes coma. Once aldrin is absorbed, either through the skin or through the digestive tract, it is rapidly metabolized to dieldrin.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to aldrin:

Skin: Dermatitis associated with aldrin is unusual. Most reaction from skin contact is internal due to absorption. Symptoms include vomiting,

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to aldrin and can last for months or even years:

Cancer Hazards: Aldrin may be a carcinogen in humans since it has been shown to cause liver cancer in some test animals.

Reproductive Hazard: Aldrin may be a teratogen in humans since it has been shown to be a teratogen in some test animals.

Other Chronic Effects: Aldrin may cause a skin allergy (sensitization). If an allergy develops, very low future skin-contact exposures to aldrin crystals or dust can cause itching and rash. Prolonged exposures may damage the liver.

🚫 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with aldrin. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around aldrin. A self-

contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever aldrin is being mixed with liquids, a chemical splash hazard exists and a face shield and rubber apron should be worn. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with aldrin.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where aldrin is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Electroencephalograph (EEG) to test brain activity/waves (identify seizure potential).
- Liver function tests.
- Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- Wash thoroughly immediately after exposure to aldrin and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of aldrin should be communicated to all exposed and potentially exposed workers.

- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of aldrin. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Aldrin is considered a noncombustible solid. While it is not a fire hazard in and of itself, it is often mixed with liquids which are either flammable or combustible. These characteristics require special consideration during any emergency situation involving a leak or spill of aldrin or aldrin mixtures. Should aldrin ever come into contact with incompatible substances such as concentrated mineral acids (sulfuric, hydrochloric, or nitric acids, for example), acid catalysts, acid oxidizing agents (chlorine), phenols, or reactive metals (such as sodium, potassium, and magnesium) either during use, transportation, or storage, violent reaction can occur.

The proper disposal/destruction method for aldrin is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

Aldrin can enter the environment through industrial discharges, urban runoff, and through spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to aldrin. This chemical has high acute toxicity to aquatic life and to birds. It has caused a variety injurious effects to both agricultural and ornamental crops. Insufficient data are available to evaluate or predict the short-term effects of aldrin to land animals.

☪ Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Aldrin has high chronic toxicity to aquatic

life. Insufficient data are available to evaluate or predict the long-term effects of aldrin to plants, birds, land animals.

◆ **Water Solubility**

Aldrin is slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

⌚ **Persistence in the Environment**

Aldrin is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Under aerobic (oxygenated) conditions, aldrin is oxidized to the highly persistent insecticide, dieldrin. Approximately 49% of aldrin will eventually end in terrestrial soils; about 46% in aquatic sediments, and the rest will end up in water.

🌊 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of aldrin found in fish tissues is expected to be much higher than the average concentration of aldrin in the water from which the fish was taken.

🛡️ **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of aldrin should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If aldrin should contact the water table, aquifer, or navigable waterway, remediation activities should be

prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of aldrin.

If aldrin is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Collect powdered material in the most convenient (safe) manner possible and deposit in sealed containers.
- ☑ It may be necessary to dispose of aldrin as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving aldrin can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Extremely irritating to the lungs, throat, nose and eyes. Coughing and shortness of breath that may persist for hours after exposure. Can cause permanent damage to the lungs. Fluid can build up in the lungs (pulmonary edema), which is a medical emergency. ABSORPTION: Contact with the liquid can cause severe skin burns, deep aching, and "bone pain." The liquid can cause severe eye burns leading to permanent damage. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Suspected Animal | 5th Annual Report | Group 3 | 29 CFR 1910.1000 Table Z-1 | Respiratory system, eyes, skin, kidneys, liver. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis); Renal or liver disorders. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours since pulmonary edema may be a delayed reaction. If <u>swallowed,</u> seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by SARA III, if applicable. | | | | |
| Preferred Waste Disposal Method Incineration (with after burner and scrubber). | | | | |
| Precautions to be Taken in Handling and Storage Allyl chloride is a combustible liquid. Store to avoid contact with strong oxidizers, acids, amines, and metals since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat. Ground and bond all containers prior to transfer. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where allyl chloride is used, handled, or stored. Use only non-sparking tools and equipment, especially when opening or closing containers of allyl chloride. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures below the PEL, use a half mask respirator with organic vapor cartridge. For all other exposures, use a MSHA/NIOSH approved supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Solvent resistant rubber | | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Rubber Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ALLYL CHLORIDEC₃H₅Cl

CAS: 107-05-1

**IDENTIFICATION AND TYPICAL USES**

Allyl chloride is a colorless or yellow, or sometimes purple liquid with a strong, disagreeable odor. It is used in the organic synthesis of allyl compounds. It is used to manufacture epichlorohydrin, epoxy resin, glycerin pesticides, and sodium allyl sulfonate.

RISK ASSESSMENT: HEALTH**General Assessment**

Exposure to allyl chloride is possible through *inhalation* of its vapors and by *absorption* of the liquid through unbroken skin. Allyl chloride is an irritant of the eyes, mucous membranes, and skin. In animals, it causes renal (kidney), hepatic (liver), and pulmonary damage and, at high concentrations, central nervous system depression.

Inhalation can cause headache, dizziness, and in high concentrations, loss of consciousness. Its vapors can cause conjunctiva irritation and eye pain with photophobia. Eye irritation occurs between 50 and 100 ppm. Irritation of the nose occurs at levels below 25 ppm. Skin *absorption* results in surface burning and deep-seated (“bone”) pain. It is rapidly absorbed and distributed throughout the body.

Allyl chloride is a suspected carcinogen with experimental tumorigenic data reported. While the primary routes are inhalation and absorption, it is also moderately toxic by ingestion. Human mutation data has also been reported.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to allyl chloride:

Skin: Irritation or burning and deep-seated (bone) pain.

Eye: Severe irritation; may cause burns and permanent damage.

Lung: Irritation of the nose, throat, and lungs following exposure. Pulmonary edema is possible (24 to 48 hours following a high exposure).

CNS: Headache, dizziness, loss of consciousness. Possible mild neuropathy, weakness, paresthesia, cramping pain, and numbness in the extremities with sensory impairment and diminished ankle reflexes.

☪ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to allyl chloride and can last for months or even years:

Cancer Hazards: Allyl chloride may cause mutations (genetic changes) in living cells. The data on its carcinogenicity are inconclusive.

Reproductive Hazard: There is limited evidence to show that exposure to allyl chloride may damage the developing fetus.

Other Chronic Effects: Allyl chloride may damage the liver and kidneys. Long-term exposures may cause drying and cracking of the skin. It is very irritating to the lungs (it is not known whether chronic exposure causes lung damage).

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with allyl chloride. If a less toxic chemical can not be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around allyl chloride. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If

a full facepiece is not available, then chemical goggles should be worn to protect the eyes. For low concentrations (below the PEL), an organic vapor cartridge respirator (equipped with a mist/vapor filter) is acceptable protection. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with allyl chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where allyl chloride is used or stored.

For those personnel with frequent or potentially high exposure (half the PEL or greater), the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- Liver and kidney function tests.
- Lung function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, exposure to allyl chloride may be more pronounced in smokers than in non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible exposure factors.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to allyl chloride and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on

the health and safety hazards of allyl chloride should be communicated to all potentially exposed workers.

- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to allyl chloride, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of allyl chloride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of allyl chloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Allyl chloride is considered a class 1B flammable liquid. Because of its low flash point and high autoignition temperature, it requires extreme caution in handling, storage, transportation, and disposal. It is incompatible with oxidizing agents and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of allyl chloride. Should allyl chloride ever come into contact with incompatible substances such as oxidizers, acids, amines, iron, and aluminum chlorides, magnesium, zinc, and galvanized metals, chlorosulfonic acid, and oleum either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible. The proper disposal/destruction method for allyl chloride waste is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Allyl chloride can enter the environment mainly industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to allyl chloride. This

chemical has moderate acute toxicity to aquatic life. No data are available on the short-term effects of allyl chloride exposure to plants, birds, or land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Allyl chloride has moderate chronic toxicity in aquatic life. No data are available on the long-term effects of allyl chloride to plants, birds, or land animals.

💧 *Water Solubility*

Allyl chloride is slightly soluble in water. Concentrations of 1 milligram will mix with a liter of water.

🕒 *Persistence in the Environment*

Allyl chloride is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 99.3% of allyl chloride will eventually end up in water; the remainder will end up in air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of allyl chloride found in fish tissues is expected to be about the same as the average concentration of allyl chloride in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of allyl chloride should be segregated from incompatible chemicals to minimize the risk of cross-

contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If allyl chloride should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of allyl chloride. If allyl chloride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of allyl chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving allyl chloride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly effect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛑 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the

development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Wash contaminated skin with soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Never attempt to give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in the most convenient way possible and deposit in sealed containers. Remove all sources of ignition. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Aluminum is a naturally occurring metal and does not pose a significant threat to the environment. | | | | |
| Precautions to be Taken in Handling and Storage Containers should be protected against physical damage. Store in tightly closed containers in a cool, dry, well ventilated area away from acids, caustics, chlorinated hydrocarbons, and combustible metals. Keep aluminum dry. | | | | |
| Other Precautions and Warnings Whenever bulk or finely powdered aluminum is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures near or over 2 mg/m³: NIOSH approved respirator with particulate (dust/fume/mist) filters. Otherwise, use a self-contained breathing apparatus in continuous flow mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Suitable to protect from skin contact | Eye Protection Chemical/Dust Goggles | Other Protective Clothing N/A | | |
| Work/Hygiene Practices Always wash hands thoroughly after working with aluminum powders and dusts; never bring food, drink, or smoking materials into vicinity of aluminum powders. | | | | |

ALUMINUM

Al

CAS: 7429-90-5

**IDENTIFICATION AND TYPICAL USES**

Aluminum is a silvery white metallic solid. It may have a bluish tint. It may be present as a fine or coarse powder or dust. It is mined from bauxite and has many uses in construction and in industry. It may be present in metal alloys and is used in the paper and printing industries, in medicine, electronics, and in packaging. Fine powder is used in explosives, fireworks, as flashlights in photography, and in aluminum paints. It is also used in combination with other chemicals to serve many purposes such as water purification, for medicinal purposes, catalysts, dyes, baking powder, fireproofing, and tanning.

RISK ASSESSMENT: HEALTH**General Assessment**

Although aluminum is not generally considered to be an industrial poison, *inhalation* of finely divided powder has resulted in the scarring of lung tissues (pulmonary fibrosis). Skin contact with fibers of aluminum may result in scratching and scarring. The same holds true for eye contact. *Ingested* aluminum is poorly absorbed, and there appears to be no retention of aluminum from nutritional sources in individuals with normal kidneys. Dusts of metallic aluminum and aluminum oxide are not significantly absorbed systemically, although fumes from welding aluminum is absorbed through the lung, producing an increase in aluminum levels in plasma and in urine.

The biological half-life of absorbed aluminum, as measured by urinary excretion, is approximately 9 days in workers exposed less than 1 year, and increases to 6 months after 10 years of occupational exposure. The neurotoxicity of aluminum and its salts is not known.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to aluminum:

Skin: Irritation/scratching on contact with particles.

Eye: Irritation/scratching on contact with particles.

Lung: Possible irritation of the nose, throat, and lungs following exposure to fibers and dusts.

CNS: Inconclusive.

☛ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to aluminum and can last for months or even years:

Cancer Hazards: There is limited evidence of an increase in bladder, lung, and other cancers among aluminum smelter workers. However, the increase appears to be due to exposure to polycyclic aromatic hydrocarbons, not to aluminum compounds.

Reproductive Hazard: Aluminum salts such as aluminum chloride and aluminum nitrate are toxic to the animal fetus and cause fetal damage. No data are available on the teratogenicity of aluminum in humans.

Other Chronic Effects: Long-term exposure to the fine dusts of aluminum can cause scarring of the lungs (pulmonary fibrosis) with symptoms of cough and shortness of breath. Very high levels of aluminum may damage the brain, although the data are not conclusive in this regard.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with aluminum. *Engineering controls* are always the most effective method of reducing exposures. The best protection, especially when working with fine powders and dusts of aluminum, is to enclose operations and/or provide explosion-proof, local exhaust ventilation at the site of powder/dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around aluminum. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the best respiratory pro-

tection. However, for exposures near or over the 2 mg/m³ PEL for dusts, a respirator with a dust/mist/fume filter would suffice. If a full facepiece respirator is not available, then dust goggles or safety glasses with side shields attached should be worn to protect the eyes. To prevent hand and skin exposures, suitable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with aluminum.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where aluminum is used or stored. Before beginning work with aluminum, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Lung function tests.
- Chest X-ray should be considered.
- Urinalysis (monitor aluminum content).

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site where aluminum powder or dust is worked. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when working with aluminum compounds.
- Wash thoroughly immediately after exposure to aluminum and at the end of the work shift or before eating, drinking, or smoking. Clothing contaminated with aluminum dusts or powders should not be taken home.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of aluminum should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of alumi-

num. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of aluminum materials, especially the dusts and powders. Accidental contact with a variety of incompatible materials can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Aluminum is considered a combustible solid. It is incompatible with oxidizing agents and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of aluminum. Should aluminum ever come into contact with incompatible substances such as oxidizers, acids, halogenated hydrocarbons, or other reactive metals either during use, transportation, or storage, the formation of highly explosive commodities is extremely possible.

Elemental aluminum is one of the most abundant metals in the earth's crust. It is used extensively across a broad spectrum of industries for a large variety of purposes. Because of its frequent use and common occurrence, aluminum enters the environment from point and non-point sources.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to aluminum.

This metal has moderate acute toxicity to aquatic life and high toxicity to birds. Insufficient data are available on the short-term effects of aluminum exposure to plants or land animals.

☠* Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Aluminum has high chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of aluminum to plants, birds, or land animals.

💧 Water Solubility

Aluminum solubility in water is dependent upon pH. As pH increases or decreases from near neutrality, solubility in water increases.

Persistence in the Environment

Aluminum is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Aluminum will not accumulate in fish tissues.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in the contamination of the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of aluminum should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. When environmental contamination occurs, the local and/or state emergency response authorities may require notification. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of aluminum. If aluminum is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources and ventilate area of aluminum powder spill or leak.

- Collect powdered materials in the safest manner possible and deposit in sealed containers.
- It may be necessary to dispose of aluminum as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving aluminum can present a significant threat to business operations. The loss or damage of equipment or facilities due to explosion or fire can significantly effect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

ALUMINUM BROMIDEAlBr₃

CAS: 7727-15-3

**IDENTIFICATION AND TYPICAL USES**

Aluminum bromide is a white to yellowish-red deliquescent crystalline solid. The solid crystal is used as an acid catalyst in organic synthesis. It is similar to aluminum chloride, but is more reactive and more soluble in organic media.

RISK ASSESSMENT: HEALTH***General Assessment***

Aluminum bromide is a toxic and corrosive material. It has a high affinity for water and moisture which can cause severe tissue burns. Due to the water content in the eyes and perspiration on the skin, aluminum bromide can be extremely destructive and damaging on contact. It is toxic by *inhalation* of finely divided powders and by *ingestion*.

Prolonged exposures can lead to inorganic bromide poisoning with symptoms of depression, emaciation, and in severe cases, psychoses and mental deterioration.

Inhalation of aluminum bromide powders or vapors is extremely irritating to the mucous-lined, moisture-rich respiratory tract. The liquid can cause severe burns to these areas. Symptoms may take several hours to develop and usually include shortness of breath, coughing, wheezing, nausea, aching muscles, and slight fever. Inhalation may prove fatal in some cases due to spasm, inflammation, and edema of the larynx and bronchi, chemical pneumonitis, and delayed pulmonary edema (a medical emergency that can be fatal. Skin contact causes corrosive damage, especially when moist. Prolonged contact may lead to bromide rashes.

On ingestion, aluminum bromide is extremely toxic and destructive to the mucous membranes. Prolonged exposure may lead to bromide poisoning. Mild poisoning is characterized by nausea, vomiting, and diarrhea. Severe poisoning can cause convulsions and liver and kidney damage.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to aluminum:

Skin: Strong irritation and corrosive damage. Moist or wet skin will be affected more severely.

Eye: Highly irritating and destructive. Liquid will cause severe burns. Possible damage or loss of vision.

Lung: Extremely irritating to the respiratory tract. May result in coughing, wheezing, nausea, aching muscles, and slight fever. Can also cause pulmonary edema (fluid in the lungs).

CNS: Inconclusive. However symptoms such as depression, emaciation, and, in severe cases, psychoses and mental deterioration have been reported as a result of bromide poisoning.

●* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to aluminum and can last for months or even years:

Cancer Hazards: Insufficient data exists to properly evaluate or predict the carcinogenicity of aluminum bromide in humans or test animals. While some studies suggest no carcinogenicity, the results of numerous other studies were inconclusive.

Reproductive Hazard: Other aluminum salts such as aluminum chloride and aluminum nitrate are toxic to the animal fetus and cause fetal damage. No data are available on the teratogenicity of aluminum bromide in humans.

Other Chronic Effects: Prolonged exposure may lead to bromide rashes on the skin (an irritating and difficult to heal form of dermatitis). Severe poisoning by ingestion can lead to liver and kidney damage.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with aluminum bromide. *Engineering controls* are always the most effective method of reducing exposures. The best protection, especially when working with powders and dusts of aluminum bromide, is to enclose operations and provide explosion-proof, local exhaust ventilation at the site of powder/dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around aluminum bromide. A MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the best respiratory protection. However, for exposures near or over the 2 mg/m³ PEL for dusts, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist/fume pre-filter would suffice. If a full facepiece respirator is not available, then dust goggles or safety glasses with side shields attached should be worn to protect the eyes. To prevent hand and skin exposures, suitable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with aluminum bromide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where aluminum bromide is used, handled, or stored. Before beginning work with aluminum, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- ☑ Lung function tests.
- ☑ Chest X-ray should be considered (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site where aluminum powder or dust is worked. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when working with aluminum compounds.

- ☑ Wash thoroughly immediately after exposure to aluminum and at the end of the work shift or before eating, drinking, or smoking. Clothing contaminated with aluminum dusts or powders should not be taken home.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of aluminum bromide should be communicated to all exposed and potentially exposed workers.
- ☑ A safety shower and emergency eyewash station should be readily available for emergency use in or near areas where aluminum bromide is used, handled, or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of aluminum bromide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of aluminum bromide, especially the dusts and powders. Accidental contact with a variety of incompatible materials, including water, can result in fire, explosion, generation of other hazardous commodities, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Aluminum bromide is considered a non-combustible solid. However, it is incompatible with oxidizing agents and contact can cause fire or explosion. Mixtures with sodium or potassium can cause extremely violent explosions. These characteristics require special consideration during any emergency situation involving a leak or spill of aluminum. Should aluminum bromide ever come into contact with incompatible substances either during use, transportation, or storage, the formation of highly explosive commodities is extremely possible. On contact with water or moist air, it evolves flammable and corrosive hydrogen bromide along with heat.

Aluminum bromide can enter the environment through industrial discharges and from spills.

☠ **Acute Ecological Effects**

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to aluminum bromide. This material has moderate acute toxicity to aquatic life and high toxicity to birds. Insufficient data are available on the short-term effects of exposure to plants or land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Aluminum bromide has high chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of aluminum bromide to plants, birds, or land animals.

◆ *Water Solubility*

Aluminum bromide solubility in water is dependent upon pH. As pH increases or decreases from near neutrality, solubility in water increases.

⌚ *Persistence in the Environment*

Aluminum bromide is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Aluminum bromide will not accumulate in fish tissues.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in the contamination of the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of aluminum bromide should be segregated from incompatible chemicals to minimize the risk of

cross-contamination or contact. It should be kept in tightly closed containers, preferably under a nitrogen purge. It must be kept free of moisture and away from water. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. When environmental contamination occurs, the local and/or state emergency response authorities may require notification. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of aluminum bromide.

The proper destruction or disposal method for aluminum bromide is to burn it in a chemical incinerator equipped with an afterburner and scrubber.

If aluminum bromide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area of spill or leak.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Use a vacuum equipped with a HEPA filter for cleanup. Dry sweeping is not recommended (generates airborne dusts). Keep water away. Hydrolysis can be extremely violent and destructive.
- ☑ It may be necessary to dispose of aluminum bromide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving aluminum bromide can present a significant threat to business operations. The loss or damage of equipment or facilities due to explosion or fire can significantly effect fiscal viability.

Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

|--|--|------------------------------------|
| Characterization Chloride | RCRA Number Not Listed | EPA Class Not Applicable |
| DOT Proper Shipping Name Aluminum Chloride Solution | Chemical Abstract Service (CAS) Number 7446-70-0 | |
| DOT Hazard Class and Label Requirements Corrosive Material | DOT Emergency Guide Code No Citation | |
| DOT Identification Number UN 1725 (anhydrous) UN 2581 (solution) | Chemical Symbol AlCl₃ | |

Synonyms

Aluminum trichloride, tribromoaluminum.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|---------------------------------------|---|--|
| Aluminum chloride (derivation: By reaction of purified gaseous chlorine with molten aluminum; by reaction of bauxite with coke and chlorine at approximately 875°C). | PEL: 2 mg(Al)/m³ STEL: Not Established | REL: Not Established | Not Established | TLV: 2 mg(Al)/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 358°F (181°C) Decomposes | Specific Gravity (H ₂ O = 1) 2.44 |
| Vapor Pressure (mm Hg) 1 at 212°F (100°C) | Molecular Weight 133.33 |
| Vapor Density (Air = 1) 1.0 | Melting Point 381°F (194°C) sublimes |

Solubility

Violently soluble in water; soluble in absolute alcohol, ether, tetrachloromethane, benzene.

Appearance and Odor

White to yellowish deliquescent crystalline solid. May have an odor of hydrogen chloride.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Non-Combustible Powder | Autoignition Temperature Not Applicable |

Extinguishing Media

Carbon dioxide, dry chemical, alcohol, or foam. DO NOT use water.

Special Fire Fighting Procedures

Wear full protective clothing with self-contained breathing apparatus (SCBA). Structural fire fighting clothing is permeable and will not provide adequate protection. Poisonous gases are produced in fire. Move containers from fire area if it can be done without risk.

Unusual Fire and Explosion Hazards

Keep water away from fires involving aluminum chloride. Reacts with water forming hydrochloric acid and explosive hydrogen gas. Aluminum chloride presents a fire hazard when stored in metal containers and exposed to moisture.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|---|---|
| Stability | | Conditions to Avoid Keep away from incompatible materials, especially water and moisture, since violent and even explosive reactions can occur. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Water, allyl chloride, ethylene, ethylene oxide, most metals, benzoyl chloride/naphthalene, carbon dioxide or ethylenimine, most peroxides, ethyl oxide, nitromethane, oxygen difluoride, perchlorobenzene. | | |
| Hazardous Polymerization | | Conditions to Avoid Keep away from heat and alkenes. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Highly exothermic reaction with water or steam produces toxic fumes of hydrogen chloride (a corrosive) and hydrogen gas (a flammable). | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X | |
| Health Hazards INHALATION: Destructive to the mucous membranes and upper respiratory tract. Dusts and vapors are extremely irritating. The liquid solution can cause severe burns. Symptoms include burning sensation in the lungs, coughing, wheezing, headache, nausea, vomiting, and inflammation of the larynx and bronchi. Pulmonary edema also possible. SKIN & EYES: Skin and eye contact with powder can result in severe irritation and burns. INGESTION: Toxic and destructive to the mucus membranes. Can cause nausea, vomiting, burning in the throat, and diarrhea. | | | | |
| Carcinogenicity No Evidence. | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No Specific Listing | Target Organs? Respiratory system, eyes, skin, liver, kidney. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Wash contaminated skin with soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 24-48 hours for lung effects. If swallowed: Do NOT induce vomiting. Give one pint of water immediately and repeat every 10 minutes. Seek medical attention at immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in the most convenient way possible and deposit in sealed containers. Remove all sources of ignition. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method Incineration in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Containers should be protected against physical damage. Store in tightly closed containers in a cool, dry, well ventilated area preferably under a nitrogen purge. Keep aluminum chloride dry. Old containers may explode on opening, due to spontaneous decomposition in the presence of moisture. | | | | |
| Other Precautions and Warnings Whenever bulk or finely powdered aluminum chloride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures near or over 2 mg/m³: NIOSH approved respirator with high efficiency particulate air (HEPA) filter and a dust/fume/mist pre-filter. Greater protection is provided with a SCBA. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Neoprene, Viton, Butyl Rubber | Eye Protection Chemical/Dust Goggles | Other Protective Clothing Full Protective Suit | | |
| Work/Hygiene Practices Always wash hands thoroughly after working with aluminum powders and dusts; never bring food, drink, or smoking materials into vicinity of aluminum powders. | | | | |

ALUMINUM CHLORIDE

AlCl₃

CAS: 7446-70-0

IDENTIFICATION AND TYPICAL USES

Aluminum chloride (anhydrous) is a white to yellow crystalline powder that may have no odor or may have an odor of hydrogen chloride due to the formation of that gas in the presence of moist air. Aluminum chloride (hydrate) appears as a white or yellowish deliquescent crystalline solid, nearly odorless, with a sweat astringent taste. The anhydrous form is often used as an ethylbenzene catalyst, as a dyestuff intermediate, a detergent alkylate, in making ethyl chloride, in pharmaceuticals and organics, in the manufacture of butyl rubber, petroleum refining, hydrocarbon resins, and as a nucleating agent for titanium dioxide pigments. The hydrate is used in antiperspirants, and as roofing granules.

RISK ASSESSMENT: HEALTH

General Assessment

Aluminum chloride is a toxic and corrosive material. It has a high affinity for water and moisture which can cause severe tissue burns. Due to the water content in the eyes and perspiration on the skin, aluminum chloride can be extremely destructive and damaging on contact. It is toxic by *inhalation* of finely divided powders and by *ingestion*. The acute biological hazards of aluminum chloride are mostly due to the extremely acid products generated when it contacts water which it will take from the tissues, and the heat generated in that reaction.

Inhalation of aluminum chloride powders or vapors is extremely irritating to the mucous-lined, moisture-rich respiratory tract. The liquid can cause severe burns to these areas. Symptoms may take several hours to develop and usually include a burning sensation in the chest, coughing, wheezing, headache, nausea, and vomiting. Inhalation may prove fatal in some cases due to spasm, inflammation, and edema of the larynx and bronchi, chemical pneumonitis, and

pulmonary edema. Prolonged exposures may lead to lung damage.

On ingestion, aluminum chloride is extremely toxic and destructive to the mucous membranes. It is an oral irritant. Symptoms of mild poisoning include nausea, vomiting, burning in the throat, and diarrhea. Severe poisoning can cause convulsions and liver and kidney damage. Exposure to the hydrate form may cause stomach irritation, and relaxation and swelling of the duodenum and small intestine (animal studies confirm).

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to aluminum:

Skin: Dusts and vapors are strong irritants and the liquid may cause severe burns. Moist or wet skin will be affected more severely.

Eye: Highly irritating and destructive. Liquid causes severe burns. Possible damage or loss of vision.

Lung: Extremely irritating to the respiratory tract and destructive to the mucous membranes. May cause burning sensation, coughing, wheezing, nausea, headache, and vomiting. Can also cause pulmonary edema (fluid buildup in the lungs) and/or chemical pneumonitis.

Other: Ingestion may result in severe gastrointestinal irritation with symptoms of nausea, vomiting, burning in the throat, and diarrhea. Severe poisoning may cause convulsions and kidney and liver damage.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to aluminum and can last for months or even years:

Cancer Hazards: Insufficient data exist to properly evaluate or predict the carcinogenicity of aluminum chloride in humans or test animals. While some studies suggest no carcinogenicity, the results of numerous other studies were inconclusive (some studies suggest action on the chromosomal level).

Reproductive Hazard: Some aluminum salts, including aluminum chloride and aluminum nitrate, are toxic to the animal fetus and cause fetal damage. No data are available on the teratogenicity of aluminum chloride in humans.

Other Chronic Effects: Prolonged exposure to aluminum chloride may result in lung damage. Animal studies using hydrated aluminum chloride dust have reported changes in alveoli and the development of granule growths in the lung. The hydrated form also has been found to inhibit sweating and cause clinical irritation after prolonged exposure. Aluminum chloride may cause dermatitis.

🔧 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with aluminum chloride. *Engineering controls* are always the most effective method of reducing exposures. The best protection, especially when working with powders and dusts of aluminum chloride, is to enclose operations and provide explosion-proof, local exhaust ventilation at the site of powder/dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around aluminum chloride. A MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the best respiratory protection. However, for exposures near or over the 2 mg/m³ PEL for dusts, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist/fume pre-filter would suffice. If a full facepiece respirator is not available, then dust goggles or safety glasses with side shields attached should be worn to protect the eyes. If splash hazards exist, then a face shield is required. Eye contact must be prevented since severe and perhaps permanent damage is likely on contact with aluminum chloride powders or solutions. To prevent hand and skin exposures, suitable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which

specify the methods and techniques that will be practiced whenever personnel are to work with aluminum chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where aluminum chloride is used, handled, or stored. Before beginning employment with aluminum, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Lung function tests.
- Chest X-ray should be considered.

If symptoms occur or an overexposure is suspected, the following additional tests may be useful:

- Kidney and liver function tests.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site where aluminum powder or dust is worked. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when working with aluminum compounds.
- Wash thoroughly immediately after exposure to aluminum and at the end of the work shift or before eating, drinking, or smoking. Clothing contaminated with aluminum dusts or powders should not be taken home.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of aluminum chloride should be communicated to all potentially exposed workers.
- A safety shower and emergency eyewash station should be readily available for emergency use in or near areas where aluminum chloride is used, handled, or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of aluminum chloride. In almost every scenario, the threat of environmental exposure is contingent upon the

proper handling of aluminum chloride, especially the dusts and powders (anhydrous form). Accidental contact with a variety of incompatible materials, including water, can have adverse and potentially dangerous results. This includes fire, explosion, generation of other hazardous commodities, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Aluminum chloride is considered a non-combustible solid. However, it is incompatible with many other commodities including chemically active metals (potassium and sodium, for example), and oxidizing agents. Contact can cause fire or explosion. Contact with water or moisture will result in a violent evolution of heat and the generation of hydrochloric acid fumes. These characteristics require special consideration during any emergency situation involving a leak or spill of aluminum. Should aluminum chloride ever come into contact with such incompatible substances either during use, transportation, or storage, the formation of highly explosive commodities is extremely possible.

Aluminum chloride can enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to aluminum chloride. This material has moderate acute toxicity to aquatic life. Insufficient data are available on the short-term effects of exposure to plants, birds, or land animals.

☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Aluminum chloride has high chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of aluminum chloride to plants, birds, or land animals.

💧 *Water Solubility*

Aluminum chloride is violently soluble in water. It will react on contact to form toxic fumes of hydrochloric acid and evolve heat.

Hydrochloric acid is highly soluble in water. Concentrations of 1000 milliliters and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Aluminum chloride is practically non-persistent in water, since it undergoes exothermic reaction to evolve heat and hydrochloric acid. Hydrochloric acid is moderately persistent in the aquatic environment with a half life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Aluminum chloride will not accumulate in fish tissues.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in the contamination of the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of aluminum chloride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. It should be kept in tightly closed containers, preferably under a nitrogen purge. It must be kept free of moisture and away from water. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. When environmental contamination occurs, the local and/or state emergency response authorities may require notification. A comprehensive

emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of aluminum chloride.

Spills of aluminum chloride can be neutralized by rinsing with sodium bicarbonate and lime solution. If crushed limestone, soda ash or lime is used, flush spill area with water.

The proper destruction or disposal method for aluminum chloride is to burn it in a chemical incinerator equipped with an afterburner and scrubber.

If aluminum chloride is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources and ventilate area of spill or leak.
- Collect powdered materials in the safest manner possible and deposit in sealed containers. Use a vacuum equipped with a HEPA filter for cleanup. Dry sweeping is not recommended (generates airborne dusts). Keep water away.
- It may be necessary to dispose of aluminum chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving aluminum chloride can present a significant threat to business operations. The loss or damage of equipment or facilities due to explosion or fire can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations

officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| | | X | X | X |
| Health Hazards | | | | |
| INHALATION: Symptoms of fluoride poisoning, including shortness of breath, congestion of the lungs, muscle spasm, asthma-like problems, and convulsions. Exposures can prove fatal. May cause perforation of the nasal septum. May affect the brain, liver, kidneys, and lungs. | | | | |
| ABSORPTION: Skin and eye contact with powder can result in severe irritation and burns. Can pass through unbroken skin to cause toxic systemic effects of fluoride poisoning. | | | | |
| INGESTION: Symptoms of toxic systemic fluoride poisoning. May also cause shock, blurred vision, shallow breathing, convulsions, kidney failure, and death. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| No Evidence. | No | No | No Specific Listing | Respiratory system, eyes, skin, liver, kidney, brain. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes, followed by irrigation with normal saline for 30 minutes. Do NOT use calcium gluconate gel. Seek medical attention. Skin contact: Remove all contaminated clothing. If calcium gluconate gel is available, rub into effected areas until pain subsides. If not available, wash contaminated skin with soap and water for 30 minutes. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Do NOT induce vomiting. If conscious, give milk or calcium gluconate by mouth. Seek medical attention immediately. Never try to give an unconscious person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Collect powdered material in the most convenient way possible (use HEPA vacuum). Remove all sources of ignition and ventilate area. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method | | | | |
| Neutralize with water and sodium carbonate. Dispose in landfill regulated for hazardous wastes. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Aluminum fluoride should not be stored in glass containers. Use tightly closed containers stored in a cool, dry, well-ventilated area. Always wear full-protective clothing to avoid contact. | | | | |
| Other Precautions and Warnings | | | | |
| Do not breathe dusts and avoid contact with eyes, skin, and clothing. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For exposures near or over 2 mg/m³: NIOSH approved respirator with high efficiency particulate air (HEPA) filter and a dust/fume/mist pre-filter. Greater protection is provided with a SCBA. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Impervious Rubber (not chlorinated) | Chemical/Dust Goggles | Full Protective Clothing | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after working with aluminum powders and dusts; never bring food, drink, or smoking materials into vicinity of aluminum powders. | | | | |

ALUMINUM FLUORIDEAlF₃

CAS: 7784-18-1

**IDENTIFICATION AND TYPICAL USES**

Aluminum fluoride is a white crystalline solid or a white powder. The anhydrous form is used in the production of aluminum to lower the melting point and increase the conductivity of the electrolyte. It is also used as a flux in ceramic glazes and enamels, in the manufacture of aluminum silicate, and as a catalyst. The hydrate is primarily used in the production of white enamels used in ceramics.

RISK ASSESSMENT: HEALTH***General Assessment***

Aluminum fluoride is generally less toxic than most fluorides because of its slight water solubility. However, it is a human poison by *ingestion*, *inhalation*, and *absorption*. Exposures can be fatal in extreme cases. General symptoms of overexposure may include salivation, nausea, vomiting, abdominal pain, fever, and difficulty breathing. Exposure to high concentrations of fluoride results in hypocalcemia (low calcium content).

Inhalation causes symptoms of fluoride poisoning and may be fatal if large quantities are inhaled. Symptoms of severe poisoning include shortness of breath, congestion of the lungs, muscle spasm, and convulsions. Aluminum chloride has also been shown to be associated with asthma-like problems. Prolonged exposure to the fumes and dusts can cause perforations in the nasal septum.

Contact with the eye is severely irritating and may result in corneal burns. It is also extremely irritating to the skin and may result in deep and painful burns. The material may be absorbed through unbroken skin, resulting in symptoms of fluoride poisoning. There may or may not be any noticeable pain on initial contact. However, as the fluoride ions pass to deeper layers of skin, the pain will become quite severe and may be extremely difficult to remedy.

Ingestion of aluminum fluoride results in symptoms of fluoride poisoning. Severe exposures may cause shock, blurred vision, muscle spasms, shallow breathing, and convulsions. Kidney failure may also result.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to aluminum:

Skin: Dusts and vapors are strong irritants and the liquid may cause severe burns. May pass through unbroken skin to cause toxic systemic effects. Fluoride will also attack bones because of its high affinity for calcium.

Eye: Highly irritating and destructive. Liquid causes severe burns. Possible damage to cornea and loss of vision.

Lung: Extremely irritating to the respiratory tract and destructive to the mucous membranes. May result in shortness of breath, coughing, lung congestion, muscle spasms, and convulsions.

CNS: Inconclusive. However, ingestion and inhalation can lead to symptoms of blurred vision, muscle spasms, shallow breathing, and convulsions.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to aluminum and can last for months or even years:

Cancer Hazards: According to the information presented in the references, aluminum fluoride has not been shown to cause cancer in test animals.

Reproductive Hazard: Some aluminum salts have been shown to be toxic to the animal fetus and cause fetal damage. No data are available on the teratogenicity of aluminum fluoride in humans.

Other Chronic Effects: Prolonged exposures to powders and dusts can cause perforations to appear in the nasal septa. Degenerative changes in the brain, liver, and kidneys were reported in animal tests. Histological changes are also possible in the lungs following chronic exposures. Chronic exposures also cause excessive calcification of the bones, ligaments, and tendons. Exposures to high concentrations can result in hypocalcemia.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with aluminum fluoride. It is extremely irritating to tissues and, because of its ability to cause toxic fluoride poisoning, any form of contact is considered hazardous. *Engineering controls* are always the most effective method of reducing exposures. The best protection, especially when working with powders and dusts of aluminum fluoride, is to enclose operations and provide local exhaust ventilation at the site of powder/dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around aluminum fluoride. An MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the best respiratory protection. However, for exposures near or over the PEL (2 mg/m^3 for dusts), a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist/fume pre-filter would suffice. If a full facepiece respirator is not available, then dust goggles or safety glasses with side shields attached should be worn to protect the eyes. If splash hazards exist, then a face shield is required. Eye contact must be prevented since severe and perhaps permanent damage is likely on contact with aluminum fluoride powders or solutions. To prevent hand and skin exposures, suitable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with aluminum fluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where aluminum fluoride is used or stored.

If symptoms occur or an overexposure is suspected, the following tests may be useful:

- ☑ Kidney and liver function tests.
- ☑ Lung function tests.
- ☑ Chest X-ray should be considered.

Other methods to reduce exposure include:

- ☑ Have calcium gluconate gel available for emergency use. On contact with skin, rub the gel into affected area until pain subsides. The fluoride ion will attack calcium. The gluconate will provide a calcium source to deter bone effects or damage. If swallowed, administer calcium gluconate by mouth (conscious victims only). Never apply gluconate gel to the eyes.
- ☑ Where possible, enclose operations and use local exhaust ventilation at the site where aluminum powder or dust is worked. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when working with aluminum compounds.
- ☑ Wash thoroughly immediately after exposure to aluminum and at the end of the work shift or before eating, drinking, or smoking. Clothing contaminated with aluminum dusts or powders should not be taken home.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of aluminum fluoride should be communicated to all exposed or potentially exposed workers.
- ☑ A safety shower and emergency eyewash station should be readily available for emergency use in or near areas where aluminum fluoride is used, handled, or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of aluminum fluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of aluminum fluoride, especially the dusts and powders (anhydrous form). Accidental contact with a variety of incompatible materials can have adverse and

potentially dangerous results. This includes fire, explosion, generation of other hazardous commodities, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Aluminum fluoride is considered a non-combustible solid. However, it is incompatible with many other commodities including chemically active metals (potassium and sodium, for example), acids, and acid fumes. Contact can cause fire or explosion. When heated, it can emit toxic fumes of fluoride (including extremely toxic hydrogen fluoride). These characteristics require special consideration during any emergency situation involving a leak or spill of aluminum. Should aluminum fluoride ever come into contact with any incompatible substances either during use, transportation, or storage, extremely hazardous results can occur.

Aluminum fluoride can enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to aluminum fluoride. Insufficient data are available on the short-term effects of aluminum fluoride exposure aquatic life, plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available on the long-term effects of aluminum fluoride to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Aluminum fluoride is very slightly soluble in water. Concentrations of less than 100 milliliters will mix with a liter of water.

🕒 *Persistence in the Environment*

Aluminum fluoride is slightly non-persistent in the aquatic environment with a half life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of aluminum fluoride found in fish tissue is expected to be about the same as that found in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in the contamination of the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of aluminum fluoride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. It should be kept in tightly closed containers, never in glass. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. When environmental contamination occurs, the local and/or state emergency response authorities may require notification. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of aluminum fluoride.

Small spills of aluminum fluoride may be disposed of by cautiously adding water and immediately neutralizing with sodium carbonate. A little hydrochloric acid may be followed immediately by sodium carbonate if the material has not completely dissolved. Add calcium chloride in excess of the amount needed to precipitate the fluoride and/or carbonate. Separate the solids and dispose of in a landfill site approved for hazardous waste.

If aluminum fluoride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources and ventilate area of spill or leak.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Use a vacuum equipped with a HEPA filter for cleanup. Dry sweeping is not recommended (generates airborne dusts). Keep water away.
- ☑ It may be necessary to dispose of aluminum fluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving aluminum fluoride can present a significant threat to business operations. The loss or damage of equipment or facilities due to explosion or fire can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

ALUMINUM HYDROXIDE

CAS: 21645-51-2

**IDENTIFICATION AND TYPICAL USES**

Aluminum hydroxide is a white crystalline sand-like powder with no odor. Depending upon its preparation, appearance can also be as white balls or lumps of various sizes. It is used in the production of glass and ceramics, in iron-free aluminum and aluminum salts, in the manufacture of activated alumina, and in flame retardant materials (mattress bedding, for example). Finely divided particles are used as a rubber reinforcing agent, in paper coatings, as fillers, and in cosmetics. May also be used in the manufacture of some antiperspirants.

RISK ASSESSMENT: HEALTH***General Assessment***

The aluminas are generally considered nuisance dusts and under some conditions of human exposure may cause a minimal pulmonary nodular response. However, excessive *inhalation* of finely divided particles may lead to lung damage (Shaver's disease) characterized by scarred tissue (pulmonary fibrosis) with shortness of breath, tightness and pain in the chest, and coughing. The condition can be fatal.

It should be noted that population studies of potentially exposed workers have shown minimal evidence of pulmonary fibrosis or pneumoconiosis. Also, animal experiments with aluminum hydroxide have shown that the type of reaction in lung tissue varies with the form of alumina used and its particle size, the species of animal tested, and the route of administration. However, the data from both human and animal studies seem to indicate that alumina is efficiently eliminated from the lung and has a low degree of fibrogenicity.

This does not mean there is no health risk associated with aluminum hydroxide. Symptoms of exposure can include nausea, vomiting, and constipation. There is no way of estimating exact human response under all possible types of exposure conditions. Prudent risk

management requires caution when working with or around aluminum hydroxide.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to aluminum hydroxide:

Skin: Irritation with a potential for allergic reaction with itching and redness.

Eye: Severe eye irritation likely.

Lung: Can irritate the respiratory tract, in large doses, may cause pulmonary fibrosis, emphysema, and pneumothorax.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to aluminum hydroxide and can last for months or even years:

Cancer Hazards: According to the information presented in the references, aluminum hydroxide has been tested and has not been shown to cause cancer in animals. No data were found on its human carcinogenic capabilities. However, some sources reported limited mutagenic data on test animals.

Reproductive Hazard: According to the information presented in the references, aluminum hydroxide has not been adequately tested for its ability to affect reproduction. Some aluminum compounds have been shown to adversely affect the developing fetus in test animals. Human data are inadequate to evaluate the effects of exposure to aluminum hydroxide on human reproduction.

Other Chronic Effects: Repeated exposure to large amounts of aluminum hydroxide dust may damage the lungs, leading to scarring of the tissue (pulmonary fibrosis), with shortness of breath and possible death.

☉ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with aluminum hydroxide. The exact nature of its harmful capacities is not clearly understood in the references. Therefore, it is recommended that it be handled as a toxic material. If a less toxic material cannot be substituted for aluminum hydroxide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of aluminum hydroxide release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection and other personal protective equipment (PPE) is less effective than the engineering controls mentioned above, but is still advisable whenever working with or around aluminum hydroxide. Under normal operating conditions of low exposure potential, a dust/mist respirator will suffice. However, for maximum protection in large concentrations or when the capacity of the dust/mist respirator is exceeded, personnel should wear a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical/dust goggles, safety glass with side shields, or a face shield should be worn to protect the eyes. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with aluminum hydroxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where aluminum hydroxide is used or stored.

If there has been a long history of high exposure, or if lung symptoms develop, the following medical tests are recommended:

- ☑ Consider chest X-ray following an acute overexposure to aluminum hydroxide.
- ☑ Pulmonary function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause lung cancer, emphysema, and a host

of other medical problems, working with or around aluminum hydroxide may aggravate these conditions further.

Other methods to reduce exposure to aluminum hydroxide include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, then respiratory protection should be required.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances. Never allow contaminated clothing to be taken home from the work place.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of aluminum hydroxide should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of aluminum hydroxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where aluminum hydroxide contacts incompatible commodities can result in violent reactions as well as the possible contamination of the surrounding environmental mediums (water, soil, and air).

Aluminum hydroxide is considered a noncombustible solid. However, because it is incompatible with strong oxidizers, extreme caution is required in handling, storage, transportation, and disposal of aluminum hydroxide. These characteristics also require special consideration during any emergency situation involving a leak or spill of aluminum hydroxide. Should aluminum hydroxide ever come into contact with incompatible substances either during use, transportation, storage, or disposal, dangerous reactions are possible.

Aluminum hydroxide occurs naturally in the environment in the minerals bauxite, baerites, boehmite, corundum, diasporite, and gibbsite. It therefore occurs

naturally in the aquatic environment but can also enter it through industrial discharges and/or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to aluminum hydroxide.

Aluminum hydroxide has slight acute toxicity to aquatic life, but its toxicity will be increased under alkaline conditions. Insufficient data are available to evaluate or predict the short-term toxic effects of aluminum hydroxide to plants, birds, and land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure to toxic chemicals.

Aluminum hydroxide has slight chronic toxicity to aquatic life, but this toxicity will increase under alkaline conditions. Insufficient data are available to evaluate or predict the long-term toxic effects of aluminum hydroxide to plants, birds, or land animals.

💧 *Water Solubility*

Aluminum hydroxide is slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

⌚ *Persistence in the Environment*

Aluminum hydroxide is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Aluminum hydroxide is not expected to accumulate in the edible tissues of aquatic life that are normally consumed by humans.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of aluminum hydroxide into the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of aluminum hydroxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If aluminum hydroxide should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of aluminum hydroxide.

If aluminum hydroxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Do not allow exposure to incompatible materials.
- ☑ Close or remove all ignition sources and ventilate area of spill.
- ☑ Collect powdered materials in the safest and most efficient manner possible. Place materials in a sealed drum. Do not dry sweep (generates dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter instead.
- ☑ It may be necessary to dispose of aluminum hydroxide as a hazardous waste. Consult state, local, or federal environmental regulations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving aluminum hydroxide can present a moderate threat to business operations. Although not likely, equipment and facilities may be lost or their use disrupted as a result of an incident involving aluminum hydroxide which can significantly

effect fiscal viability. Lawsuits that may result from personnel injury, illness, and/or death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures that focus on emergency response, disaster preparedness, and disaster recovery.

A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Wash contaminated skin with soap and water. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed</u>: Do NOT induce vomiting. Give one pint of water immediately. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in the most convenient way possible and deposit in sealed containers. Remove all sources of ignition. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Containers should be protected against physical damage. Store in tightly closed containers in a cool, dry, well ventilated area away from heat, sparks, or open flame. Personnel assigned to area must be properly trained on the hazards associated with aluminum nitrate. | | | | |
| Other Precautions and Warnings Whenever bulk or finely powdered aluminum nitrate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures near or over 2 mg/m³: NIOSH approved respirator with high efficiency particulate air (HEPA) filter and a dust/fume/mist pre-filter. Greater protection is provided with a SCBA. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Neoprene, Viton, Butyl Rubber | | Eye Protection Chemical/Dust Goggles | | Other Protective Clothing Full Protective Suit |
| Work/Hygiene Practices Always wash hands thoroughly after working with aluminum powders and dusts; never bring food, drink, or smoking materials into vicinity of aluminum powders. | | | | |

ALUMINUM NITRATE

CAS: 7784-27-2

IDENTIFICATION AND TYPICAL USES

Aluminum nitrate is a white, crystalline powder that is usually present in a powder (sugar or sand-like) form. It is used as a mordant in textiles, leather tanning, manufacture of incandescent filaments, as a catalyst in petroleum refining, in nucleonics, as an anticorrosion agent, as a transformer core laminate, in heating elements, in the preparation of insulating papers, and in the manufacture of antiperspirant.

RISK ASSESSMENT: HEALTH

General Assessment

Aluminum nitrate is a human poison. The biological hazards of aluminum nitrate appear to be mainly due to the toxicity of the nitrate group. Exposures can occur through *inhalation* of the fine powders, *ingestion* of the material, or through skin *absorption*.

Inhaling the dusts of aluminum nitrate is a common route of exposure in the occupational setting. Risk managers should look for those work practices that may have a tendency to generate airborne dusts and powders. Aluminum nitrate will irritate the upper respiratory tract causing sore throat, coughing, and a possibility of congestion if exposure continues. It may cause symptoms such as dizziness and headaches.

Skin contact produces mild irritation, possible rash, and, in prolonged or repeated exposures, may cause dermatitis in sensitive people. Aluminum nitrate will also pass through unbroken skin to cause symptoms of systemic exposure, such as those occurring after inhalation or ingestion. Eye contact will cause severe irritation and must be avoided. Prolonged contact can cause damage to vision.

Ingestion of nitrates causes symptoms of dizziness and headaches. More severe poisoning may cause abdominal pain, vomiting, bloody diarrhea, flushing of the skin, shock, convulsions, and could cause a loss of consciousness, coma, and possibly death.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to aluminum:

Skin: Dusts and vapors can be strong irritants and the liquid (hydrate) may cause severe burns. Can pass through unbroken skin to cause toxic systemic effects.

Eye: Highly irritating and destructive. Liquid causes severe burns. Possible damage or loss of vision.

Lung: Mildly irritating to the upper respiratory tract. May result in burning sensation, cough, headache, and dizziness.

Other: Ingestion may result in severe gastrointestinal irritation with symptoms of dizziness, headache, nausea, vomiting, abdominal cramps, bloody diarrhea, flushing of the skin, and shock. Severe poisoning may cause convulsions and loss of consciousness.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to aluminum and can last for months or even years:

Cancer Hazards: Insufficient data exist to properly evaluate or predict the carcinogenicity of aluminum nitrate in humans or test animals. While some studies suggest no carcinogenicity, the results of numerous other studies were inconclusive (some studies suggest possible anti-tumor activity). Further research is required before any determinations on the carcinogenic properties of aluminum nitrate can be made.

Reproductive Hazard: Some aluminum salts, including aluminum nitrate, are toxic to the animal fetus and cause fetal damage. No data are available on the teratogenicity of aluminum nitrate in humans.

Other Chronic Effects: Repeated exposures to aluminum nitrate can lead to weakness, general depression, headache, and mental impairment. Aluminum nitrate may cause dermatitis.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with aluminum nitrate. *Engineering controls* are always the most effective method of reducing exposures. The best protection, especially when working with powders and dusts of aluminum nitrate, is to enclose operations and provide explosion-proof, local exhaust ventilation at the site of powder or dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around aluminum nitrate. A MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the best respiratory protection. However, for exposures near or over the 2 mg/m³ TLV for dusts, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist/fume pre-filter would suffice. If a full facepiece respirator is not available, then dust goggles or safety glasses with side shields attached should be worn to protect the eyes. If splash hazards exist, then a face shield is required. Eye contact must be prevented since severe and perhaps permanent damage is likely on contact with aluminum nitrate powders or solutions. To prevent hand and skin exposures, suitable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with aluminum nitrate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where aluminum nitrate is used, handled, or stored. Before beginning employment with aluminum, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- ☑ Lung function tests.
- ☑ Chest X-ray should be considered.
- ☑ Evaluation by a qualified allergist to determine sensitivity and potential for dermatitis.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site where aluminum powder or dust is worked. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when working with aluminum compounds.
- ☑ Wash thoroughly immediately after exposure to aluminum and at the end of the work shift or before eating, drinking, or smoking. Clothing contaminated with aluminum dusts or powders should not be taken home.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of aluminum nitrate should be communicated to all exposed and potentially exposed workers.
- ☑ A safety shower and emergency eyewash station should be readily available for emergency use in or near areas where aluminum nitrate is used, handled, or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of aluminum nitrate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of aluminum nitrate, especially the dusts and powders (anhydrous form). Accidental contact with a variety of incompatible materials, including ordinary combustibles (wood, paper, oil, fuel), can have adverse and potentially dangerous results. This includes fire, explosion, generation of other hazardous commodities, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Aluminum nitrate is considered a non-combustible solid. However, it is incompatible with many other commodities including other finely divided metal powders, strong reducing agents, strong acids, cyanides, thiocyanates, isothiocyanates, and hypophosphites. Contact can cause fire or explosion. The aqueous solutions are slightly corrosive. These characteristics require special consideration during any emergency situation involving a leak or spill of aluminum. Should aluminum nitrate ever come into contact with such incompatible substances either during use, transportation,

or storage, the formation of highly explosive commodities is extremely possible.

Aluminum nitrate can enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to aluminum nitrate.

This material has moderate acute toxicity to aquatic life. Insufficient data are available on the short-term effects of exposure to plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Aluminum nitrate has high chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of aluminum nitrate to plants, birds, or land animals.

💧 *Water Solubility*

Aluminum nitrate is slightly soluble in water. Concentrations of 1 - 100 milliliters will mix with a liter of water.

⌚ *Persistence in the Environment*

Aluminum nitrate is slightly-persistent in water, with a half life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of aluminum nitrate found in the tissue of fish is expected to be slightly lower than that found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in the contamination of the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of aluminum nitrate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. It should be kept in tightly closed containers, in a cool, well ventilated area, away from sources of heat or ignition. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. When environmental contamination occurs, the local and/or state emergency response authorities may require notification. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of aluminum nitrate.

Small spills of aluminum nitrate powder can be neutralized by cautiously mixing with large amounts of water while stirring. Any insoluble solids or liquids should be separated for disposal. Aqueous solutions can be flushed to sanitary sewer system with flooding amounts of water.

If aluminum nitrate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources and ventilate area of spill or leak.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Use a vacuum equipped with a HEPA filter for cleanup. Dry sweeping is not recommended (generates airborne dusts). Keep water away.
- ☑ It may be necessary to dispose of aluminum nitrate as a hazardous waste. The responsible state agency or the regional office of the federal Envi-

ronmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving aluminum nitrate can present a significant threat to business operations. The loss or damage of equipment or facilities due to explosion or fire can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|--|--------------------------------|
| Characterization Metal | RCRA Number Not Listed | EPA Class Not Listed |
| DOT Proper Shipping Name Chemicals, N.O.S. | Chemical Abstract Service (CAS) Number 1344-28-1 | |
| DOT Hazard Class and Label Requirements Non-Regulated | DOT Emergency Guide Code No Citation | |
| DOT Identification Number None Established | Molecular Formula Al₂O₃ | |

Synonyms

Alumina; α -alumina (OSHA); β -alumina; γ -alumina; aluminum trioxide; activated aluminum oxide; almite; alon; alumite; α -aluminum oxide.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|--|---|---|
| Aluminum oxide (derivation: Leaching of bauxite with caustic soda and precipitation of hydrated aluminum oxide by hydrolysis and seeding of the solution. The alumina hydrate is then washed, filtered, and calcined to remove water and obtain the anhydrous oxide. Also, coal mine waste waters are used to get aluminum sulfate, which is then reduced to alumina). | PEL: 15 mg/m³ (total) 5 mg/m³ (respiratory) | REL: 10 mg/m³ (proposed) | Not Determined | TLV: 10 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|---|
| Boiling Point 5396°F (2977°C) | Specific Gravity (H ₂ O = 1) 4.0 |
| Vapor Pressure (mm Hg) 1 (approx.) at 2158°C | Molecular Weight 101.96 |
| Vapor Density (Air = 1) Not Applicable | Melting Point 3686°F (2030°C) |

Solubility

Negligible solubility (less than 0.1%). Difficult, but soluble in mineral acids and strong alkali.

Appearance and Odor

White, odorless, crystalline powder. Depending upon method of preparation, appearance can also be as white balls, or lumps of various mesh.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Noncombustible Solid | Autoignition Temperature Not Applicable |

Extinguishing Media

Use extinguishing media suitable to surrounding fires.

Special Fire Fighting Procedures

None noted. But, aluminum oxide dust is toxic by inhalation. Fire fighters should take care to avoid dusty situations or wear appropriate respiratory protection where aluminum oxide may be present.

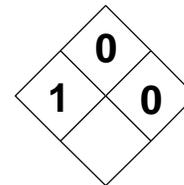

Unusual Fire and Explosion Hazards

Aluminum oxide is a noncombustible solid. But, its dusts may form explosive mixtures in air. Caution is warranted when approaching situations that may involve aluminum oxide dusts.

| SECTION V - REACTIVITY DATA | | | | |
|--|-------------------|---|------------------------|---------------------------------------|
| Stability | | Conditions to Avoid None documented. However, aluminum oxide should be kept away from contact with hot chlorinated rubber. It is considered stable under normal conditions of temperature and pressure. | | |
| Stable | Unstable | Incompatibility (<i>materials to avoid</i>) | | |
| X | | Aluminum oxide is not compatible with hot chlorinated rubber; acids; oxidizers; and chlorine trifluoride. | | |
| Hazardous Polymerization | | Conditions to Avoid Explosive hydrogen gas may be formed when finely divided iron contacts moisture during crushing and milling operations. Hazardous polymerization cannot occur. | | |
| May Occur | Will Not Occur | Hazardous Decomposition or By-products | | |
| | X | Exothermic reaction above 200°C with halocarbon vapors produces toxic hydrogen chloride and phosgene gases and fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? | Absorption (skin/eye)? | Ingestion? |
| | | X | | |
| Health Hazards | | | | |
| INHALATION: Inhaling finely divided particles may cause lung damage (Shaver's disease). In general, dust inhalation may cause tightness and pain in chest, coughing, difficulty breathing. | | | | |
| SKIN & EYES: Contact with the skin or eyes may cause irritation. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | Not Listed | No | Not Listed | Eyes, Skin, Respiratory System |
| Medical Conditions Generally Aggravated by Exposure | | | | |
| Pre-existing lung disease or dysfunction may be aggravated by exposure to aluminum oxide dusts. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed, remove person to fresh air and seek medical attention immediately. Begin rescue breathing if breathing has stopped and CPR if heart action has stopped. Do not attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Collect spilled powdered materials in safest manner possible and deposit in sealed drum for disposal. Notify appropriate authorities, as required by applicable environmental regulations. | | | | |
| Preferred Waste Disposal Method | | | | |
| Not listed. Check applicable federal, state, and/or local environmental regulations. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Aluminum oxide is a noncombustible solid. Store to avoid contact with strong acids and oxidizers. Store in tightly closed containers in cool, well-ventilated area. | | | | |
| Other Precautions and Warnings | | | | |
| Aluminum oxide is suitable for storage in general chemical storage areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| None required where adequate ventilation conditions exist. If airborne concentrations exceed the TLV, a dust/mist respirator is recommended. For high exposures, or if concentrations exceed the capacity of the respirator, then a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode is advised. | | | | |
| Ventilation | | | | |
| Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Impervious Rubber | | Safety Glasses with Side Shields | | Not Applicable |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ALUMINUM OXIDE

CAS: 1344-28-1

**IDENTIFICATION AND TYPICAL USES**

Aluminum oxide is a white crystalline sand-like powder with no odor. The mineral corundum is natural aluminum oxide. Emery, ruby, and sapphire are impure crystalline varieties. The mixed mineral bauxite is a hydrated aluminum oxide. It is used in the production of aluminum; in the manufacture of abrasives, refractories, ceramics, and electrical insulators; as catalysts and catalyst supports; in some paper products; spark plugs; crucible and laboratory wares; as adsorbent for gases and water vapors, in chromatographic analysis; in fluxes and light bulbs; as artificial gems; in heat-resistant fibers; and as a dispersing agent in food additives.

RISK ASSESSMENT: HEALTH**General Assessment**

The aluminas are generally considered nuisance dusts and under some conditions of human exposure may cause a minimal pulmonary nodular response. However, excessive *inhalation* of finely divided particles may lead to lung damage (Shaver's disease) characterized by scarred tissue (pulmonary fibrosis) with shortness of breath, tightness and pain in the chest, and coughing. The condition can be fatal.

It should be noted that population studies of potentially exposed workers have shown minimal evidence of pulmonary fibrosis or pneumoconiosis. Also, animal experiments with aluminum oxide have shown that the type of reaction in lung tissue varies with the form of alumina used and its particle size, the species of animal tested, and the route of administration. However, the data from both human and animal studies seem to indicate that alumina is efficiently eliminated from the lung and has a low degree of fibrogenicity.

This does not mean there is no health risk associated with aluminum oxide. There is no way of estimating exact human response under all possible types

of exposure conditions. Prudent risk management requires caution when working with or around aluminum oxide.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to aluminum oxide:

Skin: Irritation.

Eye: Severe eye irritation likely.

Lung: Can irritate the respiratory tract, in large doses, may cause pulmonary fibrosis.

☹ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to aluminum oxide and can last for months or even years:

Cancer Hazards: According to the information presented in the references, aluminum oxide has been tested and has not been shown to cause cancer in animals. No data were found on its human carcinogenic capabilities.

Reproductive Hazard: According to the information presented in the references, aluminum oxide has been tested and has not been shown to affect reproduction.

Other Chronic Effects: Repeated exposure to large amounts of aluminum oxide dust may damage the lungs, leading to scarring of the tissue (pulmonary fibrosis), with shortness of breath and possible death.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with aluminum oxide. The exact nature of its harmful capacities is not clearly understood in the references. Therefore, it is recommended that it be handled as a toxic material. If a less toxic material cannot be substituted for alumi-

num oxide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of aluminum oxide release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection and other personal protective equipment (PPE) is less effective than the engineering controls mentioned above, but is still advisable whenever working with or around aluminum oxide. Under normal operating conditions of low exposure potential, a dust/mist respirator will suffice. However, for maximum protection in large concentrations or when the capacity of the dust/mist respirator is exceeded, personnel should wear a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical/dust goggles, safety glass with side shields, or a face shield should be worn to protect the eyes. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with aluminum oxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where aluminum oxide is used or stored.

If there has been a long history of high exposure, or if lung symptoms develop, the following medical tests are recommended:

- Chest X-ray.
- Pulmonary function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause lung cancer, emphysema, and a host of other medical problems, working with or around aluminum oxide may aggravate these conditions further.

Other methods to reduce exposure to aluminum oxide include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not

used, then respiratory protection should be required.

- Always ensure that proper protective clothing is worn when using chemical substances. Never allow contaminated clothing to be taken home from the work place.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of aluminum oxide should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of aluminum oxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where aluminum oxide contacts incompatible commodities can result in violent reactions as well as the possible contamination of the surrounding environmental mediums (water, soil, and air).

Aluminum oxide is considered a noncombustible solid. However, its dusts may form explosive mixtures in air. Also, because it is incompatible with strong oxidizers and strong acids, extreme caution is required in handling, storage, transportation, and disposal of aluminum oxide. These characteristics also require special consideration during any emergency situation involving a leak or spill of aluminum oxide. Should aluminum oxide ever come into contact with incompatible substances either during use, transportation, storage, or disposal, dangerous reactions are possible.

Aluminum oxide occurs naturally in the environment in the minerals bauxite, baerites, boehmite, corundum, diaspore, and gibbsite. It therefore occurs naturally in the aquatic environment but can also enter it through industrial discharges and/or spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to aluminum oxide.

Aluminum oxide has slight acute toxicity to aquatic life, but its toxicity will be increased under alkaline conditions. Insufficient data are available to evaluate or predict the short-term toxic effects of aluminum oxide to plants, birds, and land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure to toxic chemicals.

Aluminum oxide has slight chronic toxicity to aquatic life, but this toxicity will increase under alkaline conditions. Insufficient data are available to evaluate or predict the long-term toxic effects of aluminum oxide to plants, birds, or land animals.

◆ *Water Solubility*

Aluminum oxide has slight solubility in water. Concentrations of 1 milligram or less will mix with a liter of water.

⌚ *Persistence in the Environment*

Aluminum oxide is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐡 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Aluminum oxide will not accumulate in the edible tissues of aquatic life that are consumed by humans.

🕒 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of aluminum oxide into the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of aluminum oxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If aluminum oxide should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of aluminum oxide.

If aluminum oxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Do not allow exposure to incompatible materials.
- ☑ Collect powdered materials in the safest and most efficient manner possible. Place materials in a sealed drum.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving aluminum oxide can present a moderate threat to business operations. Although not likely, equipment and facilities may be lost or their use disrupted as a result of an incident involving aluminum oxide which can significantly affect fiscal viability. Lawsuits that may result from personnel injury, illness, and/or death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures that focus on emergency response, disaster preparedness, and disaster recovery. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies

should be developed, approved, and implemented long before any need for such arises.

Solubility

Moderately soluble in water.

Appearance and Odor

Colorless or yellowish-brown crystalline (sand-like) solid material with a floral-like odor (Note: Turns purple on contact with air due to oxidation process). It can also exist in liquid solutions.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) <p style="text-align: center;">Not Found</p> | Explosive Limits in Air % by Volume <p style="text-align: center;">LEL: Not Found UEL: Not Found</p> |
| NFPA Classification <p style="text-align: center;">Combustible Solid</p> | Autoignition Temperature <p style="text-align: center;">842°F (450°C)</p> |

Extinguishing Media

Use extinguishing media suitable to surrounding fires. Recommend water spray/mist or dry chemical.

Special Fire Fighting Procedures

Poisonous gases may be emitted during fire. Fire fighters should take precautions to avoid inhalation or skin contact by wearing full body protection and use a self-contained breathing apparatus (SCBA).

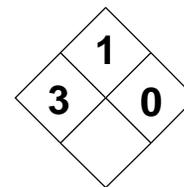

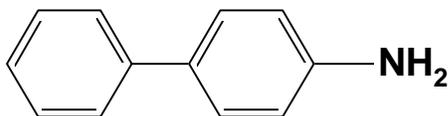

Unusual Fire and Explosion Hazards

4-Aminodiphenyl must be preheated before ignition is possible. It is a slight to moderate fire hazard when exposed to heat, flames, sparks, or powerful oxidizers.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|---|------------------------------------|--|
| Stability | | Conditions to Avoid Normally stable but avoid contact with air. 4-Aminodiphenyl will oxidize on contact with air. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) May react explosively on contact with powerful oxidizers. | | |
| Hazardous Polymerization | | Conditions to Avoid Hazardous polymerization cannot occur. Ignition may occur when mixed with red fuming nitric acid. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, 4-aminodiphenyl emits toxic oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: Exposure may interfere with the ability of the blood to carry oxygen causing headache, fatigue, difficulty in breathing, and blue or violet discoloration of the lips and skin due to depleted oxygen content in blood. Also causes dizziness, lethargy, and dyspnea. ABSORPTION: Ataxia, weakness, and interference in the oxygen-carrying capabilities of the blood (see symptoms noted above for inhalation). INGESTION: May cause acute urinary burning due to bladder irritation. Blood may be present as well. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Confirmed Human Confirmed Animal | 5th Annual Report | Group 1 | 29 CFR 1910.1011 | Bladder (causes bladder cancer), skin |
| Medical Conditions Generally Aggravated by Exposure None reported. However, it may be assumed that any previous skin conditions might be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed, remove person to fresh air and seek medical attention immediately. Begin rescue breathing if breathing has stopped and CPR if heart action has stopped. Do not give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Collect spilled powdered materials in safest manner possible and deposit in sealed drum for disposal. Notify appropriate authorities, as required by applicable environmental regulations. | | | | |
| Preferred Waste Disposal Method Dissolve in a combustible solvent, burn in chemical incinerator equipped with afterburner & scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Prior to working with 4-aminodiphenyl, personnel must, by law, be trained. A regulated, marked area must be established where it is handled, used, or stored that is maintained under a negative pressure. | | | | |
| Other Precautions and Warnings Bulk storage is not recommended. Refer to OSHA 29 CFR 1910.1011 for regulatory requirements. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) At any exposure level, use a supplied air respirator with a full facepiece operated in positive pressure mode; or a full facepiece, hood, or helmet in the continuous flow mode; or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with a full facepiece operated in pressure demand mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Polyvinyl Chloride (PVC) | Eye Protection Chemical/dust Goggles or Face Shield | Other Protective Clothing Full Body Protection Recommended | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

4-AMINODIPHENYL

CAS: 97-67-1

**IDENTIFICATION AND TYPICAL USES**

4-Aminodiphenyl is a colorless or yellowish-brown crystalline (sand-like) solid material with a sweet, floral odor. It may also exist in liquid solutions. It is used primarily in research laboratories. It was previously used as a rubber antioxidant. However, it is no longer produced on a commercial scale.

RISK ASSESSMENT: HEALTH**General Assessment**

4-Aminodiphenyl is a confirmed carcinogen in humans. It is also a mutagen and there is evidence of animal teratogenic effects reported. Many scientists believe there may be no safe level of exposure to human carcinogens and, therefore, all contact (including skin) should be reduced to the lowest possible level. No exposure limits have been established. However, there is a full OSHA standard (29 CFR 1910.1011) that provides detailed information and requirements on how 4-aminodiphenyl must be handled.

Exposure is possible by all routes (*inhalation*, skin *absorption*, and *ingestion*), all having similar systemic effects as well as localized irritation at point of contact. Inhalation exposures and skin absorption may result in a condition known as methemoglobinemia (a decrease in the blood's oxygen-carrying capabilities). This condition is characterized by a blue or violet discoloration of the lips and skin. Other symptoms of exposure include headaches, fatigue, difficulty in breathing, lethargy, dizziness, ataxia, and weakness. 4-Aminodiphenyl is a known bladder carcinogen, especially on ingestion. Related symptoms may include burning urination with possible blood present in urine.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to 4-aminodiphenyl:

Skin: Irritation.

Eye: Severe eye irritation likely.

Lung: Can irritate the respiratory tract and cause difficulty in breathing. Will inhibit the oxygen carrying capabilities of the blood and lead to methemoglobinemia.

CNS: Symptoms of dizziness, weakness, fatigue, ataxia, lethargy, and headaches are likely.

☛ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to 4-aminodiphenyl and can last for months or even years:

Cancer Hazards: 4-Aminodiphenyl is a confirmed carcinogen in humans. It has been shown to cause bladder cancer in humans and animals. Human and animal mutation data also reported.

Reproductive Hazard: There is limited evidence that 4-aminodiphenyl may damage the developing fetus in test animals. Human teratogenic data are inconclusive.

Other Chronic Effects: This chemical has not been adequately evaluated to determine whether brain or other nerve damage could occur with repeated exposure. However, many solvents and other petroleum based chemicals have been shown to cause such damage. Effects may include reduced memory and concentration, personality changes (withdrawal, irritability), fatigue, sleep disturbances, reduced coordination, and/or effects on nerves supplying internal organs (autonomic nervous system), and/or nerves to the arms and legs characterized by weakness and a feeling of "pins and needles."

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with 4-aminodiphenyl. This chemical is extremely dangerous and should therefore be handled with caution in all

situations. If a less toxic material cannot be substituted for 4-aminodiphenyl, then specific *engineering controls* as required by OSHA are the most effective method of reducing exposures. For example, OSHA requires a *regulated area* be established wherever 4-aminodiphenyl is manufactured, used, or stored. Only specifically trained and authorized personnel can be allowed in this area. Other special engineering controls are established for this chemical by OSHA at 29 CFR 1910.1011. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of 4-aminodiphenyl release. While not always operationally feasible, isolating operations within the regulated area can also reduce exposure potential further.

Using respiratory protection and other personal protective equipment (PPE) is less effective than the engineering controls mentioned above, but is still required whenever working with or around 4-aminodiphenyl. At any exposure level to a known carcinogen, personnel should wear a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles or a face shield should be worn to protect the eyes. To prevent hand and skin exposures, impervious polyvinyl chloride (PVC) gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* selecting gloves.

Administrative controls must also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 4-aminodiphenyl.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) and 29 CFR 1910.1011 (4-Aminodiphenyl), prior to the first assignment in an area where 4-aminodiphenyl is used or stored.

At regular intervals (at least twice a year) after employment, the following medical tests are recommended for those who work with 4-aminodiphenyl:

- Urine cytology (a test for abnormal cells in urine).
- Interview for possible brain effects, noting any accounts of recent memory loss, mood shifts (such as irritability or withdrawal), concentration problems, headaches, malaise, and altered sleeping patterns. Consider performing cerebellar, autonomic, and peripheral nervous system evaluation. Positive and borderline individuals should be referred for neuropsychological testing.

If symptoms develop or overexposure is suspected, the following may be useful:

- Blood methemoglobin level test.

It is recommended that the most recent version of OSHA 29 CFR 1910.1011 be consulted for information on specific tests required by law for those exposed to 4-aminodiphenyl.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure to 4-aminodiphenyl include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Respiratory protection is required whenever exposure to a carcinogen is possible.
- Ensure that proper, full-body protective clothing is worn. Never allow contaminated clothing to be taken home from the work place. Clothing contaminated by 4-aminodiphenyl should only be laundered by those who have been informed of the hazards of exposure to 4-aminodiphenyl.
- Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of 4-aminodiphenyl should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure, emergency showers must also be provided in the immediate work area.
- On skin contact, immediately wash or shower to remove the chemical. Wash any areas of the body that may have contacted 4-aminodiphenyl prior to each exit from the regulated area.
- Do not eat, drink, or smoke in areas where 4-aminodiphenyl is handled, processed, or stored since the chemical can be swallowed. Wash hands carefully before eating or smoking.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 4-aminodiphenyl. In almost every scenario, the threat of envi-

ronmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where 4-aminodiphenyl contacts incompatible commodities can result in violent reactions as well as the possible contamination of the surrounding environmental mediums (water, soil, and air).

4-Aminodiphenyl is considered a combustible solid. Also, because it is incompatible with strong oxidizers and because it will oxidize itself upon contact with air, extreme caution is required in handling, storage, transportation, and disposal of 4-aminodiphenyl. These characteristics also require special consideration during any emergency situation involving a leak or spill of 4-aminodiphenyl. Should 4-aminodiphenyl ever come into contact with incompatible substances either during use, transportation, storage, or disposal, dangerous reactions are possible.

4-Aminodiphenyl can enter it through industrial discharges and/or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 4-aminodiphenyl.

4-Aminodiphenyl has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term toxic effects of 4-aminodiphenyl to plants, birds, and land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure to toxic chemicals.

4-Aminodiphenyl has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term toxic effects of 4-aminodiphenyl to plants, birds, or land animals.

💧 *Water Solubility*

4-Aminodiphenyl is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

4-Aminodiphenyl is moderately persistent in water, with a half-life between 2 and 200 days. The half-life

of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 90% of 4-aminodiphenyl will eventually end up in water; approximately 4.5% will end up in terrestrial soils; about 4.25% will end up in aquatic sediments; and the remainder (1.25%) will end up in the air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 4-aminodiphenyl found in fish is expected to be somewhat higher than the average concentration of 4-aminodiphenyl in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of 4-aminodiphenyl into the environment. The correct use of labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 4-aminodiphenyl should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage is not recommended.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If 4-aminodiphenyl should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 4-aminodiphenyl.

If 4-aminodiphenyl is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area is cleared for normal operations.

- ☑ Do not allow exposure to incompatible materials.
- ☑ Do not dry sweep for cleanup. Use a vacuum equipped with a high efficiency particulate air (HEPA) filter, not a standard shop vacuum.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 4-aminodiphenyl can present a serious threat to business operations. Although not likely, equipment and facilities may be lost or their use disrupted as a result of an incident involving 4-aminodiphenyl which can significantly affect fiscal viability. Lawsuits that may result from personnel injury, illness, and/or death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures that focus on emergency response, disaster preparedness, and disaster recovery. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Solubility

Very miscible in water, alcohol, and ether; aqueous solution is highly alkaline.

Appearance and Odor

Colorless gas with extremely pungent, intense, irritating, and even suffocating odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|----------------------------------|-------------------------------------|--------------------------|
| Flash Point (method used) | Not Applicable (gas) | Explosive Limits in Air % by Volume | LEL: 15% UEL: 28% |
| NFPA Classification | Class 1B Flammable Liquid | Autoignition Temperature | 1204°F (650°C) |

Extinguishing Media

Reactive Gas.

Special Fire Fighting Procedures

Ammonia gas is difficult to ignite but presents an explosion hazard when exposed to flame or in fire. Gas is extremely irritating: wear full protective clothing and self-contained breathing apparatus (SCBA). Heat will build pressure and may rupture closed storage containers. Keep fire-exposed containers cool with water spray.

Unusual Fire and Explosion Hazards

Emits toxic fumes of NH₃ and NO_x when exposed to heat. To stop fire, stop the flow of gas. Use extinguishing agent suitable for the type of surrounding fire.

| SECTION V - REACTIVITY DATA | |
|--|----------------|
| Stability | |
| Conditions to Avoid Ammonia is corrosive to copper and galvanized surfaces. Forms sensitive explosive mixtures with air and hydrocarbons. Explosive reaction with silver chloride, silver nitrate, silver azide, and silver oxide. | |
| Stable X | Unstable |
| Incompatibility (materials to avoid) Ammonia is incompatible with numerous commodities, primarily strong oxidizers, acids, halogens, salts of silver and zinc, gold, mercury, calcium, and hypochlorite bleaches. | |
| Hazardous Polymerization | |
| Conditions to Avoid Potentially violent or explosive reactions on contact with interhalogens. Do not mix with other materials, especially for cleaning purposes (never mix ammonia with bleach as toxic gas emissions can occur). | |
| May Occur X | Will Not Occur |
| Hazardous Decomposition or By-products Ammonia catalyzes the polymerization of acrolein and other unsaturates, causing an increase in temperatures and pressure, which may explode containers. Emits toxic NH₃ and NO_x in heat conditions. | |

SECTION VI - HEALTH HAZARD DATA

| | | | |
|---|-------------------------|---------------------------|-------------------------------------|
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards | | | |
| INHALATION: Eye, nose, and throat irritant. Toxic effects include lachrymation, respiratory distress, chest pain, and pulmonary edema. | | | |
| SKIN & EYES: Ammonia is corrosive to skin because it reacts with moisture to form caustic ammonium hydroxide. Long exposure may result in destruction of tissue. | | | |
| INGESTION: Headache, dizziness, nausea, may cause vomiting. | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? |
| Insufficient data | No | No | 29 CFR 1910.1000 (Table Z-1) |
| Target Organs? Respiratory system; skin; eyes. | | | |

Medical Conditions Generally Aggravated by Exposure
Respiratory function impairments (bronchitis, asthma, etc.); Skin conditions (dermatitis).

Emergency and First-aid Procedures
Eye contact: Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. Observation for 24 - 48 hours since pulmonary edema is possible. If swallowed, seek medical attention immediately.

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled
Remove all ignition sources. Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. For liquid spills, neutralize with hydrochloric acid. Wipe with mop or use water aspirator.

Preferred Waste Disposal Method
None specified in the references (incineration of a gas may be the only alternative).

Precautions to be Taken in Handling and Storage
Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from sunlight. Keep away from ignition sources such as fire, sparks, and flame.

Other Precautions and Warnings
Bulk storage of ammonia is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight).

SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT

Respiratory Protection (specify type)
Exposures above 50 ppm: MSHA/NIOSH approved full-facepiece respirator with an ammonia vapor cartridge. Greater protection is obtained from a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode.

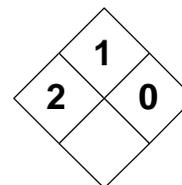

Ventilation
Local exhaust or general mechanical systems recommended.

|--|--|--|

Work/Hygiene Practices
Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals.

AMMONIANH₃

CAS: 7664-41-7

NH₃**IDENTIFICATION AND TYPICAL USES**

Ammonia is a colorless gas with a strong, intense, suffocating odor. It is a common molecule given off by living organisms. It is used to make fertilizers, animal foods, synthetic fibers, glues and explosives. It is also used in the treatment and refining of metals; in the manufacture of nitric acid, hydrazine hydrate, and acrylonitrile. It is often used in refrigeration.

Higher exposures can lead to pulmonary edema (fluid in the lungs), a medical emergency which can be fatal.

CNS: Data on the acute effects of ammonia on the central nervous system are inconclusive. However, exposure can result in headaches and the loss of sense of smell (exact mechanism for reaction not completely understood).

RISK ASSESSMENT: HEALTH**General Assessment**

Ammonia is a severe irritant of the eyes, respiratory tract, and skin. Exposures to and *inhalation* of large concentrations of liquid anhydrous ammonia causes severe corneal irritation, dyspnea, bronchospasm, chest pain, and pulmonary edema, which may be fatal. Exposure of liquid ammonia to the eyes may cause serious injury to the cornea and deeper structures and sometimes loss of sight. Skin contact causes first and second degree burns that are severe and, if extensive, may be fatal. Extremely high concentrations of vapor (10,000 ppm) can still result in skin burns. With skin and mucous membrane contact, burns are of three types: *cryogenic* (from liquid ammonia), *thermal* (from exothermic dissociation of ammonium hydroxide), and *chemical* (alkaline).

Although no carcinogenic data are reported, there are inconclusive reports of mutagenic reactions.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ammonia:

Skin: Irritation and burning on contact with liquid.

Eye: Burns which can lead to permanent damage.

Lung: Irritation of the mouth, nose, and throat causing coughing and/or shortness of breath.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ammonia and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to ammonia does not currently lead to carcinogenic effects (although some mutagenic data are reported).

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: Repeated exposures can cause chronic irritation of the eyes, nose, throat, and airways. Very irritating to the lungs. It is not known whether ammonia causes lung damage in the long-term.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with ammonia. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with ammonia. A NIOSH-approved, full-facepiece respirator with ammonia vapor cartridge or canister is sufficient for low exposures. A self-contained breathing apparatus (SCBA) with full facepiece and pressure de-

mand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ammonia.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ammonia is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Other methods to reduce exposure to chemicals include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to ammonia and at the end of the work shift or before eating, drinking, or smoking. Work clothing contaminated with ammonia should never be taken home for laundering. Only personnel trained in the hazards of exposure should launder contaminated clothing.
- Safety shower and eyewash stations should be readily available in work areas where ammonia is used or stored.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ammonia should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ammonia. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Ammonia is not considered to be a flammable gas. However, because it is incompatible with so very many other commodities, contact with which can result in violent explosion and fire, ammonia requires special consideration during any emergency involving a leak or release of ammonia gas or liquid.

Ammonia can enter the environment through natural organic matter decomposition, run-off from agricultural fields or feedlots, municipal waste treatment plant discharges, oil refinery and chemical manufacturing effluents, or from atmospheric fallout.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ammonia. "Total ammonia" refers to the sum of ammonia (NH₃) plus the ionized form (NH₄⁺).

The toxicity of liquid ammonia solutions is primarily due to the presence of NH₃, the percentage of which increases with pH and temperature. Therefore, the toxicity of "total ammonia" is greater in more alkaline waters at higher temperatures. It is also more toxic under conditions of decreased oxygen concentrations.

Under natural conditions of pH and temperature, ammonia has a moderate acute toxicity to aquatic life. No data are available on the short-term effects of ammonia on plants, birds, or land animals.

☠* Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Under natural conditions of pH and temperature, total ammonia has moderate chronic toxicity in aquatic life. No data are available to evaluate the long-term effects of ammonia to plants, birds, or land animals.

◆ **Water Solubility**

Ammonia is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ **Persistence in the Environment**

Total ammonia is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Ammonia is not expected to accumulate in the tissues of fish.

🛡️ **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ammonia should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ammonia should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster prepar-

edness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ammonia. If ammonia is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep ammonia out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- ☑ It may be necessary to dispose of ammonia as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ammonia can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, ammonium acetate emits toxic nitric oxide and ammonia fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Dusts are irritating to the nose, mouth, and respiratory tract. General symptoms of exposure may include loss of facial muscle firmness, tremor, general discomfort, and impairment of motor functions and recognition. Inhalation toxicity seems to be low. SKIN & EYES: Skin contact may cause mild irritation. Absorption has NOT been reported. INGESTION: Irritation of the digestive tract, diarrhea, diuresis, and systemic ammonia poisoning. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Not Listed Human Not Listed Animal | No | No | Not Listed. | Respiratory system; skin; eyes, digestive tract. |
| Medical Conditions Generally Aggravated by Exposure None identified, however pre-existing liver disease may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 30 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed, Give large amounts of water and seek medical attention immediately. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Evacuate area of non-essential personnel. Remove all sources of ignition. Wear SCBA, heavy rubber boots and gloves. Minimize dust generation, use a vacuum equipped with HEPA filter and damp mop residue. Collect and contain in tightly closed drum. Ventilate area of spill site. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Keep in tightly closed container, stored in a cool, dry, ventilated area. Protect against physical damage. Store separate from ignition sources and strong oxidizers. Keep airborne concentrations to the lowest possible level using adequate dilution ventilation. | | | | |
| Other Precautions and Warnings All employees assigned to work with, use, handle, or store ammonium acetate must be trained on its hazards prior to their first assignment. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Where exposure to dusts are anticipated, a full facepiece respirator equipped with a dust/mist pre-filter should be worn. For emergency situations or very high transient exposures, use a supplied-air respirator or a self-contained breathing apparatus (SCBA) may be necessary. | | | | |
| Ventilation Local exhaust systems recommended (explosion-proof electrical equipment may be necessary). | | | | |
| Protective Gloves Chemical Resistant Rubber | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

AMMONIUM ACETATE

CAS: 631-61-8

**IDENTIFICATION AND TYPICAL USES**

Ammonium acetate is a white, deliquescent crystalline solid with a slightly acetic odor. It is used as a reagent in analytical chemistry for determining lead and iron content, a chemical intermediate in manufacturing acetamide. It is also a diuretic in veterinary medicine, in other drugs, in textile dyeing, in meat preservative, in foam rubbers, in vinyl plastics, in stripping explosives, and in determining lead and iron content.

RISK ASSESSMENT: HEALTH***General Assessment***

Ammonium acetate is not rated for carcinogenic, mutagenic, or teratogenic effects. No data are available to substantiate claims to the contrary. However, prudent risk management requires that all contact with this chemical be reduced to the lowest possible level. The references contain very little information on the toxic nature of this chemical; however, it is believed to be relatively low. Human exposure to ammonium acetate can occur primarily through two routes of entry into the body: *inhalation* and *ingestion*. Each can present a mild to moderate level of toxicity. Absorption through the skin has not been reported.

Inhalation can cause irritation of the nose, throat, and upper respiratory tract. Systemic toxicity by this route of entry has not been fully researched and is therefore, not clearly understood.

Ingestion can lead to irritation of the digestive tract, diarrhea, diuresis (urine secretion indicating increased kidney function), and systemic ammonia poisoning. Other possible symptoms include flaccid facial muscles (loss of firmness and tension), tremor, general discomfort, anxiety, and impairment of motor performance and recognition. In the long term, exposure may cause liver dysfunction and/or disease.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to ammonium acetate:

Skin: Mild irritation.

Eye: Mild irritation and redness.

Lung: Irritation of the mucous membranes of the nose and throat as well as mild irritation of the upper respiratory tract.

Other: Ingestion can cause irritation of the digestive tract with diarrhea and general discomfort.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to ammonium acetate and can last for months or even years:

Cancer Hazards: According to the references, ammonium acetate has not been tested for its ability to cause cancer.

Reproductive Hazard: According to the references, ammonium acetate has not been tested for its ability to adversely affect reproduction.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with ammonium acetate. Unless another chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ammonium acetate.

For low exposures, a respirator fitted with a dust/fume/mist pre-filter is acceptable protection. At higher concentrations of exposure, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a potential for airborne release of dusts exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, heavy rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ammonium acetate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ammonium acetate is used or stored. If symptoms develop or overexposure is suspected, the following may be useful:

- Liver function tests.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances. Clothing contaminated with ammonium acetate should never be laundered at home. Only personnel who have been trained on exposure hazards should launder contaminated clothing.
- Wash thoroughly immediately after exposure to ammonium acetate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ammonium acetate should be communicated to all exposed and potentially exposed workers.
- Never eat, drink, or smoke in areas where ammonium acetate is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ammonium acetate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ammonium acetate is a combustible solid that can react in contact with incompatible materials to cause fire or explosion. Its dusts may form explosive mixtures in air. At high temperatures, its decomposition products of nitrous oxides are highly toxic. These characteristics require special consideration during any emergency situation involving a leak or spill of ammonium acetate. Should ammonium acetate ever come into contact with incompatible substances, such as oxidizing materials, either during use, transportation, or storage, explosive reactions may occur. All federal, state, and local environmental regulations must be observed during transportation and disposal of ammonium acetate.

Ammonium acetate can enter the environment through industrial or municipal waste treatment plant discharges, agricultural runoff, or spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ammonium acetate.

This chemical has moderate acute toxicity to aquatic life. No data are available to evaluate the short-term effects of ammonium acetate to plants, animals, or birds.

Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Ammonium acetate has moderate chronic toxicity in aquatic life. Insufficient data are available to evaluate or predict the long-term effects of ammonium acetate to plants, birds, or land animals.

◆ *Water Solubility*

Crystalline ammonium acetate is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Ammonium acetate is moderately persistent in the aquatic environment with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Most ammonium compounds will probably not accumulate in edible tissues of aquatic species that are eaten by humans.

🕒 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ammonium acetate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil.

If ammonium acetate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely possible. The ammonia constituent will probably evaporate quickly. When such spills occur, the local

and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ammonium acetate.

If ammonium acetate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Cover solutions with vermiculite, sand, earth, or other absorbent and collect/contain in sealed drum or container. Collect dry spills for reclamation or disposal. Avoid generating dusts. Wet mop area to collect residue after bulk materials have been collected.
- ☑ It may be necessary to dispose of ammonium acetate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ammonium acetate can present a significant threat to business operations. The loss or damage of equipment or facilities due to fire or explosion can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of safety, health, or environmental procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Severe irritation of the respiratory tract with initial stimulation of the respiratory system followed by depressed respiration and possible death due to respiratory paralysis. | | | | |
| SKIN & EYES: Irritation and rash (may be large with numerous pustules). Moist skin may form hydrochloric acid with deep, severe burns. Eye contact causes serious burns and vision loss. | | | | |
| INGESTION: Irritation or corrosion of the digestive tract, nausea, bloody vomiting, bloody diarrhea, abdominal pain, muscle weakness, spasms, dehydration, convulsions, progressive CNS depression, cardiac arrhythmia, and excessive potassium and calcium levels in blood. | | | | |
| Carcinogenicity Not Listed Human Not Listed Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 (As Fluorides, F-) | Target Organs? Skin, eyes, teeth, bones, kidneys, CNS. |
| Medical Conditions Generally Aggravated by Exposure Pre-existing kidney or bone disorders may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 30 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Rub a 2.5% solution of calcium gluconate gel until pain subsides. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Give large amounts of water to dilute and seek medical attention immediately. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Evacuate area of non-essential personnel. Wear SCBA, heavy rubber boots and gloves. Neutralize with sodium bicarbonate, soda ash, slacked lime, or crushed limestone. Do NOT dry sweep, use a vacuum equipped with HEPA filter and damp mop residue. Collect and contain in tightly closed drum. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in plastic, rubber, or paraffin containers. Do NOT use metal (will corrode and generate flammable hydrogen gas). Store in cool dry, well-ventilated area. | | | | |
| Other Precautions and Warnings Do NOT use in moist or humid areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| Where low exposure to dusts are anticipated, use a full facepiece respirator equipped with a dust/mist pre-filter. For emergency situations or very high transient exposures, use a supplied-air respirator or a self-contained breathing apparatus (SCBA) may be necessary. | | | | |
| Ventilation Local exhaust or general dilution systems recommended. | | | | |
| Protective Gloves Chemical Resistant Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

AMMONIUM BIFLUORIDE

CAS: 1341-49-7

**IDENTIFICATION AND TYPICAL USES**

Ammonium bifluoride is a white, odorless, orthorhombic, crystalline solid. It is used as a chemical reagent, in the production of ceramics, as a sour in laundering cloth, in electroplating processing beryllium, and for etching glass (white acid). It is also used as a sterilizing agent for brewery, dairy, and other equipment.

RISK ASSESSMENT: HEALTH***General Assessment***

Ammonium bifluoride is not rated for carcinogenic, mutagenic, or teratogenic effects. No data are available to substantiate claims to the contrary. However, prudent risk management requires that all contact with this chemical be reduced to the lowest possible level. It is a caustic poison and extremely corrosive to human tissue and highly toxic through all routes of exposure (*inhalation, ingestion, and absorption*). Each can present a severe level of toxicity. While pure “absorption” (in the classical sense) leading to systemic effects is not likely, the chemical will still pass through intact skin to cause serious burns and possible bone damage. The primary mechanism for its local corrosive action as well as its systemic toxicity is its conversion to hydrogen fluoride and fluoride ion absorption. Fluoride ion is a direct cellular poison which has the ability to interfere with calcium and magnesium balances.

Inhalation can cause moderate to severe irritation of the respiratory tract. Initially, it will stimulate and then depress the respiration process, making breathing difficult and labored. Death can occur from respiratory paralysis.

Ingestion can lead to irritation or corrosion of the digestive tract, nausea, vomiting (with blood), bloody diarrhea, abdominal pain, muscle weakness and spasms, dehydration, convulsions, cardiac arrhythmia,

and excessive blood levels of potassium and calcium. It will also depress the central nervous system with symptoms progressing from fatigue, coma to respiratory arrest (even in the absence of circulatory failure).

Skin contact is irritating and may cause an unusual, large, red rash with numerous puss-filled sections appearing in a balloon-like fashion on the surface of the rash. If the skin surface is moist (either through natural perspiration or from some other means), hydrochloric acid can form and cause serious, deep burns. These burns may initially seem mild, but may penetrate through to the bone. Eye contact will result in serious (dangerous) ocular burns and possible loss of vision.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to ammonium bifluoride:

Skin: Severe irritation, unusual red rash with pustules. Possible deep burning (to the bone).

Eye: Dangerous burns and potential loss or damage to vision.

Lung: Irritation of the mucous membranes of the nose and throat as well as severe irritation of the upper respiratory tract leading to respiratory paralysis.

CNS: Fatigue, coma, and respiratory arrest.

Other: Ingestion can cause irritation of the digestive tract with bloody diarrhea, vomiting, convulsions, and death due to action on the CNS.

☛ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to ammonium bifluoride and can last for months or even years:

Cancer Hazards: According to the references, ammonium bifluoride has not been adequately tested for its ability to cause cancer.

Reproductive Hazard: According to the references, ammonium bifluoride has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Hazards: Repeated or long-term exposure to and subsequent absorption of the fluoride ion can result in kidney damage as well as fluorosis, which is a serious illness characterized by brittle bones, calcified ligaments, and chronic anemia.

🔑 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ammonium bifluoride. It is extremely corrosive locally and highly toxic systemically. Unless another chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ammonium bifluoride. For low exposures, a respirator fitted with a dust/fume/mist pre-filter is acceptable protection. At higher concentrations of exposure, a supplied-air respirator with full facepiece operated in positive pressure or continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a potential for airborne release of dusts exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, heavy rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ammonium bifluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ammonium bifluoride is used or stored. If

symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Kidney function tests (with urinalysis).
- ☑ Nervous system examination and evaluation by a qualified neurologist concentrating on motor functions and muscle control.
- ☑ Examination of the skin to ensure absence of burns or rash (reaction can be delayed).

To prevent skin burns from becoming serious, a 2.5% calcium gluconate gel should be gently massaged into burn area until pain is relieved.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances. Clothing contaminated with ammonium bifluoride should never be laundered at home. Only personnel who have been trained on exposure hazards should launder contaminated clothing.
- ☑ Wash thoroughly immediately after exposure to ammonium bifluoride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ammonium bifluoride should be communicated to all potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where ammonium bifluoride is used, handled or stored.
- ☑ A safety shower and emergency eyewash station should be located in any area where ammonium bifluoride is used, handled, or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ammonium bifluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possi-

ble contamination of the surrounding environmental mediums (water, soil, and air).

Ammonium bifluoride is a non-combustible solid, but can react in contact with incompatible materials to liberate heat and other more toxic commodities. Its dusts may form explosive mixtures in air. At high temperatures, its decomposition products of nitrogen oxide, fluorine, and ammonia gasses are highly toxic. In sufficient levels, ammonia gas can form explosive mixtures in air. These characteristics require special consideration during any emergency situation involving a leak or spill of ammonium bifluoride. Should ammonium bifluoride ever come into contact with incompatible substances, such as oxidizing materials, acids, or water, either during use, transportation, or storage, dangerous reactions may occur. All federal, state, and local environmental regulations must be observed during transportation and disposal of ammonium bifluoride.

Ammonium bifluoride can enter the environment through industrial or municipal waste treatment plant discharges, agricultural runoff, or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ammonium bifluoride. This chemical has slight acute toxicity to aquatic life.

It will react with water to form hydrochloric acid which has moderate acute toxicity to aquatic life. No data are available to evaluate the short-term effects of ammonium bifluoride to plants, animals, or birds.

☠ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. This chemical has slight chronic toxicity in aquatic life. It will react with water to form hydrochloric acid which has moderate acute toxicity to aquatic life. No data are available on the long-term effects of ammonium bifluoride to plants, birds, or land animals.

💧 *Water Solubility*

Crystalline ammonium bifluoride is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water to form hydrochloric acid.

⌚ *Persistence in the Environment*

Ammonium bifluoride not persistent in the aquatic environment since it will form hydrochloric acid when mixed with water. Hydrochloric acid is moderately persistent in the aquatic environment with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Ammonium bifluoride is biodegradable and is not expected to accumulate in the edible tissues of aquatic species that are eaten by humans.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ammonium bifluoride should be segregated from incompatible chemicals and moisture to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil.

If ammonium bifluoride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be possible. The formation of hydrochloric acid will probably occur quickly. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster prepar-

edness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ammonium bifluoride.

If ammonium bifluoride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Cover solutions with vermiculite, sand, earth, or other absorbent and collect/contain in sealed drum or container. Collect dry spills for reclamation or disposal. Avoid generating dusts. Wet mop area to collect residue after bulk materials have been collected. Use a dilute solution of sodium bicarbonate to neutralize residue.
- ☑ It may be necessary to dispose of ammonium bifluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ammonium bifluoride can present a significant threat to business operations. The loss or damage of equipment or facilities due to fire or explosion can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of safety, health, or environmental policies or procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Boiling Point Decomposes at 410°F (210°C) | Specific Gravity (H ₂ O = 1) Not Applicable |
| Vapor Pressure (mm Hg) Not Applicable | Molecular Weight 80.06 |
| Vapor Density (Air = 1) 1.725 at 25°C | Freezing Point Not Applicable |

Solubility in Water
Soluble in water, alcohol, and alkalis.

Appearance and Odor
Colorless crystals; no appreciable odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Not Classified | Autoignition Temperature Not Applicable |

Extinguishing Media
Water spray (do not use salt water, carbon dioxide, or foam extinguishers).

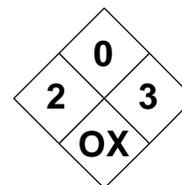

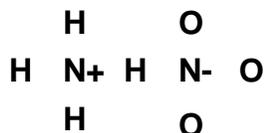

Special Fire Fighting Procedures
Wear full protective clothing and self-contained breathing apparatus (SCBA) to protect skin and eyes. A strong oxidizer; can cause combustible materials (wood, paper, and oil) to self-ignite. Never attempt to smother fire. Do not add steam. Fight fire from protected location as steam eruptions are common.

Unusual Fire and Explosion Hazards
Nitrogen oxide gases are emitted on decomposition are toxic. Contamination of ammonium nitrate with organics or other oxidizable substances may result in explosion. May undergo detonation if heated under confinement or if subjected to strong shock. Compound decomposes by heat, evolving oxygen to support combustion.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|--|---------------------------------------|--|
| Stability | | Conditions to Avoid Stable under ordinary conditions of use and storage. At temperatures ranging 80 - 90°C, decomposes endothermically to ammonia and nitric acid. Above 210°C, exothermic reaction produces nitrous oxide. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Aluminum, antimony, chromium, copper, iron, lead, magnesium, manganese, nickel, zinc, brass, oil, charcoal, organic material, acetic acid, ammonium chloride, bismuth, cadmium, chlorides, cobalt, phosphorus, potassium and ammonium sulfate, sodium, and sulfur. | | |

| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

AMMONIUM NITRATE

CAS: 75-07-0

**IDENTIFICATION AND TYPICAL USES**

Ammonium nitrate is a colorless crystalline solid that occurs in two forms:

- α -NH₄NO₃, tetragonal crystals that are stable between -16°C and 32°C (specific gravity = 1.66).
- β -NH₄NO₃, rhombic or monoclinic crystals, stable between 32°C and 84°C (specific gravity = 1.725).

Ammonium nitrate is a synthetic inorganic compound which is produced in large volumes. Crystalline forms are a major constituent of nitrogen fertilizers, herbicides, and insecticides. Lesser amounts are used to make explosives (especially as prills/oil mixture, pyrotechnics) and nitrous oxide. It is also used as an anesthetic and as an ingredient for freezing mixtures. It may be the oxidizer in rocket propellants. It is also used as a nutrient for antibiotics and yeast.

RISK ASSESSMENT: HEALTH**General Assessment**

Ammonium nitrate is not rated for carcinogenic, mutagenic, or teratogenic effects. No data are available to substantiate claims to the contrary. However, all contact with this chemical should be reduced to the lowest possible level. Human exposure to ammonium nitrate can occur through three routes of entry into the body: *inhalation*, *absorption*, and *ingestion*. Each presents a moderate level of toxicity. Absorption through the skin and direct ingestion may cause dizziness, abdominal pain, vomiting, bloody diarrhea, weakness, convulsions, and collapse. Large doses can be fatal. Skin contact can also cause irritation. Eye contact can result in irritation, redness, and pain. Inhalation may irritate the mucous membranes; symptoms may include coughing, sore throat, and shortness of breath. At high temperatures (above 300°C), exposure

to toxic nitrogen oxides can quickly cause acute respiratory problems (pulmonary edema).

With severe overexposures, a condition known as methemoglobinemia (decrease in the oxygen-carrying ability of the blood) can result. This condition is characterized by a bluish color of the skin and lips (cyanosis), headaches, dizziness, and with higher exposures, collapse and death.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ammonium nitrate:

Skin: Irritation/rash, possible contact dermatitis.

Eye: Irritation, redness, and possible pain.

Lung: Irritation of the mucous membranes of the nose and throat causing coughing and shortness of breath. Higher concentrations can lead to severe respiratory problems.

CNS: Inhalation of high concentrations of the vapor may cause dizziness, weakness, loss of consciousness, or death.

☹ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ammonium nitrate and can last for months or even years:

Cancer Hazards: According to the references, ammonium nitrate has not been tested for its ability to cause cancer.

Reproductive Hazard: According to the references, ammonium nitrate has not been tested for its ability to adversely affect reproduction.

Other Chronic Effects: Small repeated oral doses of nitrates, including ammonium nitrate, may cause weakness, malaise, depression, headaches, and mental im-

pairment. No other chronic, long-term effects are known at this time.

🔊 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ammonium nitrate. Unless another chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. Electrical equipment should be rated as explosion-proof. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ammonium nitrate. For low exposures, a respirator fitted with a dust/fume/mist pre-filter is acceptable protection. At higher concentrations of exposure, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a potential for airborne release of dusts exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, heavy rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ammonium nitrate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ammonium nitrate is used or stored. If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ A blood test for methemoglobin levels.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use explosion-proof local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances. Clothing

contaminated with ammonium nitrate should never be laundered at home. Only personnel who have been trained on exposure hazards should launder contaminated clothing.

- ☑ Wash thoroughly immediately after exposure to ammonium nitrate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ammonium nitrate should be communicated to all potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where ammonium nitrate is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ammonium nitrate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ammonium nitrate is highly reactive and is therefore a dangerous fire and explosion hazard. At high temperatures, its decomposition products of nitrous oxides are highly toxic. These characteristics require special consideration during any emergency situation involving a leak or spill of ammonium nitrate. Should ammonium nitrate ever come into contact with incompatible substances such as other oxidizing materials, combustibles, or metal either during use, transportation, or storage, extremely explosive reactions may occur. Waste disposal of small quantities can be accomplished by cautiously adding ammonium nitrate to a large, stirred excess of water, adjusting for pH to neutral, and separating any insoluble solids. Aqueous solution can be flushed to drain with copious amounts of water. The hydrolysis and neutralization reactions may generate heat and fumes which can be controlled by rate of addition. All federal, state, and local environmental regulations must be observed.

Ammonium nitrate can enter the environment through industrial or municipal waste treatment plant discharges, agricultural runoff, or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ammonium nitrate.

This chemical has moderate acute toxicity to aquatic life. No data are available to evaluate the short-term effects of ammonium nitrate to plants, animals, or birds.

☹ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Ammonium nitrate has moderate chronic toxicity in aquatic life. No data are available on the long-term effects of ammonium nitrate to plants, birds, or land animals.

💧 *Water Solubility*

Crystalline ammonium nitrate is highly soluble in water and, because of its negative heat of solution in water, is used to prepare freezing mixtures, such as mixtures with salt and water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Nitrate compounds are probably highly persistent in water. Due to volatilization, most ammonia will disappear from aquatic ecosystems in less than 2 days.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Most ammonia and nitrate compounds will probably not accumulate in edible tissues of aquatic species that are eaten by humans.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill

to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ammonium nitrate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil.

If ammonium nitrate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely possible. While ammonia will likely evaporate quickly, nitrate can remain. When such spills occur, the local and/or state emergency response authorities must be notified.

A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ammonium nitrate.

If ammonium nitrate is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Cover materials with dry lime or soda ash and collect/contain in sealed drum or container.
- Keep ammonium nitrate out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- It may be necessary to dispose of ammonium nitrate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving ammonium nitrate can present a significant threat to business operations. The loss or damage of equipment or facilities due to fire or explosion can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Natural Rubber | Chemical Goggles or Face Mask | Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ANILINE

CAS: 62-53-3

**IDENTIFICATION AND TYPICAL USES**

Aniline is an oily, colorless liquid with characteristic odor and burning taste; color darkens to brown or tan upon exposure to air or light. Aniline is used in the manufacture of dyes, pharmaceuticals, varnishes, resins, photographic chemicals, perfumes, shoe blacks, herbicides, and fungicides. It is also used in vulcanizing rubber and as a solvent. It occurs naturally in coal tar and is produced from the biodegradation of many pesticides. It is an intermediate in chemical synthesis and one of the most important of the organic bases. It is a metabolite of many toxic compounds, such as nitrobenzene, phenacetin, and phenylhydroxylamine.

RISK ASSESSMENT: HEALTH**General Assessment**

Aniline is moderately toxic through *inhalation*, *ingestion*, and *absorption* through the skin. Toxic symptoms of aniline exposure include headache, weakness, dizziness, ataxia, and cyanosis (blue tinting of the lips, skin, and nail beds due to oxygen deprivation). Cyanosis is due to the formation of methemoglobin which restricts the blood's oxygen carrying capabilities. Cyanosis occurs when the methemoglobin concentration is 15% or more. Blueness develops first in the lips, nose, and earlobes. At 40% concentration, there is weakness and dizziness. At up to 70% concentration, symptoms may include ataxia, dyspnea on mild exertion, and tachycardia. Coma may ensue at concentrations over 70%. Overexposure (between 85% and 90% concentrations) may lead to death from respiratory paralysis.

Contact with the pure liquid aniline on the skin can produce moderate irritation, while the effect on the eyes can be quite severe. Oral administration to laboratory animals resulted in tumors in the kidney and bladder. However, aniline carcinogenicity in both animals and humans is suspected but not confirmed due to inconclusive data. Aniline may cause mutations. Such sub-

stances may also have the potential to cause reproductive damage in humans.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to aniline:

Skin: Irritation and possible color change around nails and fingers.

Eye: Severe irritation; may cause corneal damage.

Lung: Not known to be acutely irritating to lung tissue. However, overexposure can lead to death due to respiratory arrest.

Other: Aniline affects the blood's ability to transport oxygen and high exposure can cause death. Symptoms include headaches, weakness, irritability, drowsiness, and shortness of breath.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to aniline and can last for months or even years:

Cancer Hazards: Aniline may cause mutations (genetic changes) in living cells. The data on its carcinogenicity are inconclusive.

Reproductive Hazard: There is limited evidence to show that exposure to aniline may damage the developing fetus.

Other Chronic Effects: Continuous exposure to small doses of aniline may produce anemia, loss of energy, digestive disturbance, and headache. Repeated exposures may cause anemia and brownish staining of the eyes can occur.

☠ Recommended Risk-Reduction Measures

Personnel should avoid direct contact with aniline. If a less toxic chemical can not be substituted for a hazard-

ous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around aniline. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, natural rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with aniline.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where aniline is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Methemoglobin tests.
- Urinalysis (for blood content).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Safety showers should be provided in areas where work is performed around aniline.
- Wash thoroughly immediately after exposure to aniline and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of aniline should be communicated to all potentially exposed workers.

- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to aniline, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of aniline. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Aniline is considered a class IIIA combustible liquid. Alone, its high flash point and autoignition temperature do not present a serious fire or explosion hazard. However, because it is incompatible with so very many other commodities, extreme caution is required in handling, storage, transportation, and disposal of aniline. These characteristics also require special consideration during any emergency situation involving a leak or spill of aniline. Should aniline ever come into contact with incompatible substances such as oxidizers, acids, or alkalis either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for aniline waste is to dissolve it in a combustible solvent and burn it in a chemical incinerator equipped with an afterburner and air scrubber. Aniline can enter the environment through direct disposal and indirect use, such as industrial discharges and non-point source from agricultural use.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to aniline. This chemical has high acute toxicity to aquatic life and moderate acute toxicity to birds. Aniline causes germination decrease, stunting and size decreases on numerous agricultural crops. No data are available on the short-term effects of aniline to land animals.

☼ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Aniline has high chronic toxicity in aquatic life. No data are available on the long-term effects of aniline to plants, birds, or land animals.

💧 *Water Solubility*

Aniline is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Aniline is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 93% of aniline will eventually end up in water; about 6.5% will end up in air; and less than 1% will end up in terrestrial soil and aquatic sediments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of aniline found in fish tissues is expected to be somewhat higher than the average concentration of aniline in the water from which the fish was taken.

🚚 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of aniline should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous

materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If aniline should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of aniline. If aniline is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of aniline as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving aniline can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🚚 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|--------------------------------|
| Characterization Polyaromatic Hydrocarbon | RCRA Number Not Listed | EPA Class Not Listed |
| DOT Proper Shipping Name Anthracene | Chemical Abstract Service (CAS) Number 120-12-7 | |
| DOT Hazard Class and Label Requirements Hazardous Substance; Solid | DOT Emergency Guide Code No Citation | |
| DOT Identification Number UN 3077 | Chemical Formula C₁₄H₁₀ | |

Synonyms

Anthracin; green oil; paranaphthalene; Tetra Olive N2G.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|---|---|--|
| Anthracene (derivation: Distillation of crude anthracene oil with alkali carbonate in iron retorts; by salting-out from crude anthracene oil and draining; occurs naturally in smoke from gas, coal, cigarettes, etc., char-broiled foods, and coal tar pitch volatiles). | PEL: 0.2 mg/m³ STEL: Not Established | REL: 0.1 mg/m³ Suspected Human Carcinogen | 700 ppm | TLV: 0.2 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 644°F (340°C) | Specific Gravity (H ₂ O = 1) 1.25 |
| Vapor Pressure (mm Hg) 1 at 293°F (145°C) | Molecular Weight 178.24 |
| Vapor Density (Air = 1) 6.15 | Melting Point 423°F (217°C) |

Solubility

Insoluble in water (1.29 mg/L at 77°F, distilled water); slightly soluble in absolute alcohol, benzene, chloroform, ether, carbon disulfide, carbon tetrachloride, toluene, and acetone.

Appearance and Odor

Colorless crystalline solid with a violet fluorescence (pure), or yellow crystals with a green fluorescence due to tetracene and naphacene.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) 250°F (121°C) closed cup | Explosive Limits in Air % by Volume LEL: 0.6% UEL: Not Identified |
| NFPA Classification Combustible Solid | Autoignition Temperature 1004°F (540°C) |

Extinguishing Media

Carbon dioxide, dry chemical, water spray or mist, or alcohol foam.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire.

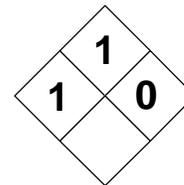

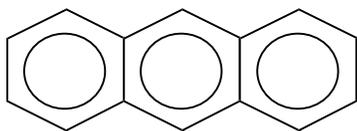

Unusual Fire and Explosion Hazards

Anthracene may explode on contact with air. Moderately explosive when exposed to flame, Ca(OCL)₂, or chromic acid. Explodes on contact with fluorine.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|--|--|---|
| Stability | | Conditions to Avoid Reacts with strong oxidizers (such as chlorine, bromine, and fluorine), chromic acid, and calcium hypochlorite. Anthracene darkens upon exposure to sunlight and transforms to <i>para</i> -anthracene. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Avoid exposure to heat, ignition sources, sunlight, and incompatibilities. | | |
| Hazardous Polymerization | | Conditions to Avoid Many perchlorates form solvated adducts with organic solvents, including anthracene, which explode on impact. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, anthracene can emit carbon dioxide and acrid, irritating smoke. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? |
| Health Hazards INHALATION: Irritation of the respiratory tract, headache, nausea, vomiting, loss of appetite, slowed reactions, and adynamia (a lack of strength). ABSORPTION: Coal tar derivatives may absorb through unbroken skin. Irritation with burning, itching, and edema (fluid buildup). Irritates the conjunctiva of the eye. INGESTION: Gastrointestinal tract irritation. | | | | |
| Carcinogenicity Suspected Human Suspected Animal | NTP Listed? Not Cited | IARC Cancer Review Group? Group 3 | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory sys., eyes, skin, digestive system |
| Medical Conditions Generally Aggravated by Exposure Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For red or blistered skin, contact physician. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed , seek medical attention immediately. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powered materials in most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by applicable environmental regulations. | | | | |
| Preferred Waste Disposal Method Incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Anthracene is a combustible solid. Store to avoid contact with strong oxidizers, since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat. | | | | |
| Other Precautions and Warnings Sources of ignition (heat, flame, cigarettes, incompatibles) are prohibited where anthracene is used, handled, or stored. Bulk storage of anthracene is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use a MSHA/NIOSH approved supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a full facepiece operated in pressure demand or other positive pressure mode or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Polyvinylchloride (PVC) | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Boots; Aprons; Gauntlets | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. Use photoprotective creams or pastes on bare skin areas. | | | | |

ANTHRACENEC₁₄H₁₀

CAS: 120-12-7

**IDENTIFICATION AND TYPICAL USES**

Pure anthracene is a colorless crystalline solid with a violet fluorescence. Also appears as yellow crystals with a green fluorescence due to the presence of tetracene and naphthacene. It is a naturally occurring compound found in coal-tar and is formed during the incomplete combustion of organic compounds. It occurs naturally in smoke (gasoline, coal, cigarette) and in char-broiled foods. It is used primarily in manufacturing of dyestuffs, and in chemical manufacturing (of phenanthrene, carbazole, and anthraquinone); in calico printing; as a component of dyes, scintillation fluids, and in smoke screens; and in organic semi-conductor research.

RISK ASSESSMENT: HEALTH**General Assessment**

Anthracene is a skin irritant and allergen. It is a questionable (human) carcinogen with experimental neoplastigenic and tumorigenic data. Mutation data is also reported. It is moderately toxic by *inhalation* and *absorption* (skin/eye contact). Inhalation can result in symptoms such as headache, nausea and vomiting, loss of appetite, and slowed reactions coupled with weakness. Direct skin or eye contact can lead to itching and burning and possible allergic reactions at site of contact.

Anthracene often contains acridine as a contaminant. Acridine can also cause skin and eye allergies and irritates the skin, eyes, and air passages. Exposure to sunlight can further aggravate skin irritation and cause dermatitis.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after (within hours or days) exposure to anthracene:

Skin: Irritation with burning, itching, and edema (buildup of fluid), redness and swelling.

Eye: Severe irritation of the conjunctiva with burning, itching, and watering. Direct contact with heated “fumes” can irritate the eyes.

Lung: Irritation of the bronchial tubes and other members of the respiratory tract. May cause headache, loss of appetite, nausea, vomiting, slowed reactions, and a loss of strength.

CNS: No conclusive evidence of effect on CNS.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to anthracene and can last for months or even years:

Cancer Hazards: Anthracene may cause mutations (genetic changes) in living cells. The data on its carcinogenicity are inconclusive.

Reproductive Hazard: According to the references, anthracene has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Continuous exposures can cause allergies to the eyes and skin which are greatly aggravated upon exposure to sunlight during or shortly after exposure. Repeated skin exposures can cause patchy areas of increased brown pigment changes, loss of skin pigment, thinning or patchy thickening of the skin, skin warts, skin cancer, and pimples. Repeated breathing of “fumes” from heated anthracene may cause chronic bronchitis with cough and phlegm. Repeated exposure to male scrotum can cause skin thinning and increased pigment.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with anthracene. If a less toxic chemical can not be substituted for a hazardous substance, then *engineering controls* are the

most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around anthracene. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and a polyvinylchloride (PVC) apron should also be worn. To prevent hand and skin exposures, PVC gloves should be worn and photoprotective creams or pastes should be used on bare skin surfaces.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with anthracene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where anthracene is used or stored.

Before beginning employment, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for personnel working with anthracene:

- Skin examination for growths or changes in warts or moles (skin cancers are generally easily curable when removed early).
- Lung function test.

If symptoms develop or overexposure is suspected, the following may be useful:

- Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to anthracene and at the end of the work shift or before eating, drinking, or smoking. Avoid contact with direct sunlight.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of anthracene should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to anthracene, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of anthracene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Anthracene is considered a combustible solid. Alone, its high flash point and autoignition temperature do not present a serious fire or explosion hazard. However, because it is incompatible with many other commodities, extreme caution is required in handling, storage, transportation, and disposal of anthracene. These characteristics also require special consideration during any emergency situation involving a leak or spill of anthracene crystals. Should anthracene ever come into contact with incompatible substances (such as oxidizers) either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for anthracene waste is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

Due to its widespread occurrence in nature and its use in the dye industries, anthracene can enter the environment from non-point sources, as well as industrial and municipal discharges.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to anthracene. This chemical has high acute toxicity to aquatic life and to birds. It showed no effect on corn root size or respiration in one study. No data are available on the short-term effects of anthracene to land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of anthracene to plants, birds, or land animals.

💧 *Water Solubility*

Anthracene is very slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

🕒 *Persistence in the Environment*

Anthracene is moderately persistent in water, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 77.5% of anthracene will eventually end up in air; about 9.5% will end up in terrestrial soil; about 9% in aquatic sediments; and the rest will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of anthracene found in fish tissues is expected to be much higher than the average concentration of anthracene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill

of anthracene into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of anthracene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If anthracene should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of anthracene. If anthracene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers.
- ☑ It may be necessary to dispose of anthracene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving anthracene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any safety, health or environmental policies or procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? |
| Health Hazards INHALATION: Irritation of the respiratory tract. Can cause metallic taste, nausea, sore throat. Higher concentrations can cause lung congestion and may cause irregular heartbeat. ABSORPTION: Skin contact causes irritation and itchy rash. Powders can be absorbed through the skin. May cause papules and pustules around sweat and sebaceous glands. INGESTION: Possible gastrointestinal tract irritation. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Suspected Animal | 5th Annual Report | No | 29 CFR 1910.1000 Table Z-1 | Eyes, respiratory system, skin, CVS. |
| Medical Conditions Generally Aggravated by Exposure Skin conditions (dermatitis); respiratory problems; heart or other cardiovascular conditions. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 1 or 2 days after overexposure, as lung and heart conditions may be delayed. If swallowed, seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powered materials in most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by applicable environmental regulations. | | | | |
| Preferred Waste Disposal Method Incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Antimony is a noncombustible solid, but its dusts is a moderate explosion hazard when exposed to heat. Store to avoid contact with strong oxidizers and acids, since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat. Do not use near heat or flame. | | | | |
| Other Precautions and Warnings Sources of ignition (heat, flame, cigarettes, incompatibles) are prohibited where antimony is used, handled, or stored. Bulk storage of antimony powders or dusts is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) A full facepiece respirator with a high efficiency particulate air (HEPA) filter. Greater protection is provided by a powered air purifying respirator. At high exposures, use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Rubber | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Apron, Boots |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ANTIMONY

Sb

CAS: 7440-36-0

**IDENTIFICATION AND TYPICAL USES**

Antimony is a silvery white lustrous metal, appearing frequently as a hard and brittle solid. Can also exist as scale-like crystals or a dark gray lustrous powder. Antimony tarnishes slowly in moist air. There is no appreciable odor. Can also exist as a dust. It is used to make alloys such as Babbit metal, white metal, and hard lead, and for coating metals. It is a constituent of alloys of other metals such as copper and tin. Its sulfides are used in compounding of rubber and the manufacture of pyrotechniques, including bullets and fireworks. Its chlorides are used as coloring agents and as catalysts. Its fluorides are used in organic synthesis and pottery manufacture.

RISK ASSESSMENT: HEALTH***General Assessment***

Antimony is an experimental poison and a questionable human carcinogen with experimental carcinogenic data being reported. It is an irritant of the mucous membranes, eyes, and skin. Heavy exposure to antimony trioxide and pentoxide is associated with pulmonary injury while antimony trisulfide is considered cardiotoxic (harmful to the heart and cardiovascular system).

Inhalation or exposure to dusts or fumes can result in rhinitis, irritation of the eyes and sore throat. Higher levels (at the IDLH and above) could cause antimony poisoning with symptoms of headache, pain or tightness in the chest, shortness of breath, metallic taste, nausea, vomiting, diarrhea, and weight loss, and even death. Repeated exposure can cause an abnormal chest X-ray to develop and can also damage the heart and liver. Current data are inconclusive regarding any increase risk of lung cancer and reproductive disorders due to antimony exposures.

Skin contact with antimony or its compounds causes papules and pustules around sweat and seba-

ceous glands. Prolonged or repeated skin contact can cause skin, nose, and mouth ulcers and sores.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to antimony:

Skin: Irritation with itchy rash and possible papules and pustules around sweat and sebaceous glands.

Eye: Severe irritation, possible itching or burning.

Lung: Can cause metallic taste, nausea, sore throat, and irritation of the air passages. Higher levels can cause congestion of the lungs.

CVS: Can cause damage to the heart. May cause irregular heartbeat and might even cause heart to stop.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to antimony and can last for months or even years:

Cancer Hazards: Antimony is a questionable carcinogen in animals and humans. The data on its carcinogenicity are not totally conclusive.

Reproductive Hazard: There is limited evidence that antimony may decrease fertility in females.

Other Chronic Effects: Repeated exposure can cause headaches, poor appetite, dry throat, and loss of sleep. Damage to the liver and heart muscle with abnormal EKG may also occur, especially with higher or frequent exposures.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with antimony, especially its dusts or powders. If a less toxic material

or compound can not be substituted for antimony, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of antimony dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around antimony. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. However, for low or infrequent exposure, a MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with antimony.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where antimony is used or stored.

Before beginning employment working with antimony, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

- ☑ Urine test for antimony (and arsenic if arsenic contamination is suspect).

If symptoms develop or overexposure is suspected, the following additional tests may be useful:

- ☑ EKG (electrocardiogram).
- ☑ Liver function test.
- ☑ Consider chest X-ray following acute exposure.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also note that commercial grade antimony is often contaminated with arsenic, a toxic chemical and carcinogen. Use of antimony near acid or acid mist can cause the release of the deadly gas, stibine. Therefore, such potential for

“mixed exposures” warrants additional caution when working with or around antimony.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to antimony and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of antimony should be communicated to all exposed or potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to antimony, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of antimony. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where antimony contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Antimony is considered a noncombustible solid. However, in powder or dust form it can present a moderate fire and explosion hazard. In bulk form, it does not present a serious fire or explosion hazard. However, because it is incompatible with many other commodities, extreme caution is required in handling, storage, transportation, and disposal of antimony. These characteristics also require special consideration during any emergency situation involving a leak or spill of antimony powder or dust.

Should antimony ever come into contact with incompatible substances (such as oxidizers) either during use, transportation, storage, or disposal, the formation

of highly toxic and/or reactive commodities is extremely possible.

Antimony may occur in the aquatic environment from natural weathering of mineral formations, from mining and manufacturing effluents, and from municipal wastes.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to antimony. Antimony has high acute toxicity to aquatic life. No data are available on the short-term effects of antimony to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of antimony to plants, birds, or land animals.

💧 *Water Solubility*

Antimony and its salts have varying degrees of solubility in water ranging from low to high.

🕒 *Persistence in the Environment*

Antimony is highly persistent in water, with a half-life of longer than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of antimony persistence in the aquatic or terrestrial environments.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of antimony found in fish tissues is expected to be about the same as the average concentration of antimony in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of antimony dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of antimony should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If antimony should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of antimony. If antimony is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers.
- ☑ It may be necessary to dispose of antimony as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving antimony can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expen-

dition of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Medical Conditions Generally Aggravated by Exposure Skin conditions (dermatitis); respiratory problems; renal conditions and hepatic disorders. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed , seek medical attention immediately. For severe cases, use BAL as antidote. For milder cases, use penicillamine (not penicillin). | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powered materials in most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by applicable environmental regulations. | | | | |
| Preferred Waste Disposal Method Incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Arsenic is a noncombustible solid, but its dusts is a moderate explosion hazard when exposed to heat. Store to avoid contact with strong oxidizers and acid. Store in tightly closed containers in cool, well-ventilated area away from heat. Do not use near heat or flame. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where arsenic is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) Arsenic is a human poison by inhalation. At any exposure level, use a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Apron, Boots | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ARSENIC

As

CAS: 7440-38-2

**IDENTIFICATION AND TYPICAL USES**

Metallic arsenic is a silver-gray crystalline solid that darkens in moist air. It also exists in black and yellow amorphous forms. Arsenic trichloride is an oily liquid. Arsenic trioxide is a crystalline solid. It is used for hardening metals such as copper and lead, battery grids, cable sheaths, boiler tubes, and as a doping agent in solid-state products of silicon and germanium, special solders, and medicine. Its salts are used in making herbicides, rodenticides, in semiconductors, and in pyrotechniques.

RISK ASSESSMENT: HEALTH***General Assessment***

All arsenic compounds are toxic. Arsenic compounds are irritants of the skin, mucous membranes, and eyes. Arsenic is absorbed into the body through a gastrointestinal route (*ingestion*), *absorption* through the skin, and through *inhalation*. Acute arsenic poisoning is rare in the occupational setting and results primarily from ingestion of contaminated foods. Symptoms include burning of the lips, constriction of the throat, and dysphasia followed by excruciating abdominal pain, severe nausea, projectile vomiting, and profuse diarrhea. Other toxic effects are on the liver, the blood-forming organs, the central and peripheral nervous systems, and the cardiovascular system. Convulsions, coma, and death follow within 24 hours of severe exposures.

Inhalation can irritate the upper respiratory tract leading to nasal perforations. Other symptoms of arsenic poisoning can include weakness, conjunctivitis, visual disturbances, pharyngitis, pulmonary irritation, peripheral neuropathy, hyperpigmentation of the skin, palmar and plantar hyperkeratosis, dermatitis, and skin cancer.

Arsenic is a confirmed human carcinogen producing liver tumors. It may also cause cancer of the lungs, larynx, lymphoid system, or viscera. There are re-

ported teratogenic effects, including exencephaly, skeletal defects, and genitourinary system defects.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to arsenic:

Skin: Irritation, burning, itching, and rash. Contact dermatitis is possible.

Eye: Red, watery eyes and irritation. Conjunctivitis may occur in some people.

Lung: Nose and throat irritation and possible nasal perforation.

CVS: Can affect the rhythm of the heart and cause abnormal EKG at high exposures.

CNS: Can cause nausea, poor appetite, vomiting, and muscle cramps, cognitive impairments, and peripheral neuropathy.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to arsenic and can last for months or even years:

Cancer Hazards: Arsenic is a carcinogen in humans. It has been shown to cause skin, lung, and liver cancer.

Reproductive Hazard: There is reported evidence that arsenic causes teratogenic effects (fetal damage) in laboratory test animals.

Other Chronic Effects: Repeated exposure can cause nerve damage with “pins and needles” effect, burning, numbness, and later weakness of arms and legs. Repeated skin contact can cause thickened skin and/or patchy areas of darkening and loss of pigment. Some persons develop white lines on the nails. Repeated exposures can also damage the liver, cause narrowing of the blood vessels, or interfere with the bone marrow’s ability to make red blood cells.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with arsenic, especially its dusts or powders. If a less toxic material or compound can not be substituted for arsenic, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of arsenic dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around arsenic. At any exposure level, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with arsenic.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where arsenic is used or stored.

Before first exposure and every 6 to 12 months thereafter, a medical history and examination is recommended, including the following:

- ☑ Examination of the nose (nasal septum), skin, eyes, nails, and nervous system.
- ☑ Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a work shift) should not be greater than 100 micrograms per gram creatinine in the urine.

After suspected overexposure, repeat these tests and consider complete blood count (CBC) and liver function tests. Also examine skin periodically for abnormal growths (skin cancer from arsenic can be easily cured if detected early).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Use of arsenic near acid or acid mist can cause the release of the

deadly gas, arsine. Therefore, such potential for "mixed exposures" warrants additional caution when working with or around arsenic.

The antidote for severe poisoning is to administer BAL. For milder poisoning, use penicillamine (not penicillin) has been used. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to arsenic and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of arsenic should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to arsenic, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of arsenic. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where arsenic contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Arsenic is considered a noncombustible solid. However, in powder or dust form it can present a moderate fire and explosion hazard. In bulk form, it does not present a serious fire or explosion hazard. However, because it is incompatible with many other commodities, extreme caution is required in handling, storage, transportation, and disposal of arsenic. These characteristics also require special consideration during

any emergency situation involving a leak or spill of arsenic powder or dust. Should arsenic ever come into contact with incompatible substances (such as oxidizers) either during use, transportation, storage, or disposal, the formation of highly toxic and/or reactive commodities is extremely possible.

Arsenic enters the environment mainly from its use as a pesticide and from emissions from coal-fueled power plants.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to arsenic.

Arsenic metabolism and effects are significantly influenced by the animal/plant tested, the route of administration, the physical and chemical form of the arsenical, and the dose. Inorganic arsenic compounds are more toxic than organic arsenic compounds.

Arsenic has high acute toxicity to aquatic life, birds, and land animals. Except where soil arsenic content is high (e.g., around smelters and where arsenic-based pesticides are known to have been used), arsenic does not accumulate in plants to toxic levels. Where soil content is high, growth of crops and crop yields can be decreased.

☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Arsenic has high chronic toxicity to aquatic life, and moderate chronic toxicity to birds and land animals.

💧 *Water Solubility*

Arsenic and its salts have low solubility in water. Concentrations of less than 1 milligram will mix with a liter of water.

⌚ *Persistence in the Environment*

Arsenic is highly persistent in water, with a half-life of longer than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of arsenic found in fish tissues is expected to be somewhat higher than the average concentration of arsenic in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of arsenic dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of arsenic should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If arsenic should contact the water table, aquifer, or navigable waterway, time is of the essence since arsenic is so highly soluble. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of arsenic. If arsenic is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers.
- ☑ It may be necessary to dispose of arsenic as a hazardous waste. The responsible state agency or the regional office of the federal Environmental

Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving arsenic can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public hysteria, emotion, and ignorance can run equally high. This must be carefully considered whenever developing or implementing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

ARSINEAsH₃

CAS: 7440-38-2

**IDENTIFICATION AND TYPICAL USES**

Arsine is a colorless gas with a mild but disagreeable garlic-like odor. It is used in organic synthesis, as a doping agent in the electronics industry to manufacture gallium arsenide and gallium arsenide phosphide for semiconductors and other such solid-state electronic equipment. It also has been used as a military poison gas.

RISK ASSESSMENT: HEALTH***General Assessment***

Arsine is a highly toxic hydride. It is the most acutely toxic form of arsenic. It is particularly dangerous because of its volatility and ease of entry into the body. It is a confirmed human carcinogen and a poison by *inhalation*. Human blood cells, the gastrointestinal tract, the central nervous system, the liver, the kidneys, and the lungs are all affected by inhalation exposures. Symptoms of exposure include headache, weakness, malaise, dizziness, vomiting, abdominal pain, and dyspnea. Arsenic is excreted in the urine following exposure. Dark red urine may occur 4 to 6 hours after exposure. This often progresses to dark brown urine, with jaundice appearing 24 to 48 hours after exposure. In severe cases of acute exposure, death can occur due to renal failure or pulmonary edema (or a combination of both). Chronic poisoning can lead to jaundice, hemoglobinuria, hemolysis, and renal damage. The target organs are the blood, kidneys, and liver (although lung and lymphatic cancers can also occur). An unusual brown skin color has been noted in some patients. Symptoms of arsenic poisoning, in addition to those of arsine may be present. There may also be mild to severe anemia and peripheral neuropathy. The later resulting in numbness of the hands and feet, severe muscle weakness, and photophobia.

Inhaled arsine is oxidized to form trivalent arsenic (As⁺³) and arsenous oxide (As₂O₃), which are both hu-

man carcinogens. Arsine is a non-irritating gas when inhaled. Although its garlic-like odor may be a warning of exposure, it is inadequate to warn of exposure to hazardous levels.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to arsine:

Skin: Frostbite may occur upon exposure to compressed liquefied gas.

Eye: Frostbite and severe irritation on exposure to compressed liquefied gas.

Lung: May cause severe irritation of the respiratory tract resulting in pulmonary edema (a medical emergency) which can lead to death.

CNS: Can cause headache, malaise, weakness, vomiting, dizziness, and dyspnea.

Other: Abdominal pain, hematuria, jaundice, oliguria, anuria, and anemia.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to arsine and can last for months or even years:

Cancer Hazards: Arsine is a carcinogen in humans. It has been shown to cause carcinogenic effects on the blood, liver, kidney, lung, and lymphatic system.

Reproductive Hazard: There is insufficient data in the references that arsine presents a reproductive hazard.

Other Chronic Effects: Chronic poisoning can lead to jaundice, hemoglobinuria, hemolysis, and renal (kidney) injury or damage.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with arsine. Although it is a gas, it is often shipped as a compressed

liquefied gas. Therefore, frostbite can occur upon exposure. If a less toxic material cannot be substituted for arsine, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of arsine gas release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around arsine. At any exposure level, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical goggles or face shield should be worn to protect the eyes. To prevent hand and skin exposures (frostbite), gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with arsine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where arsine is used or stored.

Before first exposure and every 6 to 12 months thereafter, a medical history and examination is recommended, including the following:

- ☑ Pulmonary function test (baseline).
- ☑ Complete blood count (CBC) for baseline of plasma hemoglobin and white cell count.
- ☑ Urinalysis to test for urine arsine and/or arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a work shift) should not be greater than 100 micrograms per gram creatinine in the urine. Also check urinary concentration of hemoglobin.

After suspected overexposure, repeat these tests and consider the following additional medical protocols:

- ☑ Liver function tests.
- ☑ Examine skin periodically for abnormal coloring (jaundice).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a

substitute for controlling exposures. Use of arsine near acid, oxidizers, or if heated can cause the release of arsenic fumes. Therefore, such potential for "mixed exposures" warrants additional caution when working with or around arsine.

The treatment of choice for acute and severe arsine poisoning is exchange transfusion and, if renal failure develops, hemodialysis. Dimercaprol (BAL), which is an antidote for arsenic poisoning is of no use in arsine poisoning because it affords no protection against hemolysis.

Other methods to reduce exposure to arsine include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances. Never allow contaminated clothing to be taken home from the work place. Clothing that has been contaminated should be laundered only by persons who have been trained on exposure hazards.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of arsine should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to compressed liquefied arsine, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of arsine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where arsine contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible limited contamination of the surrounding environmental mediums (water and air).

Arsine is considered a flammable gas. It can present a moderate fire and explosion hazard. In compressed liquefied form as well as in gas form, it is

shock-sensitive and can explode under powerful shock conditions that may occur during transport.

Also, because it is incompatible acids and oxidizers, extreme caution is required in handling, storage, transportation, and disposal of arsine. These characteristics also require special consideration during any emergency situation involving a leak or spill of arsine gas. Should arsine ever come into contact with incompatible substances (such as oxidizers) either during use, transportation, storage, or disposal, the formation of highly toxic commodities is extremely possible.

Arsine enters the environment mainly through accidents and industrial discharges.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to arsine.

As a gas, arsine presents little toxicity to terrestrial or aquatic plants. As a liquefied compressed gas, it can cause destruction on contact with plant life.

Arsine has minimal acute toxicity to aquatic life, birds, and land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

There is insufficient data to establish whether arsine poses chronic toxicity to aquatic life, birds, or land animals.

💧 *Water Solubility*

Arsine has slight solubility in water. Concentrations of 2 to 20 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

As a gas, there is no evidence in the references to show that arsine has any measurable persistence in the environment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contami-

nated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of arsine found in fish tissues is expected to be much lower than the average concentration of arsine in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of arsine into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of arsine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If arsine should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of arsine.

Arsine may be destroyed by oxidation of aqueous copper sulfate under a nitrogen atmosphere. The reaction is carried out in a three-necked flask equipped with a stirrer, a gas inlet, and a nitrogen inlet.

If arsine gas is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ If possible, remove leaking containers to a ventilated area and attempt to seal leak. Exercise extreme caution, arsine gas is shock-sensitive. If leak cannot be sealed, allow to vent until empty.
- ☑ Remove all sources of ignition and do not allow exposure to incompatible materials.
- ☑ Ventilate area of spill or leak.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving arsine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety, or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|--|--|
| Characterization Mineral | RCRA Number Not Listed | EPA Class Nonhazardous Waste |
| DOT Proper Shipping Name Asbestos | Chemical Abstract Service (CAS) Number 1332-21-4 | |
| DOT Hazard Class and Label Requirements ORM-C | DOT Emergency Guide Code 31 | |
| DOT Identification Number UN 2212 (blue) UN 2590 (white) | Chemical Formula Various compositions | |
| Synonyms Asbestos is a generic term for a number of hydrated silicates, including amosite (CAS: 12172-73-5); actinolite (CAS: 13768-00-8); anthophyllite (CAS: 17068-78-9); chrysotile (CAS: 12001-29-5); crocidolite (CAS: 12001-28-4); and tremolite (CAS: 14567-73-8). | | |

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|--|
| Asbestos (derivation: A group of impure magnesium silicate minerals which occur in fibrous form. Colors: white, gray, green, brown, blue. In the U.S., found in Vermont, Arizona, California, North Carolina. Also found in Africa, Italy, Yukon, Quebec, Mexico). | PEL: 2 million fb/m³ CEILING: 10 million fb/m³ Cancer Hazard | REL: 100,000 fb/m³ >5 μm in length Recognized Human Carcinogen | Cancer Hazard | TLV (current): 2 fb/cc TLV (proposed): 0.2 fb/cc Confirmed Human Carcinogen |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point Decomposes | Specific Gravity (H ₂ O = 1) Varies depending on type of asbestos |
| Vapor Pressure (atmospheres) 0 (approx) at 69°F (20°C) | Molecular Weight (atomic weight) Varies depending on type of asbestos |
| Vapor Density (Air = 1) Not Found | Melting Point 1112°F (600°C) (decomposes) |
| Solubility Insoluble in water. | |
| Appearance and Odor Mineral fibers of various sizes, colors, lengths, and textures. No odor. | |

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

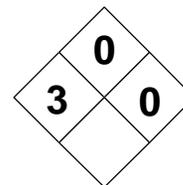

| | |
|---|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Noncombustible Solid | Autoignition Temperature Not Applicable |
| Extinguishing Media Use agent suitable for type of surrounding fire, asbestos itself does not burn or support combustion. | |
| Special Fire Fighting Procedures Care should be taken to contain asbestos materials that may have been disturbed in fire. To avoid breathing fibers, wear full protective clothing and self-contained breathing apparatus (SCBA). | |
| Unusual Fire and Explosion Hazards No unusual fire or explosion hazards listed. Asbestos is a noncombustible solid. It can resist temperatures over 500°C. It can resist most acids, has a high tensile strength, and provides excellent thermal and acoustical insulation. It may therefore be encountered in many older structures during fire fighting activities. Caution is warranted when approaching any fire where the presence of asbestos is suspected. | |

| SECTION V - REACTIVITY DATA | | | | |
|---|-------------------------------------|--|---|---|
| Stability | | Conditions to Avoid Avoid unprotected and/or unauthorized disturbance of asbestos materials. Do not allow asbestos or asbestos containing materials to become airborne. Asbestos is stable and inert. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) None reported. | | |
| Hazardous Polymerization | | Conditions to Avoid Hazardous polymerization will not occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products None reported. However, it should be noted that asbestos fibers themselves present the primary hazard associated with these materials. In a friable, airborne state, asbestos is extremely hazardous. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? |
| Health Hazards INHALATION: Repeated, long-term exposures can cause asbestosis, a disease characterized by diffuse interstitial pulmonary fibrosis (a scarring of the lung tissues). Depending upon the nature of exposure (length of time in years, type of asbestos exposed to, size of fibers reaching the lung tissue), more serious cancers, including mesothelioma, can occur. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Confirmed Human Confirmed Animal | 5th Annual Report | Group 1 | 29 CFR 1910.1001 | Eyes, respiratory system (lung cancer) |
| Medical Conditions Generally Aggravated by Exposure Pre-existing respiratory problems (bronchitis, asthma, etc.) may be aggravated by exposure to asbestos over the long-term (years); however, the data are inconclusive. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Respiratory problems associated with asbestos do not occur for many years following repeated exposures. All exposures should be documented. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Restrict those not involved in cleanup from entering area. Proper procedures for the repair or removal of asbestos must be followed by trained personnel. Notify appropriate authorities, as required by applicable environmental regulations. | | | | |
| Preferred Waste Disposal Method Asbestos wastes may be solidified prior to their landfill burial. | | | | |
| Precautions to be Taken in Handling and Storage Prior to working with asbestos, persons must be trained (by law) on its proper handling and storage. A regulated, marked area should be established where asbestos is used or stored. | | | | |
| Other Precautions and Warnings Airborne asbestos dust is difficult to remove. It is essential that asbestos work areas be closed or isolated to ensure controlled exposures. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) Asbestos is a human carcinogen. At any exposure level, use a MSHA/NIOSH combination respirator which includes a Type-C supplied air respirator with a full facepiece operated in pressure demand mode with either emergency HEPA back-up filter or auxiliary self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of asbestos work. Area should be isolated from other work areas. | | | | |
| Protective Gloves Impervious Rubber | | Eye Protection Dust Goggles and Face Mask | Other Protective Clothing Full Body Protective Suit (disposable) with Boots and Head Protection | |
| Work/Hygiene Practices Always wash thoroughly after working around asbestos; never bring food, drink, or smoking materials into vicinity of asbestos work or abatement projects. | | | | |

ASBESTOS

CAS: 1332-21-4

| ASBESTOS TYPE | CAS NUMBER | CHEMICAL COMPOSITION |
|---------------|------------|--|
| Actinolite | 13768-00-8 | 2CaO • 4MgO • FeO • 8SiO ₂ • H ₂ O |

| Tremolite | 14567-73-8 | 2CaO • 5MgO • 8SiO ₂ • H ₂ O |

IDENTIFICATION AND TYPICAL USES

Asbestos is a general term used to describe a variety of naturally occurring hydrated silicates that produce mineral fibers upon mechanical processing. There are two varieties of asbestos: serpentine and amphibole minerals. Asbestos occurs in nature in fibrous stones, silicate minerals, rocks, open-pit quarries, and underground mines. It also occurs in burial pits and man-made sites where it was dumped in the era before regulations. Because of the unique physical and chemical properties of asbestos fibers (noncombustible and capable of withstanding temperatures over 500°C, high tensile strength, resistance to acids, and thermal and acoustic insulation), asbestos was used widely in many products. These include textiles, cement, paper, wicks, ropes, floor and roofing tiles, water pipe, wallboard, fire resistant clothing, gaskets, curtains, and many other products.

RISK ASSESSMENT: HEALTH

General Assessment

Health hazards associated with asbestos occur as a result of prolonged and repeated exposures over the course of many years. Asbestos is a confirmed human carcinogen producing lung tumors and other cancers. Exposure to airborne dusts can cause asbestosis, mesothelioma, lung cancer, and gastrointestinal cancer. These asbestos-related diseases usually show a long latency period, sometimes many years after the last known exposure episode. This latency time, however, will vary depending upon the species of asbestos, the degree of exposure, and the type of disease. *Inhalation* is the primary route of entry of asbestos particles into the body. Other than the pulmonary system, fibers may accumulate in the gastrointestinal tract from drinking

water contaminated with asbestos or due to transportation from the nasal passage (i.e., when swallowing).

Asbestosis is a disease characterized by lung disorder and a diffuse interstitial fibrosis that is irreversible in nature. It can lead to respiratory disability and cause death from inability of the body to obtain needed oxygen or from cardiac failure.

Mesothelioma is a rare malignant tumor that can occur after a short intensive exposure to certain types of asbestos (as well as other minerals). Unlike asbestosis, mesothelioma develops in a shorter latent time and death may occur within a year of diagnosis. It is characterized by malignant cancer spread over the surfaces of the lung, heart, and abdominal organs (the area known as the mesothelium). Early symptoms include shortness of breath, chest pain, progressive weight loss, and abdominal swelling. Among the asbestos types, crocidolite is most hazardous, followed by amosite and chrysotile, in causing mesotheliomas in humans.

Lung cancer may occur from moderate exposure to airborne asbestos fibers. The latency period may range from 15-35 years. Symptoms include irritating cough, blood-flecked sputum, chest pain, loss of weight and appetite.

☠ *Acute Health Effects*

There are no known acute (short-term) health effects associated with exposure to asbestos. People who develop serious and even fatal diseases later in life may be asymptomatic (without symptoms) at the time of exposure and for several months or years thereafter.

☪ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to asbestos and can last for months or even years before death occurs:

Cancer Hazards: Asbestos is a carcinogen in humans. It has been shown to cause lung cancers (including mesothelioma) as well as stomach, colon, rectal, vocal cord, and kidney cancers.

Reproductive Hazard: According to the references, asbestos has been tested and has not been shown to affect reproduction.

Other Chronic Effects: Repeated, long-term exposures to asbestos can cause the disease asbestosis, a scarring of the lungs. The higher the exposure, and the longer the time of the exposure, the greater the chance of developing serious illness. Asbestosis develops many years (from 7 to 30) after the period of exposure. It can progress to disability and death. Changes in chest X-ray can indicate the presence of fibrous tissues.

🔗 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with asbestos. Its airborne dusts present a serious health hazard to unprotected, exposed individuals. By law, only trained and qualified persons are permitted to work with or remove asbestos or asbestos containing materials (ACM). *Engineering controls* are required to ensure maximum reduction of exposure potential. Specific procedures are required when working with asbestos. These include, but are not limited to: total containment of the affected work area; use of air showers and barriers; use of specific personnel protective equipment (PPE); use of specialized mechanical equipment to ensure total capture of all ACM; and use of specific waste disposal techniques and methods. During any work with asbestos (abatement, removal, or otherwise), the best protection is to enclose operations and/or provide local exhaust ventilation at the site of asbestos work. Isolating operations will also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around friable asbestos. At any exposure level, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. However, for non-abatement work, a powered respirator equipped with a high efficiency particulate air (HEPA) filter may suffice. If a full facepiece is not available, then dust goggles or face shield should be worn to protect the eyes. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These are required by law and include written procedures or poli-

cies which specify the methods and techniques that will be practiced whenever personnel are to work with asbestos.

All personnel must receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) and 29 CFR 1910.1001 (Asbestos), prior to the first assignment in an area where asbestos is used, removed, stored, or destroyed.

Before beginning employment with asbestos and at regular intervals thereafter (e.g., annually), a medical history and examination is recommended, including the following:

- ☑ Pulmonary function test (baseline and annually).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, respiratory conditions caused by asbestos exposure may be more severe. The risk of lung cancer may be as much as 92 times higher for people with asbestos exposure who also smoke than for those without both exposures.

Other methods to reduce exposure to asbestos include:

- ☑ Specific engineering controls are required by OSHA 29 CFR 1910.1001 and 29 CFR 1926.58. Also refer to NIOSH Criteria Document: *Occupational Exposure to Asbestos* (#77-169).
- ☑ Substitute the less toxic mineral wool and fiberglass for asbestos where possible. There are substitutes for almost every use of asbestos.
- ☑ Always ensure that proper protective clothing is worn when working with asbestos.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of asbestos must be communicated to all potentially exposed workers.
- ☑ Wash any areas of the body that may have contacted asbestos.
- ☑ Do not eat, drink, or smoke where asbestos is handled, processed, or stored since asbestos can be swallowed. Wash hands carefully before eating or smoking.
- ☑ On-going asbestos abatement projects in sealed areas become hot and humid. There is a risk of

heat stress. Personnel should be trained to recognize the warning signs and the proper actions to take to avoid seriously dangerous working conditions.

- ☑ Do not sweep for cleanup. Use a vacuum equipped with a HEPA filter or a wet method to reduce dust generation.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to asbestos, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of asbestos. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of asbestos.

Accidental spills and damaged asbestos materials must be cleaned using wet methods. Asbestos spills must never be dry swept or shoveled. Such actions will cause the generation of dusts and airborne asbestos fibers. Since asbestos is a common air contaminant, its threat to the surrounding environment is minimal. However, this does not justify careless or unprofessional cleanup methods in the event of a spill.

Asbestos is considered a noncombustible solid. It was commonly used for a multitude of purposes for many years before becoming regulated by OSHA and before its carcinogenic properties were discovered. These characteristics mean that asbestos can unknowingly be present when other types of materials are being transported.

Asbestos is a naturally occurring mineral. In the United States, it is found primarily in Vermont, Arizona, California, and North Carolina. It also occurs in Africa, Italy, the Yukon, Quebec, and Mexico. It can enter the environment through run-off, or through accidental spill.

☠ *Acute Ecological Effects*

Acute (short-term) ecological toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to asbestos.

The data in the references are insufficient to determine if asbestos (in any form) poses any acute toxicity

hazard to aquatic life, plants, birds, or terrestrial animals.

☠* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Asbestos (fibers) can cause cancer if inhaled; birds or land animals which inhale asbestos fibers are therefore susceptible to cancer or other long-term effects. Asbestos fibers which are ingested (swallowed) are generally not toxic to birds or animals, but they are passed through their digestive systems.

💧 *Water Solubility*

Asbestos minerals are slightly soluble in water. Concentrations of less than 1 milligram will mix with a liter of water.

⌚ *Persistence in the Environment*

Asbestos fibers are highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of asbestos found in fish tissues is expected to be less than the average concentration of asbestos in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of asbestos into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, hazardous materials spill response personnel should be

notified immediately. Cleanup must be attempted only by those trained in proper asbestos spill containment procedures. If asbestos should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of asbestos.

Asbestos wastes may be solidified prior to their landfill burial. This may be achieved by a cementing process, such as that using pozzolanic concrete, which contains fly ash or kiln dust mixed with lime, water, and other additives. Other methods of solidification include thermoplastic and polymeric processes.

If asbestos is spilled or damaged, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill until cleanup is complete.
- Applicable OSHA regulations must be strictly followed during any abatement procedures.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving asbestos can present a significant threat to business operations. The use of the term asbestos can generate serious emotional response from employees as well as the public in surrounding communities. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the word "asbestos" or the terms "cancer," or "carcinogen" are used, public emotion, hysteria, and ignorance can run equally high. This should be carefully considered whenever developing or implementing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and

policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|--|--------------------------------|
| Characteristic Herbicide | RCRA Number Not Listed | EPA Class Not Listed |
| DOT Proper Shipping Name Atrazine | Chemical Abstract Service (CAS) Number 1912-24-9 | |
| DOT Hazard Class and Label Requirements Noncombustible Solid | DOT Emergency Guide Code 55 (triazine pesticide) | |
| DOT Identification Number UN 2763 | Molecular Formula C₈H₁₄ClN₅ | |

Synonyms

2-chloro-4-ethylamino-6-isopropylamino-s-triazine; 2-chloro-4-ethylamino-6-isopropyl-1,3,5-triazine; 6-chloro-N-ethyl-N'-(1-methylethyl)1,3,5-triazine-2,4-diamine; Gesaprim; Primatol; Weedx A; Zeazine.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|--|---|--|
| Atrazine (derivation: An s-triazine herbicide). | PEL: Not Established STEL: Not Established | REL: 5 mg/m³ Questionable Human Carcinogen | Not Determined | TLV: 5 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point Decomposes | Specific Gravity (H ₂ O = 1) 1.19 |
| Vapor Pressure (atmospheres) 3 x 10⁻⁷ at 69°F (20°C) | Molecular Weight (atomic weight) 215.06 |
| Vapor Density (Air = 1) Not Found | Melting Point 340°F (173°C) |

Solubility

At 25°C: Insoluble in water (70 ppm); slightly soluble in ether (12,000 ppm) and methanol (18,000 ppm); soluble in chloroform (52,000 ppm).

Appearance and Odor

Colorless or white crystalline solid powder, no odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Noncombustible Solid | Autoignition Temperature Not Applicable |

Extinguishing Media

Use extinguishing media suitable to surrounding fires.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA) when fighting fires near or around atrazine since poisonous gases are produced in fire.

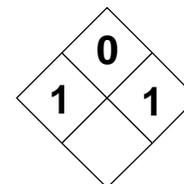

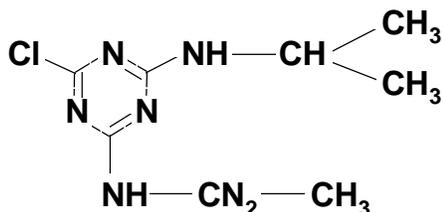

Unusual Fire and Explosion Hazards

Atrazine is a noncombustible solid. But, it common to find it mixed with flammable or combustible liquids. Fires involving atrazine mixtures present additional hazards caused by the release of toxic gases.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|--|------------------------|---|
| Stability | | Conditions to Avoid Atrazine is a very stable s-triazine herbicide. It should be kept away from heat, flame, and incompatible materials. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) Can react violently and vigorously in the presence of strong acids and strong bases. | | |
| Hazardous Polymerization | | Conditions to Avoid Hazardous polymerization of atrazine has not been reported. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, emits highly toxic Cl and NO_x fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? X |
| Health Hazards INHALATION: Human data are inconclusive. Symptoms may include ataxia, dyspnea, and convulsion, conjunctivitis, excessive salivation, sneezing, and muscle weakness. INGESTION: Human data are inconclusive. Symptoms may include gradual reduction in hemoglobin content and erythrocyte and leukocyte count; an increase in glucose, cholesterol, total proteins, and the enzyme transaminases. There may be a loss of appetite, debility, progressive anemia, enteritis, and muscle weakness. There may also be visible effects on multiple organs. There is limited evidence to show that atrazine taken orally may affect the brain, the liver, and the kidney in experimental studies using test animals. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | Not Listed | No | Not Listed | Eyes, Skin, Respiratory System, CNS, Liver |
| Medical Conditions Generally Aggravated by Exposure The data do not indicate any pre-existing medical conditions that might be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed, seek medical attention immediately. Do not attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove ignition sources. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Collect spilled powdered materials in safest manner possible and deposit in sealed drum for disposal. Notify appropriate authorities, as required by applicable environmental regulations. | | | | |
| Preferred Waste Disposal Method Incineration. | | | | |
| Precautions to be Taken in Handling and Storage Atrazine is a nonflammable solid. Store to avoid contact with strong acids and bases. Store in tightly closed containers in cool, well-ventilated area away from heat. Do not use near heat or flame. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where atrazine is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) Atrazine is mildly toxic by inhalation. An MSHA/NIOSH approved half-mask respirator with organic vapor cartridge and dust/mist pre-filter should be worn. For high exposures, a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode is recommended. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Rubber | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ATRAZINEC₈H₁₄ClN₅

CAS: 1912-24-9

**IDENTIFICATION AND TYPICAL USES**

Atrazine is a colorless or white solid crystalline powder with no detectable odor. Of the *s*-triazine herbicides, atrazine is the best known example. It is used for the control of broad-leaf and grassy weeds, in corn, asparagus, tomatoes, potatoes, and ornamentals.

RISK ASSESSMENT: HEALTH***General Assessment***

The acute and chronic toxicity of atrazine is considered to be low in both animal and human exposures. Although there have been no substantial reports of skin or eye irritation resulting from experimental or commercial applications of atrazine, its properties are conducive to causing such problems in animals and possibly in humans as well. No human poisoning cases have been reported from ingestion of atrazine.

However, from a *risk management* perspective, atrazine should be considered mildly toxic by *inhalation* and *skin contact* and moderately toxic by *ingestion*. This is recommended because animal studies have shown some adverse effects resulting from exposure by these routes. Specifically, animal studies have produced a variety of symptoms, including ataxia, dyspnea, and convulsions. There have also been documented reports of debility, loss of appetite, progressive anemia, enteritis, and muscle weakness following oral exposure to test animals. Although most organs were also affected in some way, the primary targets appear to be the eyes, liver, kidney, brain, and respiratory tract.

There is also limited evidence to show that exposure to atrazine affects the action of the central nervous system. The *s*-triazine herbicides are not retained very long in body tissues and fluids of animals. They are excreted in the urine and feces.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to atrazine:

- Skin:** Irritation and possible rash or allergic reaction.
- Eye:** Severe eye irritation likely, conjunctivitis possible in some exposures.
- Lung:** Can irritate the respiratory tract, in large doses, may be absorbed through respiratory tissues.
- CNS:** May cause ataxia, headache, muscle weakness, dyspnea, and convulsions.

●* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to atrazine and can last for months or even years:

Cancer Hazards: Atrazine may be a questionable carcinogen humans, however, lengthy studies in animals have shown no substantial data to support any claims of carcinogenicity of atrazine. The data are inconclusive on the exact nature of any carcinogenic properties. However, some limited mutagenic data have been reported.

Reproductive Hazard: Atrazine is considered an experimental teratogen but the data are insufficient to confirm that atrazine presents a reproductive hazard.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with atrazine. The exact nature of its harmful capacities is not clearly understood in the references. Therefore, it should be handled as a toxic material. If a less toxic material cannot be substituted for atrazine, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of

atrazine release. While not always operationally feasible, isolating operations can also reduce exposure. These may be appropriate actions in manufacturing, production, and packing operations. However, since the primary application of atrazine is outdoors, isolation and local ventilation are not considered practical exposure control measures.

Using respiratory protection and other personal protective equipment (PPE) is less effective than the engineering controls mentioned above, but is still advisable whenever working with or around atrazine. Under normal operating conditions of low exposure potential, a half mask respirator equipped with an organic vapor cartridge and dust/mist pre-filter will suffice. However, for maximum protection, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended. If a full facepiece is not available, then chemical/dust goggles or face shield should be worn to protect the eyes. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with atrazine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where atrazine is used or stored.

After suspected overexposure, consider the following medical tests:

- Urinalysis to check for *s*-triazine herbicide metabolite excretion.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure to atrazine include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release, especially during manufacturing/production and packing or shipping operations. If local exhaust ventilation or enclosure is not used in these situations, respiratory protection should be required.
- Always ensure that proper protective clothing is worn when using chemical substances. Never allow contaminated clothing to be taken home from the work place.

- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of atrazine should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to atrazine, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

While the environment is at risk of exposure during transportation, storage, disposal, or destruction of atrazine, its ordinary use as an herbicide poses the greatest potential for environmental contamination. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where atrazine contacts incompatible commodities can result in violent reactions as well as the possible contamination of the surrounding environmental mediums (water, soil, and air).

Atrazine is considered a noncombustible solid. However, it may often be mixed with other materials and commodities that are flammable. Such mixtures can present a moderate fire and explosion hazard. Also, because it is incompatible with strong bases and strong acids, extreme caution is required in handling, storage, transportation, and disposal of atrazine. These characteristics also require special consideration during any emergency situation involving a leak or spill of atrazine. Should atrazine ever come into contact with such incompatible substances either during use, transportation, storage, or disposal, dangerous reactions are possible.

Atrazine enters the environment mainly through its primary use as an herbicide but also as a result of accidents and industrial discharges.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to atrazine.

Atrazine has minimal acute toxicity to aquatic life, birds, and land animals. As an herbicide, it poses high toxicity to some plant life.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

There are insufficient data to establish whether atrazine poses chronic toxicity to aquatic life, birds, or land animals. It poses high chronic toxicity to some forms of plant life.

💧 *Water Solubility*

Atrazine has very slight solubility in water. Concentrations of 2 to 20 milligrams will mix with 1000 liters of water.

🕒 *Persistence in the Environment*

There is no evidence in the references to show that atrazine has any measurable persistence in the environment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of atrazine found in fish tissues is expected to be much lower than the average concentration of atrazine in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of atrazine into the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of atrazine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures. If atrazine should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of atrazine.

Atrazine may be destroyed by incineration in a chemical incinerator equipped with an air scrubber.

If atrazine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ If possible, remove leaking containers to a ventilated area and attempt to seal leak.
- ☑ Do not allow exposure to incompatible materials.
- ☑ Collect powdered materials in the safest and most efficient manner possible. Place materials in a sealed drum.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving atrazine can present a moderate threat to business operations. Although not likely, equipment and facilities may be lost or their use disrupted as a result of an incident involving atrazine which can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures that focus on emergency response, disaster preparedness, and disaster recovery. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

BARIUM

Ba

CAS: 7440-39-3

**IDENTIFICATION AND TYPICAL USES**

Barium is a silver white or yellowish white, slightly malleable metal. It can also exist as a powder or dust. It is used in the manufacture of electronic tubes and as a carrier for radium. It is also used as a catalyst for organic reactions; as a lubricating oil additive; as rat poison; in manufacture of paper electrodes; in fireworks; and in electroplating. Many barium salts are used for various purposes, such as in paints, ceramics, in tanning and finishing leathers, as a mordant for fabrics and dyes, in aluminum refining, in rubber manufacture, and in analytical work.

RISK ASSESSMENT: HEALTH**General Assessment**

Certain compounds of barium are irritants of the eyes, mucous membranes, and skin. Primary exposure routes are *inhalation* and *ingestion*. Inhalation of barium dusts can cause irritation of the nose and upper respiratory tract and may produce a benign pneumoconiosis known as baritosis. There may be characteristic X-ray changes. All soluble salts of barium are acute poisons. The barium ion is toxic to muscle producing stimulation and then paralysis.

Ingestion can cause severe hypokalemia. Ingesting barium salts or powders produces initial symptoms related to gastrointestinal reaction. These include nausea, vomiting, colic, diarrhea, followed by myocardial and general muscular stimulation with tingling in the extremities. Severe cases continue to loss of tendon reflexes, general muscular paralysis, and death from respiratory arrest or ventricular fibrillation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to barium:

Skin: No initial symptoms. However, sweating may cause burning sensation as barium dusts react on contact with water.

Eye: Severe irritation and possible damage. Due to water content in the eye, reactions may be immediate and serious.

Lung: Can cause metallic taste, nausea, sore throat, and irritation of the air passages.

Other: Serious effects on musculatory system at high exposures. May cause tingling of the extremities followed by irregular heartbeat and might even cause heart to stop (ventricular fibrillation). Death is also possible as a result of respiratory arrest.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to barium and can last for months or even years:

Cancer Hazards: According to the references, barium has not been tested for its ability to cause cancer in animals.

Reproductive Hazard: According to the references, barium has not been tested for its ability to affect reproduction.

Other Chronic Effects: Repeated exposure can cause abnormal chest X-ray. This usually takes years to develop. An abnormal chest X-ray from barium exposure does not necessarily mean the lung has been damaged but future exposures to irritating substances may affect the lungs. It is not currently known whether barium causes lung damage.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with barium, especially its dusts or powders. If a less toxic material or compound cannot be substituted for barium, then *engi-*

neering controls are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of barium dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around barium. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection, especially when exposures near the IDLH level of 250 mg/m³. However, for low or infrequent exposure, a MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with barium.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where barium is used or stored.

Before beginning employment working with barium, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

- Lung function test.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to barium may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with barium powders.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to barium and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of barium should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to barium, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by barium should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to barium.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of barium. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where barium contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In powdered form, barium is considered a flammable solid. It can present a moderate fire and explosion hazard. In bulk form, it does not present a serious fire or explosion hazard. However, because it is incompatible with water and many other commodities, extreme caution is required in handling, storage, transportation, and disposal of barium. These characteristics also require special consideration during any emergency situation involving a leak or spill of barium powder or dust. Should barium ever come into contact with incompatible substances (such as water and strong acids) either during use, transportation, storage, or disposal, violent and even explosive reactions are possible.

Barium may enter the environment as a result of industrial and municipal waste treatment plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to barium. Barium and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of barium or its salts to plants, birds, or land animals.

💧 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Barium and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of barium to plants, birds, or land animals.

💧 *Water Solubility*

Most of the barium salts are either highly or moderately soluble in water. Concentrations of 1 to 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Barium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of barium persistence in the aquatic or terrestrial environments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of barium found in fish tissues is expected to be about the same as the average concentration of barium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill

of barium dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of barium should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If barium should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of barium. If barium is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of barium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving barium can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an

injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

BARIUM BROMATEBa(BrO₃)₂•H₂O

CAS: 13967-90-3

**IDENTIFICATION AND TYPICAL USES**

Barium bromate is a white crystal or crystalline powder. Many barium compounds are used in the manufacture of electronic tubes and as carriers for radium. Barium is also used as a catalyst for organic reactions; as a lubricating oil additive; as rat poison; in manufacture of paper electrodes; in fireworks; and in electroplating. Many barium salts are used for various purposes, such as in paints, ceramics, in tanning and finishing leathers, as a mordant for fabrics and dyes, in aluminum refining, in rubber manufacture, and in analytical work.

RISK ASSESSMENT: HEALTH**General Assessment**

Certain compounds of barium are irritants of the eyes, mucous membranes, and skin. Primary exposure routes are *inhalation* and *ingestion*. Inhalation of barium dusts can cause irritation of the nose and upper respiratory tract and may produce a benign pneumoconiosis known as baritosis. There may be characteristic X-ray changes. All soluble salts of barium are acute poisons. The barium ion is toxic to muscle producing stimulation and then paralysis.

Ingestion can cause severe hypokalemia. Ingesting barium salts or powders produces initial symptoms related to gastrointestinal reaction. These include nausea, vomiting, colic, diarrhea, followed by myocardial and general muscular stimulation with tingling in the extremities. Severe cases continue to loss of tendon reflexes, general muscular paralysis, and death from respiratory arrest or ventricular fibrillation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure (within hours or within days) to barium bromate:

Skin: May cause severe irritation and even burns.

Eye: Severe irritation and possible damage.

Lung: Dusts will irritate the lungs causing cough and phlegm.

Other: Industrial grade barium compounds may be contaminated with silica. Exposure can lead to lung scarring and reduce lung function.

☛ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to barium and can last for months or even years:

Cancer Hazards: According to the references, barium has not been tested for its ability to cause cancer in animals.

Reproductive Hazard: According to the references, barium has not been tested for its ability to affect reproduction.

Other Chronic Effects: Repeated exposure can cause abnormal chest X-ray. This usually takes years to develop. An abnormal chest X-ray from barium exposure does not necessarily mean the lung has been damaged but future exposures to irritating substances may affect the lungs. It is not currently known whether barium causes lung damage. Repeated skin contact can cause chronic dryness and cracking. Repeated inhalation can cause bromine to build up in the body.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with barium bromate dusts or powders. If a less toxic material or compound cannot be substituted for barium bromate, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of barium dust release. While not always operationally feasible, isolating operations can

also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around barium bromate. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection, especially when exposures near the IDLH level of 1100 mg/m³. However, for low or infrequent exposure, a MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with barium bromate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where barium bromate is used or stored.

Before beginning employment working with barium bromate, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

- Lung function test.
- Serum bromide level.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to barium may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with barium powders.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.

- Wash thoroughly immediately after exposure to barium bromate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of barium bromate should be communicated to all exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to barium bromate, emergency shower facilities should also be provided in the immediate area.
- Workers whose clothing has been contaminated by barium bromate should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to barium bromate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of barium compounds. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where barium bromate contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its powdered form, barium bromate is considered a non-combustible solid. However, it can react explosively and present a serious fire hazard. Because it is incompatible with many commodities, including other metals and most combustibles, extreme caution is required in handling, storage, transportation, and disposal of barium bromate. These characteristics also require special consideration during any emergency situation involving a leak or spill of barium bromate powder or dust. Should barium bromate ever come into contact with incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible.

Barium bromate can enter the environment from industrial and municipal waste treatment plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to barium. Barium and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of barium or its salts to plants, birds, or land animals.

💧 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Barium and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of barium to plants, birds, or land animals.

💧 *Water Solubility*

Most of the barium salts are either highly or moderately soluble in water. Concentrations of 1 to 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Barium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of barium persistence in the aquatic or terrestrial environments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of barium found in fish tissues is expected to be about the same as the average concentration of barium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill

of barium bromate dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of barium bromate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If barium bromate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of barium bromate. If barium bromate powder is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of barium bromate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving barium bromate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious

expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin/eye)? | Ingestion? X | |
| Health Hazards INHALATION: May produce benign pneumoconiosis (baritosis) which may cause X-ray changes. Other symptoms of exposure include eye, nose, and throat irritation, coughing, and a potential for potassium deficiency that can effect the function of the heart and CNS. SKIN & EYES: Exposure to the eyes and skin may cause moderate to severe irritation. INGESTION: Water and stomach acids solubilize barium salts and can cause poisoning. Symptoms are vomiting, colic, diarrhea, slow irregular pulse, transient hypertension, convulsive tremors. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Respiratory system, GI tract, CNS, muscles, heart. |
| Medical Conditions Generally Aggravated by Exposure Persons with existing lung dysfunction, hypertension, CNS, or muscular disorders may be effected. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of water. For reddened or blistered skin, seek medical assistance. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed</u>, seek medical attention. Never give anything by mouth to a convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in most convenient and safe manner and deposit in sealed containers. Dry sweep not recommended. Use HEPA vacuum. Ventilate area of spill. Restrict those not involved in cleanup from entering area. Keep combustible materials away. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Explosion risks vary with type of barium compound. Store to avoid contact with incompatible materials, moisture, and combustible materials. Prevent physical damage to containers. Keep tightly closed. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where barium carbonate is used, handled, or stored. Store on floors constructed of impermeable and non-combustible materials. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For dust exposures below PEL, use a respirator with a high efficiency particulate air (HEPA) filter, otherwise use a self-contained breathing apparatus with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Impervious Rubber | Chemical/Dust Goggles or Face Mask | Protective Apron, Boots | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BARIUM CARBONATE

BaCO₃

CAS: 513-77-9

IDENTIFICATION AND TYPICAL USES

Barium carbonate is a white to grayish-white fine granular powder with no detectable odor. Used in rodenticides, ceramics, paints, enamels, marble substitutes, and rubber. Also used in the manufacturing of paper, electrodes, barium salts, optical glasses, as an analytical reagent, in the treatment of brines in chlorine-alkali cells to remove sulfates, in casehardening baths, and in radiation-resistant glass for color television tubes.

RISK ASSESSMENT: HEALTH

General Assessment

Certain compounds of barium are irritants of the eyes, mucous membranes, and skin. Primary exposure routes are *inhalation* and *ingestion*. It has not been established if exposure to barium poses any carcinogenic, teratogenic, or mutagenic effects.

Inhalation of barium dusts can cause hypokalemia (potassium deficiency in blood). It will cause irritation of the nose and upper respiratory tract and may produce a benign pneumoconiosis known as baritosis. There may be characteristic X-ray changes. All soluble salts of barium are acute poisons. The barium ion is toxic to muscle producing stimulation and then paralysis. Specifically, barium carbonate will irritate the nose, throat, and mucosa of the upper respiratory tract and bronchial tubes. There may be adverse effects on the heart and the function of the central nervous system (CNS).

Ingesting barium salts or powders produces initial symptoms related to gastrointestinal reaction. These include nausea, vomiting, colic, diarrhea, followed by myocardial and general muscular stimulation with tingling and paralysis in the extremities. Severe cases continue to loss of tendon reflexes, general muscular paralysis, and death from respiratory arrest or ventricular fibrillation. In addition to these effects, inges-

tion of barium carbonate specifically can cause stomach ulcers, muscle weakness, hypertension, bradycardia (slow pulse rate), paresthesia (tingling sensation of the skin), bloody diarrhea, dyspnea, salivation, nausea, vomiting, and paralysis. It can adversely effect the central nervous system (CNS) with giddiness, convulsions, and tremors.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to barium carbonate:

Skin: May cause mild to moderate irritation, depending on the conditions of skin contact and length of exposure.

Eye: Severe irritation.

Lung: Can cause metallic taste, nausea, sore throat, and irritation of the air passages.

Other: Serious effects on musculatory system at high exposures. May cause tingling and paralysis of the extremities followed by irregular heart-beat and might even cause the heart to stop (ventricular fibrillation). Death is also possible as a result of respiratory arrest.

☛ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to barium carbonate and can last for months or even years:

Cancer Hazards: According to the references, barium carbonate has not been tested for its ability to cause cancer in animals.

Reproductive Hazard: According to the references, there is limited evidence that exposure to barium carbonate causes adverse reproductive effects in test animals. In rats, it will impair the function of the female

and male genitalia. It is not known if exposure to barium carbonate will have this effect on humans.

Other Chronic Effects: Repeated exposure can cause abnormal chest X-ray. This usually takes years to develop. An abnormal chest X-ray from barium carbonate exposure does not necessarily mean the lung has been damaged but future exposures to irritating substances may affect the lungs. It is not currently known whether barium carbonate causes lung damage.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with barium, especially its dusts or powders. If a less toxic material or compound cannot be substituted for barium carbonate, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of barium carbonate dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around barium carbonate. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection, especially when exposures near the IDLH level of 250 mg/m³ (as barium). However, for low or infrequent exposure, a MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with barium carbonate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where barium carbonate is used or stored.

Before beginning employment working with barium carbonate, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

☑ Lung function test (establish baseline).

If symptoms develop or overexposure is suspected, consider the following additional tests:

☑ Electrocardiogram (EKG).

☑ Neurological examination.

☑ Consider chest X-ray.

☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to barium carbonate may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with barium carbonate powders.

Other methods to reduce exposure include:

☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

☑ Always ensure that proper protective clothing is worn when using chemical substances. Proper maintenance and care of protective equipment is essential to its proper function.

☑ Wash thoroughly immediately after exposure to barium carbonate and at the end of the work shift or before eating, drinking, or smoking.

☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of barium carbonate should be communicated to all potentially exposed workers.

☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to barium carbonate, emergency shower facilities should be provided.

☑ Workers whose clothing has been contaminated by barium carbonate should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have

been informed of the hazards of exposure to barium carbonate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of barium carbonate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where barium carbonate contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Barium carbonate is considered a non-combustible solid. However, finely divided dusts and powders may create an explosive mixture in air in closed spaces. It is incompatible with many acids and extreme caution is required in handling, storage, transportation, and disposal of barium carbonate. These characteristics also require special consideration during any emergency situation involving a leak or spill of barium carbonate powder or dust. Should barium carbonate ever come into contact with incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible.

Barium carbonate may enter the environment as a result of industrial and municipal waste treatment plant discharges and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to barium.

Barium and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of barium or its salts to plants, birds, or land animals.

☠ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Barium and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of barium to plants, birds, or land animals.

💧 Water Solubility

Barium carbonate is nearly insoluble (0.002 g/100 cc at 20°C) in water. Concentrations of less than 1 milligram may mix with a liter of water.

⌚ Persistence in the Environment

Barium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of barium persistence in the aquatic or terrestrial environments.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of barium found in fish tissues is expected to be about the same as the average concentration of barium in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of barium carbonate dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of barium carbonate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If barium carbonate should

contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble and will decompose. Therefore, total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of barium carbonate. If barium carbonate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of barium carbonate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving barium carbonate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Hazard Class and Label Requirements Poison B | DOT Emergency Guide Code 53 | |
| DOT Identification Number UN 1565 | Molecular Formula Ba(CN)₂ | |

Synonyms

Barium cyanide solid; barium dicyanide.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|--|---|--|
| Barium cyanide (derivation: By the action of hydrocyanic acid on barium hydroxide with subsequent crystallization). | PEL: 0.5 mg(Ba)/m³ STEL: Not Established | REL: 0.5 mg(Ba)/m³ STEL: Not Established | 1100 mg(Ba)/m³ | TLV: 0.5 mg(Ba)/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point Not Applicable | Specific Gravity (H ₂ O = 1) Not Listed |
| Vapor Pressure (mm Hg) <1 at 69°F (20°C) | Molecular Weight (atomic weight) 189.4 |
| Vapor Density (Air = 1) 6.5 | Melting Point Not Listed |

Solubility in Water

Soluble in water and alcohol.

Appearance and Odor

White crystalline (sugar or sand-like) solid powder, no appreciable odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Not Found | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Not Found | Autoignition Temperature Not Found |

Extinguishing Media

Barium cyanide itself does not burn. Extinguish fire with an agent suitable to surrounding fire. Avoid use of carbon dioxide extinguishers if possible.

Special Fire Fighting Procedures

Fire fighting clothing normally worn for structural fires is inadequate protection. Wear fully contained suit with self-contained breathing apparatus (SCBA) set on positive pressure or pressure demand mode. Poisonous gases are produced in fire.

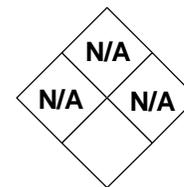

Unusual Fire and Explosion Hazards

Even though barium cyanide by itself will not burn, if it should contact acids, acid salts, or carbon dioxide in air, it may produce highly flammable hydrogen cyanide gas. It will also emit toxic cyanides of barium oxides when it is involved in a fire.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|--|---|---|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials. Keep away from heat and open flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Acids, acid salts (such as potassium bisulfate, calcium biphosphate, and calcium nitrate); carbon dioxide, and strong oxidizers (such as nitrates, chlorates, and chlorine). | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of barium cyanide will not occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Contact with acids or acid salts forms deadly, flammable, hydrogen cyanide gas. Also, poisonous gases of cyanide are emitted during fire. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin/eye)? X | Ingestion? | |
| Health Hazards INHALATION: Will cause weakness, headaches, nausea, vomiting, gasping for air, collapse, and even death from cyanide poisoning. After repeated exposure, it may show up as spots in the lungs on chest X-ray. ABSORPTION: Irritation followed by desquamation and itching. High exposures may be fatal. EYE CONTACT: Eye contact causes irritation. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 (Barium) | Target Organs? Respiratory system, eyes, CNS, skin. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, persons with existing lung dysfunction may experience effects quicker. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed and patient is conscious, give large amounts of water and induce vomiting. Seek medical attention immediately. Never give anything by mouth to a convulsing or unconscious person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in most convenient and safe manner and deposit in sealed containers. Dry sweep not recommended. Use HEPA vacuum. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by applicable regulations. | | | | |
| Preferred Waste Disposal Method Incinerate in a chemical incinerator equipped with a scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Explosion risks vary with type of barium compound. Store to avoid contact with strong acids and acid salts. Store powders in sealed containers away from heat, flame, or other sources of ignition. While barium cyanide itself will not burn, it will emit poisonous cyanide gas in a fire. | | | | |
| Other Precautions and Warnings Use only non-sparking tools or equipment when working around barium cyanide, especially when opening or closing containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Barium cyanide is a class B poison. Where potential exists for exposure above 0.5 mg/m³, use a self-contained breathing apparatus with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Full Protective Suit | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BARIUM CYANIDEBa(CN)₂

CAS: 542-62-1

**IDENTIFICATION AND TYPICAL USES**

Barium cyanide is a silver white or yellowish white crystalline powder. It is used primarily in metallurgy and electroplating. It may also be used as a catalyst for organic reactions; as a lubricating oil additive; as rat poison; in manufacture of paper electrodes and in fireworks. Many barium salts are used for various purposes, such as in paints, ceramics, in tanning and finishing leathers, as a mordant for fabrics and dyes, in aluminum refining, in rubber manufacture, and in analytical work.

RISK ASSESSMENT: HEALTH***General Assessment***

Barium cyanide is a class B poison. On *inhalation* or *ingestion*, exposure to barium cyanide at low concentrations can cause headaches, vertigo, nausea, and vomiting as a result of cyanide poisoning. At higher concentrations, there can be difficulty in breathing, heart palpitation, paralysis, unconsciousness, respiratory arrest, cyanosis, and death. Similar symptoms may appear as a result of *absorption* through the skin. Industrial grade cyanide often contains silica. If so, over-exposure can lead to gradual lung scarring which can resemble barium spots on chest X-ray and can also reduce lung function. Also, if barium cyanide is near acid or acid mist, deadly cyanide gas is released and rapid poisoning can occur.

Eye contact can result in severe irritation of the conjunctiva and possible damage to corneal tissues.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to barium:

Skin: Irritation, rash, desquamation, and itching. Absorption is likely with resulting toxic sys-

temic effects attributed to acute cyanide poisoning.

Eye: Severe irritation and possible damage.

Lung: Irritation of the respiratory tract with difficulty breathing and shortness of breath, cough, and possible death due to respiratory arrest as a result of acute cyanide poisoning.

CNS: Symptoms include headaches, vertigo, confusion, nausea, and vomiting at low concentrations. Higher acute concentrations cause heart palpitation, paralysis, unconsciousness, and cyanosis.

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to barium and can last for months or even years:

Cancer Hazards: According to the references, barium cyanide has not been tested for its ability to cause cancer in animals.

Reproductive Hazard: According to the references, barium has not been tested for its ability to affect reproduction.

Other Chronic Effects: Repeated exposure can cause abnormal chest X-ray (spots on lungs). This usually takes years to develop. An abnormal chest X-ray from barium cyanide exposure does not necessarily mean the lung has been damaged but future exposures to irritating substances may affect the lungs.

Repeated exposures can interfere with the thyroid gland's normal functioning, causing enlarged thyroid (goiter).

Long-term effects of repeated exposures to small amounts of barium cyanide also include loss of appetite, headaches, weakness, nausea, dizziness, and irritation of the upper respiratory tract and eyes.

☉ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with barium cyanide, especially its dusts or powders. If a less toxic material or compound cannot be substituted for barium cyanide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of barium cyanide dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around barium. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection, especially when exposures near the IDLH level of 1100 mg/m³. However, for low or infrequent exposure below the 0.5 mg/m³ PEL, a MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with barium cyanide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where barium is used or stored.

For those with frequent or potentially high exposure (half the PEL or greater), or significant skin contact, the following medical tests are recommended before initial assignment and at regular intervals (e.g., annually) thereafter:

- ☑ Urine thiocyanate test (most accurate if performed right after exposure).

If symptoms develop or overexposure is suspected, the following should also be considered:

- ☑ Blood cyanide level. (Note: Since cigarettes contain some cyanide, smokers may show an increase in cyanide level on testing).
- ☑ Evaluation of thyroid function
- ☑ Lung function test and chest X-ray (for baseline).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, personnel who smoke should avoid any unprotected contact with barium cyanide powders.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to barium cyanide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of barium cyanide should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to barium cyanide, emergency shower facilities should also be provided in the immediate area.
- ☑ Workers whose clothing has been contaminated by barium cyanide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to barium cyanide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of barium cyanide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where barium cyanide contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its powdered form, barium cyanide is considered a noncombustible solid and by itself, it will not burn. However, if it should contact acid, acid mist, acid salts or carbon dioxide in air, it may produce highly flammable and extremely toxic hydrogen cyanide gas. Extreme caution is always required in handling, storage, transportation, and disposal of barium cyanide. These characteristics also require special consideration during any emergency situation involving a leak or spill of barium cyanide powder or dust. Should barium cyanide ever come into contact with incompatible substances (such as strong acids) either during use, transportation, storage, or disposal, poisonous cyanide gases may be formed.

Barium cyanide enters the environment from industrial and municipal waste treatment plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to barium. Barium and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of barium or its salts to plants, birds, or land animals.

💧 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Barium and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of barium to plants, birds, or land animals.

💧 *Water Solubility*

Most of the barium salts are either highly or moderately soluble in water. Concentrations of 1 to 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Barium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated

percentages of barium cyanide persistence in the aquatic or terrestrial environments.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of barium found in fish tissues is expected to be about the same as the average concentration of barium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of barium cyanide dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of barium cyanide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If barium cyanide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of barium. If barium cyanide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate the area.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Rec-

ommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).

- ☑ It may be necessary to dispose of barium cyanide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving barium cyanide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

BARIUM FLUORIDEBaF₂

CAS: 7787-32-8

**IDENTIFICATION AND TYPICAL USES**

Barium fluoride can appear as a transparent, cube-shaped, crystalline solid or a white powder with a strong, disagreeable odor. It is used as a ceramic flux, in carbon brushes for electrical equipment, in glass making, in the manufacture of other fluorides, in crystals for spectroscopy, in electronics, and in dry-film lubricants.

RISK ASSESSMENT: HEALTH***General Assessment***

Certain compounds of barium (including barium fluoride) are irritants of the eyes, mucous membranes, and skin. Primary exposure routes are *inhalation* and *ingestion*. Inhalation of barium fluoride dusts can cause irritation of the nose and upper respiratory tract and may produce a benign pneumoconiosis known as baritosis. Barium fluoride exposure can lead to a condition known as fluorosis with symptoms of joint pain, mottling of teeth, ossification on X-rays, and osteosclerosis. There may be characteristic X-ray changes. All soluble salts of barium are acute poisons. The barium fluoride ion is toxic to muscle producing stimulation and then paralysis.

Ingestion can cause severe hypokalemia. Ingesting barium fluoride salts or powders produces initial symptoms related to gastrointestinal reaction. These include nausea, vomiting, colic, diarrhea, excessive salivation, followed by myocardial and general muscular stimulation with tingling in the extremities, mouth, and face. There may be irregular heart beat, kidney dysfunction (decreased urine excretion) or injury, hypokalemia (potassium deficiency), convulsions, slowed pulse rate, and potentially fatal pulmonary edema (fluid in the lungs). Indication of pulmonary edema may be delayed up to 48 hours, creating a false sense of security with regard to health exposure risk. Severe cases continue to loss of tendon reflexes, general muscular

paralysis, and death from respiratory arrest or ventricular fibrillation. There may also be vascular constriction, bladder contraction, and increased voluntary muscle tension leading to paralysis or rhabdomyolysis, a disease that can cause death as a result of the destruction or degeneration of skeletal muscle.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to barium fluoride:

- Skin:** No initial symptoms. However, sweating may cause burning sensation as barium fluoride dusts react on contact with moist skin. Severe exposure may cause necrosis (localized tissue destruction).
- Eye:** Severe irritation with inflammation, burning, and watering.
- Lung:** Can cause metallic taste, nausea, sore throat, and irritation of the air passages. Pulmonary edema (fluid in the lungs) is possible.
- Other:** Serious effects on muscular system at high exposures. May cause tingling of the extremities followed by irregular heartbeat and might even cause heart to stop (ventricular fibrillation). Death is also possible as a result of respiratory arrest.

●* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to barium fluoride and can last for months or even years:

Cancer Hazards: According to the information presented in the references, barium fluoride has not been adequately tested for its ability to cause cancer in laboratory test animals.

Reproductive Hazard: According to the references, there is limited evidence that exposure to barium fluoride may adversely affect the developing fetus.

Other Chronic Effects: Repeated exposure can cause abnormal chest X-ray. This usually takes years to develop. An abnormal chest X-ray from barium fluoride exposure does not necessarily mean the lung has been damaged but future exposures to irritating substances may affect the lungs. Fluorosis may develop in the long-term with symptoms of joint pain, mottling of teeth, ossification, and osteosclerosis.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with barium fluoride, especially its dusts or powders. If a less toxic material or compound cannot be substituted for barium fluoride, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of barium fluoride dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around barium fluoride. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection, especially when exposures near the IDLH level of 250 mg/m³. However, for low or infrequent exposure, a MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with barium fluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where barium fluoride is used or stored.

Before beginning employment working with barium fluoride, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high

exposures should be provided the following recommended medical tests:

Lung function test.

If symptoms develop or overexposure is suspected, consider the following additional tests:

Electrocardiogram (EKG).

Neurological examination.

Consider chest X-ray.

Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to barium fluoride may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with barium fluoride powders.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances. Adequate maintenance and care of protective equipment are essential to ensure proper function.

Wash thoroughly immediately after exposure to barium fluoride and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of barium fluoride should be communicated to all exposed or potentially exposed workers.

Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to barium fluoride, emergency shower facilities should be provided.

- ☑ Workers whose clothing has been contaminated by barium fluoride should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to barium fluoride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of barium fluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where barium fluoride contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In powdered form, barium fluoride is considered a combustible solid. It can present a moderate fire and explosion hazard. It is incompatible with a number of materials, especially inorganic acids. Extreme caution is always required in handling, storage, transportation, and disposal of barium fluoride. These characteristics also require special consideration during any emergency situation involving a leak or spill of barium fluoride powder or dust. Should barium fluoride ever come into contact with incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible.

Barium fluoride may enter the environment as a result of industrial and municipal waste treatment plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to barium. Barium and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of barium or its salts to plants, birds, or land animals.

💧* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and

changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Barium and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of barium to plants, birds, or land animals.

💧 *Water Solubility*

Most of the barium fluoride is sparingly soluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

⌚ *Persistence in the Environment*

Barium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of barium persistence in the aquatic or terrestrial environments.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of barium found in fish tissues is expected to be about the same as the average concentration of barium in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of barium dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of barium fluoride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Con-

taminated soils should be removed for incineration and replaced with clean soil. If barium fluoride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is nearly insoluble and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of barium fluoride. If barium fluoride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources, ventilate area.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of barium fluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving barium fluoride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and

policies should be developed, approved, and implemented long before any need for such arises.

| 4 | 0 | 0 | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|--|---|--|
| Characterization Inorganic (metallic) hydroxide | RCRA Number D005 | EPA Class Characteristic (T) Waste |
| DOT Proper Shipping Name Barium Compounds, N.O.S. | Chemical Abstract Service (CAS) Number 17194-00-2 | |
| DOT Hazard Class and Label Requirements Varies (depending on toxicity) | DOT Emergency Guide Code 49 | |
| DOT Identification Number UN 1564 | Atomic Symbol Ba(OH)₂ | |

Synonyms

Barium hydrate, anhydrous; barium dihydrate; caustic baryta.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|--|--|--|
| Barium hydroxide (derivation: By dissolving barium oxide in water with subsequent crystallization or by precipitation from an aqueous solution of the sulfide by caustic soda). | PEL: 0.5 mg(Ba)/m³ STEL: Not Established | REL: 0.5 mg(Ba)/m³ STEL: Not Established | Not Established for BaO₂ (250 mg/m³ for Soluble Ba Compounds) | TLV: 0.5 mg(Ba)/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point Not Determined | Specific Gravity (H ₂ O = 1) 2.2 at 61°F (16°C) |
| Vapor Pressure (mm Hg) 227 at 172°F (80°C) | Molecular Weight (atomic weight) 171.35 |
| Vapor Density (Air = 1) Not Determined | Melting Point 766°F (408°C) |

Solubility

Most of the barium salts are either highly or moderately soluble in water. Barium hydroxide powder is slightly soluble in water. Soluble in alcohol and ether, insoluble in acetone.

Appearance and Odor

Clear or white powder with no discernible odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Not Found | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Not Listed | Autoignition Temperature Not Found |

Extinguishing Media

Use agents suitable to surrounding fire (alcohol foam, carbon dioxide, dry chemical, or water).

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Structural fire-fighting clothing is permeable and may not provide adequate protection. Wear full protective clothing and self-contained breathing apparatus (SCBA). Use water mist to keep fire-exposed containers cool. Fight fire from distance, if possible.

Unusual Fire and Explosion Hazards

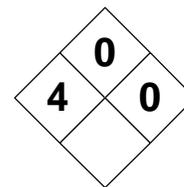

The material may become unstable at high temperatures. Do not touch spilled materials; barium hydroxide is an extremely dangerous neurotoxin. Move containers from fire if it can be done without risk. Material may explode in contact with acids or chlorinated rubber.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|---|--|--|
| Stability | | Conditions to Avoid Avoid heat and open flame, especially around dusts and powders of barium hydroxide. It is normally stable under normal conditions of handling and storage. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with acids, oxidizers, and chlorinated rubber. It can be extremely corrosive to metals and generates extreme heat when combined with oxygen, nitrogen, hydrogen, ammonia, water, halogens, sulfides. | | |
| Hazardous Polymerization | | Conditions to Avoid Hazardous polymerization of anhydrous barium hydroxide will not occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products None reported for this barium compound. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? X |
| Health Hazards INHALATION: Dusts can irritate the nose, throat, and respiratory tract. High concentrations can also be swallowed along with inhalation, thereby increasing the overall toxicity of exposure. EYES & SKIN: Exposure to the eyes and skin may cause moderate to severe irritation. INGESTION: Can cause death. Symptoms include hypokalemia (low blood potassium) causing muscle stimulation and subsequent paralysis. There can be nausea, vomiting, diarrhea, tremors, leg cramps, facial twitching, speech impairment, bladder constriction, convulsions, paralysis in the extremities, cardiac arrhythmia and/or fibrillation, and respiratory failure. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, CNS, heart. |
| Medical Conditions Generally Aggravated by Exposure Persons with existing lung dysfunction, hypertension, CNS, or muscular disorders may be affected. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with flooding amounts of water. For reddened or blistered skin, seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Never give anything by mouth to a convulsing person. If conscious and alert, give 3-4 glasses of water. Seek medical attention. Inducing vomiting may or may not be advisable. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in most convenient and safe manner and deposit in sealed containers. Dry sweep not recommended. Use HEPA vacuum. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Keep combustible materials away. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Explosion risks vary with type of barium compound. Store to avoid contact with incompatible materials, moisture, and combustible materials. Prevent physical damage to containers. Keep tightly closed. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where barium hydroxide is used, handled, or stored. Avoid any conditions which may cause the generation of airborne dusts. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For dust exposures below PEL, use a respirator with a high efficiency particulate air (HEPA) filter, otherwise use a self-contained breathing apparatus with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Apron, Boots | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BARIUM HYDROXIDE

CAS: 17194-00-2

IDENTIFICATION AND TYPICAL USES

Barium hydroxide (anhydrous) is a clear to white powder with no detectable odor. It is used in the manufacture of alkalis, glass, oil and grease additives, barium soaps, and other barium compounds. It is also used in the vulcanization of synthetic rubber, as a corrosion inhibitor, in drilling fluids, as a lubricant, in pesticides, in the sugar industry, for softening water, in painting, as a agent for caustic soda, and as a steel carbonizing agent.

RISK ASSESSMENT: HEALTH

General Assessment

Certain compounds of barium are irritants of the eyes, mucous membranes, and skin. Primary exposure routes are *inhalation* and *ingestion*. It has not been established if exposure to barium hydroxide poses any carcinogenic, teratogenic, or mutagenic effects. Barium hydroxide is an extremely dangerous neurotoxin.

Inhalation of barium dusts can cause irritation of the nose and upper respiratory tract and may produce a benign pneumoconiosis known as baritosis. There may be characteristic X-ray changes. If exposed to large amounts, some barium hydroxide may be ingested as well as inhaled. This will increase the severity of the toxic exposure. All soluble salts of barium are acute poisons. The barium ion is toxic to muscle, especially the heart, producing stimulation and then paralysis. Specifically, inhalation barium hydroxide will irritate the nose, throat, and mucosa of the upper respiratory tract and bronchial tubes. There may be adverse effects on the heart and the function of the central nervous system (CNS).

Ingesting barium hydroxide can be fatal. As noted above for inhalation exposure, once inside the body, barium competes with blood potassium content to cause muscle stimulation followed by paralysis. Symptoms of exposure include nausea, vomiting, violent diarrhea,

tremors, salivation, twitching of the neck and facial muscles (tightness or tingling also possible), abdominal pain, leg cramps, speech impairment, convulsions, weakness, bladder contraction, paralysis in the extremities, dyspnea (difficulty breathing), slowed pulse rate, cardiac arrhythmia and/or fibrillation, and respiratory failure.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to barium hydroxide:

Skin: Extreme irritation at site of contact.

Eye: Severe irritation, damage may be serious.

Lung: Can cause metallic taste, nausea, sore throat, and irritation of the air passages.

Other: Serious effects on musculatory system at high exposures. May cause tingling and paralysis of the extremities followed by irregular heart-beat and might even cause the heart to stop (ventricular fibrillation). Death is also possible as a result of respiratory arrest. Also, kidney failure may occur as a result of circulatory dysfunction.

🌱 *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to barium hydroxide and can last for months or even years:

Cancer Hazards: According to the information presented in the references, barium hydroxide has not been adequately tested for its ability to cause cancer in laboratory test animals.

Reproductive Hazard: According to the information presented in the references, barium hydroxide has not been adequately tested for its ability to adversely affect reproduction in animals.

Other Chronic Effects: Repeated exposure can cause abnormal chest X-ray. This usually takes years to develop. An abnormal chest X-ray from barium hydroxide exposure does not necessarily mean the lung has been damaged but future exposures to irritating substances may affect the lungs. It is not currently known whether barium hydroxide causes lung damage. Also, the barium ion can remain in bone tissue for up to 50 days.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with barium, especially its dusts or powders. If a less toxic material or compound cannot be substituted for barium hydroxide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of barium hydroxide dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around barium hydroxide. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection, especially when exposures near the IDLH level of 250 mg/m³ (as barium). However, for low or infrequent exposure, a MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with barium hydroxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where barium hydroxide is used or stored.

Before beginning employment working with barium hydroxide, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures to barium hydroxide should be provided the following recommended medical tests:

Lung function test (establish baseline).

If symptoms develop or overexposure is suspected, consider the following additional tests:

Electrocardiogram (EKG).

Neurological examination.

Consider chest X-ray.

Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to barium hydroxide may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with barium hydroxide powders.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to barium hydroxide and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of barium hydroxide should be communicated to all exposed workers.

Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to barium hydroxide, emergency shower facilities should also be provided.

Workers whose clothing has been contaminated by barium hydroxide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to barium hydroxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of barium hydroxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where barium hydroxide contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Finely divided powders of barium hydroxide in air may present a moderate fire or explosion hazard. It is incompatible with acids, oxidizers, and chlorinated rubber. It is corrosive to metals can generate excessive heat when combined with oxygen, nitrogen, hydrogen, ammonia, water, and halogens, and sulfides. Extreme caution is required in handling, storage, transportation, and disposal of barium hydroxide. These characteristics also require special consideration during any emergency situation involving a leak or spill of barium hydroxide powder or dust. Should barium hydroxide ever come into contact with these incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible.

Barium hydroxide may enter the environment as a result of industrial and municipal waste treatment plant discharges and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to barium. Barium and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of barium or its salts to plants, birds, or land animals.

☠ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Barium and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of barium to plants, birds, or land animals.

◆ Water Solubility

Barium hydroxide is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

⌚ Persistence in the Environment

Barium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of barium persistence in the aquatic or terrestrial environments.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of barium found in fish tissues is expected to be about the same as the average concentration of barium in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of barium hydroxide dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of barium hydroxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Impermeable floors constructed of non-combustible materials are recommended.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If barium hydroxide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble and total remediation may be possible. The local and/or

state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of barium hydroxide. If barium hydroxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources, ventilate area.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of barium hydroxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving barium hydroxide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? | Absorption (skin/eye)? | Ingestion? |
| | | X | | X |
| Health Hazards INHALATION: May cause irritation of the respiratory tract with symptoms of sore throat, coughing, and shortness of breath or labored breathing. EYE & SKIN: Irritation with redness and pain. Repeated eye contact may cause conjunctivitis. INGESTION: Severe gastrointestinal irritation with nausea, vomiting, diarrhea, colic, and excessive salivation. Dryness and constriction of mouth and throat with metallic taste. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Respiratory system, CNS, muscular system, kidneys. |
| Medical Conditions Generally Aggravated by Exposure Persons with pre-existing chronic respiratory, cardiovascular, or skin diseases are at increased risk. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed,</u> Induce vomiting immediately, seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Keep combustibles away from spilled material. Do not touch spilled materials with bare skin. For small spills, use a clean shovel to place materials into clean, dry container and cover. For large spills, dike area far ahead of spill for later disposal. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method Refer to local, state, and/or federal disposal regulations for characteristic waste disposal requirements. | | | | |
| Precautions to be Taken in Handling and Storage Protect against physical damage. Separate from combustible, organic or other easily oxidized materials. Avoid storage on wood floors. Immediately remove and dispose of any spilled materials. Store in tightly closed containers in cool, well ventilated location. | | | | |
| Other Precautions and Warnings Mixtures of barium nitrate with finely divided aluminum or magnesium alloys are easily ignitable and extremely sensitive to friction or impact. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For dust exposures below PEL, use a respirator with a high efficiency particulate air (HEPA) filter. Greater protection is provided by a powered air purifying respirator or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Impervious Rubber | Chemical/Dust Goggles or Face Mask | Protective Apron, Boots | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BARIUM NITRATEN₂O₆•Ba

CAS: 7440-39-3

**IDENTIFICATION AND TYPICAL USES**

Barium nitrate is shiny yellowish-white or colorless crystalline (sugar or sand-like) solid with no odor. It can exist in a variety of salt forms. It is used in the manufacture of pyrotechniques and fireworks (it produces green light), incendiaries, chemicals (barium peroxide), ceramic glazes, rodenticides, and in the electronics industry.

RISK ASSESSMENT: HEALTH***General Assessment***

Barium nitrate is a human poison via *ingestion* and *inhalation*. It is also a strong irritant to the eyes and skin. Symptoms of inhalation include nose and throat irritation, bronchial tube inflammation causing cough and phlegm.

The most severe cases of poisoning from barium nitrate exposure are those resulting from ingestion. The initial effects from soluble barium compounds are those of severe gastrointestinal irritation, including nausea, vomiting and diarrhea that may be accompanied by abdominal colic, and excessive salivation. There may also be dryness, a sense of constriction of the mouth and throat, and a metallic taste. Systemic effects follow and may include ringing in the ears, dizziness, elevated blood pressure, ocular changes causing blurred vision, and convulsive tremors. Hypokalemia may occur and result in abnormalities of myocardial function and impaired neuromuscular function, which may vary from minimal weakness to frank paralysis.

Other effects of exposure may include anxiety, weakness, and gradually increasing sleepiness with mental confusion. The central nervous system may be first stimulated and then depressed. Hemorrhages may occur in the stomach, intestines, and kidneys. Kidney damage and kidney failure have been attributed to barium nitrate exposure. Collapse and death from respiratory failure, severe hypokalemia, and cardiac arrest may occur. Rarely, inorganic nitrates may be con-

verted to nitrates by nitrate-reducing bacteria in the digestive tract, resulting in methemoglobinemia.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to barium nitrate:

Skin: Severe irritation and burns, redness, and pain.

Eye: Severe irritation, redness, and pain.

Lung: Respiratory tract irritation causing cough, labored breathing, and phlegm discharge.

CNS: First stimulated, then depressed. Causes a number of mild to serious systemic effects.

🕒* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to barium nitrate and can last for months or even years:

Cancer Hazards: According to the references, barium nitrate has not been tested for its ability to cause cancer in animals.

Reproductive Hazard: According to the references, barium nitrate has not been tested for its ability to affect reproduction.

Other Chronic Effects: Repeated barium exposure may cause spots to appear on lung X-rays. This usually takes 1 to 2 years to develop and can remain for years after exposure. It is not believed that barium itself affects lung function but exposure to other irritants may have more pronounced effects. Repeated skin contact may cause dryness and cracking. Prolonged eye contact may cause conjunctivitis. Very high exposures (such as swallowing or extremely high dust exposure) can cause barium poisoning with symptoms of vomiting, irregular heartbeat, paralysis, and death.

🛡️ *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with barium nitrate dusts or powders. If a less toxic material or compound cannot be substituted for barium nitrate, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of barium nitrate dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around barium nitrate. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection, especially when exposures near the IDLH level of 250 mg/m³. However, for low or infrequent exposure, a MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with barium nitrate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where barium nitrate is used or stored.

Before beginning employment working with barium nitrate, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

- Lung function test.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

When barium poisoning has occurred, the following antidote is recommended. However, the decision as to whether the severity of poisoning requires administration of any antidote and actual dose required should be made by qualified medical personnel:

- Give 30 grams of sodium sulfate in 250 milliliters of water orally and repeat in one hour. Give by

gastric tube if symptoms have appeared. Administration of sulfate salts intravenously is extremely hazardous, since they induce the precipitation of barium sulfate in the kidney, with subsequent renal failure. Administration of potassium is critical. Any antidote must be administered by qualified medical personnel.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to barium nitrate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of barium nitrate should be communicated to all exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to barium nitrate, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by barium nitrate should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to barium nitrate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of barium nitrate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where barium nitrate contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Barium nitrate is an oxidizer. By itself, it will not burn. However, it readily facilitates the combustion of other materials. It can therefore present a moderate fire and explosion hazard. Also, because it is incompatible so many commonly encountered materials such as wood and paper, as well as other commodities, extreme caution is required in handling, storage, transportation, and disposal of barium nitrate. These characteristics also require special consideration during any emergency situation involving a leak or spill of barium nitrate powder or dust. Should barium nitrate ever come into contact with incompatible substances (such as combustible materials and aluminum or magnesium alloys) either during use, transportation, storage, or disposal, violent and even explosive reactions are possible.

Barium nitrate enter the environment from industrial and municipal waste treatment plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to barium nitrate.

Barium and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of barium or its salts to plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Barium and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of barium or its salts to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Most of the barium salts are either highly or moderately soluble in water. Concentrations of 1 to 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Barium nitrate is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of barium nitrate persistence in the aquatic or terrestrial environments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of barium nitrate found in fish tissues is expected to be about the same as the average concentration of barium nitrate in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of barium nitrate dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of barium nitrate should be segregated from incompatible chemicals and materials to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If barium nitrate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of barium nitrate.

If barium nitrate is spilled or leaked, the following actions are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using clean shovel for small spills, depositing materials in clean container. For larger spills, use a vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of barium nitrate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving barium nitrate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? X |
| Health Hazards INHALATION: Dusts can irritate the nose, throat, and respiratory tract. High concentrations can also be swallowed along with inhalation, thereby increasing the overall toxicity of exposure. EYES & SKIN: Exposure to the eyes and skin may cause moderate to severe irritation. INGESTION: Can cause death. Symptoms include hypokalemia (low blood potassium) causing muscle stimulation and subsequent paralysis. There can be nausea, vomiting, diarrhea, tremors, leg cramps, facial twitching, speech impairment, bladder constriction, convulsions, paralysis in the extremities, cardiac arrhythmia and/or fibrillation, and respiratory failure. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, CNS, heart. |
| Medical Conditions Generally Aggravated by Exposure Persons with existing lung dysfunction, hypertension, CNS or muscular disorders may be effected. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with flooding amounts of water. For reddened or blistered skin, seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Never give anything by mouth to a convulsing person. If conscious and alert, give 3-4 glasses of water. Seek medical attention. Inducing vomiting may or may not be advisable. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in most convenient and safe manner and deposit in sealed containers. Dry sweep not recommended. Use HEPA vacuum. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Keep combustible materials away. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Explosion risks vary with type of barium compound. Store to avoid contact with incompatible materials, moisture, and combustible materials. Prevent physical damage to containers. Keep tightly closed. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where barium octahydrate is used, handled, or stored. Avoid any conditions which may cause the generation of airborne dusts. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For dust exposures below PEL, use a respirator with a high efficiency particulate air (HEPA) filter, otherwise use a self-contained breathing apparatus with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |

| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BARIUM OCTAHYDRATE

CAS: 12230-71-6

IDENTIFICATION AND TYPICAL USES

Barium octahydrate is a white crystalline solid with no detectable odor. It is used in the manufacture of alkalis, glass, oil and grease additives, barium soaps, and other barium compounds. It is also used in organic preparations, in making barium salts, in analytical chemistry, in the vulcanization of synthetic rubber, as a corrosion inhibitor, in drilling fluids, as a lubricant, in pesticides, in the sugar industry, for softening water, in painting, as a agent for caustic soda, and as a steel carbonizing agent.

RISK ASSESSMENT: HEALTH

General Assessment

Certain compounds of barium are irritants of the eyes, mucous membranes, and skin. Primary exposure routes are *inhalation* and *ingestion*. It has not been established if exposure to barium octahydrate poses any carcinogenic, teratogenic, or mutagenic effects. Barium octahydrate is an extremely dangerous neurotoxin.

Inhalation of barium dusts can cause irritation of the nose and upper respiratory tract and may produce a benign pneumoconiosis known as baritosis. There may be characteristic X-ray changes. If exposed to large amounts, some barium octahydrate may be ingested as well as inhaled. This will increase the severity of the toxic exposure. All soluble salts of barium are acute poisons. The barium ion is toxic to muscle, especially the heart, producing stimulation and then paralysis. Specifically, inhalation of barium octahydrate will irritate the nose, throat, and mucosa of the upper respiratory tract and bronchial tubes. There may be adverse effects on the heart and the function of the central nervous system (CNS).

Ingesting barium octahydrate can be fatal. As noted above for inhalation exposure, once inside the body, barium competes with blood potassium content to cause muscle stimulation followed by paralysis.

Symptoms of exposure include nausea, vomiting, violent diarrhea, tremors, salivation, twitching of the neck and facial muscles (tightness or tingling also possible), abdominal pain, leg cramps, speech impairment, convulsions, weakness, bladder contraction, paralysis in the extremities, dyspnea (difficulty breathing), slowed pulse rate, cardiac arrhythmia and/or fibrillation, and respiratory failure.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to barium octahydrate:

Skin: Extreme irritation at site of contact.

Eye: Severe irritation, damage may be serious.

Lung: Can cause metallic taste, nausea, sore throat, and irritation of the air passages.

Other: Serious effects on musculatory system at high exposures. May cause tingling and paralysis of the extremities followed by irregular heart-beat and might even cause the heart to stop (ventricular fibrillation). Death is also possible as a result of respiratory arrest. Also, kidney failure may occur as a result of circulatory dysfunction.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to barium octahydrate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, barium octahydrate has not been adequately tested for its ability to cause cancer in laboratory test animals.

Reproductive Hazard: According to the references, barium octahydrate has not been tested for its ability to affect reproduction.

Other Chronic Effects: Repeated exposure can cause abnormal chest X-ray. This usually takes years to develop. An abnormal chest X-ray from barium octahydrate exposure does not necessarily mean the lung has been damaged but future exposures to irritating substances may affect the lungs. It is not currently known whether barium octahydrate causes lung damage. Also, the barium ion can remain in bone tissue for up to 50 days.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with barium, especially its dusts or powders. If a less toxic material or compound cannot be substituted for barium octahydrate, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of barium octahydrate dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around barium octahydrate. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection, especially when exposures near the IDLH level of 250 mg/m³ (as barium). However, for low or infrequent exposure, a MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with barium octahydrate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where barium octahydrate is used or stored.

Before beginning employment working with barium octahydrate, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

Lung function test (establish baseline).

If symptoms develop or overexposure is suspected, consider the following additional tests:

Electrocardiogram (EKG).

Neurological examination.

Consider chest X-ray.

Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to barium octahydrate may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with barium octahydrate powders.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to barium octahydrate and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of barium octahydrate should be communicated to all potentially exposed workers.

Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to barium octahydrate, emergency shower facilities should also be provided.

Workers whose clothing has been contaminated by barium octahydrate should change into clean clothes before leaving work. Contaminated work clothes should be laundered only by individuals who have been informed of the hazards of exposure to barium octahydrate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of barium octahydrate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where barium octahydrate contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Finely divided powders of barium octahydrate in air may present a moderate fire or explosion hazard. It is incompatible with acids, oxidizers, and chlorinated rubber. It is corrosive to metals and can generate excessive heat when combined with oxygen, nitrogen, hydrogen, ammonia, water, and halogens, and sulfides. Extreme caution is required in handling, storage, transportation, and disposal of barium octahydrate. These characteristics also require special consideration during any emergency situation involving a leak or spill of barium octahydrate powder or dust. Should barium octahydrate ever come into contact with these incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible.

Barium octahydrate may enter the environment as a result of industrial and municipal waste treatment plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to barium.

Barium and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of barium or its salts to plants, birds, or land animals.

💧* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Barium and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evalu-

ate or predict the long-term effects of barium to plants, birds, or land animals.

💧 *Water Solubility*

Barium octahydrate is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Barium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of barium persistence in the aquatic or terrestrial environments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of barium found in fish tissues is expected to be about the same as the average concentration of barium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of barium octahydrate dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of barium octahydrate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Impermeable floors constructed of non-combustible materials are recommended.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If barium octahydrate should

contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of barium octahydrate. If barium octahydrate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of barium octahydrate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving barium octahydrate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

BARIUM PEROXIDE

BaO₂

CAS: 1304-29-6

IDENTIFICATION AND TYPICAL USES

Barium peroxide is a grayish-white, heavy powder with no appreciable odor. It is used as a bleaching agent for animal substances, vegetable fibers, and straw. It is also used to strip the color from glass, in dyeing textiles, in the manufacture of pyrotechnics and tracer bullet formulations, in the manufacture of hydrogen peroxide, as a oxidizing agent, and as a polysulfide curing agent.

RISK ASSESSMENT: HEALTH

General Assessment

Certain compounds of barium are irritants of the eyes, mucous membranes, and skin. Primary exposure routes are *inhalation* and *ingestion*. It has not been established if exposure to barium poses any carcinogenic, teratogenic, or mutagenic effects.

Inhalation of barium dusts can cause irritation of the nose and upper respiratory tract and may produce a benign pneumoconiosis known as baritosis. There may be characteristic X-ray changes. All soluble salts of barium are acute poisons. The barium ion is toxic to muscle producing stimulation and then paralysis. Specifically, barium peroxide will irritate the nose, throat, and mucosa of the upper respiratory tract and bronchial tubes. There may be adverse effects on the heart and the function of the central nervous system (CNS).

Ingesting barium salts or powders produces initial symptoms related to gastrointestinal reaction. These include nausea, vomiting, colic, diarrhea, followed by myocardial and general muscular stimulation with tingling and paralysis in the extremities. Severe cases continue to loss of tendon reflexes, general muscular paralysis, and death from respiratory arrest or ventricular fibrillation. In addition to these effects, ingestion of barium peroxide specifically can cause excessive salivation, giddiness, convulsions, bloody and watery diarrhea, dilated pupils, vertigo, and dizziness.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to barium peroxide:

Skin: No initial symptoms. However, sweating may cause burning sensation as barium dusts react on contact with water.

Eye: Severe irritation. Due to water content in the eye, reactions may be immediate and serious.

Lung: Can cause metallic taste, nausea, sore throat, and irritation of the air passages.

Other: Serious effects on musculatory system at high exposures. May cause tingling and paralysis of the extremities followed by irregular heart-beat and might even cause the heart to stop (ventricular fibrillation). Death is also possible as a result of respiratory arrest.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to barium peroxide and can last for months or even years:

Cancer Hazards: According to the references, barium peroxide has not been tested for its ability to cause cancer in animals.

Reproductive Hazard: According to the references, barium peroxide has not been tested for its ability to affect reproduction.

Other Chronic Effects: Repeated exposure can cause abnormal chest X-ray. This usually takes years to develop. An abnormal chest X-ray from barium peroxide exposure does not necessarily mean the lung has been damaged but future exposures to irritating substances may affect the lungs. It is not currently known whether barium peroxide causes lung damage. Also, the barium ion can remain in bone tissue for up to 50 days.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with barium, especially its dusts or powders. If a less toxic material or compound cannot be substituted for barium peroxide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of barium peroxide dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around barium peroxide. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection, especially when exposures near the IDLH level of 250 mg/m³. However, for low or infrequent exposure, a MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with barium peroxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where barium peroxide is used or stored.

Before beginning employment working with barium peroxide, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

- ☑ Lung function test (establish baseline).

If symptoms develop or overexposure is suspected, consider the following additional tests:

- ☑ Electrocardiogram (EKG).
- ☑ Neurological examination.
- ☑ Consider chest X-ray.
- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to barium peroxide may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with barium peroxide powders.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to barium peroxide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of barium peroxide should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to barium peroxide, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by barium peroxide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to barium peroxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of barium peroxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where barium peroxide contacts incompatible commodities can result in fire, explosion

(depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In powdered form, barium is considered a flammable solid. It can present a moderate fire and explosion hazard. It is incompatible with many other commodities and extreme caution is required in handling, storage, transportation, and disposal of barium peroxide. These characteristics also require special consideration during any emergency situation involving a leak or spill of barium peroxide powder or dust. It is incompatible with numerous substances such as hydrogen sulfide, water, peroxyformic acid, hydroxylamine solution, organic matter, and mixtures of manganese, zinc, and barium nitrate. It is divalent and combines with oxygen, nitrogen, hydrogen, ammonia, water, halogens, and sulfides, generating large amounts of heat. Should barium peroxide ever come into contact with these incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible.

Barium peroxide may enter the environment as a result of industrial and municipal waste treatment plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to barium. Barium and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of barium or its salts to plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Barium and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of barium to plants, birds, or land animals.

💧 *Water Solubility*

Most of the barium salts are either highly or moderately soluble in water. Concentrations of 1 to 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Barium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of barium persistence in the aquatic or terrestrial environments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of barium found in fish tissues is expected to be about the same as the average concentration of barium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of barium peroxide dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of barium peroxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Impermeable floors constructed of non-combustible materials are recommended.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If barium peroxide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble and will decompose. Therefore, total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of barium per-

oxide. If barium peroxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of barium peroxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving barium peroxide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Special Fire Fighting Procedures Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire, including bromide. Remain clear of smoke and fumes. Use water mist from unmanned device to keep fire-exposed containers cool. Keep cooling containers after fire is extinguished. | | | | | | |
| Unusual Fire and Explosion Hazards No specific explosion hazards noted. However, heating with aluminum can produce an explosion. Move fire-exposed containers from fire if it can be done without risk. | | | | | | |

| SECTION V - REACTIVITY DATA | | | | |
|--|---|---|--|--|
| Stability | | Conditions to Avoid Very stable at room temperature and pressure under normal conditions of handling and storage. Avoid contact with incompatible materials and do not create dusty conditions. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with aluminum and potassium. When heated with aluminum, it can produce an extremely violent explosion. | | |
| Hazardous Polymerization | | Conditions to Avoid Hazardous polymerization of barium sulfate will not occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Poisonous gases, including oxides of sulfur and barium fumes, are emitted during fire. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? X |
| Health Hazards INHALATION: The insolubility of barium sulfate in water makes for low-level toxicity. It does not exhibit the systemic toxicity noted for other barium salts. However, any soluble impurities can lead to toxic effects. Breathing fine dusts may irritate the nose, throat, and respiratory tract leading to a benign form of pneumoconiosis (baritosis). EYES & SKIN: Exposure to the eyes may cause moderate to severe irritation and even burns. INGESTION: No specific effects noted. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed, seek medical attention immediately. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in most convenient and safe manner and deposit in sealed containers. Dry sweep not recommended. Use HEPA vacuum. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by applicable regulations. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with aluminum or potassium. Store powders in sealed containers in cool, dry, well-ventilated area. Protect containers from physical damage. | | | | |
| Other Precautions and Warnings Avoid actions or practices that may create dusty conditions, such as moving opened containers or sweeping up storage areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For dust exposures below PEL, use a respirator with a high efficiency particulate air (HEPA) filter, otherwise use a NIOSH/MSHA approved self-contained breathing apparatus or a supplied-air respirator with full facepiece operated in positive pressure or some other continuous flow mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Apron, Boots | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BARIUM SULFATEBaSO₄

CAS: 7727-43-7

**IDENTIFICATION AND TYPICAL USES**

Barium sulfate is a white or yellowish, odorless powder. It is used in the manufacture of photographic papers, artificial ivory, cellophane, paper coatings, and paints. It is also used as a filler and delustrant for textiles, rubber, plastic, linoleum, oil cloth, paper, lithograph inks, polymeric fibers, and resins. It is a base for lake colors; it is used in X-ray photography, it is an opaque medium for gastrointestinal radiography; and is used in battery plate expanders.

RISK ASSESSMENT: HEALTH***General Assessment***

Barium sulfate is unlike most other barium salts in that its low water solubility makes for low-level toxicity under most conditions of exposure. However, commercial grades may contain insoluble impurities that can be quite toxic. Primary exposure routes are *inhalation* and, to a lesser degree, *ingestion*. While there is no evidence in the references of its carcinogenic potential, the data are inconclusive and conflicting in this regard.

Inhalation can cause irritation of the nose, throat, and respiratory system. High exposures may lead to a benign form of pneumoconiosis known as baritosis.

Ingestion of barium salts can cause severe hypokalemia (potassium deficiency). However, ingesting barium sulfate is not thought to cause this effect. More research is required based upon the amount of conflicting and inconclusive data presented in the references. Ingesting other barium salts or powders produces initial symptoms related to gastrointestinal reaction. These include nausea, vomiting, colic, diarrhea, followed by myocardial and general muscular stimulation with tingling in the extremities. Severe cases continue to loss of tendon reflexes, general muscular paralysis, and death from respiratory arrest or ventricular fibrillation. Before dismissing these potential health risks as unrelated to barium sulfate, additional research

is required to ensure proper risk management of barium sulfate exposure.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure (within hours or within days) to barium sulfate:

Skin: May cause moderate irritation on contact.

Eye: Severe irritation and possible damage.

Lung: Dust exposures may cause no effect or irritation of the lungs with cough and phlegm.

Other: Industrial grade barium compounds may be contaminated with impurities (such as silica) which can produce toxic effects. Exposure can lead to lung scarring and reduce lung function.

☛ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to barium and can last for months or even years:

Cancer Hazards: According to the references, barium has not been tested for its ability to cause cancer in animals. The data are conflicting and inconclusive with regard to its specific ability to cause cancer in test animals. Some tumorigenic data have been reported.

Reproductive Hazard: According to the references, barium has not been tested for its ability to affect reproduction.

Other Chronic Effects: Repeated exposure can cause abnormal chest X-ray with the appearance of small nodules despite otherwise normal respiratory function. This usually takes years to develop. An abnormal chest X-ray from barium exposure does not necessarily mean the lung has been damaged but future exposures to irritating substances may affect the lungs. It is not currently known whether barium causes lung damage.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with barium sulfate dusts or powders. The specific toxicity of barium sulfate is poorly understood as compared to other barium compounds. However, as a barium salt, caution is suggested whenever working with or around barium sulfate. If a less toxic material or compound can not be substituted for barium sulfate, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of barium dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around barium sulfate. A supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand or other positive pressure mode is recommended for the greatest possible respiratory protection. However, for low or infrequent exposure, a MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with barium sulfate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where barium sulfate is used or stored.

Before beginning employment working with barium sulfate, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

- ☑ Lung function test.
- ☑ Consider chest X-ray, especially if chronic exposure is alleged or suspected.
- ☑ Serum bromide level.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical

tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to barium may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with barium powders.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to barium sulfate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of barium sulfate should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to barium sulfate, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by barium sulfate should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to barium sulfate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of barium compounds. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where barium sulfate contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its powdered form, barium sulfate is considered a non-combustible solid. However, it can react explosively and present a serious fire hazard. Because it is incompatible with many commodities, including other metals (such as aluminum and potassium), extreme caution is required in handling, storage, transportation, and disposal of barium sulfate. These characteristics also require special consideration during any emergency situation involving a leak or spill of barium sulfate powder or dust. Should barium sulfate ever come into contact with incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible.

Barium sulfate can enter the environment from industrial and municipal waste treatment plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to barium. Barium and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of barium or its salts to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Barium and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of barium to plants, birds, or land animals.

💧 *Water Solubility*

Most of the barium salts are either highly or moderately soluble in water. Concentrations of 1 to 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Barium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of barium persistence in the aquatic or terrestrial environments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of barium found in fish tissues is expected to be about the same as the average concentration in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of barium sulfate dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of barium sulfate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers should be protected from physical damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If barium sulfate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is nearly insoluble and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of barium sulfate.

If barium sulfate powder is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).

- ☑ It may be necessary to dispose of barium sulfate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving barium sulfate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BENZAL CHLORIDE

CAS: 98-87-3

**IDENTIFICATION AND TYPICAL USES**

Benzal chloride is an oily, colorless liquid with a faint but characteristic aromatic odor. Benzal chloride is used in the manufacture of dyes, in the manufacture of benzaldehyde and cinnamic acid.

RISK ASSESSMENT: HEALTH**General Assessment**

Benzal chloride is a poison through *inhalation* and *absorption* and is moderately toxic by *ingestion*. Inhalation causes irritation of the eyes, nose, throat, and lungs. Excessive exposures can cause fluid to buildup in the lungs in a condition known as pulmonary edema, which can be fatal. Eye contact causes severe irritation and excessive tearing. Toxic symptoms of benzal chloride exposure through inhalation and through absorption include headache, weakness, dizziness, lightheadedness, shortness of breath, cough, and possible loss of consciousness at high exposures.

Benzal chloride is a suspected human carcinogenic. It is a strong irritant and lachrymator. Exposure causes central nervous system depression with symptoms as noted above primarily occurring subsequent to inhalation. Mutation data have also been reported but not well substantiated.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzal chloride:

Skin: Severe irritation, rash. Possible dermatitis.

Eye: Severe irritation with excessive tearing.

Lung: Severe irritation of the nose and throat. Can cause cough, congestion, difficulty in breathing, and, in high exposures, fluid buildup in the

lungs (pulmonary edema), which is a medical emergency and can be fatal.

CNS: Benzal chloride is a CNS depressant. Can cause dizziness, lightheadedness, and loss of consciousness.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzal chloride and can last for months or even years:

Cancer Hazards: There is limited evidence that benzal chloride causes cancer in animals. Human carcinogenicity is suspect but not confirmed. It may cause mutations (genetic changes) in living cells. The data, however, are inconclusive.

Reproductive Hazard: According to information available in the references, benzal chloride has not been tested for its ability to adversely affect reproduction.

Other Chronic Effects: Benzal chloride is very irritating to lung tissue. However, while pulmonary edema usually occurs subsequent to high acute exposures, it is not known whether long-term exposures can damage the lungs.

☞ Recommended Risk-Reduction Measures

Personnel should avoid direct contact with benzal chloride. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around benzal chloride. Since no exposure limits have been established for this chemical and its human car-

cinogenic properties are suspect, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, natural, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzal chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where benzal chloride is used or stored.

Before beginning employment and at regular times thereafter, those personnel with frequent or potentially frequent exposures should be provided with the following medical tests:

- Pulmonary function tests.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Consider chest X-ray following acute overexposure.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause emphysema, lung cancer, and other respiratory problems, exposure to benzal chloride may affect smokers quicker and with more pronounced symptoms. Therefore, smokers should avoid unprotected contact with benzal chloride.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- Safety showers and eye wash stations should be provided in areas where work is performed with or around benzal chloride.

- Wash thoroughly immediately after exposure to benzal chloride and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzal chloride should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to benzal chloride, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzal chloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Benzal chloride is considered a combustible liquid. Alone, it is not considered a serious fire hazard. However, it is incompatible with acid and acid fumes and violent reactions can occur upon contact. Also, in fire situations, toxic gases of chlorine can be emitted, including hydrogen chloride and phosgene. Therefore, extreme caution is required in handling, storage, transportation, and disposal of benzal chloride. These characteristics also require special consideration during any emergency situation involving a leak or spill of benzal chloride. Once again, should benzal chloride ever come into contact with incompatible substances either during use, transportation, storage, or disposal, the formation of highly toxic commodities is extremely possible.

The proper disposal/destruction method for benzal chloride waste is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Benzal chloride can enter the environment through manufacturing effluents or from spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to benzal chloride. This chemical has moderate acute toxicity to aquatic life. No data are available on the short-term toxicity of benzal chloride to plants, birds, or land animals.

☞ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Benzal chloride has moderate chronic toxicity in aquatic life. No data are available on the long-term effects of benzal chloride to plants, birds, or land animals.

💧 *Water Solubility*

Benzal chloride is moderately soluble in water. Concentrations of between 1 and 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Benzal chloride is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 93% of benzal chloride will eventually end up in air; about 5% will end up in water; and less than 0.6% will end up in terrestrial soils and aquatic sediments, respectively.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of benzal chloride found in fish tissues is expected to be somewhat higher than the average concentration of benzal chloride in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and

quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzal chloride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage is not recommended.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzal chloride should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of benzal chloride. If benzal chloride is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of spill.
- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- It may be necessary to dispose of benzal chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving benzal chloride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies associated with chemical substances. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

BENZALDEHYDEC₆H₅CHO

CAS: 100-52-7

**IDENTIFICATION AND TYPICAL USES**

Benzaldehyde is a colorless liquid with a bitter almond taste and odor. It is used as an intermediate in the production of flavoring chemicals, such as cinnamaldehyde, cinnamyl alcohol, and amyl- and hexylcinnamaldehyde for perfume, soap, and food flavor; synthetic penicillin, ampicillin, and ephedrine; and as a raw material for the herbicide Avenge. It also occurs in nature in the seeds of almonds, apricots, cherries, and peaches. It occurs in trace amounts in corn oil. Other uses include odor additive in aromatic alcohols; solvent for oils, resins, some cellulose ethers, cellulose acetate and nitrate; in pharmaceuticals; and in photographic chemicals.

RISK ASSESSMENT: HEALTH**General Assessment**

Benzaldehyde is a poison by *ingestion* and moderately toxic by other routes of exposure. It acts as a mild anesthetic on contact with skin. It may cause contact dermatitis as well as irritation. It is an allergen. Persons allergic to benzaldehyde may therefore display more pronounced reactions than those not allergic to this chemical.

Inhalation of its vapors may cause irritation of the eyes and throat and can cause eye and lung injury on prolonged exposure. However, their vapors cannot normally be tolerated for long periods of time and chronic exposure is therefore not common. Direct contact with the liquid in the eyes causes immediate and potentially severe irritation. Benzaldehyde causes central nervous system depression in small doses and can cause convulsions when exposed to large amounts.

It is a questionable human carcinogen. Mutation data have also been reported, although the references are inconclusive.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzaldehyde:

- Skin:** Irritation and possible contact dermatitis.
- Eye:** Irritation which can lead to injury if allowed to remain in contact with the eyes.
- Lung:** Irritation of the throat and eyes causing coughing, nausea, and possible vomiting.
- CNS:** Depression of the CNS at low doses and possible convulsions at higher doses. May act as a narcotic at high concentrations.

⚠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzaldehyde and can last for months or even years:

Cancer Hazards: Benzaldehyde is a questionable carcinogen and mutagen, although the data are inconclusive.

Reproduction: According to the references, benzaldehyde has not been adequately tested for its ability to adversely affect reproduction in test animals.

🚫 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with benzaldehyde. Even though benzaldehyde is considered to have low to moderate toxicity, a less toxic chemical should be substituted for a hazardous substance. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around benzaldehyde. Since no exposure levels have been established and this chemical has questionable carcinogenic properties, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzaldehyde.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where benzaldehyde is used or stored.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to benzaldehyde and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzaldehyde should be communicated to all potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where benzaldehyde is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzaldehyde. In almost every scenario, the threat of environ-

mental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Benzaldehyde is considered a moderate fire hazard. Because of its flash point and boiling point, it is classified as a Class IIIA combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of benzaldehyde. Should benzaldehyde ever come into contact with incompatible substances such as oxidizers or acids, either during use, transportation, or storage, violent reactions are extremely possible. The proper disposal/destruction method for benzaldehyde is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Benzaldehyde can occur in the environment naturally as well as through manufacturing, unchecked discharge into effluents, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to benzaldehyde. This chemical has low acute toxicity to aquatic life. No data are available on the short-term effects of benzaldehyde to birds, plants or terrestrial animals.

🌱 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Benzaldehyde has low chronic toxicity in aquatic life. No data are available on the long-term effects of benzaldehyde to plants, birds, or land animals.

💧 *Water Solubility*

Benzaldehyde is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Benzaldehyde is moderately persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of

the chemical to be degraded. No data are available on the percentages of benzaldehyde that will eventually end-up in water.

🌀 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of benzaldehyde found in fish tissues is expected to be about the same as the average concentration of benzaldehyde in water from which the fish was taken.

🕒 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzaldehyde should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Benzaldehyde is stored in stainless steel, glass, Teflon, or phenolic resin-lined containers. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If benzaldehyde should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of benzaldehyde. If benzaldehyde is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ If applicable, stop flow of leaking liquid. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air and repair or allow cylinder to empty.
- ☑ Keep benzaldehyde out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- ☑ It may be necessary to dispose of benzaldehyde as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving benzaldehyde can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the terms "cancer" or "carcinogen" are used, public emotion, ignorance, and hysteria can run equally high. This must be carefully considered whenever drafting or implementing public relations policies.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be devel-

oped, approved, and implemented long before any need for such arises.

Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. If person is conscious, immediately give large amounts of water. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Collect powder materials in safest and most convenient manner possible. Avoid generating airborne dust concentrations. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. | | | | |
| Preferred Waste Disposal Method Not Listed. Refer to local, state, or federal requirements for the proper disposal methods of benzamide. | | | | |
| Precautions to be Taken in Handling and Storage Protect containers against physical damage. Store in tightly closed containers in cool, well ventilated location. General chemical storage of benzamide in bulk is permissible. | | | | |
| Other Precautions and Warnings Sources of ignition such as smoking, is prohibited where benzamide is used or stored. Where possible, automatically transfer liquid benzamide from drums or other containers to process containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use a MSHA/NIOSH approved respirator with a high efficiency particulate air (HEPA) filter. Greater protection is provided by a powered air purifying respirator or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Rubber | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Not Applicable |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BENZAMIDE

CAS: 55-21-0

**IDENTIFICATION AND TYPICAL USES**

Benzamide is a colorless, crystalline (sand-like) solid with a slight aromatic or benzene-like odor. Its primary use is in organic synthesis in the manufacture of other chemicals.

RISK ASSESSMENT: HEALTH**General Assessment**

Benzamide is moderately toxic by ingestion. It can also enter the body by inhalation and by absorption through unbroken skin. While its carcinogenic properties are not known, some human mutation data have been reported. Chemicals that are similar in structure can adversely affect the blood's capability to transport oxygen. This condition, known as methemoglobinemia, can lead to further complications, including death from respiratory arrest. It is not known whether exposure to benzamide causes this condition but caution is warranted. Also, similar chemicals can cause liver damage as well but, once again, there is insufficient data to validate the effect of benzamide exposure on the liver.

Other effects of exposure may include irritation of the eyes, nose, and throat. There may be also coughing and shortness of breath.

While no exposure limits have been established for benzamide, it does not mean that exposure to this chemical is without risk to human health. Sufficiently similar compounds can adversely affect health and, therefore, safe work practices should always be followed when working with or around benzamide.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzamide:

Skin: Irritation with potential for redness and rash.

Eye: Severe irritation; redness and pain possible.

Lung: Nose, throat, and respiratory tract irritation with possible difficulty in breathing.

Other: Possible liver damage since other sufficiently similar compounds can target the liver. Also, acute overexposure may cause a disruption in the blood's ability to transport oxygen (methemoglobinemia) since other quite similar compounds have this effect.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzamide and can last for months or even years:

Cancer Hazards: According to the references, benzamide has not been tested for its ability to cause cancer in animals.

Reproductive Hazard: According to the references, benzamide has not been tested for its ability to affect reproduction.

Other Chronic Effects: Similar chemicals (amides) cause liver damage. It is not known if benzamide has this effect.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with benzamide dusts or powders. If a less toxic material or compound cannot be substituted for benzamide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of benzamide dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around benzamide. A MSHA/NIOSH approved full facepiece respirator with a high efficiency particulate air (HEPA) filter is recommended. For extremely dusty conditions, a self-

contained breathing apparatus (SCBA) with full facepiece and pressure demand is more appropriate. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, impervious gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzamide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where benzamide is used or stored.

If symptoms develop or overexposure is suspected, the following recommended medical tests should be considered:

- Liver function test.
- Blood methemoglobin test.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to benzamide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzamide should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to benzamide, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by benzamide should change into clean clothes before

leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to benzamide.

- Where possible, automatically transfer liquids containing benzamide from drums or other containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzamide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Benzamide is a combustible solid. By itself, it does not present a serious fire hazard. However, it readily supports the combustion of other materials. It can therefore present a moderate fire hazard. Also, finely divided airborne dusts can present an explosion hazard. Caution is always required in handling, storage, transportation, and disposal of benzamide. Emergency responders should be made aware of the presence of benzamide at any emergency response situation.

Benzamide can enter the environment from industrial discharges and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to benzamide.

Benzamide has slight acute toxicity to aquatic life. It has caused injury to agricultural crops. Insufficient data are available to evaluate the short-term effects of benzamide on birds or land animals.

☠* Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Benzamide has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of benzamide to plants, birds, or terrestrial animals.

◆ **Water Solubility**

Benzamide is moderately soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ **Persistence in the Environment**

Benzamide is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.9% of benzamide will eventually end up in water; the rest will be divided about equally among air, terrestrial soils, and aquatic sediments.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of benzamide found in fish tissues is expected to be about the same as the average concentration of benzamide in the water from which the fish was taken.

🛡️ **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of benzamide dusts or powders into the environment. While benzamide is a non-regulated substance under DOT requirements, all containers, trucks, and rail cars should still carry nomenclature on their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzamide should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzamide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble and total remediation may not be possible. The local and/or state

emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of benzamide. If benzamide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in the safest, most convenient manner possible and deposit in sealed containers. Recommend using clean shovel for small spills, depositing materials in clean container for disposal or reclamation. For larger spills, use a vacuum with high-efficiency particulate air (HEPA) filter. Do NOT dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of benzamide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving benzamide can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. While the specific effects of benzamide on human health or the environment may not be clearly understood, litigious situations can still arise. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents.

A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

|--|--------------------------------------|---|------------------------------------|---|
| Stability | | Conditions to Avoid Heat, flame, other sources of ignition, and contact with incompatible materials and chemicals. | | |
| Stable | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, mainly fluorides and perchlorates, and strong acids such as sulfuric and nitric acid. | | |
| X | | | | |
| Hazardous Polymerization | | Conditions to Avoid Hazardous polymerization has not been reported to occur under normal conditions of temperature and pressure. | | |
| May Occur | Will Not Occur | Hazardous Decomposition or By-products Poisonous gases, including carbon monoxide and carbon dioxide are emitted during fire. | | |
| | X | | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: May cause nausea, headache, vomiting, dizziness, narcosis, suffocation, lower blood pressure, CNS depression. Vapors may cause severe irritation or burns of the respiratory system, pulmonary edema, or lung inflammation. ABSORPTION: Irritation with possible redness and pain to the skin and eyes. Also, absorbs through the skin and may cause dermatitis. Eye contact may result in temporary corneal damage. INGESTION: May cause nausea, vomiting, headache, dizziness, gastrointestinal irritation; blurred vision, lowering of blood pressure. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Confirmed Human Confirmed Animal | 5th Annual Report | Group 1 | 29 CFR 1910.1028 | Eyes, skin, respiratory sys. blood, CNS, bone marrow (leukemia). |
| Medical Conditions Generally Aggravated by Exposure None identified. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Do not induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Wear SCBA respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Stop leak if it can be done without risk. Ventilate area of spill. Absorb with vermiculite or other similar material and deposit in sealed containers. | | | | |
| Preferred Waste Disposal Method Burn in chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well ventilated location. Keep away from sources of heat. | | | | |
| Other Precautions and Warnings Sources of ignition such as open flame or smoking, is prohibited where benzene is used or stored. Metal containers should be bonded and grounded during transfer operations. Bulk storage not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use a MSHA/NIOSH approved powered air purifying respirator or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Polyvinyl Alcohol Gloves | Chemical Goggles or Face Mask | Protective Apron if Splash is Likely | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BENZENEC₆H₆

CAS: 71-43-2

**IDENTIFICATION AND TYPICAL USES**

Benzene is a clear, colorless to light yellow, mobile, nonpolar liquid of highly refractive nature with a characteristic hydrocarbon odor. Benzene occurs in coal and coal-tar distillation products and in petroleum products such as gasoline.

It is used as a solvent for waxes, resins, and oils; in the manufacture of dyes, pharmaceuticals, varnishes, and linoleum; and as a raw material to produce a number of organic compounds. It is also used in the manufacture of other chemicals such as ethylbenzene (for styrene monomer), dodecylbenzene (for detergent), cyclohexane (for nylon), phenol, nitrobenzene (for aniline), maleic anhydride, chlorobenzene, diphenyl, benzene hexachloride, and benzene-sulfonic acid.

RISK ASSESSMENT: HEALTH**General Assessment**

Benzene is an acute as well as chronic toxicant. It is a confirmed human carcinogen producing myeloid leukemia, Hodgkin's disease, and lymphomas by inhalation. It is also believed to be a human poison by skin contact. It is moderately toxic by ingestion. Benzene can severely irritate the eyes, nose, and respiratory system and cause moderate irritation on skin contact. Chronic effects are much more severe than its acute toxicity. The target organs to acute and chronic poisoning are the blood, bone marrow, central nervous system, respiratory system, eyes, and skin.

Human systemic effects by *inhalation* and *ingestion* include blood changes and increased body temperature. Heavy occupational exposures to benzene can cause bone marrow depression and anemia. In rare cases, leukemia has been attributed to benzene exposure. Lung cancer has also been reported.

Other effects of inhalation include headaches, nausea, vomiting, dizziness, narcosis, suffocation, CNS depression, pulmonary edema or lung inflammation, blurring of vision, convulsions, weakness, loss of appetite, abdominal discomfort, and dyspnea on exertion.

Skin contact may cause dermatitis and absorption can occur with harmful effects. It is a comparatively strong irritant, producing erythema, and burning, and, in severe cases, edema and even blistering.

Ingestion may cause nausea, vomiting, headaches, dizziness, gastrointestinal irritation, blurred vision, and lowering of blood pressure.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzene:

- Skin:** Irritation with potential for redness, blistering, and burning.
- Eye:** Severe irritation; pain and permanent damage possible.
- Lung:** Nose, throat, and respiratory tract irritation causing difficulty in breathing, possible pulmonary edema on high exposure (a medical emergency) which can be fatal.
- CNS:** Confusion, dizziness, tightening of the leg muscles, cranial pressure (headaches), possible coma.

●* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzene and can last for months or even years:

Cancer Hazards: Benzene is a known carcinogen in humans. It has been shown to cause leukemia, Hodg-

kin's disease, and lymphoma by inhalation. Human mutation data have also been reported.

Reproductive Hazard: There is limited evidence that benzene is a teratogen in animals. Until further tests are performed, it should be treated as a possible human teratogen.

Other Chronic Effects: Heavy exposures over a long period of time can cause bone marrow depression with symptoms of anemia with a tendency for hemorrhagic symptoms such as easy bruising, epistaxis, bleeding from the gums, nosebleeds, menorrhagia, petachiae, purpura, and other symptoms of fatigue, headache, dizziness, nausea and loss of appetite, loss of weight and weakness, pallor. Repeated exposures can cause irreversible damage to the blood-forming organs resulting in aplastic anemia and possibly leukemia. There is great variation in individual response to chronic exposure to benzene.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with benzene. Occupational poisoning occurs most commonly by inhalation. If a less toxic material or compound cannot be substituted for benzene, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of benzene release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around benzene. A MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand is the appropriate level of respiratory protection when exposure to benzene is anticipated. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, polyvinyl alcohol gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where benzene is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered:

- ☑ Complete blood count (CBC).
- ☑ Urinary phenol (a test to see if benzene is in the body).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to benzene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzene should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to benzene, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by benzene should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to benzene.
- ☑ Where possible, automatically transfer liquids containing benzene from drums or other containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small,

can result in contamination of the surrounding environmental mediums (water, soil, and air).

Benzene is a moderately flammable liquid. Because of its low flash point and high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). It is a dangerous fire hazard and moderate explosion hazard when exposed to heat or flame. Caution is always required in handling, storage, transportation, and disposal of benzene. Emergency responders should be made aware of the presence of benzene at any emergency response situation.

Benzene can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to benzene.

Benzene has high acute toxicity to aquatic life. It can cause death in plants and roots and membrane damage in leaves of various agricultural crops. Insufficient data are available to evaluate the short-term effects of benzene on birds or land animals.

☞ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Benzene has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of benzene to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Benzene is moderately soluble in water. Concentrations between 1 and 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Benzene is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.5% of benzene will eventually end up in air; the rest will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of benzene found in fish tissues is expected to be somewhat higher than the average concentration of benzene in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of benzene into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzene should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of benzene.

For disposal, benzene may be burned in a chemical incinerator equipped with an afterburner and scrubber.

If benzene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Absorb liquids in vermiculite, sand, earth, or similar material and deposit in sealed drum.

- ☑ Ventilate area of spill or leak. Container should be removed to safer area if it can be done without increasing the risk.
- ☑ Use water spray to knock-down vapors.
- ☑ It may be necessary to dispose of benzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving benzene can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness (leukemia), injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Boiling Point | 752°F (400°C) | Specific Gravity (H ₂ O = 1) | 1.25 |
| Vapor Pressure (mm Hg) | Low | Molecular Weight (atomic weight) | 184.3 |
| Vapor Density (Air = 1) | Not Found | Melting Point | 239°F (120°C) |

Solubility

Slightly soluble in cold water (0.04% at 54°F); moderately soluble in hot water, alcohol, and ether.

Appearance and Odor

Grayish-yellow crystalline powder, or white to slightly reddish crystals (sand or sugar-like), powder, or leaf-like solid.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|--------------------------|-------------------------------------|-----------------------|
| Flash Point (method used) | Not Found | Explosive Limits in Air % by Volume | |
| | | LEL: Not Found | UEL: Not Found |
| NFPA Classification | Combustible Solid | Autoignition Temperature | |
| | | Not Found | |

Extinguishing Media

Benzidine by itself is difficult to burn. Extinguish fire using an agent suitable for surrounding fires.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Move container from fire area if it can be done without risk.

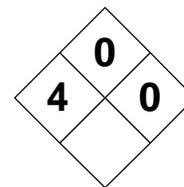

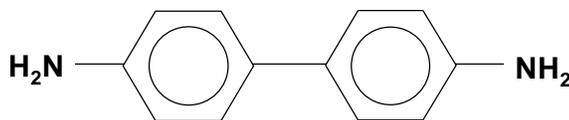

Unusual Fire and Explosion Hazards

Benzidine is a combustible solid. No unusual fire or explosion hazards have been reported. However, firefighters must be aware that exposure to any level can be extremely hazardous.

| SECTION V - REACTIVITY DATA | | | | |
|---|-------------------------------------|--|------------------------------------|--|
| Stability | | Conditions to Avoid None reported. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reactions on contact with red fuming nitric acid may be violent. | | |
| Hazardous Polymerization | | Conditions to Avoid Hazardous polymerization has not been reported to occur under normal conditions of temperature and pressure. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, benzidine emits highly toxic fumes of nitrous oxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: May cause irritation of the eyes, nose, and throat. Benzidine is a confirmed human carcinogen (bladder cancer). ABSORPTION: Possible skin irritation, rash, and dermatitis. Can pass through skin and present cancer hazard in humans. May cause tumors on the skin as well. INGESTION: May cause nausea, vomiting, kidney and liver damage, lung tumors, and may cause damage to the blood including hemolysis and bone marrow depression. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Confirmed Human Confirmed Animal | 5th Annual Report | Group 1 | 29 CFR 1910.1010 | Bladder, skin, kidney, liver, blood, bone marrow. |
| Medical Conditions Generally Aggravated by Exposure None identified. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Do not dry sweep (generates airborne dusts); collect powdered materials in most efficient and safest manner possible. Recommend use of vacuum equipped with HEPA filter. | | | | |
| Preferred Waste Disposal Method Dissolve in a combustible solvent, burn in chemical incinerator equipped with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Benzidine should be handled and stored only in a regulated area, as required by OSHA 29 CFR 1910.1010. | | | | |
| Other Precautions and Warnings Prior to working with benzidine, the law requires personnel to be trained on its proper handling and storage requirements. Bulk storage not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At any exposure to a carcinogen, use a MSHA/NIOSH approved powered air purifying respirator or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Skin Protection |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BENZIDINE

CAS: 92-87-5

**IDENTIFICATION AND TYPICAL USES**

Benzidine is a grayish-yellow or white to reddish crystalline solid (powder or dust). It has been used extensively in the manufacture of dyes. Because of its carcinogenic effects on humans, its application has been extremely curtailed. Other uses of its compound are in chemical analysis, as a reagent for the determination of hydrogen peroxide in milk, and in the analysis of nicotine. Its hydrochloride is used as a reagent to analyze metals and sulfate. Benzidine has been used as a stiffening agent in rubber compounding. In microscopy, it is used as a stain or to aid in the detection of blood stains.

RISK ASSESSMENT: HEALTH**General Assessment**

Benzidine is known to cause cancer of the bladder in humans. There are numerous reports in the references on its carcinogenicity in both humans and animals. Human mutation data have also been reported. The routes of entry into the body are primarily the *inhalation* of its dusts and *absorption* through the skin. However, its physical properties (dust, powder) also make *ingestion* an extremely possible exposure route. Any exposure to benzidine by any route should be considered extremely hazardous.

Inhalation causes irritation to the eyes, nose, throat, and respiratory tract. Once in the body, it can cause damage to the blood including hemolysis and bone marrow depression.

Skin contact may cause dermatitis and absorption can occur with harmful effects to the blood, blood-forming organs, the liver, the kidneys, and the bladder. Dermatitis may occur and there may also be the presence of skin tumors subsequent to prolonged or repeated contact.

Ingestion may cause nausea, vomiting, kidney, and liver damage. There can also be adverse effects on the blood, including bone marrow changes.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzidine:

Skin: Irritation with potential for dermatitis and even skin tumors.

Eye: Severe irritation; pain and permanent damage possible.

Lung: Nose, throat, and respiratory tract irritation causing difficulty in breathing.

Other: Heavy exposures can cause bone marrow depression and anemia with a tendency for hemorrhagic symptoms such as easy bruising, epistaxis, bleeding from the gums, or menorrhagia, and leukemia. The skin and mucous membranes may appear pale.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzidine and can last for months or even years:

Cancer Hazards: Benzidine is a known carcinogen in humans. It has been shown to cause bladder cancer. Other tumorigenic effects suspect (liver and kidney).

Reproductive Hazard: According to the information available in the references, benzidine has not been tested for its ability to adversely affect reproduction.

Other Chronic Effects: Benzidine may cause skin allergy (sensitization). Once sensitized to benzidine skin contact, even the slightest future exposures can cause itching and skin rash.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with benzidine. Occupational poisoning can occur through all common exposure routes (inhalation, absorption, and ingestion). If a less toxic material or compound cannot be substituted for benzidine, then *engineering controls* (as required by OSHA 29 CFR 1910.1010) are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of benzidine dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around benzidine. A MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection, when any exposure to benzidine is anticipated. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, polyvinyl alcohol gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzidine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) and OSHA 29 CFR 1910.1010 (Benzidine) prior to the first assignment in an area where benzidine is used or stored.

Before beginning employment and at regular times thereafter (e.g., annually), the following recommended medical tests should be considered:

- ☑ Urine cytology (a test for abnormal cells in the urine).

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Evaluation by a qualified allergist, including careful evaluation of exposure history and special testing (may help diagnose skin allergy).

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- ☑ According to OSHA, benzidine should be handled in an enclosed system. There should be local exhaust ventilation at the site of chemical release. Even with local exhaust ventilation or enclosure, respiratory protection must be used.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to benzidine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzidine should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to benzidine, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by benzidine should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to benzidine.
- ☑ A regulated work area must be established. No unauthorized personnel can enter the area where benzidine is used, handled, or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzidine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Benzidine is a combustible solid that does not easily burn. However, caution is always required in handling, storage, transportation, and disposal of benzidine. Emergency responders should be made aware of the presence of benzidine at any emergency response situation.

Benzidine can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to benzidine. Benzidine and its salts have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of benzidine on birds or land animals.

☀ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Benzidine and its salts have moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of benzidine to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Benzidine and its salts are moderately soluble in water. Concentrations between 1 and 1000 will mix with a liter of water.

🕒 *Persistence in the Environment*

Benzidine is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.3% of benzidine will eventually end up in water; 0.3% will end up in terrestrial soil, aquatic sediments, respectively.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of benzidine found in fish tissues is expected to be about the same as the average concentration of benzidine in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of benzidine into the environment. Labels on all con-

tainers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzidine should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzidine should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of benzidine.

For disposal, benzidine may be dissolved in a combustible solvent and burned in a chemical incinerator equipped with an afterburner and scrubber.

If benzidine is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Collect spilled powders in the safest and most convenient manner possible and place in a sealed drum for disposal. Do not dry sweep (generates airborne dusts). Recommend use of a vacuum equipped with a high efficiency particulate air (HEPA) filter.
- Ventilate area of spill or leak.
- It may be necessary to dispose of benzidine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving benzidine can present a serious threat to business operations. The loss or dam-

age of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness (cancer), injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

BENZOTRICHLORIDEC₇H₅Cl₃

CAS: 98-07-7

**IDENTIFICATION AND TYPICAL USES**

Benzotrichloride is a colorless to slightly yellow oily liquid with a pungent, irritating odor. It is used primarily as an intermediate in the production of other chemicals such as benzoyl chloride, benzotrifluoride, dyes, and ultraviolet light stabilizers.

RISK ASSESSMENT: HEALTH**General Assessment**

Benzotrichloride is a corrosive liquid. It is an irritant and a suspected human carcinogen. Carcinogenic data have been reported following exposures. Mutation data have also been reported. It can enter the body through inhalation, absorption, and/or ingestion.

Toxic effects of exposure may include central nervous system excitation followed by depression, irritation of the eyes, nose, mucous membranes, and upper respiratory tract, and slowed respiration. Contact with the eyes can cause corneal injury. Upon exposure to 1000 mg/m³, test animals developed motor automatism and twitching of the peripheral muscles. Other potential symptoms include leukopenia, mild anemia, and possible decreases in renal function in chronic cases. Although there are no data clearly linking exposure to benzotrichloride to cancer in humans, an excess in respiratory cancers (six cases) has been reported in benzoyl chloride manufacturing workers who were potentially exposed to benzotrichloride.

Animal tests have reported skin carcinomas (squamous cell), lung carcinomas, pulmonary adenomas, and lymphomas. Higher concentrations may cause pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can lead to death.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzotrichloride:

Skin: Severe irritation. Skin tumors may be possible.

Eye: Severe irritation, burns, pain, and possible permanent damage to vision.

Lung: Nose, throat, and respiratory irritation causing difficulty in breathing. High-level acute exposures can lead to pulmonary edema, which may be fatal.

CNS: Benzotrichloride may act to depress the central nervous system causing weakness, fatigue, irritability, headache, poor appetite, loss of consciousness, sleeplessness, and other symptoms of CNS depression.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzotrichloride and can last for months or even years:

Cancer Hazards: Benzotrichloride may cause mutations (genetic changes) in living cells. It is considered a probable human carcinogen since there is limited evidence in the references that exposure may cause cancer in animals. There is insufficient data to evaluate the exact nature of its carcinogenic potential in humans.

Reproductive Hazard: According to the references, benzotrichloride has not been tested for its ability to adversely affect reproduction.

Other Chronic Effects: Over the long-term, exposure to benzotrichloride can affect the nervous system causing

weakness, fatigue, headache, irritability, sleeplessness, and loss of appetite. Long-term effects on the brain and other organs are unclear. However, repeated exposures may damage the liver and kidneys.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with benzotrachloride. If a less toxic material or compound cannot be substituted for benzotrachloride, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of benzotrachloride release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around benzotrachloride. For any exposure level, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzotrachloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where benzotrachloride is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered for those with frequent or potentially high exposures:

- ☑ Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Liver and kidney function tests.
- ☑ Consider chest X-ray following acute exposure.
- ☑ Examination of the nervous system.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling

exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- ☑ Benzotrachloride should be handled in an enclosed system. There should be local exhaust ventilation at the site of chemical release.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to benzotrachloride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzotrachloride should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to benzotrachloride, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by benzotrachloride should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to benzotrachloride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzotrachloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Benzotrachloride is a combustible liquid. However, caution is always required in handling, storage, transportation, and disposal of benzotrachloride. It can react with moisture to produce irritating fumes of hydrogen chloride. It is a powerful corrosive and contact with combustible materials such as wood, paper, or oil may cause ignition. Emergency responders should be made aware of the presence of benzotrachloride at any emergency response situation.

Benzotrachloride can enter the environment from industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to benzotrachloride. Benzotrachloride has moderate acute toxicity to aquatic life and high acute toxicity to birds. Insufficient data are available to evaluate or predict the acute (short-term) effects of benzotrachloride to plants or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Benzotrachloride has high chronic toxicity to aquatic life. Insufficient data are available to evaluate the chronic (long-term) effects of benzotrachloride on plants, birds, or land animals.

💧 *Water Solubility*

Benzotrachloride is moderately soluble in water. Concentrations between 1 and 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Benzotrachloride is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. The chemical properties of benzotrachloride indicates that approximately 98% will enter the air and about 0.7% will end up in water, terrestrial soil, and aquatic sediments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of benzotrachloride found in edible fish tissue is expected to be somewhat higher than the average concentration of benzotrachloride found in the water from which the fish was taken.

🔧 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of benzotrachloride into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzotrachloride should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzotrachloride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of benzotrachloride.

For disposal, benzotrachloride should be burned in a chemical incinerator equipped with a scrubber and afterburner.

If benzotrachloride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work. Avoid skin and eye contact.
- ☑ Absorb liquids in vermiculite or other similar materials and deposit in sealed drum for disposal. Use non-sparking tools
- ☑ A regulated, marked area should be established where benzotrachloride is handled, stored, or used. No unauthorized personnel should enter the area.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of benzotrachloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving benzotrachloride can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the words "cancer" or "carcinogen" are used, public emotion, hysteria, and ignorance can run equally high. This should be carefully considered whenever developing or implementing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? |
| Health Hazards INHALATION: Vapor can severely irritate the nose, throat, and bronchial tubes. High exposures can cause a dangerous buildup of fluid in the lungs (pulmonary edema), which can be fatal. Chronic exposures to low levels may cause reduction in sense of smell. SKIN & EYES: Irritation on contact with skin and eyes. Strong corrosive action causing burns. Repeated exposure could cause chronic rash, dermatitis, and warts. INGESTION: If swallowed, will irritate digestive tract possibly causing ulceration. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | No | Group 3 | No | Respiratory system, skin, eyes. |
| Medical Conditions Generally Aggravated by Exposure Respiratory function disorders (bronchitis); skin conditions (dermatitis, psoriasis). | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 25 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observation recommended for 24 - 48 hours after exposure (pulmonary edema can be delayed reaction). If swallowed: Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Absorb liquids in vermiculite or other suitable material and place in sealed drums. | | | | |
| Preferred Waste Disposal Method Burn in chemical incinerator equipped with an afterburner and scrubber. Verify disposal methods in accordance with local, state, and/or federal environmental regulations. | | | | |
| Precautions to be Taken in Handling and Storage Store in closed containers in cool, dry, well ventilated area away from water, moisture, and combustibles. | | | | |
| Other Precautions and Warnings Avoid storage with strong oxidizers, alcohols, and water since violent reactions can occur. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) None required where adequate ventilation exists. If airborne concentrations are high, use a MSHA/NIOSH approved chemical cartridge respirator with organic vapor cartridge. Greater protection is provided by a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Rubber Gloves | Eye Protection Chemical Goggles and Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BENZOYL CHLORIDEC₆H₅COCl

CAS: 98-88-4

**IDENTIFICATION AND TYPICAL USES**

Benzoyl chloride is a transparent or colorless liquid with a strong, penetrating, pungent odor. Its vapors cause tearing. It is an analytical reagent and is used in the manufacture of benzoyl peroxide and other various products including dye intermediates, resins, perfumes, pharmaceuticals, and polymers.

RISK ASSESSMENT: HEALTH**General Assessment**

Benzoyl chloride is a questionable carcinogen with experimental tumorigenic data by skin contact also reported. Exposure occurs primarily through inhalation. It is an extremely corrosive material. Immediate irritation and burns on contact with skin and eyes. Eye damage can be irreversible. Also irritating to mucous membranes on inhalation. High exposures are extremely dangerous since benzoyl chloride vapors can irritate the bronchial tubes and cause a buildup of fluid in the lungs (pulmonary edema), which is a medical emergency and can be fatal. Repeated low exposures can cause a reduction in the sense of smell which may be permanent. Effects of long-term exposures on respiratory tract not documented since pulmonary edema usually develops in the short term.

Repeated or prolonged contact with skin can lead to chronic rash, irritation, and possible dermatitis in sensitive persons.

Ingestion is not normally an occupational exposure route. If swallowed, benzoyl chloride could cause irritation of the digestive tract and possibly result in ulceration of the mucous membrane.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzoyl chloride:

Skin: Contact could cause burns and severe irritation.

Eye: Severe irritation, burns, pain, and possible permanent damage to vision.

Lung: Nose, throat, and respiratory tract (bronchial tubes) irritation causing difficulty in breathing. May cause pulmonary edema on high exposures, which can be fatal.

☛ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzoyl chloride and can last for months or even years:

Cancer Hazards: There is limited evidence that employees working in benzoyl chloride manufacturing have an increased risk of developing lung cancer. It is not known what factors cause this risk.

Reproductive Hazard: According to the information available in the references, benzoyl chloride has not been tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated exposures could lead to chronic sore throat, chronic sinus symptoms, loss or reduced sense of smell (thereby affecting the taste of foods), and/or chronic rash. Very irritating substances may affect the lungs. It is not known whether benzoyl chloride causes lung damage.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with benzoyl chloride. Occupational exposure can occur primarily through inhalation. Skin and eye contact also present risks to health. If a less toxic material or compound cannot be substituted for benzoyl chloride, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at

the site of benzoyl chloride dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still recommended whenever working with or around benzoyl chloride. For low exposures, a chemical cartridge respirator with organic vapor cartridge is recommended. For higher exposures, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzoyl chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where benzoyl chloride is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered for those with frequent or potentially high exposures:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Consider chest X-ray after acute overexposure.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, persons who smoke are already susceptible to lung cancer, emphysema, and other respiratory problems and may have a more rapid and pronounced adverse response on exposure to benzoyl chloride.

Other methods to reduce exposure include:

- Benzoyl chloride should be handled in an enclosed system. There should be local exhaust ventilation at the site of chemical release.
- Always ensure that proper protective clothing is worn when using chemical substances.

- Wash thoroughly immediately after exposure to benzoyl chloride and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzoyl chloride should be communicated to all exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to benzoyl chloride, emergency shower facilities should be provided.
- Workers whose clothing has been contaminated by benzoyl chloride should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to benzoyl chloride.
- Where possible, automatically pump liquid benzoyl chloride from drums or other storage containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzoyl chloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Benzoyl chloride is a combustible liquid. However, caution is always required in handling, storage, transportation, and disposal of benzoyl chloride. It will react violently on contact with water or steam to produce heat and toxic and corrosive fumes. It will also react violently on contact with strong oxidizers (such as bromine, chlorine, and fluorine). Emergency responders should be made aware of the presence of benzoyl chloride at any emergency response situation.

Benzoyl chloride can enter the environment from industrial discharges and from spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after ani-

mals or plants are exposed to benzoyl chloride. Benzoyl chloride has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of benzoyl chloride on birds or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Benzoyl chloride has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of benzoyl chloride to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Benzoyl chloride is moderately soluble in water. Concentrations between 1 and 1000 will mix with a liter of water.

⌚ *Persistence in the Environment*

Benzoyl chloride will react rapidly with water and therefore is not persistent in the aquatic environment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Benzoyl chloride will react rapidly with water and therefore it will not accumulate in aquatic organisms or the environment.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of benzoyl chloride into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzoyl chloride should be segregated from other chemicals and materials, especially water, to

minimize the risk of cross-contamination and violent reactions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzoyl chloride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of benzoyl chloride.

For disposal, benzoyl chloride may be burned in a chemical incinerator equipped with an afterburner and scrubber.

If benzoyl chloride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin contact. Benzoyl chloride is extremely corrosive.
- ☑ Absorb liquids in vermiculite or other similar materials and deposit in sealed drum for disposal. Do not allow contact with water, steam, or moisture.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of benzoyl chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving benzoyl chloride can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness (cancer), injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental

damage can also result in a loss of profits and loss of current as well as future business.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, releases toxic fumes or carbon dioxide and carbon monoxide. Also produces dense white smoke of benzoic acid, phenyl benzoate, terphenyls, biphenyls, and benzene. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? |
| Health Hazards INHALATION: Can severely irritate the nose, throat, and lungs. May cause asthmatic effects. SKIN & EYES: Causes both primary irritation to skin and sensitized dermatitis. Skin tumors may also result. A serious eye irritant causing possible permanent damage. INGESTION: A human poison by ingestion. May cause gene damage and DNA inhibition | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | No | Group 3 | 29 CFR 1910.1000 Table Z-1 | Skin, eyes, respiratory system. |
| Medical Conditions Generally Aggravated by Exposure None reported; however, existing skin conditions (dermatitis, psoriasis) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 25 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Do not attempt to give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Soak with water or cover with wet vermiculite or sand or other suitable material and place in sealed drums. | | | | |
| Preferred Waste Disposal Method Benzoyl peroxide is diluted in water and disposed of in a large flowing stream of water. | | | | |
| Precautions to be Taken in Handling and Storage Protect containers from impact, blows, shock, or friction. Avoid contact with heat or flame. | | | | |
| Other Precautions and Warnings Use only non-sparking tools and equipment. Use explosion-proof electrical fittings in storage areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposures, use an MSHA/NIOSH approved cartridge or canister respirator with a dust/mist filter containing non-oxidizable sorbents to prevent fires or explosion. For higher exposures, use self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Rubber Gloves | Chemical/Dust Goggles and Face Mask | Rubber Apron, Disposable Uniform | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BENZOYL PEROXIDE

CAS: 94-36-0

**IDENTIFICATION AND TYPICAL USES**

Benzoyl peroxide is a colorless to white crystalline solid or a powder with a faint, benzaldehyde odor and no taste. It may also appear as a liquid. It is used as a source of free radicals in many organic syntheses and to initiate polymerization of styrene, vinyl chloride, vinyl acetate, and acrylics. Also used to cure thermoset polyester resins and silicone rubbers; in medicine for treating acne; for bleaching vegetable oil, waxes, cheeses, flour, and fats. Also used as a drying agent for unsaturated oils.

RISK ASSESSMENT: HEALTH**General Assessment**

Benzoyl peroxide is a questionable carcinogen with experimental tumorigenic data by skin contact also reported (animal studies). Exposure occurs primarily through *inhalation* and *ingestion*; however, skin and eye contact will also result in adverse health effects. Can cause dermatitis, asthmatic effects, testicular atrophy, and vasodilatation. It is a skin allergen, with possible tumors resulting from exposure. Benzoyl peroxide can severely irritate the eyes on contact with possibility for permanent damage. Some evidence of human mutation data also reported, but systemic effects of human exposures have not been accurately documented.

Dusts may be irritating to the eyes, skin, nose, throat, and lungs. Benzoyl peroxide may cause gene damage and DNA inhibition. While it has been reported to cause skin tumors, evidence of its carcinogenicity is inadequate.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzoyl peroxide:

Skin: Irritation with possible allergenic effects (dermatitis). Skin tumors may be possible.

Eye: Severe irritation, burns, pain, and possible permanent damage to vision.

Lung: Nose, throat, and respiratory irritation causing difficulty in breathing.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzoyl peroxide and can last for months or even years:

Cancer Hazards: According to the information available in the references, benzoyl peroxide has not been tested for its ability to cause cancer in animals.

Reproductive Hazard: According to the information available in the references, benzoyl peroxide has not been tested for its ability to adversely affect reproduction.

Other Chronic Effects: Over the long-term, exposure to benzoyl peroxide can lead to skin allergy. If an allergy develops, very low future exposures can cause itching and rash. Very irritating substances such as benzoyl peroxide can affect the lungs. It is not known whether benzoyl peroxide causes lung damage.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with benzoyl peroxide. Occupational exposure can occur primarily through inhalation and ingestion. Skin and eye contact also present risks to health. If a less toxic material or compound cannot be substituted for benzoyl peroxide, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of benzoyl peroxide dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory

protection is less effective than the controls mentioned above, but is still recommended whenever working with or around benzoyl peroxide. For low exposures, a chemical cartridge respirator with a dust/mist filter is recommended. For higher exposures, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzoyl peroxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where benzoyl peroxide is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered for those with frequent or potentially high exposures:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Skin testing with dilute benzoyl peroxide may help diagnose allergy, if performed by a qualified allergist.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- Benzoyl peroxide should be handled in an enclosed system. There should be local exhaust ventilation at the site of chemical release.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to benzoyl peroxide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on

the health and safety hazards of benzoyl peroxide should be communicated to all exposed workers.

- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to benzoyl peroxide, emergency shower facilities should also be provided in the immediate area.
- Workers whose clothing has been contaminated by benzoyl peroxide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to benzoyl peroxide.
- Specific engineering controls are recommended for this chemical by NIOSH. Refer to NIOSH Criteria Document Number 77-166 on benzoyl peroxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzoyl peroxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Benzoyl peroxide is a combustible solid. However, caution is always required in handling, storage, transportation, and disposal of benzoyl peroxide. It is a moderate fire hazard by spontaneous chemical reaction in contact with reducing agents. It ignites readily and burns rapidly. It is a powerful oxidizer. It presents a dangerous explosion hazard and may explode spontaneously when heated. It is moderately sensitive to heat, shock, friction, or contact with combustible materials. It will also react violently on contact with strong oxidizers, strong acids, strong reducing agents, most metals, and amines. Emergency responders should be made aware of the presence of benzoyl peroxide at any emergency response situation.

Benzoyl peroxide can enter the environment from industrial discharges and from spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after ani-

mals or plants are exposed to benzoyl peroxide. Insufficient data are available to evaluate the acute (short-term) effects of benzoyl peroxide on aquatic life, birds or land animals.

☼ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the chronic (long-term) effects of benzoyl peroxide to aquatic life, plants, birds, or terrestrial animals.

◆ *Water Solubility*

Benzoyl peroxide is moderately soluble in water. Concentrations between 1 and 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Benzoyl peroxide will react rapidly with water and therefore is not persistent in the aquatic environment.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Benzoyl peroxide will react rapidly with water and therefore it will not accumulate in aquatic organisms or the environment.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of benzoyl peroxide into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzoyl peroxide should be segregated from other chemicals and materials and combustible materials to minimize the risk of cross-contamination and violent reactions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzoyl peroxide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of benzoyl peroxide.

For disposal, benzoyl peroxide is diluted in water and disposed of in a large flowing stream of water. Another common disposal method is to spread the material over a large area on the downwind side of a pit. The waste solvent is fed to the pit and ignited carefully from a remote position.

If benzoyl peroxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin contact.
- ☑ Absorb liquids in vermiculite or other similar materials and deposit in sealed drum for disposal. Collect powdered materials in the most convenient manner using wet methods and deposit in sealed containers.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of benzoyl peroxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving benzoyl peroxide can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can

also result in a loss of profits and loss of current as well as future business.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Call poison control center for advice. Give 1-2 glasses of water and induce vomiting unless advised otherwise. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire, and flame away. If possible, automatically transfer liquids between containers. | | | | |
| Other Precautions and Warnings Use non-sparking tools to open and close containers. Ground and bond all metal containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels established and benzyl acetate may be a carcinogen. For best protection, recommend using a MSHA/NIOSH approved supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves (avoid rubber) | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Impermeable Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BENZYL ACETATE

CAS: 140-11-4

**IDENTIFICATION AND TYPICAL USES**

Benzyl acetate is a colorless or water-white liquid with a floral, fruity, or pear-like odor and pungent, bitter taste. It is used in the production of fragrances (artificial jasmine and other perfumes); in soap perfumes; as a flavoring agent; as a solvent and high boiler for cellulose acetate and nitrate, and natural and synthetic resins; in oils, lacquers, and polishes; in printing inks; and in varnish removers.

RISK ASSESSMENT: HEALTH**General Assessment**

Benzyl acetate is a human poison by *inhalation* causing toxic systemic effects. It is mildly toxic by *ingestion*. Skin contact can produce localized effects but absorption has not been reported. It has been shown to cause cancer in some laboratory studies with test animals and its human carcinogenicity should therefore be considered suspect.

Inhalation of benzyl acetate vapors is not likely to occur under normal operating conditions because of its rather low volatility. However, inhalation is still possible and, therefore, presents a health exposure risk that must be managed. Should an exposure occur by inhalation, it will likely result in irritation of the eyes, nose, throat, and upper respiratory tract, including the mucosa (particularly the gums and respiratory passages). In high concentrations, it may cause unspecified antipsychotic effects with action on the central nervous system. Urinary system effects have also been reported.

Skin contact results in the removal of the skin's natural protective oily layer on its surface with subsequent drying, cracking, and possible sensitization. Eye contact can cause mild to moderate irritation.

Ingestion of benzyl acetate may cause gastrointestinal tract irritation with nausea and vomiting.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzyl acetate:

- Skin:** Mild to moderate irritation. May cause sensitization in some individuals.
- Eye:** Mild to moderate irritation.
- Lung:** Irritation of the eyes, nose, throat and lungs (especially the mucus membranes).
- Other:** Possible antipsychotic effects and urinary system reactions.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzyl acetate and can last for months or even years:

Cancer Hazards: According to the references, benzyl acetate has been shown to produce tumors of the pancreas, liver, and stomach in some test animals. Human data are inconclusive but carcinogenicity is considered questionable at this time.

Reproduction: According to the references, benzyl acetate has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Known Effects: Once inside the body, benzyl acetate will hydrolyze to benzyl alcohol, then oxidize to benzoic acid, and is excreted as hippuric acid.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with benzyl acetate. Its human carcinogenic properties are questioned but not completely understood at this time. The best risk reduction measure is to use a less toxic chemical as a substitute for benzyl acetate. If this is not possible or feasible, then *engineering controls* are the most effective.

tive method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around benzyl acetate. No exposure levels have been established for benzyl acetate. This does not mean that exposure is without risk. It is a questionable human carcinogen and no exposure level may be entirely safe. For the best protection, use a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode or a supplied-air respirator with full facepiece operated in pressure demand or other positive pressure mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted to obtain permeation studies *before* gloves are selected.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzyl acetate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where benzyl acetate is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- Liver and kidney function tests.
- Urinalysis with specific attention on excreted hippuric acid.
- Lung function tests.
- Skin testing with dilute benzyl acetate to help diagnose allergy (performed by a qualified allergist).

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, smokers exposed to benzyl acetate may experience symptoms more quickly than non-smokers under the same conditions of exposure. Pru-

dent risk management requires careful consideration of *all* possible factors that may be causing the appearance of exposure symptoms in the workplace.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to benzyl acetate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzyl acetate should be communicated to all exposed and potentially exposed workers.
- Never eat, drink, or smoke in areas where benzyl acetate is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzyl acetate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Benzyl acetate is considered a class IIIA combustible liquid (according to OSHA 29 CFR 1910.106). This means that it can be ignited as well as support the combustion of other materials. Also, because it is incompatible with a number of common oxidizers, contact can result in violent and explosive reactions. These characteristics require special consideration during any emergency situation involving a leak or spill of benzyl acetate.

The proper disposal/destruction method for benzyl acetate is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Benzyl acetate can enter the environment through unchecked industrial discharges into effluents and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to benzyl acetate. This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of benzyl acetate to plants, birds, or terrestrial animals.

💧 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Benzyl acetate has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of benzyl acetate to plants, birds, or land animals.

💧 *Water Solubility*

Benzyl acetate is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Benzyl acetate is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of benzyl acetate found in fish tissues is expected to be somewhat higher than the average concentration of benzyl acetate in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars

will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzyl acetate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzyl acetate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in water and, therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of benzyl acetate. If benzyl acetate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill, remove ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools.
- ☑ It may be necessary to dispose of benzyl acetate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving benzyl acetate can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the words “cancer” or “carcinogen” are used, public hysteria, emotion, and ignorance can run equally high. This is a matter for careful consideration during the development and implementation of any public relations policies.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Flash Point (method used) 200°F (93°C) closed cup | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Class IIIA Combustible Liquid | Autoignition Temperature 817°F (436°C) |

Extinguishing Media

Dry chemical, carbon dioxide, or alcohol-resistant foam. Water may cause frothing.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Continue to cool containers with water after fire is extinguished. Move containers from fire area if it can be done without risk.

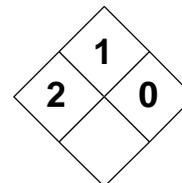

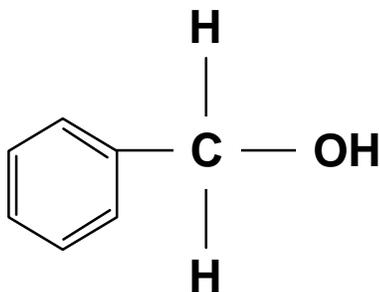

Unusual Fire and Explosion Hazards

Vapors are heavier than air and may travel a distances to ignition source to flashback. Vapors may explode if ignited in an enclosed area.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|--|--------------------------------|--|
| Stability | | Conditions to Avoid Benzyl alcohol slowly oxidizes in air to benzaldehyde and benzoic acid. Keep stable in air-tight containers. Avoid contact with incompatible materials. Keep away from heat, flame, and other ignition sources. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with acids (especially sulfuric), hydrogen bromides + iron at temperatures above 212°F (100°C), and oxidizers (such as chlorine, bromine, and fluorine). It will attack some plastic materials. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, benzyl alcohol is not expected to undergo hazardous polymerization. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, benzyl alcohol emits acrid and irritating fumes, including oxides of carbon (monoxide and dioxide). | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: There may be slight irritation of the eyes, nose, and mucosa of the respiratory tract. Exposure can also cause stupor, fatigue, and sleepiness. There can be headache, nausea, vomiting, diarrhea, respiratory paralysis, convulsion, unconsciousness, and death. It can also cause neurologic, liver, kidney, and blood disturbances. | | | | |
| ABSORPTION: As a solvent, causes skin dryness, cracking, possible dermatitis. Eye contact causes in burning, stinging, tearing, corneal injury, and hyperemia of the conjunctiva. May pass through intact skin to cause toxic systemic effects. | | | | |
| INGESTION: Gastrointestinal irritation with nausea, stomach cramps, diarrhea, and tissue ulceration. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Skin, eyes, CNS, liver, blood, kidneys. |
| Medical Conditions Generally Aggravated by Exposure Pre-existing skin, liver, kidney, nervous system, or blood disorders may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Give 1-2 glasses of water to dilute. Do NOT induce vomiting. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Contain spills using vermiculite (or other absorbent). Ventilate area of spill. Remove ignition sources. Have extinguishing agent available in case of fire. Store materials in DOT-approved containers. | | | | |
| Preferred Waste Disposal Method | | | | |
| Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store in air-tight closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire, and flame away. Outside or underground storage is recommended. | | | | |
| Other Precautions and Warnings | | | | |
| Ground and bond all metal containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| No exposure limits have been established. For low exposures, an organic vapor air-purifying respirator may suffice. Greater protection is obtained using a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Impervious Butyl Rubber Gloves | | Chemical Goggles or Face Mask | | Impermeable Apron or Protective Suit |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BENZYL ALCOHOLC₆H₅CH₂OH

CAS: 100-51-6

**IDENTIFICATION AND TYPICAL USES**

Benzyl alcohol is a colorless or water-white liquid with a faint, aromatic odor and a sharp, pungent, burning taste. It is used in the manufacture of perfumes and flavors; in photographic development for color movie films; for dyeing nylon filament, other textiles, and sheet plastics; as a solvent for dyestuffs, cellulose esters, casein, and waxes; in heat-sealing polyethylene films; as an intermediate for benzyl esters and ethers; as a bacteriostat; in the manufacture of some cosmetics, ointments, and emulsions; and in ball-point pen inks and stencil inks.

RISK ASSESSMENT: HEALTH***General Assessment***

Benzyl alcohol is a human poison by *ingestion* and is considered moderately toxic by *inhalation* and skin *absorption*. There are no reports of any carcinogenic or teratogenic effects subsequent to exposure to benzyl alcohol. However, mutation data have been reported and some scientists believe that such chemicals may pose a cancer risk in the long-term. Additional research is required in this regard.

Inhalation can cause irritation of the eyes, nose, throat, and respiratory tract. There can be headache, nausea, vomiting, diarrhea, respiratory and muscular paralysis, convulsions, unconsciousness, and death. Exposure can cause neurological, liver, kidney, and blood disturbances. Human data are lacking for adequate evaluation of health exposure risk. The majority of data appear to follow from exposures of infants given medication containing benzyl alcohol as a preservative. When administered rectally, it caused grad-

ual neurological deterioration, severe acidosis, gasping breath, skin disorders, decreased blood pressure, and liver and kidney failure followed by cardiovascular collapse and death. It is not known if occupational exposure by inhalation or any other route will have these effects.

Liquid contact with the eyes causes immediate burning and stinging with lachrymation and reflex closure of the lids. There may be injury to the corneal epithelium and possible hyperemia (excessive blood) of the conjunctiva. Skin contact results in drying and cracking which can lead to secondary infections and dermatitis.

Ingestion of benzyl alcohol is not likely to occur in the industrial environment. However, if it does, symptoms can include gastrointestinal tract irritation with nausea, vomiting, cramps, and diarrhea. There may be ulceration of stomach tissue or other tissues in the digestive system.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzyl alcohol:

- Skin:** Causes dryness and cracking leading to dermatitis and possible infection.
- Eye:** Severe irritation with burning and stinging with possible damage to the cornea and conjunctiva.
- Lung:** Irritation of the eyes, nose, throat, and respiratory tract.
- Other:** High concentrations can cause neurological, liver, and kidney problems and possible blood disturbances.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to benzyl alcohol and can last for months or even years:

Cancer Hazards: It is not known if exposure to benzyl alcohol will lead to cancer in humans. There are some mutation data reported but the references are limited in this area of study.

Reproduction: According to information presented in the references, it is not currently known if exposure to benzyl alcohol will have teratogenic or other reproductive effects in humans or test animals.

Other Chronic Effects: Very high or prolonged skin exposure may cause contact dermatitis.

🔒 **Recommended Risk-Reduction Measures**

The best risk-reduction measure is to use a less toxic chemical as a substitute for a benzyl alcohol. If substitution is not possible or operationally feasible, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around benzyl alcohol. No exposure levels have been established for benzyl alcohol. This does not mean that exposure is without risk. For relatively low or infrequent exposure, an air-purifying respirator with an organic vapor cartridge may suffice. For higher exposures, a supplied-air respirator with full facepiece operated in positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation data obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which spec-

ify the methods and techniques that will be practiced whenever personnel are to work with benzyl alcohol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where benzyl alcohol is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- Liver and kidney function tests.
- Skin testing with dilute benzyl alcohol to help diagnose allergy (performed by a qualified allergist).
- Evaluation of nervous system function by a qualified neurologist.
- Complete blood count (CBC) with blood gases.

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures. Also, since consuming large quantities of alcoholic beverages can lead to liver dysfunction and even cancer, persons with alcohol addiction who are exposed to benzyl alcohol on the job may develop symptoms much quicker and with greater intensity than those who do not drink under identical exposure conditions. Prudent risk management requires careful consideration of *all* possible factors which may be causing the appearance of exposure symptoms.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of benzyl alcohol from storage to process containers is recommended.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to benzyl alcohol and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzyl alcohol should be communicated to all exposed or potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzyl alcohol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Benzyl alcohol is considered a class IIIA combustible liquid (according to OSHA 29 CFR 1910.106). This means it will ignite and burn as well as accelerate the burning rate of other combustible materials. Also, because it is incompatible with a number of common materials, especially strong oxidizers and many acids, contact can result in violent and explosive reactions. It is also known to attack some plastic materials. These characteristics require special consideration during any emergency situation involving a leak or spill of benzyl alcohol.

Benzyl alcohol can enter the environment through unchecked industrial discharges into effluents and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to benzyl alcohol. This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of benzyl alcohol to plants, birds, or terrestrial animals.

☞ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Benzyl alcohol has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of benzyl alcohol to plants, birds, or land animals.

💧 *Water Solubility*

Benzyl alcohol is slightly soluble in water. Concentrations ranging between 1 to 100 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Benzyl alcohol is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 93% of benzyl alcohol will eventually end up in the air; the remainder will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of benzyl alcohol found in fish tissues is expected to be about the same or possibly lower than the average concentration of benzyl alcohol in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzyl alcohol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzyl alcohol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transporta-

tion, storage, or disposal of benzyl alcohol. If benzyl alcohol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools. Avoid plastic shovels and other plastic tools since benzyl alcohol has been known to attack plastics. Use brass or other non-sparking metal tools instead.
- ☑ It may be necessary to dispose of benzyl alcohol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving benzyl alcohol can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| 3 | 2 | 1 | COR W | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|--|---|------------------------------------|
| Characterization Halogenated Hydrocarbon | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name Benzyl Bromide | Chemical Abstract Service (CAS) Number 100-39-0 | |
| DOT Hazard Class and Label Requirements Corrosive Material; Poison | DOT Emergency Guide Code 59 | |
| DOT Identification Number UN 1737 | Molecular Formula C₇H₇Br | |

Synonyms

α-Bromotoluene; bromomethylbenzene; bromophenylmethane.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|--|
| Benzyl bromide: (derivation: By bromination of toluene; interaction of benzyl alcohol and hydrobromic acid; by reacting bromine and toluene in ultra-violet light) 1 ppm = 3.33 mg/m³ | PEL: 3 ppm 10 mg/m³ STEL: Not Established | REL (ceiling): 3 ppm 10 mg/m³ STEL: Not Established | 50 ppm 166 mg/m³ | TLV (ceiling): 3 ppm 9.9 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 390°F (199°C) | Specific Gravity (H ₂ O = 1) 1.38 |
| Vapor Pressure (mm Hg) 1 at 90°F (32°C) | Molecular Weight (atomic weight) 171.05 |
| Vapor Density (Air = 1) 5.8 | Melting Point 390°F (199°C) |

Solubility

Slowly decomposes in water to liberate hydrogen bromide gas. Soluble in alcohol, benzene, and ether.

Appearance and Odor

Colorless liquid with a pleasant, aromatic odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 174°F (79°C) closed cup | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Class IIIA Combustible Liquid | Autoignition Temperature Not Reported |

Extinguishing Media

Use dry chemical, foam, or carbon dioxide. Only use water in flooding quantities as fog.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Structural fire-fighting clothing is permeable and may not provide adequate protection. Wear full protective clothing and self-contained breathing apparatus (SCBA) operated in pressure-demand mode. Move container from fire area if it can be done without risk.

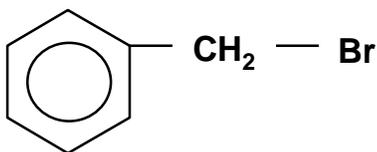

Unusual Fire and Explosion Hazards

Benzyl bromide is a combustible liquid. It is flammable and moderately explosive when exposed to heat or flame. When heated, it can release explosive hydrogen bromide gas. Will react with water or steam to produce toxic and corrosive fumes. Containers may explode in fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------|---|---------------------------------------|--|
| Stability | | Conditions to Avoid Normally stable under routine conditions of handling and storage. Do not store near heat. The buildup of hydrogen bromide gas can cause an explosion. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Benzyl bromide is incompatible with water and most metals, except lead and nickel, to liberate dangerous and toxic hydrogen bromide gas. | | |
| Hazardous Polymerization | | Conditions to Avoid Decomposition rate can reach explosive violence in presence of metals such as iron. Catalytic impurities (e.g., aluminum, iron, rust) may cause violent polymerization. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products When heated to decomposition, benzyl bromide produces toxic and poisonous gases and fumes, including toxic hydrogen bromide gas. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? X |
| Health Hazards INHALATION: May cause severe irritation or burns of the respiratory system. Can result in pulmonary edema (fluid buildup in lungs), which can be fatal. Causes CNS depression. SKIN & EYES: Contact with liquid or vapor can cause severe irritation or burns to the skin, eyes, and mucous membranes. Liquid may cause permanent eye damage. INGESTION: May cause central nervous system depression, nausea, vomiting, headaches, dizziness, gastrointestinal irritation. Chronic effects may include kidney and/or liver damage. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Skin, eyes, respiratory system, CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported, however, skin conditions (dermatitis) and respiratory problems may be aggravated. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24- 48 hours (pulmonary edema possible). If <u>swallowed:</u> Seek medical attention immediately. If conscious, give large amounts of water to dilute. Do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Do not use water. Take up with sand or vermiculite and deposit in sealed drum. | | | | |
| Preferred Waste Disposal Method Dissolve in a combustible solvent and burn in an incinerator with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Avoid contact with heat, sparks, or flame. Keep away from water. Use with adequate ventilation. | | | | |
| Other Precautions and Warnings Use only non-sparking tools and equipment. Keep away from sunlight and moisture (can react violently). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At concentrations up to 10 ppm, use a chemical respirator with an acid/organic cartridge. For higher exposures, use a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure or continuous flow mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Butyl Rubber Gloves | | Eye Protection Chemical Goggles and Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BENZYL BROMIDEC₇H₇Br

CAS: 100-39-0

**IDENTIFICATION AND TYPICAL USES**

Benzyl bromide is a colorless or clear liquid with a pleasant odor. It is used to make foaming and frothing agents and in organic synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

Benzyl bromide is a dangerously corrosive liquid. Contact with the eyes can cause corneal injury. It is a severe irritant to the eyes, mucous membranes, and the skin. Skin contact may produce dermatitis and possibly severe, deep burns. Its carcinogenicity and teratogenicity have not been determined. However, human mutation data have been reported. It is a human poison by *inhalation*. It is also moderately toxic by *ingestion*.

Exposure to its vapors can produce intense and painful irritation of the eyes, nose, and throat. Higher concentrations may cause depression of the central nervous system and pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can lead to death. Symptoms of congestion, cough, dyspnea, and tightness in chest may be delayed up to 48 hours creating a false sense of security with regard to health exposure risk.

Ingestion will result in irritation and burns to the mouth, throat, and gastrointestinal tract. It can cause nausea, abdominal pain, and possibly lead to CNS depression.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzyl bromide:

Skin: Irritation with possible allergenic effects (dermatitis). Skin burns are likely.

Eye: Severe irritation, burns, pain, and possible permanent damage to vision.

Lung: Nose, throat, and respiratory irritation causing difficulty in breathing. High-level acute exposures can lead to pulmonary edema, which may be fatal.

CNS: Benzyl bromide may act to depress the central nervous system causing weakness, irritability, headache, and other symptoms of CNS depression.

Other: Ingestion of benzyl bromide may cause nausea, vomiting, headaches, dizziness, and gastrointestinal irritation.

☼* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzyl bromide and can last for months or even years:

Cancer Hazards: Benzyl bromide may cause mutations (genetic changes) in living cells. There is limited evidence in the references that exposure to mutagenic chemicals may cause cancer in animals. There is insufficient data to evaluate its carcinogenic potential in humans. No agency (NTP, IARC, NIOSH, OSHA) lists benzyl bromide as a carcinogen.

Reproductive Hazard: There are no reports in the references to indicate that benzyl bromide may affect the developing fetus.

Other Chronic Effects: Over the long-term, exposure to benzyl bromide can lead to skin allergy. If an allergy develops, very low future exposures can cause itching and rash. Very irritating substances such as benzyl bromide can affect the lungs. It is not known whether benzyl bromide causes lung damage. Chronic exposure may also affect the liver and cause damage.

🚫 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with benzyl bromide. Occupational exposure can occur primarily

through inhalation and ingestion. Skin and eye contact also present risks to health. If a less toxic material or compound cannot be substituted for benzyl bromide, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of benzyl bromide release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still recommended whenever working with or around benzyl bromide. For low exposures, a chemical cartridge respirator with an acid/organic vapor cartridge is recommended. For higher exposures, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece and operated in pressure demand or other continuous flow mode are the appropriate levels of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, butyl rubber gloves should be worn. Glove manufacturers should be contracted and permeation studies obtained *before* glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzyl bromide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where benzyl bromide is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered for those with frequent or potentially high exposures:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Skin testing with dilute benzyl bromide may help diagnose allergy, if performed by a qualified allergist.
- Consider chest X-ray following acute exposure (may be negative if taken immediately after exposure due to the delayed onset of pulmonary edema).

- Liver function tests.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, since smoking can lead to heart disease, emphysema, and other respiratory disorders, smokers exposed to benzyl bromide may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible exposure factors.

Other methods to reduce exposure include:

- Benzyl bromide should be handled in an enclosed system. There should be local exhaust ventilation at the site of chemical release.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to benzyl bromide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzyl bromide should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to benzyl bromide, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by benzyl bromide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to benzyl bromide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzyl bromide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills,

large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Benzyl bromide is a combustible liquid. However, caution is always required in handling, storage, transportation, and disposal of benzyl bromide. It is flammable and moderately explosive when exposed to heat or flame. It can react vigorously with many metals (copper, aluminum, magnesium, iron, zinc, and tin). It can decompose violently in the presence of some metals and, therefore, do not store it in metal containers. It is a powerful oxidizer and can react violently on contact with water or moisture. It presents a dangerous explosion hazard and may explode spontaneously when heated. Emergency responders should be made aware of the presence of benzyl bromide at any emergency response situation.

Benzyl bromide can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to benzyl bromide. Benzyl bromide has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the acute (short-term) effects of benzyl bromide on plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Benzyl bromide has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate the chronic (long-term) effects of benzyl bromide on plants, birds, or land animals.

💧 *Water Solubility*

Benzyl bromide slowly decomposes and reacts in water to produce hydrogen bromide gas. Concentrations between 1 and 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Benzyl bromide is slightly persistent in the environment, with a half-life of between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for

one-half of the chemical to be degraded. The chemical properties of benzyl bromide indicate that approximately 93% will enter the air with the remaining 7% will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of benzyl bromide found in edible fish tissue is expected to be somewhat higher than the average concentration of benzyl bromide found in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of benzyl bromide into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzyl bromide should be segregated from other chemicals and materials to minimize the risk of cross-contamination and violent reactions. Water should not be kept in the same area since contact can cause violent reaction.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzyl bromide should contact the water table, aquifer, or navigable waterway, time is of the essence. It will decompose and may react violently in water releasing hydrogen bromide gas. Total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of benzyl bromide.

For disposal, halogenated hydrocarbons may be incinerated, or disposed of by hydrolysis with caustic alkalis, and/or by biodegradation.

If benzyl bromide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Absorb liquids in vermiculite or other similar materials and deposit in sealed drum for disposal.
- ☑ Ventilate area of spill or leak and remove all ignition sources.
- ☑ It may be necessary to dispose of benzyl bromide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving benzyl bromide can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Medical Conditions Generally Aggravated by Exposure None reported, however, skin conditions (dermatitis) and respiratory problems may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24- 48 hours (pulmonary edema possible). If swallowed: Seek medical attention immediately. If conscious, give large amounts of water and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Do not use water. Take up with sand or vermiculite and deposit in sealed drum. | | | | |
| Preferred Waste Disposal Method Destroy by incineration, hydrolysis with caustic alkalis, or by biodegradation. | | | | |
| Precautions to be Taken in Handling and Storage Avoid contact with heat, sparks, or flame. Keep away from water. Use with adequate ventilation. | | | | |
| Other Precautions and Warnings Use only non-sparking tools and equipment. Keep away from sunlight and moisture (can react violently). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At concentrations up to 10 ppm, use a chemical respirator with an acid/organic cartridge. For higher exposures, use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Rubber Gloves | | Eye Protection Chemical Goggles and Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BENZYL CHLORIDEC₇H₇Cl

CAS: 100-44-7

**IDENTIFICATION AND TYPICAL USES**

Benzyl chloride is a colorless to slightly yellow liquid with a pungent, aromatic odor. It is used in the manufacture of dyes, artificial resins, tanning agents, pharmaceuticals, plasticizers, perfumes, lubricants, and miscellaneous benyl compounds. Also used in the manufacture of photographic developer, gasoline gum inhibitors, penicillin precursors, and quaternary ammonium compounds.

RISK ASSESSMENT: HEALTH***General Assessment***

Benzyl chloride is a corrosive liquid. Contact with the eyes can cause corneal injury. It is a severe irritant to the eyes, mucous membranes, and the skin. Skin contact may produce dermatitis. It is a suspected carcinogen with experimental carcinogenic and tumorigenic data reported. Human mutation data have also been reported. It is a human poison by *inhalation*. It is also moderately toxic by ingestion. There is limited evidence of reproductive effects in experimental animals.

Exposure to its vapors can produce intense and painful irritation of the eyes, nose, and throat. Higher concentrations may cause depression of the central nervous system and pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can lead to death.

Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzyl chloride:

Skin: Irritation with possible allergenic effects (dermatitis). Skin tumors may be possible.

Eye: Severe irritation, burns, pain, and possible permanent damage to vision.

Lung: Nose, throat, and respiratory irritation causing difficulty in breathing. High-level acute exposures can lead to pulmonary edema, which may be fatal.

CNS: Benzyl chloride may act to depress the central nervous system causing weakness, irritability, headache, and other symptoms of CNS depression.

Other: Ingestion of benzyl chloride may cause nausea, vomiting, headaches, dizziness, and gastrointestinal irritation.

Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzyl chloride and can last for months or even years:

Cancer Hazards: Benzyl chloride may cause mutations (genetic changes) in living cells. There is limited evidence in the references that exposure may cause cancer in animals. There are insufficient data to evaluate its carcinogenic potential in humans.

Reproductive Hazard: There is limited evidence in the references to indicate that benzyl chloride may affect the developing fetus.

Other Chronic Effects: Over the long-term, exposure to benzyl chloride can lead to skin allergy. If an allergy develops, very low future exposures can cause itching and rash. Very irritating substances such as benzyl chloride can affect the lungs. It is not known whether benzyl chloride causes lung damage. Chronic exposure may also affect the liver and cause damage.

Recommended Risk-Reduction Measures

Personnel should avoid direct contact with benzyl chloride. Occupational exposure can occur primarily through *inhalation* and *ingestion*. Skin and eye contact also present risks to health. If a less toxic material or

compound cannot be substituted for benzyl chloride, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of benzyl chloride release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still recommended whenever working with or around benzyl chloride. For low exposures, a chemical cartridge respirator with an acid/organic vapor cartridge is recommended. For higher exposures, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzyl chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where benzyl chloride is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered for those with frequent or potentially high exposures:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Skin testing with dilute benzyl chloride may help diagnose allergy, if performed by a qualified allergist.
- Consider chest X-ray following acute exposure.
- Liver function tests.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- Benzyl chloride should be handled in an enclosed system. There should be local exhaust ventilation at the site of chemical release.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to benzyl chloride and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzyl chloride should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to benzyl chloride, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by benzyl chloride should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to benzyl chloride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzyl chloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Benzyl chloride is a combustible liquid. However, caution is always required in handling, storage, transportation, and disposal of benzyl chloride. It is flammable and moderately explosive when exposed to heat or flame. It can react vigorously with oxidizing materials (such as perchlorates, peroxides, chlorates, nitrates, and permanganates) and active metals (copper, aluminum, magnesium, iron, zinc, and tin). It can decompose violently in the presence of some metals. It is a powerful oxidizer and can react violently on contact with water or moisture. It presents a dangerous explosion hazard and may explode spontaneously when

heated. Emergency responders should be made aware of the presence of benzyl chloride at any emergency response situation.

Benzyl chloride can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to benzyl chloride. Benzyl chloride has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the acute (short-term) effects of benzyl chloride on plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Benzyl chloride has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate the chronic (long-term) effects of benzyl chloride on plants, birds, or land animals.

💧 *Water Solubility*

Benzyl chloride is moderately soluble in water. Concentrations between 1 and 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Benzyl chloride is slightly persistent in the environment, with a half-life of between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. The chemical properties of benzyl chloride indicate that approximately 93% will enter the air with the remaining 7% ending up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as those of humans.

The concentration of benzyl chloride found in edible fish tissue is expected to be somewhat higher than the average concentration of benzyl chloride found in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of benzyl chloride into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of benzyl chloride should be segregated from other chemicals and materials to minimize the risk of cross-contamination and violent reactions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzyl chloride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of benzyl chloride.

For disposal, halogenated hydrocarbons may be incinerated, or disposed of by hydrolysis with caustic alkalis, and/or biodegradation.

If benzyl chloride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Absorb liquids in vermiculite or other similar materials and deposit in sealed drum for disposal.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of benzyl chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving benzyl chloride can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

BENZYL ETHER $(C_6H_5CH_2)_2O$

CAS: 103-50-4

**IDENTIFICATION AND TYPICAL USES**

Benzyl ether appears as a clear, colorless, or pale-yellow unstable liquid with a faint, almond-like odor and a mushroom-like taste. It is used as a solvent in the production of nitro-musk perfumes, as a plasticizer for nitrocellulose, in the manufacture of synthetic rubber, and various resins. Also used in flavorings and insect repellents.

RISK ASSESSMENT: HEALTH**General Assessment**

Benzyl ether is a narcotic substance and is considered mildly to moderately toxic by *inhalation* and skin *absorption*. Although unlikely under normal operating conditions, *ingestion* may also be an exposure route. There are no reports to indicate that this chemical poses a carcinogenic, mutagenic, or teratogenic effect in humans. However, other similar ethers have been shown to cause mutations (genetic changes in living cells) in test animals. It is not known whether benzyl ether will cause this effect in humans.

Inhalation of high concentrations of benzyl ether vapors causes anesthetic effects because of the chemical's ability to quickly and effectively depress the central nervous system. Symptoms of exposure include exhaustion, loss of appetite, sleepiness, dizziness, headache, giddiness, excitation, nausea, vomiting, anorexia, loss of consciousness, possible seizures and convulsions, psychic disturbances, and death due to respiratory arrest. There may also be an occurrence of polycythemia, a condition characterized by an abnormal increase in circulatory red blood cells. Exposure can cause irritation of the eyes, nose, throat, and respiratory system with subsequent changes (numbing) of the sense of smell. At low concentrations, there can still be nausea due to the chemical's strong and disagreeable odor.

Skin contact with the liquid poses no serious threat because benzyl ether will evaporate rather quickly. However, if allowed to remain in contact (in wet clothing or in soaked shoes, for example) for extended periods, there can be drying, cracking, even some burning of the skin's surface. The vapors will cause irritation and slight smarting of the eyes. The liquid will cause more severe irritation and possible inflammation of the eyes and surrounding tissue areas.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to benzyl ether:

- Skin:** Mild irritation and, on prolonged exposure, drying, cracking, secondary infection, and possible burns.
- Eye:** Irritation and smarting of eye tissues and associated skin surfaces (lids).
- Lung:** Irritation to respiratory tract causing cough and sore throat. May also cause olfactory changes (numbing of the sense of smell). On high concentrations, inhalation causes anesthetic effects and narcosis (deep unconsciousness).
- CNS:** Rapid depression of the central nervous system causing a variety of toxic effects including loss of coordination and consciousness, and even death due to respiratory arrest.
- Other:** Ingestion will cause nausea, possible vomiting, and other related gastrointestinal effects.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to benzyl ether and can last for months or even years:

Cancer Hazards: There is no evidence in the references that exposure to benzyl ether causes cancer in animals or humans. However, mutation data have been reported for similar ethers in test animals. Some scientists believe that mutagenic chemicals may pose a cancer risk in the long-term. Additional research is required in this area of study before any conclusions can be made regarding the specific carcinogenic or mutagenic properties of benzyl ether.

Reproductive Hazard: According to the references, benzyl ether has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated low-dose exposures can cause anorexia, chronic fatigue or exhaustion, persistent headache, drowsiness, dizziness, excitation, and psychic disturbances due to its depression of the CNS.

☉ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with benzyl ether. If a less toxic material or compound cannot be substituted for benzyl ether, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of benzyl ether release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around benzyl ether. No exposure levels have been established for benzyl ether. This does not mean that exposure is without health risk. While an air-purifying respirator may suffice for low concentrations, there is no way to determine if sufficient protection is being provided since no occupational exposure levels have been established. Better protection is provided using a MSHA/NIOSH approved supplied air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, polyvinyl or other non-permeable gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* selecting gloves.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with benzyl ether.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where benzyl ether is used or stored.

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Liver, kidney, and lung function tests.
- ☑ Evaluation of the central nervous system.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to benzyl ether and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of benzyl ether should be communicated to all exposed or potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to benzyl ether, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by benzyl ether should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to benzyl ether.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of benzyl ether. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (primarily air, but water and soil contamination can also occur).

Benzyl ether is class IIIB combustible liquid (per OSHA 29 CFR 1910.106). This presents a moderate fire hazard. However, if involved in a fire where combustible organic materials are also involved, the presence of benzyl ether may greatly accelerate the burning rate of the combustible materials (wood, paper, oil, plastics). It can form explosive, shock-sensitive peroxides in contact with air or oxygen. It is incompatible with many oxidizers and caution is always required in handling, storage, transportation, and disposal of benzyl ether. When heated to decomposition it emits very acrid and irritating smoke and fumes. Emergency responders should be made aware of the presence of benzyl ether at any emergency response situation.

Benzyl ether may enter the environment through industrial effluents and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to benzyl ether.

Insufficient data are available to evaluate or predict the acute (short-term) effects of benzyl ether to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the chronic (long-term) effects of benzyl ether on aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Benzyl ether is nearly insoluble in water. Concentrations of 1 milligram or less may mix with a liter of water.

🕒 *Persistence in the Environment*

Benzyl ether is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 100% of benzyl ether will eventually end up in air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The references do not address the bioaccumulation capabilities of benzyl ether in aquatic organisms. However, considering the extremely volatile nature of this chemical, bioaccumulation may not be possible.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of benzyl ether into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster, thereby reducing the potential risk to the environment and to personnel.

Storage of benzyl ether should be segregated from other chemicals to minimize the risk of cross-contamination. Benzyl ether must be stored to avoid contact with strong oxidizers, such as chlorine and bromine, since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat, including sunlight. Storage containers should be kept air-tight. Once opened, shelf-life is limited and should be closely monitored for the formation of explosive peroxides. Any indication of peroxide formation, such as the appearance of crystals around the container opening, should be approached with great caution. The friction from opening the lid could cause an explosion.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If benzyl ether should contact the water table, aquifer, or navigable waterway, time is of the essence. Its rapid evaporation may make total remediation impossible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any task

or operations involving the use, transportation, storage, or disposal of benzyl ether.

Benzyl ether may be disposed of by mixing with an excess of a higher-boiling solvent and then burning in a chemical incinerator equipped with an afterburner and scrubber.

If benzyl ether is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Absorb spilled liquids with vermiculite, dry sand, or a similar material and deposit in sealed drum for disposal. Use non-sparking tools!
- ☑ Ventilate area and remove all ignition sources.
- ☑ It may be necessary to dispose of benzyl ether as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving benzyl ether can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔍 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? |
| Health Hazards INHALATION: May cause severe irritation to the respiratory system. High chronic exposures can result in the onset of berylliosis with early symptoms of slight cough and fatigue followed by progressive pulmonary insufficiency, anorexia, weight loss, weakness, chest pain, and a constant hacking cough. Cyanosis and clubbing of fingers may also be seen. SKIN & EYES: Eye contact will result in irritation. When particles get under cuts in the skin, ulcers or lumps may develop. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | 5th Annual Report | Group 2A | No | Skin, eyes, respiratory system (lung cancer). |
| Medical Conditions Generally Aggravated by Exposure None reported. However, existing respiratory problems (bronchitis, asthma) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Avoid skin contact in areas with cuts or scratches. If such contact occurs, wash with large amounts of water, scrubbing to remove chemical particles. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24- 48 hours for lung effects. If <u>swallowed</u>: Seek medical attention immediately. Do not attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Do not use water. Collect powder materials and deposit in sealed drum. | | | | |
| Preferred Waste Disposal Method Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, well ventilated area away from heat. Protect containers from physical damage. Avoid contact in storage with incompatible materials as violent reactions can occur. | | | | |
| Other Precautions and Warnings Use only non-sparking equipment and tools, especially when opening or closing containers of beryllium. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Beryllium is a suspected human carcinogen by the inhalation route. At any concentration, use a NIOSH/MSHA approved self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Impervious Gloves | | Chemical Goggles and Face Mask | | Protective Uniform or Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BERYLLIUM

Be

CAS: 7440-41-7

**IDENTIFICATION AND TYPICAL USES**

Beryllium is a metallic element of atomic number 4, Group IIA of the periodic system. It has no stable isotopes. It appears as a grayish-white, hard, light-weight solid metal and can be present in bulk or powder/dust forms. It is used as a structural material in space technology; as a moderator and reflector of neutrons in nuclear reactors; as a source of neutrons when bombarded by alpha particles; in special windows for X-ray tubes; in gyroscopes, computer parts, inertial guidance systems; and as an additive in solid propellant rocket fuels. It is also used in beryllium-copper alloys.

RISK ASSESSMENT: HEALTH**General Assessment**

Beryllium is a highly toxic metal. Primary exposure route is through inhalation of its dusts. It is a confirmed carcinogen in animals and highly suspected as such in humans. Experimental carcinogenic, neoplastigenic, and tumorigenic data are reported.

Human systemic effects following *inhalation* exposure include lung fibrosis, dyspnea, weight loss, and fatigue. The primary acute effect from single exposure to beryllium dusts is pneumonitis. Severe bronchitis or pneumonia can occur within 48 hours after high exposure and may cause death in severe cases. Chronic exposures can cause pulmonary disease. High or repeated low-level exposures can cause fibrosis (scarring of the tissue) of the lung and other organs. In severe cases, grave disability and heart failure are possible. Beryllium disease is regarded as chronic if it persists for a year or more. The onset of "berylliosis" may be insidious with only slight cough and fatigue, which can occur as early as 1 year or as late as 25 years after exposure. Progressive pulmonary insufficiency, anorexia, weight loss, chest pain, and persistent hacking cough are symptoms of the advanced diseases.

Skin contact may produce irritation or sensitization dermatitis. If dusts get under cuts or abrasions, ulcers or lumps can develop.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to beryllium:

Skin: Severe irritation. Skin ulcers may be possible.

Eye: Severe irritation, itching, and burning on contact. Sometimes an allergic eye problem develops, breaking out again with future exposures.

Lung: Overexposure can severely irritate the airways and lungs, causing nasal discharge, tightness in the chest, cough, shortness of breath, and/or fever. Future exposures can cause further attacks. Death can occur in severe cases. High level acute exposures can lead to pneumonitis.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to beryllium and can last for months or even years:

Cancer Hazards: Beryllium is a probable cancer causing agent in humans. There is some evidence that it causes lung and bone cancer in humans and it has been shown to cause lung and bone cancers in animals.

Reproductive Hazard: There is no evidence in the published studies to show that beryllium has the ability to adversely affect reproduction.

Other Chronic Effects: A single high exposure or repeated lower exposures can cause permanent scars in the lungs or other body organs. Symptoms may include fatigue, shortness of breath, weight loss, and poor appetite. These effects may occur months or years after exposure. Severe cases develop disability and even heart failure. If chemical particles get under cuts in the

skin, ulcers or lumps can develop. Surgery will be needed to remove these chemical particles. Allergic skin rashes can also occur, with itching and redness. These improve away from exposure and can come back with future exposures. Kidney stones can occur from high or repeated exposures.

🔊 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with beryllium. If a less toxic material or compound cannot be substituted for beryllium, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of beryllium release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around beryllium. For any exposure level, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with beryllium.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where beryllium is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered for those with frequent or potentially high exposures:

- ☑ Lung function tests.
- ☑ Consider chest X-ray.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- ☑ Specific engineering controls are recommended for this chemical by NIOSH. Refer to the NIOSH criteria document: Occupational Exposure to Beryllium (#72-10268).
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to beryllium and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of beryllium should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to beryllium, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by beryllium should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to beryllium.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of beryllium. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Beryllium is a combustible solid. However, caution is always required in handling, storage, transportation, and disposal of beryllium. It presents a slight to moderate explosion hazard in the form of powders and dusts. It is incompatible with halocarbons and reacts incandescently with fluorine or chlorine. Mixtures of the powder with CCl₄ or trichloroethylene will flash or spark on impact. When heated to decomposition in air it emits very toxic fumes of BeO. Emergency responders should be made aware of the presence of beryllium at any emergency response situation.

The major source of beryllium in the environment is burning fossil fuels, some of which may enter the

aquatic environment through atmospheric fallout. Beryllium may also enter the aquatic environment through the weathering of rocks and soils and through discharge from industrial and municipal operations.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to beryllium. Beryllium is more toxic in soft water than in hard water. Beryllium and its compounds have high acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the acute (short-term) effects of beryllium to birds, plants or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Beryllium and its compounds are considered to have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the chronic (long-term) effects of beryllium on plants, birds, or land animals.

💧 *Water Solubility*

Beryllium is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Beryllium is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of beryllium found in edible fish tissue is expected to be somewhat higher than the aver-

age concentration of beryllium found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of beryllium into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of beryllium should be segregated from other chemicals and materials to minimize the risk of cross-contamination. Beryllium must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), and strong acids (such as hydrochloric, sulfuric, and nitric) since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If beryllium should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of beryllium.

If beryllium is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Collect powdered material in the most convenient and safe manner possible and deposit in sealed drum for disposal.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of beryllium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental

Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving beryllium can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

BERYLLIUM CHLORIDE

CRC PRESS/LEWIS PUBLISHERS DISCLAIMER: THE INFORMATION AND RECOMMENDATIONS PRESENTED HEREIN ARE BASED ON SOURCES BELIEVED TO BE RELIABLE. CRC MAKES NO REPRESENTATION ON ITS COMPLETENESS OR ACCURACY. IT IS THE RESPONSIBILITY OF THE USER TO DETERMINE THE CHEMICAL'S SUITABILITY FOR ITS INTENDED USE, THE CHEMICAL'S SAFE USE, AND THE CHEMICAL'S PROPER DISPOSAL. NO REPRESENTATIONS AND/OR WARRANTIES, EITHER EXPRESSED OR IMPLIED, OF THE MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR OF ANY OTHER NATURE, ARE MADE WITH RESPECT TO THE INFORMATION PROVIDED IN THIS MSDS OR TO THE CHEMICAL TO WHICH INFORMATION MAY REFER. CRC NEITHER ASSUMES NOR AUTHORIZES ANY OTHER PERSON TO ASSUME FOR IT, ANY OTHER ADDITIONAL RESPONSIBILITY OR LIABILITY FOR THE USE OF, OR RELIANCE UPON, THIS INFORMATION.

HAZARD WARNING INFORMATION

| HEALTH | FIRE | REACTIVE | OTHER | DEGREE OF HAZARD | COLOR CODING | OTHER CODES |
|------------------|------------------|------------------|-------|---|---|---|
| Not Found | Not Found | Not Found | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|--|--|--------------------------------|
| Characterization Metal | RCRA Number None | EPA Class Not Listed |
| DOT Proper Shipping Name Beryllium Compound | Chemical Abstract Service (CAS) Number 7787-47-5 | |
| DOT Hazard Class and Label Requirements Poison B | DOT Emergency Guide Code 53 (compounds) | |
| DOT Identification Number UN 1566 (compounds) | Atomic Formula BeCl₂ | |

Synonyms

Beryllium dichloride.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|--|---|--|
| Beryllium chloride: (derivation: By passing chlorine over a mixture of beryllium oxide and carbon). | PEL (as Be): .002 mg/m³ STEL (as Be): .005 mg/m³ .025 mg/m³ Peak (30 min) | REL (ceiling): .0005 mg/m³ (as Be) Possible Cancer Agent | Not Determined | TLV (as Be): .002 mg/m³ Suspected Human Carcinogen |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 968°F (520°C) | Specific Gravity (H ₂ O = 1) 1.90 |
| Vapor Pressure (mm Hg) 1 (approx.) at 556°F (291°C) | Molecular Weight (atomic weight) 79.91 |
| Vapor Density (Air = 1) 2.00 | Melting Point 824°F (440°C) |

Solubility

Very soluble in water; soluble in alcohol, benzene, ether, carbon disulfide. Readily hydrolyzed.

Appearance and Odor

Can be colorless or white, slightly yellow to green deliquescent needle-like crystals; sweetish taste.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: Not Applicable UEL: Not Applicable |
| NFPA Classification Noncombustible Solid (bulk form) | Autoignition Temperature Not Applicable |

Extinguishing Media

Use extinguishing agent suitable for the type of surrounding fire. Beryllium chloride itself does not burn. DO NOT USE WATER.

Special Fire Fighting Procedures

Poisonous gases and fumes are produced in fire. Wear full protective clothing, self-contained breathing apparatus (SCBA) operated in pressure-demand mode. Move container from fire area if it can be done without risk. Remain clear of smoke, water fall-out and water run-off. Evacuate non-essential personnel 1500 feet from fire area.

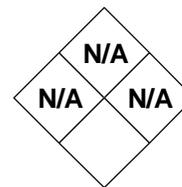

Unusual Fire and Explosion Hazards

With water, forms beryllium oxide and hydrochloric acid solution.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|------------------------------|---|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials, water, and moisture. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with water and finely powdered metals. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, beryllium chloride is not known to undergo hazardous polymerization. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition in air it emits highly toxic fumes of beryllium oxide and chloride. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? X |
| Health Hazards INHALATION: May cause severe irritation to the respiratory system with symptoms of pneumonitis, nasopharyngitis, tracheobronchitis, dyspnea, and chronic cough. Severe bronchitis can occur days after high exposure with cough, shortness of breath, and death. SKIN & EYES: Eye contact will result in conjunctival irritation. When particles get under cuts in the skin, ulcers or lumps may develop. Allergic skin rash may occur. INGESTION: Poison by ingestion. Causes irritation of the mouth and stomach. | | | | |
| Carcinogenicity Suspected Human Confirmed Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2A | OSHA Regulated? No | Target Organs? Skin, eyes, respiratory system. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, existing respiratory problems (bronchitis, asthma) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Avoid skin contact in areas with cuts or scratches. If such contact occurs, wash with large amounts of water, scrubbing to remove chemical particles. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24- 48 hours for lung effects. If swallowed: Seek medical attention immediately. Do not attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Do not use water. Collect powder materials and deposit in sealed drum. | | | | |
| Preferred Waste Disposal Method Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, well ventilated area away from heat. Protect containers from physical damage. | | | | |
| Other Precautions and Warnings A regulated, marked area should be established where beryllium chloride is handled, used, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Beryllium chloride is a suspected human carcinogen. Use a NIOSH/MSHA approved self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Butyl Rubber | | Eye Protection Chemical Dust Goggles and Face Mask | | Other Protective Clothing Protective Uniform or Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BERYLLIUM CHLORIDEBeCl₂

CAS: 7787-47-5

**IDENTIFICATION AND TYPICAL USES**

Beryllium chloride appears as a colorless or white to yellow-green needle-like crystalline solid. It has chemical properties similar to aluminum. In dry form, it is used as a catalyst for organic reactions. It is used in refining beryllium ores and as a chemical reagent. Some beryllium compounds are used to make light alloys, in nuclear reactors, in radio tube parts, in aerospace structures, and in inertial guidance systems.

RISK ASSESSMENT: HEALTH***General Assessment***

Beryllium chloride is a confirmed carcinogen with experimental tumorigenic effects. It is poisonous by *ingestion* and can cause toxic effects upon *inhalation*.

Inhalation causes pneumonitis, nasopharyngitis, tracheobronchitis, dyspnea, chronic cough, shortness of breath, and death. High or repeated exposures can lead to scars in the lungs and other organs. Fatigue, weight loss, and heart failure can occur years later. Beryllium chloride is also an experimental teratogen. Mutation data have also been reported. Beryllium chloride produces chronic systemic disease that primarily affects the lungs, but can also involve other organs such as the lymph nodes, liver, bones, and kidneys.

Ingestion causes irritation of the mouth and stomach. Eye contact with dusts causes conjunctival irritation and skin contact may cause severe irritation as well, leading to skin rash. Particles that get under cuts in skin may cause skin ulcers at site of contact.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to beryllium chloride:

Skin: Severe irritation and possible burns. Localized skin ulcers may also be possible.

Eye: Severe irritation, itching, and burning on contact. Sometimes an allergic eye problem develops, breaking-out again with future exposures.

Lung: Overexposure can severely irritate the airways and lungs, causing nasal discharge, tightness in the chest, cough, shortness of breath, and/or fever. Future exposures can cause further attacks. Death can occur in severe cases. High acute exposures can lead to pneumonitis. Symptoms may be delayed for days after exposure. Some persons later develop lung scarring after such exposures.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to beryllium chloride and can last for months or even years:

Cancer Hazards: Beryllium chloride is a probable cancer causing agent in humans. There is some evidence that it causes lung cancer in humans and it has been shown to cause lung cancers in animals.

Reproductive Hazard: There is no evidence in the published studies to show that beryllium chloride has the ability to adversely affect reproduction. Some experimental data on animals indicate inconclusive teratogenic effects.

Other Chronic Effects: A single high exposure or repeated lower exposures can cause permanent scars in the lungs or other body organs. Symptoms may include fatigue, shortness of breath, weight loss, and poor appetite. These effects may occur months or years after exposure. Severe cases result in disability and even heart failure. If chemical particles get under cuts in the skin, ulcers or lumps can develop. Surgery will be needed to remove these chemical particles. Allergic skin rashes can also occur, with itching and redness. These improve away from exposure and can come back with future exposures.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with beryllium chloride. If a less toxic material or compound cannot be substituted for beryllium, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of beryllium chloride release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around beryllium. For any exposure level, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with beryllium chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where beryllium is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered for those with frequent or potentially high exposures:

- ☑ Lung function tests (spirometry and gas transfer testing). For high exposures, such as with refinery, alloy, or ceramic workers, more frequent tests should be performed, some experts recommend monthly.
- ☑ Chest X-ray (establish baseline).
- ☑ Careful physical examination of the skin and lungs.

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Consider chest X-ray after acute exposure.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling

exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- ☑ Specific engineering controls are recommended for this chemical by NIOSH. Refer to the NIOSH criteria document: Occupational Exposure to Beryllium (#72-10268).
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to beryllium chloride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of beryllium should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to beryllium chloride, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by beryllium chloride should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to beryllium chloride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of beryllium chloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Beryllium chloride is a non-combustible solid. However, caution is always required in handling, storage, transportation, and disposal of beryllium chloride. When heated to decomposition in air it emits very toxic fumes of BeO. Emergency responders should be made aware of the presence of beryllium chloride at any emergency response situation.

The major source of beryllium chloride in the environment is burning fossil fuels, some of which may enter the aquatic environment through atmospheric fall-out. Beryllium may also enter the aquatic environment through the weathering of rocks and soils and through discharge from industrial and municipal operations.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to beryllium chloride. Beryllium chloride is more toxic in soft water than in hard water. Beryllium and its compounds have high acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the acute (short-term) effects of beryllium to birds, plants or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Beryllium and its compounds are considered to have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the chronic (long-term) effects of beryllium on plants, birds, or land animals.

💧 *Water Solubility*

Beryllium is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Beryllium is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as those of humans.

The concentration of beryllium found in edible fish tissue is expected to be somewhat higher than the average concentration of beryllium found in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of beryllium chloride into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of beryllium chloride should be segregated from other chemicals and materials to minimize the risk of cross-contamination. Beryllium chloride must be stored to avoid contact with water and finely divided metal dusts since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Neutralizing agents are agricultural lime (slaked lime), crushed limestone, and sodium bicarbonate. Contaminated soils should be removed for incineration and replaced with clean soil. If beryllium chloride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of beryllium chloride.

If beryllium chloride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Collect powdered material in the most convenient and safe manner possible and deposit in sealed drum for disposal.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of beryllium chloride as a hazardous waste. The responsible state

agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

- Use a high-efficiency particulate air (HEPA) filter vacuum system for cleanup.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving beryllium chloride can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

BERYLLIUM FLUORIDEBeF₂

CAS: 7787-49-7

**IDENTIFICATION AND TYPICAL USES**

Beryllium fluoride appears as a colorless or white to yellow deliquescent crystalline solid. It has chemical, physical, and toxicological properties similar to beryllium chloride (CAS: 7787-47-5). It is used in the production of beryllium metal by reduction with magnesium metal. Also used in nuclear reactors, in glass manufacturing, and as a chemical reagent.

RISK ASSESSMENT: HEALTH***General Assessment***

Beryllium fluoride is a confirmed carcinogen with experimental tumorigenic effects. It is poisonous by *ingestion* and can cause toxic effects upon *inhalation*.

Inhalation can cause severe bronchitis and/or pneumonia within 24 to 48 hours of high exposure. Symptoms include fever, cough, and shortness of breath. Death can also occur. Pulmonary edema (fluid buildup in the lungs) can occur following high acute exposures. High or repeated exposures can lead to scars in the lungs and other organs. Fatigue, weight loss, and heart failure can occur years later.

Beryllium fluoride is also an experimental teratogen, but the data are inconclusive in this area. Mutation data have also been reported. Beryllium fluoride produces chronic systemic disease that primarily affects the lungs as berylliosis, but it can also involve other organs such as the lymph nodes, liver, spleen, bones, and kidneys.

Ingestion causes irritation of the mouth and stomach with symptoms of fatigue, weakness, and loss of appetite.

Eye contact with dusts causes conjunctival irritation and skin contact may cause severe irritation as well, leading to skin rash. Particles that get under cuts in skin may cause persistent, non-healing skin ulcers at site of contact.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to beryllium fluoride:

Skin: Severe irritation and possible burns. Localized skin ulcers may also be possible.

Eye: Severe irritation, itching, and burning on contact. Sometimes an allergic eye problem develops, breaking out again with future exposures.

Lung: Overexposure can severely irritate the airways and lungs, causing nasal discharge, tightness in the chest, cough, shortness of breath, and/or fever. Future exposures can cause further attacks. Death can occur in severe cases. High acute exposures can lead to pulmonary edema. Symptoms may be delayed for days after exposure. Some persons later develop lung scarring after such exposures.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to beryllium fluoride and can last for months or even years:

Cancer Hazards: Beryllium fluoride is a probable cancer causing agent in humans. There is some evidence that it causes lung cancer in humans and it has been shown to cause lung cancers in animals.

Reproductive Hazard: There is no evidence in the published studies to show that beryllium fluoride has the ability to adversely affect reproduction. Some experimental data on animals indicate inconclusive teratogenic effects.

Other Chronic Effects: A single high exposure or repeated lower exposures can cause permanent scars in the lungs or other body organs. Symptoms may include fatigue, shortness of breath, weight loss, and poor appetite. These effects may occur months or years after exposure. Severe cases result in disability and even heart failure. If chemical particles get under cuts in the

skin, ulcers or lumps can develop. Surgery will be needed to remove these chemical particles. Allergic skin rashes can also occur, with itching and redness. These improve away from exposure and can come back with future exposures.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with beryllium fluoride. If a less toxic material or compound cannot be substituted for beryllium, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of beryllium fluoride release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around beryllium. For any exposure level, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, rubber or other non-permeable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with beryllium fluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where beryllium fluoride is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered for those with frequent or potentially high exposures:

- ☑ Lung function tests (spirometry and gas transfer testing). For high exposures, such as with refinery, alloy, or ceramic workers, more frequent tests should be performed, some experts recommend monthly.
- ☑ Consider chest X-ray after overexposure.
- ☑ Careful physical examination of the skin and lungs.

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Consider chest X-ray after acute exposure.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- ☑ Specific engineering controls are recommended for this chemical by NIOSH. Refer to the NIOSH criteria documents: Occupational Exposure to Beryllium (#72-10268) and Inorganic Fluoride (#76-103).
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to beryllium fluoride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of beryllium should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to beryllium fluoride, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by beryllium fluoride should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to beryllium fluoride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of beryllium fluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Beryllium fluoride is a non-combustible solid. However, caution is always required in handling, storage, transportation, and disposal of beryllium fluoride. When heated to decomposition in air it emits very toxic fumes of beryllium oxide and fluoride. Reaction with acid yields very toxic hydrofluoric acid vapors. Emergency responders should be made aware of the presence of beryllium fluoride at any emergency response situation.

The major source of beryllium fluoride in the environment is burning fossil fuels, some of which may enter the aquatic environment through atmospheric fallout. Beryllium compounds may also enter the aquatic environment through the weathering of rocks and soils and through discharge from industrial and municipal operations.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to beryllium fluoride. Beryllium fluoride is more toxic in soft water than in hard water. Beryllium and its compounds have high acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the acute (short-term) effects of beryllium to birds, plants or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Beryllium and its compounds are considered to have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the chronic (long-term) effects of beryllium on plants, birds, or land animals.

💧 *Water Solubility*

Beryllium is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Beryllium is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of beryllium found in edible fish tissue is expected to be somewhat higher than the average concentration of beryllium found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of beryllium fluoride into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of beryllium fluoride should be segregated from other chemicals and materials to minimize the risk of cross-contamination. Beryllium fluoride must be stored to avoid contact with acids and magnesium since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Neutralizing agents are agricultural lime (slaked lime), crushed limestone, and sodium bicarbonate. Contaminated soils should be removed for incineration and replaced with clean soil.

If beryllium fluoride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of beryllium fluoride. If beryllium fluoride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.

- ☑ Collect powdered material in the most convenient and safe manner possible and deposit in sealed drum for disposal.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of beryllium fluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.
- ☑ Use a high-efficiency particulate air (HEPA) filter vacuum system for cleanup.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving beryllium fluoride can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

BERYLLIUM NITRATE

CAS: 13597-99-4

**IDENTIFICATION AND TYPICAL USES**

Beryllium nitrate appears as a colorless or white to yellow deliquescent crystalline solid. It is used as a chemical reagent and as a gas mantle hardener. It also may be used in the production of beryllium metal by reduction with magnesium metal. Also used in nuclear reactors and in glass manufacturing.

RISK ASSESSMENT: HEALTH***General Assessment***

Beryllium nitrate is a confirmed carcinogen with experimental reproductive effects. It is poisonous by *ingestion* and can cause toxic effects upon *inhalation*.

Inhalation can cause severe bronchitis and/or pneumonia within 24 to 48 hours of high exposure. Symptoms include fever, cough, and shortness of breath. Death can also occur. Pulmonary edema (fluid buildup in the lungs) can occur following high acute exposures. High or repeated exposures can lead to scars in the lungs and other organs. Fatigue, weight loss, and heart failure can occur years later. Beryllium nitrate is also an experimental teratogen, but the data are inconclusive in this area.

Beryllium nitrate produces chronic systemic disease that primarily effects the lungs as berylliosis, a fatal lung disease, but it can also involve other organs such as the lymph nodes, liver, spleen, bones, and kidneys.

Ingestion causes irritation of the mouth and stomach with symptoms of fatigue, weakness, and loss of appetite.

Eye contact with dusts causes conjunctiva irritation with redness, itching, and swelling of the eyelids. Allergies may develop. Skin contact may cause severe irritation, leading to skin rash. Skin burns are also possible, depending on amount of exposure. Particles that get under cuts in skin may cause persistent, non-healing skin ulcers at site of contact.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to beryllium nitrate:

Skin: Severe irritation and possible burns. Localized skin ulcers may also be possible.

Eye: Severe irritation, itching, and burning on contact. Sometimes an allergic eye problem develops, breaking out again with future exposures.

Lung: Overexposure can severely irritate the airways and lungs, causing nasal discharge, tightness in the chest, cough, shortness of breath, and/or fever. Future exposures can cause further attacks. Death can occur in severe cases. High acute exposures can lead to pulmonary edema. Symptoms may be delayed for days after exposure. Some persons later develop lung scarring after such exposures.

💧* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to beryllium nitrate and can last for months or even years:

Cancer Hazards: Beryllium nitrate is a probable cancer causing agent in humans. There is some evidence that it causes lung cancer in humans and it has been shown to cause lung cancers in animals.

Reproductive Hazard: Beryllium nitrate may damage the testes (male reproductive glands).

Other Chronic Effects: A single high exposure or repeated lower exposures can cause permanent scars in the lungs or other body organs. Symptoms may include fatigue, shortness of breath, weight loss, and poor appetite. These effects may occur months or years after exposure. Severe cases result in disability and even heart failure. If chemical particles get under cuts in the skin, ulcers or lumps can develop. Surgery will be needed to remove these chemical particles. Allergic

skin rashes can also occur, with itching and redness. These improve away from exposure and can come back with future exposures. Kidney stones can occur from high or repeated exposure.

☉ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with beryllium nitrate. If a less toxic material or compound cannot be substituted for beryllium, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of beryllium nitrate release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around beryllium. For any exposure level, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, rubber or other non-permeable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with beryllium nitrate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where beryllium nitrate is used or stored.

Before first exposure and yearly, a medical history and exam are recommended, with:

- ☑ Lung function tests (spirometry and gas transfer testing). For high exposures more frequent tests should be performed, some experts recommend monthly.
- ☑ Chest X-ray.
- ☑ Careful physical examination of the skin and lungs.

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Consider chest X-ray after acute exposure.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- ☑ Specific engineering controls are recommended for this chemical by NIOSH. Refer to the NIOSH criteria documents: Occupational Exposure to Beryllium (#72-10268).
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to beryllium nitrate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of beryllium should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to beryllium nitrate, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by beryllium nitrate should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to beryllium nitrate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of beryllium nitrate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Beryllium nitrate is a non-combustible solid. However, it is an oxidizer and caution is always required in handling, storage, transportation, and disposal of beryllium nitrate. When heated to decomposition in air it emits very toxic fumes of beryllium oxide and nitrogen oxides. Emergency responders should be made aware

of the presence of beryllium nitrate at any emergency response situation.

The major source of beryllium nitrate in the environment is burning fossil fuels, some of which may enter the aquatic environment through atmospheric fallout. Beryllium compounds may also enter the aquatic environment through the weathering of rocks and soils and through discharge from industrial and municipal operations.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to beryllium nitrate. Beryllium nitrate is more toxic in soft water than in hard water. Beryllium and its compounds have high acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the acute (short-term) effects of beryllium to birds, plants or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Beryllium and its compounds are considered to have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the chronic (long-term) effects of beryllium on plants, birds, or land animals.

💧 *Water Solubility*

Beryllium is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Beryllium is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated

in the tissues and internal organs of animals as well as humans.

The concentration of beryllium found in edible fish tissue is expected to be somewhat higher than the average concentration of beryllium found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of beryllium nitrate into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of beryllium nitrate should be segregated from other chemicals and materials to minimize the risk of cross-contamination. Beryllium nitrate must be stored to avoid contact with fuels and flammable and combustible materials. Containers should be protected from physical damage and stored to avoid contact with heat.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Neutralizing agents are agricultural lime (slaked lime), crushed limestone, and sodium bicarbonate. Contaminated soils should be removed for incineration and replaced with clean soil.

If beryllium nitrate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of beryllium nitrate.

If beryllium nitrate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Collect powdered material in the most convenient and safe manner possible and deposit in sealed drum for disposal. Use a high efficiency particulate air (HEPA) filter vacuum during cleanup.

- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of beryllium nitrate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.
- ☑ Do not generate dusts.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving beryllium nitrate can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | | | | |
|---|----------------------------|--|--|-----------|--------------------|
| Characterization | Haloether | RCRA Number | U025 | EPA Class | Toxic Waste |
| DOT Proper Shipping Name | Dichloroethyl Ether | Chemical Abstract Service (CAS) Number | 111-44-4 | | |
| DOT Hazard Class and Label Requirements | IMO: Poison B | DOT Emergency Guide Code | 57 | | |
| DOT Identification Number | UN 1916 | Molecular Formula | (C₂H₄Cl)₂O | | |

Synonyms
Dichloroethyl ether; 2,2'-dichloroethyl ether; di(2-chloroethyl)ether; dichloroethyl oxide; 1,1'-oxybis(2-chloroethane); Chlorex; DCEE; dichlorodiethyl ether; sym-dichloroethyl ether.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|------------------------------|---|--|
| Bis(2-chloroethyl)ether: (derivation: By chlorination of ethyl ether). 1 ppm = 6 mg/m³ | PEL (skin): 15 ppm 90 mg/m³ 5 ppm (TWA) STEL (skin): 10 ppm | Possible Cancer Agent | 250 ppm | TLV (skin): 5 ppm 30 mg/m³ 5 ppm (TWA) STEL (skin): 10 ppm |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|-------------------------|----------------------|---|----------------------|
| Boiling Point | 352°F (178°C) | Specific Gravity (H ₂ O = 1) | 1.22 at 20°C |
| Vapor Pressure (mm Hg) | 2.00 | Molecular Weight (atomic weight) | 143 |
| Vapor Density (Air = 1) | 4.93 | Melting Point | -62°F (-52°C) |

Solubility
Insoluble in water. Miscible with most organic solvents.

Appearance and Odor
Colorless, clear liquid with a pungent odor like that of ethylene dichloride.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | | |
|---------------------------|--------------------------------|-------------------------------------|----------------------|----------------------------|
| Flash Point (method used) | 131°F (55°C) closed cup | Explosive Limits in Air % by Volume | LEL: 2.7% | UEL: Not Determined |
| NFPA Classification | Class II Combustible | Autoignition Temperature | 696°F (396°C) | |

Extinguishing Media
Dry chemical, foam, water spray, or carbon dioxide. Use water spray to keep closed containers cool.

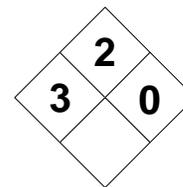

Special Fire Fighting Procedures
Poisonous gases of hydrogen chloride and phosgene are produced in fire. Structural fire-fighting protective clothing will not provide adequate protection. Wear full protective clothing, self-contained breathing apparatus (SCBA) operated in pressure-demand mode. Move container from fire area if it can be done without risk. Will attack some plastics, rubber, and coatings. Evacuate non-essential personnel 1500 feet from fire area. Isolate for ½ mile if rail or tank car is involved in fire.

Unusual Fire and Explosion Hazards
Immediately withdraw if rising sound from venting tank is heard or if fire causes discoloration to the tank.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|---|------------------------------|--|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials since violent reactions can occur. Also avoid contact with water or steam. May form unstable peroxides on exposure to air. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with strong oxidizers, such as chlorine, bromine, and chlorine dioxide, and strong acids, such as sulfuric and chlorosulfonic. Reacts with water or steam to emit toxic and corrosive fumes. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, bis (2-chloroethyl) ether is not known to undergo hazardous polymerization. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition in air it emits highly toxic chloride fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X | |
| Health Hazards INHALATION: Causes severe irritation to the respiratory system with symptoms of cough and shortness of breath. Can lead to pulmonary edema, which is a medical emergency and can be fatal. SKIN & EYES: A severe eye and skin irritant. Can pass through unbroken skin causing toxic systemic effects. INGESTION: Produces nausea and vomiting. | | | | |
| Carcinogenicity Suspected Human Confirmed Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? No | Target Organs? Skin, eyes, respiratory system. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, existing respiratory problems (bronchitis, asthma) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Wash with large amounts of soap and water for a minimum of 15 minutes. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24- 48 hours for lung effects. If swallowed: Induce vomiting if person is conscious. Seek medical attention immediately. Do not induce vomiting or attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Do not generate dusts. Collect powder materials and deposit in sealed drum. | | | | |
| Preferred Waste Disposal Method Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, well ventilated area away from heat. Protect containers from physical damage. | | | | |
| Other Precautions and Warnings Bis (2-chloroethyl) ether must be stored to avoid contact with strong oxidizers since violent reactions can occur. Sources of ignition should be prohibited in areas where this chemical is used or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Bis (2-chloroethyl) ether is a suspected human carcinogen. Use a NIOSH/MSHA approved self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Butyl Rubber (or other non-permeable) | Eye Protection Chemical Goggles and Face Mask | Other Protective Clothing Protective Uniform or Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BIS (2-CHLOROETHYL) ETHER $(C_2H_4Cl)_2O$

CAS: 111-44-4

**IDENTIFICATION AND TYPICAL USES**

Bis (2-chloroethyl) ether appears as a colorless, clear liquid with a pungent odor like that of ethylene dichloride. It is one of several chloroalkyl ethers. It is a general solvent as well as a selective solvent for producing high-grade lubricating oils, textile scouring and cleansing, fulling compounds, wetting and penetrating compounds, paints, varnishes, lacquers, finish removers, spotting and dry cleaning, soil fumigant, intermediate and cross-linker in organic synthesis. It is also used in the production of glycol products, rubber, and insecticides.

RISK ASSESSMENT: HEALTH**General Assessment**

Bis (2-chloroethyl) ether is a questionable carcinogen (has cancer-causing properties) with experimental mutagenic and tumorigenic data reported. It is poisonous by *ingestion*, *inhalation*, and by *absorption* through the skin.

Exposure to its vapors can cause severe irritation to the eyes, nose, and respiratory tract. Exposure to 1000 ppm for 30 to 60 minutes may cause death within days as a result of lung damage or possibly pulmonary edema. At lower concentrations, death due to lung damage is still possible. Other organs, such as the kidney, liver, and brain, can also be affected to a lesser degree.

Eye contact with liquid bis (2 chloroethyl) ether can cause conjunctival irritation and injury to the cornea. On the skin, its irritation effect can range from mild irritation to first degree burns on short exposures. However, on prolonged contact, the liquid may be absorbed through the skin causing second degree burns and toxic systemic effects.

Ingestion of this compound in small amounts may produce nausea and vomiting. It can irritate the mouth and stomach and manifest symptoms of systemic poi-

soning. Large doses of 50 to 75 mL is expected to be fatal in humans.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to bis (2-chloroethyl) ether:

Skin: Severe irritation and possible burns. On prolonged exposure, can be absorbed though intact skin causing toxic systemic effects.

Eye: Severe conjunctival irritation and possible damage to the cornea.

Lung: Severe irritation to respiratory tract causing shortness of breath and cough. High acute exposures can be fatal due to a buildup of fluid in the lungs (pulmonary edema).

☼ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to bis (2-chloroethyl) ether and can last for months or even years:

Cancer Hazards: Bis (2-chloroethyl) ether may be a cancer causing agent in humans since it has been shown to cause liver cancer in animals.

Reproductive Hazard: According to the references, bis (2-chloroethyl) ether has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated low-dose exposures can irritate the lungs and result in bronchitis with symptoms of cough, phlegm, and shortness of breath. It may damage the liver and kidneys.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with bis (2-chloroethyl) ether. If a less toxic material or compound cannot be substituted for bis (2-chloroethyl)

ether, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of bis (2-chloroethyl) ether release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around bis (2-chloroethyl) ether. For any exposure level, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, rubber or other non-permeable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with bis (2-chloroethyl) ether.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where bis (2-chloroethyl) ether is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical test is recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Liver, kidney, and lung function tests.
- Consider chest X-ray after acute exposure.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other respiratory ailments, any exposure to bis (2-chloroethyl) ether can result in quicker and more devastating symptoms. Smokers should therefore avoid unprotected contact with this chemical.

Other methods to reduce exposure include:

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to bis (2-chloroethyl) ether and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of bis (2-chloroethyl) ether should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to bis (2-chloroethyl) ether, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by bis (2-chloroethyl) ether should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to bis (2-chloroethyl) ether.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of bis (2-chloroethyl) ether. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Bis (2-chloroethyl) ether is class II combustible. It will support combustion as well as intensify any fire. It is incompatible with oxidizers and can also react in the presence of water or steam to evolve toxic and corrosive fumes. Caution is always required in handling, storage, transportation, and disposal of bis (2-chloroethyl) ether. When heated to decomposition in air it emits very toxic chloride fumes. Emergency responders should be made aware of the presence of bis (2-chloroethyl) ether at any emergency response situation.

Bis (2-chloroethyl) ether may enter the environment through industrial effluents, spills, and possibly from the chlorination of water.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to bis (2-chloroethyl) ether. Bis (2-chloroethyl) ether has slight acute toxicity to aquatic life. It can kill or injure plants. Insufficient data are available to evaluate or predict the acute (short-term) effects of bis (2-chloroethyl) ether to birds or land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Bis (2-chloroethyl) ether has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate the chronic (long-term) effects of bis (2-chloroethyl) ether on plants, birds, or land animals.

💧 *Water Solubility*

Bis (2-chloroethyl) ether is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Bis (2-chloroethyl) ether is moderately persistent in water, with a half-life of between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Approximately 91.5% of bis (2-chloroethyl) ether will eventually end up in water, the remainder will end up in the air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of bis (2-chloroethyl) ether found in edible fish tissue is expected to be somewhat higher than the average concentration of bis (2-chloroethyl) ether found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of bis (2-chloroethyl) ether into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of bis (2-chloroethyl) ether should be segregated from other chemicals and to minimize the risk of cross-contamination. Bis (2-chloroethyl) ether must be stored to avoid contact with strong oxidizers, such as chlorine and bromine, and strong acids, such as sulfuric and chlorosulfonic, since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If bis (2-chloroethyl) ether should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of bis (2-chloroethyl) ether.

If bis (2-chloroethyl) ether is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Absorb spilled liquids with vermiculite, dry sand, or a similar material and deposit in sealed drum for disposal.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of bis (2-chloroethyl) ether as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.
- ☑ Remove all ignition sources.

RISK ASSESSMENT: BUSINESS
General Assessment

Accidents or mishaps involving bis (2-chloroethyl) ether can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? | Absorption (skin/eye)? | Ingestion? |
| | | X | X | X |
| Health Hazards INHALATION: Causes severe irritation to the eyes, nose, and throat in humans. Eye irritation can be moderate to severe with conjunctival inflammation likely and possible burns. SKIN & EYES: A severe skin irritant. Can pass through unbroken skin causing toxic systemic effects. Symptoms may include loss of appetite, weakness, nausea, and fatigue. INGESTION: Moderate poisoning effects; may cause nausea and vomiting. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Confirmed Human Confirmed Animal | 5th Annual Report | Group 1 | 29 CFR 1910.1008 | Skin, eyes, respiratory system; CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, existing respiratory problems (bronchitis, asthma) may be aggravated. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Wash with large amounts of soap and water for a minimum of 15 minutes. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects (pulmonary edema). If <u>swallowed:</u> Induce vomiting if person is conscious. Seek medical attention immediately. If unconscious or convulsing, do not induce vomiting or attempt to give anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Absorb liquids in vermiculite (or other absorbent) and place in sealed drum. | | | | |
| Preferred Waste Disposal Method Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, well ventilated area away from heat and moisture. Protect containers from physical damage. A regulated work area is required (per OSHA 29 CFR 1910.1008). | | | | |
| Other Precautions and Warnings Use only non-sparking tools and equipment. Use explosion-proof electrical equipment. Drinking fountains are not permitted in regulated areas. Automatic transfer of liquids should be done, if possible. Sources of ignition should be prohibited in areas where this chemical is used or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Bis (2-chloromethyl) ether is a confirmed carcinogen. For any exposure, use a NIOSH/MSHA approved self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | Eye Protection | | Other Protective Clothing | |
| Butyl Rubber (or other non-permeable) | Chemical Goggles and Face Mask | | Protective Uniform or Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BIS (2-CHLOROMETHYL) ETHER $(\text{CH}_2\text{Cl})_2\text{O}$

CAS: 542-88-1

**IDENTIFICATION AND TYPICAL USES**

Bis (2-chloromethyl) ether appears as a colorless, clear liquid with a suffocating odor. It is used as an intermediate in anionic-exchange quaternary resins. Its use as a chloromethylation reagent in industry is being discontinued because of its high carcinogenic properties. Exposure risks to this compound can arise during the use or production of chloromethyl methyl ether when the latter comes into contact with traces of water in the presence of hydrogen or hydroxyl ions. It may occur in trace amounts in chloromethyl methyl ether.

RISK ASSESSMENT: HEALTH**General Assessment**

Bis (2-chloromethyl) ether is highly toxic and a confirmed carcinogenic compound (has cancer-causing properties) with experimental testing also showing neoplastigenic and tumorigenic data. It is poisonous by *ingestion*, *inhalation*, and by *absorption* through the skin.

Exposure to its vapors can cause severe irritation to the eyes, nose, and respiratory tract. The primary target organ is the lungs. Exposure to 100 ppm of this compound in air for only a few minutes can cause death within days as a result of lung damage or possibly pulmonary edema. At lower concentrations, death due to lung damage is still possible.

Eye contact with liquid bis (2 chloromethyl) ether can cause conjunctival irritation and injury to the cornea. On the skin, its irritation effect can range from mild irritation to first degree burns on short exposures. However, on prolonged contact, the liquid may be absorbed through the skin causing second degree burns and toxic systemic effects.

Ingestion of this compound in small amounts may produce nausea and vomiting. It can irritate the mouth and stomach and manifest symptoms of systemic poi-

soning. Symptoms may include weakness, vomiting, loss of appetite, fatigue, irritability, and anxiety.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to bis (2-chloromethyl) ether:

Skin: Severe irritation and possible burns. On prolonged exposure, can be absorbed though intact skin causing toxic systemic effects.

Eye: Severe conjunctival irritation and possible damage to the cornea.

Lung: Severe irritation to respiratory tract and lungs causing shortness of breath and cough. High level acute exposures can be fatal due to a buildup of fluid in the lungs (pulmonary edema).

CNS: Effects include weakness, fatigue, nausea, loss of appetite, irritability, and anxiety.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to bis (2-chloromethyl) ether and can last for months or even years:

Cancer Hazards: Bis (2-chloromethyl) ether is a cancer causing agents in humans. It has been shown to cause lung cancer in humans and other cancers in experimental animals.

Reproductive Hazard: According to the references, bis (2-chloromethyl) ether has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Other than its known carcinogenic properties, bis (2-chloromethyl) ether has not been adequately tested to accurately determine its long-term health effects in humans.

🔒 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with bis (2-chloromethyl) ether. If a less toxic material or compound cannot be substituted for bis (2-chloromethyl) ether, then *engineering controls* are the most effective method of reducing exposure risk. An established, regulated control area must be enforced wherever this chemical is used, handled, or stored (per OSHA 29 CFR 1910.1008). The best protection is to enclose operations and/or provide local exhaust ventilation at the site of bis (2-chloromethyl) ether release. While not always operationally feasible, isolating operations within the regulated control area can also reduce exposure risk. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around bis (2-chloromethyl) ether. For any exposure level, a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, rubber or other non-permeable gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around bis (2-chloromethyl) ether.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions as per OSHA 29 CFR 1910.1200 (Hazard Communication) and 29 CFR 1910.1008 (bis-Chloromethyl Ether) prior to the first assignment in an area where bis (2-chloromethyl) ether is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical test is recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Consider chest X-ray after acute exposure.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other respiratory ailments, any exposure to

bis (2-chloroethy) ether can result in quicker and more devastating symptoms. Smokers should therefore avoid unprotected contact with this chemical.

Other methods to reduce exposure include:

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to bis (2-chloromethyl) ether and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of bis (2-chloromethyl) ether should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to bis (2-chloromethyl) ether, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by bis (2-chloromethyl) ether should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to bis (2-chloromethyl) ether.
- An established and regulated work area must be enforced wherever this chemical is used, handled, or stored. Drinking fountains should not be located in regulated areas. Additional precautions and requirements are established at OSHA 29 CFR 1910.1008.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of bis (2-chloromethyl) ether. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Bis (2-chloromethyl) ether is class IC flammable liquid presenting a moderate fire hazard. Also, on contact with water and moist air, toxic vapors of formaldehyde and corrosive hydrochloric acid are produced. Caution is always required in handling, stor-

age, transportation, and disposal of bis (2-chloromethyl) ether. When heated to decomposition in air it emits very toxic chloride fumes. Emergency responders should be made aware of the presence of bis (2-chloromethyl) ether at any emergency response situation.

Bis (2-chloromethyl) ether may enter the environment through industrial effluents and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to bis (2-chloromethyl) ether. Insufficient data are available to evaluate or predict the acute (short-term) effects of bis (2-chloromethyl) ether to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the chronic (long-term) effects of bis (2-chloromethyl) ether on aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Bis (2-chloromethyl) ether is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Bis (2-chloromethyl) ether is slightly persistent in water, with a half-life of between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Approximately 84% of bis (2-chloromethyl) ether will eventually end up in air, the remainder will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become con-

centrated in the tissues and internal organs of animals as well as humans.

The concentration of bis (2-chloromethyl) ether found in edible fish tissue is expected to be approximately the same as the average concentration of bis (2-chloromethyl) ether found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of bis (2-chloromethyl) ether into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of bis (2-chloromethyl) ether should be segregated from other chemicals to minimize the risk of cross-contamination. Bis (2-chloromethyl) ether must be stored to avoid contact with water and moisture. Containers should be protected from physical damage and stored to avoid contact with heat. Transfer of liquids between containers should be done automatically, if possible. Non-sparking tools and explosion-proof equipment should be used around bis (2-chloromethyl) ether.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If bis (2-chloromethyl) ether should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of bis (2-chloromethyl) ether.

If bis (2-chloromethyl) ether is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.

- ☑ Absorb spilled liquids with vermiculite, dry sand, or a similar material and deposit in sealed drum for disposal.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of bis (2-chloromethyl) ether as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.
- ☑ Remove all ignition sources.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving bis (2-chloromethyl) ether can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| | | | |
|---------------------------|-------------------------------|-------------------------------------|---|
| Flash Point (method used) | Not Applicable | Explosive Limits in Air % by Volume | LEL: Not Determined UEL: Not Determined |
| NFPA Classification | Non-combustible Liquid | Autoignition Temperature | |
| | | Not Applicable | |

Extinguishing Media

Use agent suitable to surrounding fire. Bromine itself will not burn, but it can greatly accelerate the burning of combustible materials.

Special Fire Fighting Procedures

Poisonous and corrosive fumes are emitted during fire. Wear full protective clothing and self-contained breathing apparatus. Heat will build pressure and may rupture closed storage containers. Keep fire-exposed containers cool with water spray. Continue to cool containers after fire is extinguished.

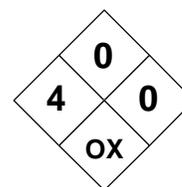

Unusual Fire and Explosion Hazards

Immediately withdraw if rising sound from venting device is heard or if fire is causing discoloration to the tank. Incompatible with a number of other chemicals. Violent and explosive reactions possible.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|--|--|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials. Mixtures with some chemicals can produce violent explosive reactions and fires. Avoid contact with heat or flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Organics, reducing agents, alkali metals, finely divided metals, hydrogen metal azides, organo metallics, ammonia, ordinary combustible (wood, paper, cotton, etc.), acetylene, acetaldehyde, acrolein, methanol. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of bromine will not occur. | | |

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Irritation of the respiratory passages and damaging to the lungs (pulmonary edema). ABSORPTION: Corrosive. Will irritate and even burn the skin and eyes. May cause acne and slow healing skin ulcers. INGESTION: Nausea, abdominal pain, diarrhea, headache. May be fatal. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system; skin; eyes; CNS |
| Medical Conditions Generally Aggravated by Exposure None reported. However, existing respiratory problems and skin disorders may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 30 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects (pulmonary edema). If <u>swallowed</u>: Seek medical attention immediately. Give the person all the water and milk they can drink. Do NOT induce vomiting. Keep person warm and at rest. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Add slowly to sodium hydroxide with stirring to form non-toxic, water soluble sodium bromide and bromate. Flush down drain with excess water. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals. Store in tightly closed containers in a cool, dark, well-ventilated area. Keep fire and flame away. Keep separate from organic, combustible, and readily oxidizable substances. Keep out of direct sunlight. | | | | |
| Other Precautions and Warnings Bulk storage of bromine is not recommended. If spilled, use anhydrous ammonia vapors from a safe distance to neutralize large quantities of bromine vapors. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Extremely corrosive and damaging to lung tissue. For any exposure, use a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Impermeable Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BROMINEBr₂

CAS: 7226-95-6

**IDENTIFICATION AND TYPICAL USES**

Bromine is a dark, reddish brown liquid with fuming vapors and a suffocating, irritating odor. It is used for bleaching fibers and silk; as a disinfectant for purifying water; in the manufacture of bromo compounds for dyes and pharmaceutical uses; as an analytical reagent; and in organic synthesis. It occurs in igneous rock and sea water. It is also used in the manufacture of ethylene dibromide (anti-knock gasoline); as a solvent, as an intermediate for fumigants (methyl bromide); as a fire retardant for plastics; in photography; and in shrink-proofing of wool.

RISK ASSESSMENT: HEALTH**General Assessment**

Bromine is a corrosive liquid and a moderately toxic substance. The target organs are the respiratory system (primarily the lungs), the eyes, and the central nervous system. The primary routes of exposure are *inhalation* of its vapors, *ingestion* of the liquid, and *skin contact*.

On inhalation, bromine is an irritant to respiratory passages and can cause injury to the lungs. Inhalation can be fatal by causing glottis to spasm and suffocation. Exposure may also result in chemical pneumonitis and pulmonary edema. A brief exposure (15 minutes) of 1000 ppm may be fatal in humans. However, the irritant qualities of bromine usually force the worker to leave the exposure area before serious poisoning can occur. Other symptoms are dizziness, headache, coughing, epistaxis, and lachrymation.

Ingestion of the liquid can cause nausea, abdominal pain, and diarrhea. It is corrosive to the skin and eyes, causing burns. Skin contact with the liquid or vapor produces a mild cooling sensation on first contact followed by a burning. If prolonged contact, it can produce deep burns. It may also cause acne or measles-

like eruptions on the face, trunk, and extremities that may turn to slow-healing, ulcer-like wounds.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to bromine:

Skin: Irritation, burns, possible ulcer-like wounds.

Eye: Irritation which can lead to permanent damage if allowed to remain in contact with the eyes.

Lung: Severe irritation of respiratory passages and lung tissue with coughing, nausea, and possible pulmonary edema (fluid on the lungs), which is a medical emergency and can be fatal.

CNS: Causes CNS depression with dizziness, nausea, headache, and related symptoms.

🕒 Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to bromine and can last for months or even years:

Cancer Hazards: According to the references, bromine is not known to cause cancer in humans or test animals. Long-term effects are not well documented since exposures to even low levels can not be tolerated for any appreciable length of time. The irritating properties of bromine make chronic effects improbable.

Reproduction: According to the references, bromine has not been adequately tested for its ability to adversely affect reproduction in test animals.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with bromine under any circumstances. A less toxic chemical should be substituted for a hazardous substance. If this is not possible or feasible, then *engineering controls* are the

most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around bromine. At virtually any exposure level, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with bromine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where bromine is used or stored. If an overexposure is suspected, the following is recommended:

- Lung function test.
- Chest X-ray.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to bromine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of bromine should be communicated to all potentially exposed workers.
- Never eat, drink, or smoke in areas where bromine is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of bromine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Bromine is considered a non-combustible liquid. However, as a powerful oxidizing agent, bromine will accelerate the burning of combustibles. These characteristics require special consideration during any emergency situation involving a leak or spill of bromine.

Should bromine ever come into contact with incompatible substances such as acids, fuels, aluminum, ammonia, hydrogen, acetylene, phosphorus, potassium, sodium, acetaldehyde, acrolein, acrylonitrile, or dimethyl formamide either during use, transportation, or storage, violent and explosive reactions are extremely possible. When heated with ammonia, the solution produces shock-sensitive nitrogen tribromide.

Destruction of bromine can be accomplished by:

- (1). Cautiously acidifying to pH 2 with sulfuric acid. Add a 50% excess of sodium bisulfite solution gradually with stirring at room temperature. Reaction should occur with an increase of temperature. If no increase occurs, add 10% excess of bisulfite followed by cautious addition of more sulfuric acid. Neutralize to pH 7 and flush the solution down the drain.
- (2). Add bromine slowly to sodium hydroxide solution with stirring. This results in the formation of mixtures of sodium bromide and bromate, which are water soluble and nontoxic and can be flushed down the drain with excess water.

Bromine can occur in the environment naturally as well as through manufacturing, unchecked discharge into effluents, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to bromine. There is insufficient data available to evaluate the short-term effects of bromine on aquatic life, birds, plants or terrestrial animals.

☛ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. There is insufficient data available to evaluate the long-term effects of bromine on aquatic life, birds, plants or terrestrial animals.

💧 *Water Solubility*

Bromine is moderately soluble in water. Concentrations of up to 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Bromine is highly persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. No data are available on the percentages of bromine that will eventually end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of bromine found in fish tissues is expected to be about the same as the average concentration of bromine in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of bromine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bromine should be shipped in quart glass bottles, nickel or Monel drums, or lead-lined tank cars. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If bromine should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of bromine. If bromine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools.
- ☑ If applicable, stop flow of leaking liquid. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air and repair or allow cylinder to empty.
- ☑ Keep bromine out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- ☑ It may be necessary to dispose of bromine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving bromine can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environ-

mental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

BROMINE PENTAFLUORIDE

BrF₅

CAS: 7789-30-2

IDENTIFICATION AND TYPICAL USES

Bromine pentafluoride is a colorless to pale-yellow, fuming liquid with a pungent odor. It will appear as a gas at temperatures above 105°F (40°C). It is usually shipped as a compressed gas. There is very little commercial usage of bromine pentafluoride. It is sometimes used as a fluorinating agent and an oxidizer.

RISK ASSESSMENT: HEALTH

General Assessment

Bromine pentafluoride is a corrosive liquid and a moderately toxic substance. The target organs are the respiratory system (primarily the lungs), the eyes, skin, liver, and the kidneys. The primary routes of exposure are *inhalation* of its vapors, *ingestion* of the liquid, and skin contact (although absorption as an entry route has not been documented in the references).

On inhalation, bromine pentafluoride is an irritant to respiratory passages and can cause injury to the lungs. Inhalation can be fatal by causing the glottis to spasm and suffocation. Exposure may also result in chemical pneumonitis and pulmonary edema (fluid in the lungs) which is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk. However, the irritant qualities of bromine pentafluoride usually force the worker to leave the exposure area before serious poisoning can occur. Other symptoms of exposure may include dizziness, headache, coughing, dyspnea, and lachrymation. The liver and/or kidneys may also be damaged as a result of exposure.

Ingestion of the liquid can cause serious mouth and esophageal burns. If swallowed, there may be nausea, abdominal pain, and diarrhea. It is corrosive to the skin and eyes, causing burns. Skin contact with the liquid or vapor produces a mild cooling sensation on first

contact followed by a burning. With prolonged contact, it can produce deep burns. Eye contact with the vapors or liquid may cause clouding of the cornea, swelling of the eyelids, and corneal necrosis (tissue death). The damage may be permanent.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to bromine pentafluoride:

Skin: Irritation, burns, possible ulcer-like wounds. Contact with the compressed gas may cause frostbite burns.

Eye: Irritation which can lead to permanent damage if allowed to remain in contact with the eyes.

Lung: Severe irritation of respiratory passages and lung tissue with coughing, nausea, and possible pulmonary edema (fluid on the lungs).

Other: Ingestion causes burning of the mouth and throat.

⚠ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to bromine pentafluoride and can last for months or even years:

Cancer Hazards: According to information presented in the references, bromine pentafluoride is not known to cause cancer in humans or test animals. Long-term effects are not well documented since exposures to even low levels cannot be tolerated for any appreciable length of time. The irritating properties of bromine pentafluoride make chronic exposure unlikely.

Reproduction: According to information presented in the references, bromine pentafluoride has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other: Although unlikely, chronic exposure to low levels of bromine pentafluoride may lead to nephrosis and hepatitis. Exposure to levels above 3 ppm has caused liver, kidney, and lung damage in test animals. It is not known if these effects will occur in humans.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with bromine pentafluoride under any circumstances. A less toxic chemical should be substituted for a hazardous substance. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around bromine pentafluoride. At virtually any exposure level, a self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand or other continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, chemically protective gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* making final glove selections.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with bromine pentafluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where bromine pentafluoride is used or stored.

If an overexposure is suspected, the following is recommended:

- ☑ Lung function test.
- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately following exposure due to delayed pulmonary edema).

Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, smokers exposed to bromine pentafluoride may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible exposure factors.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to bromine pentafluoride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of bromine pentafluoride should be communicated to all potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where bromine pentafluoride is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of bromine pentafluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Bromine pentafluoride is considered a non-combustible liquid. However, as a powerful oxidizing agent, bromine pentafluoride will accelerate the burning of combustibles. These characteristics require special consideration during any emergency situation involving a leak or spill of bromine pentafluoride.

Should bromine pentafluoride ever come into contact with incompatible substances such as acids, halogens, arsenic, selenium, sulfur, glass, organic materials, or water either during use, transportation, or storage, violent and explosive reactions are extremely possible.

Bromine pentafluoride can occur in the environment naturally as well as through manufacturing, unchecked discharge into effluents, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to bromine. There is insufficient data available to evaluate the short-term effects of bromine pentafluoride on aquatic life, birds, plants or terrestrial animals.

☪ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. There is insufficient data available to evaluate the long-term effects of bromine pentafluoride on aquatic life, birds, plants or terrestrial animals.

💧 *Water Solubility*

Bromine pentafluoride is highly reactive in water.

⌚ *Persistence in the Environment*

Since it is so readily reactive in contact with water, bromine pentafluoride is virtually non-persistent in the aquatic environment. No specific data are available on the percentages of bromine pentafluoride that will eventually end up in the environment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of bromine found in fish tissues is expected to be about the same as the average concentration of bromine in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill

to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of bromine pentafluoride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bromine pentafluoride is normally shipped as a compressed gas in cylinders. These should be properly restrained when in storage and protected from physical damage. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If bromine pentafluoride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly reactive in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of bromine pentafluoride. If bromine pentafluoride is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- If applicable, stop flow of leaking liquid. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air and repair or allow cylinder to empty.
- Keep bromine pentafluoride out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).

- ☑ It may be necessary to dispose of bromine pentafluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving bromine pentafluoride can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| 4 | 0 | 3 | OX W | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|---|--|--|
| Characterization Interhalogen Compound | RCRA Number D003 | EPA Class Characteristic (R) Waste |
| DOT Proper Shipping Name Bromine trifluoride | Chemical Abstract Service (CAS) Number 7787-71-5 | |
| DOT Hazard Class and Label Requirements Oxidizer, Corrosive, Poison | DOT Emergency Guide Code 44 | |
| DOT Identification Number UN 1746 | Chemical Formula BrF₃ | |

Synonyms

Not applicable.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|--|---|--|
| Bromine trifluoride (derivation: By fluorination of bromine at 176°F/80°C). Bromine trifluoride may contain some free bromine | PEL(fluorides): 2.5 mg/m³ STEL: Not Established | REL (fluorides): 2.5 mg/m³ STEL: Not Established | Not Determined | TLV (fluorides): 2.5 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 275°F (135°C) | Specific Gravity (H ₂ O = 1) 2.8 |
| Vapor Pressure (mm Hg) 18 at 102°F (39°C) | Molecular Weight 136.9 |
| Vapor Density (Air = 1) Not Found | Melting Point 48°F (9°C) |

Solubility

Violently decomposes in cold water (releases hydrogen fluoride gas).

Appearance and Odor

Colorless to pale yellow fuming liquid with a pungent odor. Long prisms may be solid.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-combustible Liquid | Autoignition Temperature Not Applicable |

Extinguishing Media

Use agent suitable to surrounding fire. Bromine trifluoride itself will not burn, but it can greatly accelerate the burning of combustible materials. It is a powerful oxidizer. Use water only on large fires.

Special Fire Fighting Procedures

Poisonous and corrosive fumes are emitted during fire. Wear full protective clothing and self-contained breathing apparatus. Heat will build pressure and may rupture closed storage containers. Keep fire-exposed containers cool with water spray. Continue to cool containers after fire is extinguished.

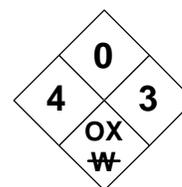

Unusual Fire and Explosion Hazards

Immediately withdraw if rising sound from venting device is heard or if fire is causing discoloration to the tank. Incompatible with a number of other chemicals. Violent and explosive reactions possible.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|--|---|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials. Mixtures with some chemicals can produce violent explosive reactions and fires. Avoid contact with heat or flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Water, ammonium halides, antimony trichloride oxide, most metallic chlorides, bismuth pentoxide, manganese iodate, rhodium tetrabromide, vanadium, sulfur, carbon monoxide, carbon tetrachloride. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of bromine trifluoride will not occur. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products When heated to decomposition, bromine trifluoride emits acrid, irritating smoke and fumes, including hydrogen fluoride and hydrogen bromide gases. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the respiratory passages and damaging to the lungs. There can be gasping, salivation, and respiratory distress subsequent to lung injury (pulmonary edema). EYES & SKIN: Corrosive. Will irritate and even burn the skin and eyes. May cause swelling of the eyelids, clouding of the cornea, lachrymation, and corneal necrosis (tissue destruction). INGESTION: Burning of the mouth and throat with nausea, abdominal pain, diarrhea, headache. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system; skin; eyes; liver, kidney. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, existing respiratory problems and skin disorders may be aggravated. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 30 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects (pulmonary edema). If <u>swallowed:</u> seek medical attention immediately. Give the person all the water and milk they can drink. Do NOT induce vomiting. Keep person warm and at rest. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals. Store in tightly closed containers in a cool, dark, well-ventilated area. Keep fire and flame away. Keep separate from organic, combustible, and readily oxidizable substances. Keep out of direct sunlight. Do NOT store near water. | | | | |
| Other Precautions and Warnings Bulk storage of bromine trifluoride is not recommended. Keep cylinders restrained properly and protect from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Extremely corrosive and damaging to lung tissue. For any exposure, use a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Impermeable Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BROMINE TRIFLUORIDEBrF₃

CAS: 7787-71-5

**IDENTIFICATION AND TYPICAL USES**

Bromine trifluoride is a colorless to pale-yellow, fuming liquid with a pungent odor. The commercial uses of bromine trifluoride are very limited. It is sometimes used as a fluorinating agent, as a solvent, and as an oxidizer.

RISK ASSESSMENT: HEALTH***General Assessment***

Bromine trifluoride is a corrosive liquid and a moderately toxic substance. The target organs are the respiratory system (primarily the lungs), the eyes, skin, liver, and the kidneys. The primary routes of exposure are *inhalation* of its vapors, *ingestion* of the liquid, and skin contact (although absorption as an entry route has not been documented in the references).

On inhalation, the action of bromine trifluoride is similar to that of bromine pentafluoride, but not quite as toxic. It is an irritant to respiratory passages and can cause injury to the lungs. Inhalation can be fatal by causing the glottis to spasm resulting in suffocation. Exposure may also result in chemical pneumonitis and pulmonary edema (fluid in the lungs) which is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk. However, the irritant qualities of bromine trifluoride usually force the worker to leave the exposure area before serious poisoning can occur. Other symptoms of exposure may include dizziness, headache, coughing, dyspnea, and lachrymation. The liver and/or kidneys may also be damaged as a result of exposure.

Ingestion of the liquid can cause serious mouth and esophageal burns. If swallowed, there may be nausea, abdominal pain, and diarrhea. It is corrosive to the skin and eyes, causing burns. Skin contact with the liquid or vapor produces a mild cooling sensation on first

contact followed by a burning. With prolonged contact, it can produce deep burns. Eye contact with the vapors or liquid may cause clouding of the cornea, swelling of the eyelids, and corneal necrosis (tissue death). The damage may be permanent.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to bromine trifluoride:

- Skin: Irritation, burns, possible ulcer-like wounds. Contact with the compressed gas may cause frostbite burns.
- Eye: Irritation which can lead to permanent damage if allowed to remain in contact with the eyes.
- Lung: Severe irritation of respiratory passages and lung tissue with coughing, nausea, and possible pulmonary edema (fluid on the lungs).
- Other: Ingestion causes burning of the mouth and throat.

●* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to bromine trifluoride and can last for months or even years:

Cancer Hazards: According to information presented in the references, bromine trifluoride is not known to cause cancer in humans or test animals. Long-term effects are not well documented since exposures to even low levels cannot be tolerated for any appreciable length of time. The irritating properties of bromine trifluoride make chronic exposure unlikely.

Reproduction: According to information presented in the references, bromine trifluoride has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other: Although unlikely, chronic exposure to low levels of bromine trifluoride may lead to nephrosis and hepatitis. Exposure to levels above 3 ppm has caused liver, kidney, and lung damage in test animals. It is not known if these effects will occur in humans.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with bromine trifluoride under any circumstances. A less toxic chemical should be substituted for a hazardous substance. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around bromine trifluoride. At virtually any exposure level, a self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand or other continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, chemically protective gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* making final glove selections.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with bromine trifluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where bromine trifluoride is used or stored.

If an overexposure is suspected, the following is recommended:

- ☑ Lung function test.
- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately following exposure due to delayed pulmonary edema).

Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, smokers exposed to bromine trifluoride may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible exposure factors.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to bromine trifluoride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of bromine trifluoride should be communicated to all potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where bromine trifluoride is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of bromine trifluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Bromine trifluoride is considered a non-combustible liquid. However, as a powerful oxidizing agent, bromine trifluoride will accelerate the burning of combustibles. These characteristics require special consideration during any emergency situation involving a leak or spill of bromine trifluoride.

Should bromine trifluoride ever come into contact with incompatible substances such as acids, halogens, arsenic, selenium, sulfur, glass, organic materials, or water either during use, transportation, or storage, violent and explosive reactions are extremely possible.

Bromine trifluoride can occur in the environment through manufacturing, unchecked discharge into effluents, and through spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to bromine. There is insufficient data available to evaluate the short-term effects of bromine trifluoride on aquatic life, birds, plants or terrestrial animals.

Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. There are insufficient data available to evaluate the long-term effects of bromine trifluoride on aquatic life, birds, plants or terrestrial animals.

Water Solubility

Bromine trifluoride is highly reactive in water.

Persistence in the Environment

Since it is so readily reactive in contact with water, bromine trifluoride is virtually non-persistent in the aquatic environment. No specific data are available on the percentages of bromine trifluoride that will eventually end up in the environment.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of bromine found in fish tissues is expected to be about the same as the average concentration of bromine in water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling

(per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of bromine trifluoride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bromine trifluoride is normally shipped as a compressed gas in cylinders. These should be properly restrained when in storage and protected from physical damage. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If bromine trifluoride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly reactive in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of bromine trifluoride. If bromine trifluoride is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- If applicable, stop flow of leaking liquid. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air and repair or allow cylinder to empty.
- Keep bromine trifluoride out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- It may be necessary to dispose of bromine trifluoride as a hazardous waste. The responsible state

agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving bromine trifluoride can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|--|---------------------------------|
| Characterization Halogenated Hydrocarbon | RCRA Number U225 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Bromoform | Chemical Abstract Service (CAS) Number 75-25-2 | |
| DOT Hazard Class and Label Requirements Poison B | DOT Emergency Guide Code 58 | |
| DOT Identification Number UN 2515 | Chemical Formula CHBr₃ | |

Synonyms

Methyl tribromide; tribromomethane; methenyl tribromide.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|--|---|--|
| Bromoform (derivation from: By heating acetone or ethanol with bromine and alkali hydroxide and recovery by distillation, similar to acetone process of chloroform). 1 ppm = 10.51 mg/m³ | PEL (skin): 0.5 ppm 5.2 mg/m³ STEL: Not Determined | REL (skin): 0.5 ppm 5.2 mg/m³ STEL: Not Determined | 850 ppm | TLV (skin): 0.5 ppm 5.2 mg/m³ STEL: Not Determined |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 291°F (144°C) | Specific Gravity (H ₂ O = 1) 2.89 |
| Vapor Pressure (mm Hg) 4.4 at 69°F (20°C) | Molecular Weight 252.8 |
| Vapor Density (Air = 1) Not Found | Melting Point 46°F (8°C) |

Solubility in Water

Slightly soluble in water; soluble in alcohol, ether, chloroform, benzene, solvent naptha, fixed and volatile oils.

Appearance and Odor

Colorless, heavy liquid with an odor and taste similar to that of chloroform.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non combustible Liquid | Autoignition Temperature Not Applicable |

Extinguishing Media

Extinguish fire using agent suitable for surrounding fire. Bromoform itself will not burn.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Heat will build pressure and may rupture closed storage containers. Keep fire-exposed containers cool with water spray. Continue to cool containers after fire is extinguished.

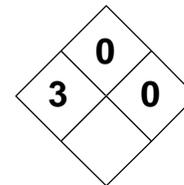

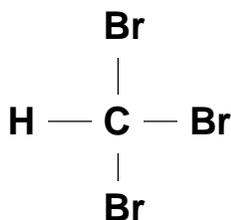

Unusual Fire and Explosion Hazards

Immediately withdraw if rising sound from venting device is heard or if fire is causing discoloration to the tank. Mixing with sodium/potassium alloy or lithium can cause explosion.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|--|--|---|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials. Keep away from heat. Explosive reaction in contact with crown ethers or potassium hydroxide. Violent reaction with acetone or bases. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Chemically active metals (such as lithium, sodium, potassium, calcium, powdered aluminum, zinc, magnesium), strong caustics, acetone, crown ethers, strong oxidizers and strong acids. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of bromoform will not occur. However, gradually decomposes, acquiring yellow color; air and light accelerate decomposition. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, bromoform emits highly toxic bromide fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Low exposures cause tearing, salivation, and the reddening of the face. Higher exposures cause dizziness, lightheadedness, and loss of consciousness. ABSORPTION: May irritate the skin causing rash or burning on contact. Will also burn the eyes. INGESTION: Poison by ingestion. Can be fatal. May adversely affect the liver on high exposures. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system; skin; eyes; CNS; liver, kidney |
| Medical Conditions Generally Aggravated by Exposure None reported. However, pre-existing respiratory ailments or skin disorders may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact</u>: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed</u>: Seek medical attention immediately. If person is conscious, give 2-3 glasses of milk or water. DO NOT induce vomiting unless directed to do so by a physician. Keep victim warm and at rest. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals. Store in tightly closed containers in a cool, dark, well-ventilated area. Do not store in direct sunlight. Keep heat, fire, and flame away. If possible, automatically transfer liquids between containers. | | | | |
| Other Precautions and Warnings Bulk storage of bromoform is not recommended. Explosive reactions can occur when bromoform comes into contact with bases, acids, or oxidizers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Where potential exists for exposure over 0.5 ppm, use a MSHA/NIOSH approved full facepiece respirator with an organic vapor cartridge. For high exposures, use a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Impermeable Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BROMOFORMCHBr₃

CAS: 75-25-2

**IDENTIFICATION AND TYPICAL USES**

Bromoform is a colorless, heavy liquid with a chloroform-like odor and taste. Used as an intermediate in organic synthesis of pharmaceuticals (sedative), in geological assaying, as a solvent for waxes, greases, and oils. It is used as an ingredient in fire-resistant chemicals and gauge fluid, and in separating mixtures of minerals. It is also used in the shipbuilding and aircraft industries.

RISK ASSESSMENT: HEALTH**General Assessment**

Bromoform is a poison by *ingestion* and moderately toxic by other routes of exposure. It is a questionable carcinogen with human mutation data also reported. It can damage the liver to a serious degree and even cause death. It has anesthetic properties similar to those of chloroform, but is not sufficiently volatile for inhalation purposes and is far too toxic for human use. As a sedative and an antitussive, its medicinal uses have caused numerous poisonings. It is a respiratory irritant and causes central nervous system depression.

Inhalation of its vapors in small amounts may cause irritation of the eyes, provoking lachrymation (tearing), salivation, and reddening of the face. Abuse can lead to addiction and related serious consequences.

Accidental *ingestion* has caused central nervous system depression with coma and loss of reflexes. Smaller doses have led to listlessness, lightheadedness, headache, and vertigo.

Bromoform can pass through unbroken skin (absorption) and enter the blood stream to cause toxic systemic effects including narcosis, lachrymation, loss of consciousness, dizziness, and salivation. Long-term

exposure by any route may damage the liver and adversely affect the kidneys.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to bromoform:

Skin: Irritation and burning on contact. Will pass through unbroken skin.

Eye: Irritation which can lead to injury if allowed to remain in contact with the eyes.

Lung: Irritation of the eyes, nose, and throat causing tears and drooling. Can also irritate the air passages causing cough and or phlegm.

CNS: Depression of the CNS causing symptoms of dizziness, listlessness, headache, nausea, loss of consciousness, and possible death.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to bromoform and can last for months or even years:

Cancer Hazards: There is inconclusive evidence that bromoform causes cancer in test animals and no evidence that it causes cancer in humans, based upon studies to date.

Reproduction: According to the references, bromoform has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Long-term exposure may lead to liver damage. There may also be adverse kidney effects resulting from overexposure. Repeated exposure can cause skin rash. Very irritating substances

such as bromoform may adversely affect the lungs. However, it is not known whether bromoform causes lung damage on long-term exposure.

🔒 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with bromoform. The best risk reduction measure is to use a less toxic chemical as a substitute for a bromoform. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around bromoform. For exposures over 0.5 ppm (8 hours), an MSHA/NIOSH approved chemical respirator with an organic vapor cartridge should be used. For higher exposures, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber or neoprene gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with bromoform.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where bromoform is used or stored.

For those with frequent or potentially high exposure, (half the PEL or greater, or significant skin contact), the following are recommended before beginning work and at regular times thereafter:

- ☑ Liver function tests.
- ☑ Lung function tests.

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to bromoform and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of bromoform should be communicated to all exposed and potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where bromoform is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of bromoform. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Bromoform is considered a non-flammable liquid. However, it is incompatible with a number of common materials (acids, bases, oxidizers, powdered metals, crown ethers, alkali earth metals) and contact can result in violent and explosive reactions. These characteristics require special consideration during any emergency situation involving a leak or spill of bromoform.

The proper disposal/destruction method for bromoform is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Bromoform can enter the environment through unchecked industrial discharges into effluents, municipal waste treatment plant discharges, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to bromoform. This chemi-

cal has moderate acute toxicity to aquatic life. No data are available on the short-term effects of bromoform to birds, plants or terrestrial animals.

☼ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Bromoform has moderate chronic toxicity to aquatic life. No data are available on the long-term effects of bromoform to plants, birds, or land animals.

💧 *Water Solubility*

Bromoform is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Bromoform is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Approximately 90% of bromoform will eventually end up in air with the remainder ending up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of bromoform found in fish tissues is expected to be somewhat higher than the average concentration of bromoform in water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of bromoform should be segregated from incompatible chemicals to minimize the risk of cross-

contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If bromoform should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of bromoform. If bromoform is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ If applicable, stop flow of leaking liquid. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air and repair or allow cylinder to empty.
- ☑ It may be necessary to dispose of bromoform as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving bromoform can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects (pulmonary edema). If swallowed: Seek medical attention immediately. Call poison control center for advice. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals. Store in tightly closed containers in a cool, dark, well-ventilated area. Do not store in direct sunlight. Keep heat, fire, and flame away. If possible, automatically transfer liquids between containers. | | | | |
| Other Precautions and Warnings Bulk storage of butyl acrylate is not recommended. Polymerization can be explosive. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Where potential exists for exposure over 10 ppm, use a MSHA/NIOSH approved full facepiece respirator with an organic vapor cartridge. For high exposures, use a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Impermeable Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

BUTYL ACRYLATEC₇H₁₂O₂

CAS: 141-32-2

**IDENTIFICATION AND TYPICAL USES**

Butyl acrylate is a colorless liquid with a rancid, plastic-like odor. It is used primarily as an intermediate in organic synthesis in the manufacture of certain polymers and copolymers which are, in turn, used as resins for textile and leather finishes, and in solvents, paints, binders, and emulsifiers.

RISK ASSESSMENT: HEALTH**General Assessment**

Butyl acrylate is moderately toxic by *ingestion*, *inhalation*, and by skin contact (*absorption*). The toxic and irritant properties of the compound are similar to those of methyl acrylate. The adverse health effects, however, may not be as severe.

Inhalation of its vapor will irritate the mucous membranes, nose, and throat. Very high exposures may damage the lungs, causing fluid buildup in a condition known as pulmonary edema. This can be fatal. Liver damage is also possible following high exposures.

Ingestion may cause upset stomach, nausea, vomiting, diarrhea, headache, and other adverse gastrointestinal reactions. Its toxicity on ingestion appears to be of low order, as compared to the other routes of exposure. Large doses, however, can cause serious and potentially damaging effects in the gastrointestinal tract and the liver.

Butyl acrylate is a skin and eye irritant. The liquid can cause corneal necrosis and other damage to the eye. It may also cause skin allergy. Once such an allergy develops, very low future exposures can cause itching and a skin rash. It can also pass through unbroken skin and enter the bloodstream to cause systemic toxic effects. Symptoms of exposure may include fatigue, sleep disturbances, malaise, general weakness, headache, nausea and vomiting.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to butyl acrylate:

- Skin:** Irritation and possible allergic reaction (rash and itching). Will pass through unbroken skin.
- Eye:** Irritation which can lead to injury and permanent damage if allowed to remain in contact with the eyes.
- Lung:** Irritation of the eyes, nose, throat and lungs. Can cause pulmonary edema (fluid buildup in the lungs) which is a medical emergency and can be fatal.
- CNS:** Insufficient evidence of nerve action on acute exposures. However, exposure to other chemicals having similar properties has resulted in adverse effects on the CNS.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to butyl acrylate and can last for months or even years:

Cancer Hazards: According to the references, butyl acrylate has not been adequately tested for its ability to cause cancer in test animals.

Reproduction: According to the references, butyl acrylate has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Very high or prolonged exposure may lead to lung and liver damage. This chemical has not been adequately evaluated to determine whether brain or other nerve damage could occur as a result of repeated exposure. However, exposure to many solvents and other petroleum-based chemicals causes a reduction in memory and concentration, personality

changes including withdrawal, irritability, fatigue, sleep disturbances, reduced coordination, and/or effects on nerves supplying internal organs (autonomic nerves), and/or nerves to the arms and legs (causing weakness and “pins and needles”).

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with butyl acrylate. The best risk reduction measure is to use a less toxic chemical as a substitute for a butyl acrylate. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around butyl acrylate. For exposures over 10 ppm (8 hours), an MSHA/NIOSH approved chemical respirator with an organic vapor cartridge should be used. For higher exposures, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber or neoprene gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with butyl acrylate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where butyl acrylate is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- ☑ Liver function tests.
- ☑ Lung function tests.
- ☑ Skin testing with dilute butyl acrylate to help diagnose allergy (performed by a qualified allergist).
- ☑ Interview for brain effects, including recent memory, mood (irritability, withdrawal), concentration,

headaches, malaise, and altered sleep patterns. Consider cerebellar, autonomic, and peripheral nervous system evaluation. Positive and borderline individuals should be referred for neuropsychological testing.

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to butyl acrylate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of butyl acrylate should be communicated to all exposed workers.
- ☑ Never eat, drink, or smoke in areas where butyl acrylate is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of butyl acrylate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Butyl acrylate is considered a class II combustible liquid (according to OSHA 29 CFR 1910.106) which presents a low to moderate fire hazard. However, because it is incompatible with a number of common materials, especially strong oxidizers and acids, contact can result in violent and explosive reactions. It can also form explosive peroxides in air and can react on exposure to sunlight. These characteristics require special consideration during any emergency situation involving a leak or spill of butyl acrylate.

The proper disposal/destruction method for butyl acrylate is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Butyl acrylate can enter the environment through unchecked industrial discharges into effluents and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to butyl acrylate. This chemical has moderate acute toxicity to aquatic life and high acute toxicity to birds. Insufficient data are available to evaluate or predict the short-term effects of butyl acrylate to plants or terrestrial animals.

🌱* *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Butyl acrylate has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of butyl acrylate to plants, birds, or land animals.

💧 *Water Solubility*

Butyl acrylate is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Butyl acrylate is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Approximately 98% of butyl acrylate will eventually end up in air with the remainder ending up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as in those of humans.

The concentration of butyl acrylate found in fish tissues is expected to be somewhat higher than the av-

erage concentration of butyl acrylate in water from which the fish was taken.

🔧 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of butyl acrylate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If butyl acrylate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of butyl acrylate. If butyl acrylate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ If applicable, stop flow of leaking liquid. If leak source is a cylinder and the leak can not be stopped in place, remove leaking cylinder to a safe place in the open air and repair or allow cylinder to empty. Send back to manufacturer for repair.
- ☑ It may be necessary to dispose of butyl acrylate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental

Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving butyl acrylate can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

***n*-BUTYRALDEHYDE**C₃H₇CHO

CAS: 123-72-8

**IDENTIFICATION AND TYPICAL USES**

n-Butyraldehyde is a clear, colorless mobile liquid with a pungent, nutty odor. It is used to make rubber accelerators, synthetic resins, high polymers, and plasticizers. It is also used as a solvent.

RISK ASSESSMENT: HEALTH***General Assessment***

n-Butyraldehyde is moderately toxic by *ingestion*, *inhalation*, and by skin contact (*absorption*). The toxicity of *n*-butyraldehyde is very low. The effect is primarily narcotic. Exposures to high levels (above 175 g/m³) for periods of 30 minutes or more may produce a general anesthetic effect, with possible action on the liver and bladder.

Inhalation may cause irritation of the nose and throat with possible nausea, vomiting, headaches, and loss of consciousness. High or prolonged exposures cause dizziness, delayed hypersensitivity, and light-headedness. Such exposures may also cause fluid to buildup in the lungs (a condition known as pulmonary edema), which is a medical emergency and can be fatal. Inhalation may also cause immunological effects in humans.

n-Butyraldehyde is a mild skin and eye irritant. However, prolonged contact may result in burns to the skin and eyes. Eye contact can also cause severe irritation and possible damage.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to *n*-butyraldehyde:

Skin: Irritation and possible burns.

Eye: Irritation and possible burns which can lead to injury and permanent damage if allowed to remain in contact with the eyes.

Lung: Irritation of the nose, throat, and lungs. Can cause pulmonary edema (fluid buildup in the lungs) which can be fatal.

CNS: Insufficient evidence of nerve action on acute exposures. However, it is reported that exposures to high levels results in an anesthetic effect on test animals.

☛ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to *n*-butyraldehyde and can last for months or even years:

Cancer Hazards: According to the references, *n*-butyraldehyde has not been adequately tested for its ability to cause cancer in test animals.

Reproduction: According to the references, *n*-butyraldehyde has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: *n*-Butyraldehyde has not been tested for other chronic (long-term) health effects.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with *n*-butyraldehyde, especially skin and eye contact. The best risk reduction measure is to use a less toxic chemical as a substitute for a *n*-butyraldehyde. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around *n*-butyraldehyde. No exposure levels have been established for this chemical. However, this does not mean that unprotected exposure is acceptable. For low level, infrequent exposures, an MSHA/NIOSH approved chemical respirator with an organic vapor cartridge should be used. For higher exposures or when exposure levels are not known, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber or neoprene gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with *n*-butyraldehyde.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *n*-butyraldehyde is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- Consider chest X-ray after acute exposure.

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- Wash thoroughly immediately after exposure to *n*-butyraldehyde and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on

the health and safety hazards of *n*-butyraldehyde should be communicated to all exposed and potentially exposed workers.

- Never eat, drink, or smoke in areas where *n*-butyraldehyde is used, handled or stored.
- Where possible, automatically pump liquid *n*-butyraldehyde from drums or other containers to process containers.
- Before entering a confined space where *n*-butyraldehyde may be present, verify that an explosive concentration does not exist.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *n*-butyraldehyde. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). *n*-Butyraldehyde is considered a class IB flammable liquid (according to OSHA 29 CFR 1910.106) which presents a serious fire hazard concern. Also, because it is incompatible with a number of common materials, especially strong oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and acids (such as hydrochloric, chlorosulfonic, sulfuric, and nitric), contact can result in violent and explosive reactions. It can also form explosive mixtures in air. These characteristics require special consideration during any emergency situation involving a leak or spill of *n*-butyraldehyde.

n-Butyraldehyde can enter the environment through unchecked industrial discharges into effluents and through spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *n*-butyraldehyde. This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of *n*-butyraldehyde to plants, birds, or terrestrial animals.

☛ **Chronic Ecological Effects**

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

n-Butyraldehyde has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of *n*-butyraldehyde to plants, birds, or land animals.

💧 **Water Solubility**

n-Butyraldehyde is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 **Persistence in the Environment**

n-Butyraldehyde is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Approximately 88% of *n*-butyraldehyde will eventually end up in air with the remainder ending up in water.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of *n*-butyraldehyde found in fish tissues is expected to be about the same the average concentration of *n*-butyraldehyde in water from which the fish was taken.

🚫 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *n*-butyraldehyde should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire

protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Explosion-proof equipment is recommended in areas where *n*-butyraldehyde is used, handled, or stored.

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If *n*-butyraldehyde should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *n*-butyraldehyde. If *n*-butyraldehyde is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ If applicable, stop flow of leaking liquid. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air and repair or allow cylinder to empty.
- ☑ It may be necessary to dispose of *n*-butyraldehyde as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving *n*-butyraldehyde can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or

environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

May cause fluid buildup in the lungs (pulmonary edema). EYE & SKIN: Possible irritation to the skin and eyes. An allergen. INGESTION: A poison by ingestion. May cause toxic systemic effects. | | | | |
| Carcinogenicity | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2A | OSHA Regulated? 29 CFR 1910.1027 | Target Organs? Lungs, liver, kidney, bone, skin, eye, prostate. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, persons with existing lung dysfunction may experience effects quicker. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 24 - 48 hours for lung effects (pulmonary edema likely). If swallowed: Seek medical attention immediately. Call poison control center for advice. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in most convenient and safe manner and deposit in sealed containers. Dry sweep not recommended. Use HEPA vacuum. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by applicable regulations. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store near heat or other sources of ignition. A regulated, marked area must be established where cadmium is used, handled, or stored. | | | | |
| Other Precautions and Warnings Store in tightly sealed drums in a cool, dry, well ventilated place. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For any exposure level use a NIOSH/MSHA approved self-contained breathing apparatus with full face-piece operated in positive pressure mode. Cadmium is a carcinogen. Inhalation of its vapors must be avoided. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Apron, Boots (avoid skin contact) | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CADMIUM

Cd

CAS: 13967-90-3

**IDENTIFICATION AND TYPICAL USES**

Cadmium is a silver-white, blue-tinged lustrous, malleable metal with no odor. Also appears as a gray-black powder. It is used in electroplating, in nickel-cadmium storage batteries, as a coating agent for other metals, in bearing and low-melting point alloys, and as control rods in nuclear reactors. Cadmium compounds have numerous applications, including dyeing and printing textiles, as TV phosphors, as pigments and enamels, in fire protection systems, in power transmission wires, in photography, as a fungicide additive, in electrodes for cadmium vapor lamps and photoelectric cells, and in semiconductors and solar cells.

RISK ASSESSMENT: HEALTH***General Assessment***

There are several reports in the references of cadmium poisoning and human death. Cadmium is a confirmed human carcinogen with experimental carcinogenic, tumorigenic, mutagenic, and neoplastigenic data also being reported. Cadmium can enter the body by *inhalation* of its dusts or fumes, or by *ingestion*. In humans, the toxic symptoms of acute exposure may include nausea, vomiting, diarrhea, abdominal pain, muscular ache, salivation, and shock. In addition, inhalation of its fumes and dusts can cause coughing, tightness in the chest, respiratory distress, congestion of the lungs, and broncho-pneumonia. Inhalation causes an excess of protein to be present in the urine. Exposure to its fumes or dusts of 30 minutes to amounts of as little as 50 mg/m³ can be fatal to humans.

Cadmium is a poison that is accumulated in the liver and kidneys. Chronic poisoning can therefore lead to liver and kidney damage. Its biological half-life in humans is estimated at approximately 20-30 years. Cadmium is also known to cause the so-called "itai, itai" disease, (a bone disease with kidney malfunction).

During welding or grinding operations, cadmium fumes are generated. Inhalation can cause a flu-like illness with chills, headache, aching and/or fever. This can lead to more serious illness.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to cadmium:

Skin: Possible irritation may occur.

Eye: Irritation and possible damage on contact.

Lung: High exposures can cause rapid and severe lung damage, with shortness of breath, chest pain, cough, and a possible buildup of fluids in the lungs (pulmonary edema), which is a medical emergency. In serious cases, death or permanent lung damage can occur. Illness can be delayed for 48 hours, allowing overexposures to occur without warning signs.

Other: High exposure to cadmium may cause nausea, cramps, salivation, vomiting, and diarrhea.

●* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to cadmium and can last for months or even years:

Cancer Hazards: Cadmium, and especially cadmium oxide, is a confirmed human carcinogen. There is sufficient evidence that it causes prostate and kidney cancer in humans. It has also been shown to cause lung and testes cancer in animals.

Reproductive Hazard: Cadmium is a known teratogen in animals and a probable teratogen in humans. It may damage the testes (male reproductive glands) and may affect the female reproductive cycle.

Other Chronic Effects: Repeated low level exposures can cause permanent kidney damage which can go unnoticed for some time without proper testing. The kidney damage can lead to kidney stones and other more serious health problems. Emphysema or lung scarring can occur from a single high exposure or repeated low exposures. Long-term exposure can cause anemia, loss of sense of smell, fatigue, and/or yellow staining of the teeth.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cadmium dusts or powders. If a less toxic material or compound cannot be substituted for cadmium, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of cadmium dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cadmium. At any exposure level, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cadmium. As per OSHA 29 CFR 1910.1027 (Cadmium), a regulated and controlled work area must be established wherever cadmium is used, handled, or stored. Unauthorized personnel are not permitted in this area.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cadmium is used or stored.

Before beginning employment working with cadmium, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

Lung function test.

- Urine test for cadmium (levels should be less than 10 micrograms per liter of urine).
- Urine test for “low molecular weight proteins” to detect kidney damage.
- Complete urinalysis (UA).

If overexposure is suspected or symptoms develop, the following additional test is recommended:

- Complete blood count (CBC).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Cigarette smoke contains some cadmium. Because it is hard for the body to eliminate cadmium, it tends to build up in the body. Any workplace exposure will therefore add to any existing levels. Smoking or carrying cigarettes near cadmium increases release of toxic fumes. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to cadmium may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with cadmium powders.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to cadmium and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cadmium should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cadmium, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by cadmium should change into clean clothes before leaving work. Contaminated work clothing should

be laundered only by individuals who have been informed of the hazards of exposure to cadmium.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Cadmium is a naturally occurring element. However, industrial uses place the environment at risk of exposure during transportation, storage, disposal, or destruction of cadmium compounds. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where cadmium contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its bulk form, cadmium is considered a non-combustible solid. However, its dusts can react explosively and present a serious fire hazard. Because it is incompatible with many commodities, including some other common metals, extreme caution is required in handling, storage, transportation, and disposal of cadmium. These characteristics also require special consideration during any emergency situation involving a leak or spill of cadmium powder or dust. Should cadmium ever come into contact with any incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible. The dust ignites spontaneously in air and is flammable and explosive when exposed to heat, flame, or by chemical reaction with oxidizing agents, metals (zinc, selenium, tellurium, elements of sulfur), strong oxidizers, and acids (explodes on contact with hydrazoic acid).

Cadmium can enter the environment from industrial and municipal waste treatment plant discharges and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cadmium. In fresh water, cadmium toxicity is influenced by water hardness. The harder the water, the lower the toxicity. Cadmium has high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of cadmium to plants, birds, or land animals.

☠ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Cadmium has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of cadmium to plants, birds, or land animals.

💧 Water Solubility

Most of the cadmium compounds are slightly soluble in water. Concentrations of less than 1 milligram will mix with a liter of water.

⌚ Persistence in the Environment

Cadmium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of cadmium persistence in the aquatic or terrestrial environments.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cadmium found in fish tissues is expected to be much higher than the average concentration of cadmium in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of cadmium dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cadmium should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If cadmium should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cadmium. If cadmium powder is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources.
- Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- It may be necessary to dispose of cadmium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cadmium can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-

designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CADMIUM ACETATEC₂H₄O₂•1/2Cd

CAS: 543-90-8

**IDENTIFICATION AND TYPICAL USES**

Cadmium acetate appears as a monoclinic, sugar or sand-like colorless, crystalline solid with an odor of acetic acid. It is used in electroplating, dyeing and printing textiles, in ceramics, and to make other acetate compounds.

RISK ASSESSMENT: HEALTH**General Assessment**

There are several reports in the references of cadmium poisoning and human death. Cadmium acetate is a confirmed human carcinogen with experimental carcinogenic, tumorigenic, mutagenic, and neoplastigenic data also being reported. Cadmium acetate can enter the body by *inhalation* of its dusts or fumes, or by *ingestion*. In humans, the toxic symptoms of acute exposure may include nausea, vomiting, diarrhea, abdominal pain, muscular ache, salivation, and shock. In addition, inhalation of its fumes and dusts can cause cough, tightness in the chest, respiratory distress, congestion of the lungs, and broncho-pneumonia. Inhalation causes an excess of protein to be present in the urine. Exposure to its fumes or dusts of 30 minutes to amounts of as little as 50 mg/m³ can be fatal to humans.

Cadmium acetate is a poison that accumulates in the liver and kidneys. Chronic poisoning can therefore lead to liver and kidney damage, emphysema, low blood sugar, and/or loss of smell. Serious damage can occur at levels below the OSHA PEL. Its biological half-life in humans is estimated at approximately 20-30 years. Cadmium is also known to cause the so-called "itai, itai" disease, which is a bone disease together with kidney malfunction.

During welding or grinding operations, cadmium fumes are generated. Inhalation can cause a flu-like illness with chills, headache, aching and/or fever. This can lead to more serious illness.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cadmium:

Skin: Possible irritation may occur.

Eye: Irritation and possible damage on contact.

Lung: High exposures can cause rapid and severe lung damage, with shortness of breath, chest pain, cough, and a possible buildup of fluids in the lungs (pulmonary edema), which is a medical emergency. In serious cases, death or permanent lung damage can occur. Illness can be delayed for 4 to 8 hours, allowing overexposures to occur without warning signs.

Other: High exposure to cadmium may cause nausea, cramps, salivation, vomiting, and diarrhea.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cadmium and can last for months or even years:

Cancer Hazards: Cadmium acetate is a confirmed human carcinogen. There is sufficient evidence that it causes prostate and kidney cancer in humans. It has also been shown to cause lung and testes cancer in test animals.

Reproductive Hazard: Cadmium acetate should be handled as a potential teratogenic agent and reproductive hazard since several related cadmium compounds are known teratogens and decreases fertility in males and females. It may damage the testes (male reproductive glands) and may affect the female reproductive cycle in humans.

Other Chronic Effects: Repeated low level exposures can cause permanent kidney damage which can go unnoticed for some time without proper testing. The kid-

ney damage can lead to kidney stones and other more serious health problems. Emphysema or lung scarring can occur from a single high exposure or repeated low exposures. Long-term exposure can cause anemia, loss of sense of smell, fatigue, and/or yellow staining of the teeth.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cadmium acetate dusts or powders. If a less toxic material or compound cannot be substituted for cadmium acetate, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of cadmium dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cadmium. At any exposure level, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cadmium acetate. As per OSHA 29 CFR 1910.1027 (Cadmium), a regulated and controlled work area must be established wherever cadmium is used, handled, or stored. Unauthorized personnel are not permitted in this area.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cadmium acetate is used or stored.

Before beginning employment working with cadmium acetate, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

- ☑ Lung function test.
- ☑ Urine test for cadmium (levels should be less than 10 micrograms per liter of urine).

- ☑ Urine test for “low molecular weight proteins” to detect kidney damage.
- ☑ Complete urinalysis (UA).

If overexposure is suspected or symptoms develop, the following additional test is recommended:

- ☑ Complete blood count (CBC).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Cigarette smoke contains some cadmium. Because it is hard for the body to eliminate cadmium, it tends to buildup in the body. Any workplace exposure will therefore add to any existing levels. Smoking or carrying cigarettes near cadmium acetate increases release of toxic fumes. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to cadmium acetate may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with cadmium acetate powders.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to cadmium acetate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cadmium acetate should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cadmium acetate, emergency shower facilities should also be provided in the immediate area.
- ☑ Workers whose clothing has been contaminated by cadmium acetate should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have

been informed of the hazards of exposure to cadmium acetate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Cadmium are naturally occurring element. However, industrial uses place the environment at risk of exposure during transportation, storage, disposal, or destruction of cadmium compounds, including cadmium acetate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where cadmium acetate contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its bulk form, cadmium acetate is considered a non-combustible solid. However, its dusts can react explosively and present a serious fire hazard. Because it is incompatible with many commodities, including some other common metals, extreme caution is required in handling, storage, transportation, and disposal of cadmium. These characteristics also require special consideration during any emergency situation involving a leak or spill of cadmium acetate powder or dust. Should cadmium acetate ever come into contact with any incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible. Cadmium acetate dust is flammable and explosive when exposed to heat, flame, or by chemical reaction with oxidizing agents, metals (zinc, selenium, tellurium, elements of sulfur), strong oxidizers, and acids.

Cadmium can enter the environment from industrial and municipal waste treatment plant discharges and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cadmium. In fresh water, cadmium toxicity is influenced by water hardness. The harder the water, the lower the toxicity. Cadmium has high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of cadmium to plants, birds, or land animals.

☠ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Cadmium has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of cadmium to plants, birds, or land animals.

💧 Water Solubility

Most of the cadmium compounds are slightly soluble in water. Concentrations of less than 1 milligram will mix with a liter of water.

⌚ Persistence in the Environment

Cadmium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of cadmium persistence in the aquatic or terrestrial environments.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cadmium found in fish tissues is expected to be much higher than the average concentration of cadmium in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of cadmium acetate dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cadmium acetate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If cadmium acetate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cadmium acetate. If cadmium acetate powder is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of cadmium acetate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cadmium acetate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔍 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-

designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CADMIUM BROMIDE

Br₂Cd

CAS: 7789-42-6

IDENTIFICATION AND TYPICAL USES

Cadmium bromide appears as a white to yellow efflorescent, hygroscopic, pearly hexagonal, crystalline solid in powder form. It is used in photography, process engraving, and lithography.

RISK ASSESSMENT: HEALTH

General Assessment

There are several reports in the references of cadmium compounds causing poisoning and human death. Cadmium bromide is a confirmed human carcinogen with experimental carcinogenic, tumorigenic, mutagenic, and neoplastigenic data also being reported. Cadmium bromide can enter the body by *inhalation* of its dusts or fumes, or by *ingestion*. In humans, the toxic symptoms of acute exposure may include nausea, vomiting, diarrhea, abdominal pain, muscular ache, salivation, and shock. In addition, inhalation of its fumes and dusts can cause cough, tightness in the chest, respiratory distress, congestion of the lungs, and broncho-pneumonia. Inhalation causes an excess of protein to be present in the urine. Exposure to its fumes or dusts of 30 minutes to amounts of as little as 50 mg/m³ can be fatal to humans.

Cadmium bromide is a poison that accumulates in the liver and kidneys. Chronic poisoning can therefore lead to liver and kidney damage, emphysema, low blood sugar, and/or loss of smell. Serious damage can occur at levels below the OSHA PEL. Its biological half-life in humans is estimated at approximately 20-30 years. Cadmium is also known to cause the so-called "itai, itai" disease, which is a bone disease together with kidney malfunction.

During welding or grinding operations, cadmium fumes are generated. Inhalation can cause a flu-like illness with chills, headache, aching and/or fever. This can lead to more serious illness.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to cadmium:

Skin: Possible irritation may occur.

Eye: Irritation and possible damage on contact.

Lung: High exposures can cause rapid and severe lung damage, with shortness of breath, chest pain, cough, and a possible buildup of fluids in the lungs (pulmonary edema), which is a medical emergency. In serious cases, death or permanent lung damage can occur. Illness can be delayed for 4 to 8 hours, allowing overexposures to occur without warning signs.

Other: High exposure to cadmium may cause nausea, cramps, salivation, vomiting, and diarrhea.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to cadmium and can last for months or even years:

Cancer Hazards: While cadmium bromide has not specifically been tested for its ability to cause cancer, it should be handled as a carcinogen since several related cadmium compounds are known cancer agents.

Reproductive Hazard: Cadmium bromide should be handled as a potential teratogenic agent and reproductive hazard since several related cadmium compounds are known teratogens and decreases fertility in males and females. It may damage the testes (male reproductive glands) and may affect the female reproductive cycle.

Other Chronic Effects: Repeated low level exposures can cause permanent kidney damage which can go unnoticed for some time without proper testing. The kidney damage can lead to kidney stones and other more

serious health problems. Emphysema or lung scarring can occur from a single high exposure or repeated low exposures. Long-term exposure can cause anemia, loss of sense of smell, fatigue, and/or yellow staining of the teeth.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cadmium bromide dusts or powders. If a less toxic material or compound cannot be substituted for cadmium bromide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of cadmium dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cadmium. At any exposure level, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selection are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cadmium bromide. As per OSHA 29 CFR 1910.1027 (Cadmium), a regulated and controlled work area must be established wherever cadmium is used, handled, or stored. Unauthorized personnel are not permitted in this area.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cadmium bromide is used or stored.

Before beginning employment working with cadmium bromide, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

- ☑ Lung function test.
- ☑ Urine test for cadmium (levels should be less than 10 micrograms per liter of urine).

- ☑ Urine test for “low molecular weight proteins” to detect kidney damage.
- ☑ Complete urinalysis (UA).

If overexposure is suspected or symptoms develop, the following additional test is recommended:

- ☑ Complete blood count (CBC).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Cigarette smoke contains some cadmium. Because it is hard for the body to eliminate cadmium, it tends to buildup in the body. Any workplace exposure will therefore add to any existing levels. Smoking or carrying cigarettes near cadmium bromide increases release of toxic fumes. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to cadmium bromide may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with cadmium bromide powders.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to cadmium bromide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cadmium bromide should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cadmium bromide, emergency shower facilities should be provided.
- ☑ Workers whose clothing has been contaminated by cadmium bromide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to cadmium bromide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Cadmium are naturally occurring element. However, industrial uses place the environment at risk of exposure during transportation, storage, disposal, or destruction of cadmium compounds, including cadmium bromide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where cadmium bromide contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its bulk form, cadmium bromide is considered a non-combustible solid. However, its dusts can react explosively and present a serious fire hazard. Because it is incompatible with many commodities, including some other common metals, extreme caution is required in handling, storage, transportation, and disposal of cadmium. These characteristics also require special consideration during any emergency situation involving a leak or spill of cadmium bromide powder or dust. Should cadmium bromide ever come into contact with any incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible. Cadmium bromide dust is flammable and explosive when exposed to heat, flame, or by chemical reaction with oxidizing agents, metals (zinc, selenium, tellurium, elements of sulfur), strong oxidizers, and acids.

Cadmium can enter the environment from industrial and municipal waste treatment plant discharges and from spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cadmium. In fresh water, cadmium toxicity is influenced by water hardness. The harder the water, the lower the toxicity. Cadmium has high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of cadmium to plants, birds, or land animals.

Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and

changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Cadmium has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of cadmium to plants, birds, or land animals.

Water Solubility

Most of the cadmium compounds are slightly soluble in water. Concentrations of less than 1 milligram will mix with a liter of water.

Persistence in the Environment

Cadmium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of cadmium persistence in the aquatic or terrestrial environments.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cadmium found in fish tissues is expected to be much higher than the average concentration of cadmium in the water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of cadmium bromide dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cadmium bromide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If cad-

mium bromide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cadmium bromide. If cadmium bromide powder is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of cadmium bromide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cadmium bromide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| NFPA Classification Non-Combustible Solid | | Autoignition Temperature Not Found | | | | |
| Extinguishing Media For dust, use carbon dioxide or dry chemical. For metal, use agent suitable to surrounding fire. Avoid use of water. A class "D" extinguisher may be required. | | | | | | |
| Special Fire Fighting Procedures Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Do not release runoff to sewers or waterways. | | | | | | |
| Unusual Fire and Explosion Hazards The dust may form flammable mixtures air and can be flammable and explosive when exposed to heat, flame. Avoid contact with other metals. | | | | | | |

| SECTION V - REACTIVITY DATA | | | | |
|--|---|---|--|--|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials. Keep cadmium nitrate powders away from open flame, heat, or other sources of ignition. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) No specific incompatible materials cited. However, keep away from other metals and sources of ignition, heat, and flame. | | |
| Hazardous Polymerization | | Conditions to Avoid Hazardous polymerization of cadmium nitrate will not occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, cadmium nitrate can produce toxic and irritating fumes of cadmium and nitrogen oxides. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin/eye)? | Ingestion? X | |
| Health Hazards INHALATION: Breathing the dusts of cadmium may cause cough, tightness in chest, respiratory distress, congestion of the lungs, vomiting, nausea, and headache. Large doses can be fatal. May cause fluid buildup in the lungs (pulmonary edema), liver, and kidney damage. EYES & SKIN: Possible irritation to the skin and eyes. An potential allergen. INGESTION: A poison by ingestion. May cause toxic systemic effects with nausea and vomiting. | | | | |
| Carcinogenicity | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2A | OSHA Regulated? 29 CFR 1910.1027 | Target Organs? Lungs, liver, kidney, skin, eyes, prostate. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, persons with existing lung dysfunction may experience effects quicker. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 24-48 hours for lung effects (pulmonary edema likely). If swallowed: Seek medical attention immediately. Call poison control center for advice. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in most convenient and safe manner and deposit in sealed containers. Dry sweep not recommended. Use HEPA vacuum. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by applicable regulations. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store near heat or other sources of ignition. A regulated, marked area must be established where cadmium nitrate is used, handled, or stored. Keep away from moisture. | | | | |
| Other Precautions and Warnings Store in tightly sealed drums in a cool, dry, well ventilated place. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) For any exposure use self-contained breathing apparatus or a supplied-air respirator with full facepiece operated in positive pressure mode. Cadmium is a carcinogen. Inhalation of its vapors must be avoided. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Apron, Boots (avoid skin contact) | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CADMIUM NITRATECd(NO₃)₂ (anhydrous) CAS: 13967-90-3Cd(NO₃)₂•4HOH (tetrahydrate) CAS: 10022-68-1**IDENTIFICATION AND TYPICAL USES**

Cadmium nitrate (anhydrous) appears as odorless, white amorphous pieces and the tetrahydrate appears as hygroscopic needles. It is used in the manufacture of cadmium salts and photographic emulsions, for the cooling of glass and porcelain, and as a laboratory reagent.

RISK ASSESSMENT: HEALTH**General Assessment**

There are several reports in the references of cadmium poisoning and human death. Cadmium is a confirmed human carcinogen with experimental carcinogenic, tumorigenic, mutagenic, and neoplastigenic data also being reported. Cadmium nitrate can enter the body by *inhalation* of its dusts or fumes, or by *ingestion*. In humans, the toxic symptoms of acute exposure may include nausea, vomiting, diarrhea, abdominal pain, muscular ache, salivation, and shock. In addition, inhalation of its fumes and dusts can cause cough, tightness in the chest, respiratory distress, congestion of the lungs, broncho-pneumonia, and/or pulmonary edema (fluid in the lungs), which can be fatal. Symptoms may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk. Inhalation of cadmium causes an excess of protein to be present in the urine (proteinuria). Exposure to its fumes or dusts of 30 minutes to amounts of as little as 50 mg/m³ can be fatal to humans.

Cadmium is a poison that is accumulated in the liver and kidneys. Chronic poisoning can therefore lead to liver and kidney damage. Its biological half-life in humans is estimated at approximately 20-30 years. Cadmium is also known to cause the so-called "itai, itai" disease, which is a bone disease together with kidney malfunction.

During welding or grinding operations, cadmium fumes are generated. Inhalation can cause a flu-like illness with chills, headache, aching and/or fever. This can lead to more serious illness.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cadmium nitrate:

Skin: Possible irritation may occur.

Eye: Irritation and possible damage on contact.

Lung: High exposures can cause rapid and severe lung damage, with shortness of breath, chest pain, cough, and a possible buildup of fluids in the lungs (pulmonary edema), which is a medical emergency. In serious cases, death or permanent lung damage may occur.

Other: High exposure to cadmium nitrate may cause nausea, cramps, salivation, vomiting, and diarrhea.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cadmium nitrate and can last for months or even years:

Cancer Hazards: Cadmium, and especially cadmium oxide, is a confirmed human carcinogen. There is sufficient evidence that it causes prostate and kidney cancer in humans. It has also been shown to cause lung and testes cancer in animals.

Reproductive Hazard: Cadmium is a probable teratogen in humans. It may damage the testes (male reproductive glands) and may affect the female reproductive cycle. Cadmium nitrate teratogenicity should be considered suspect based upon its cadmium base.

Other Chronic Effects: Repeated low level exposures can cause permanent kidney damage which can go unnoticed for some time without proper testing. The kidney damage can lead to kidney stones and other more serious health problems. Emphysema or lung scarring can occur from a single high exposure or repeated low exposures. Long-term exposure can cause anemia, loss of sense of smell, fatigue, and/or yellow staining of the teeth.

🕒 **Recommended Risk-Reduction Measures**

Cadmium and its compounds should be considered human carcinogens. Personnel should avoid direct contact with cadmium nitrate dusts or powders. If a less toxic material or compound cannot be substituted for cadmium nitrate, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of cadmium nitrate dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cadmium nitrate. At any exposure to a known carcinogen, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode are recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cadmium nitrate. As per OSHA 29 CFR 1910.1027 (Cadmium), a regulated and controlled work area must be established wherever cadmium is used, handled, or stored. Unauthorized personnel are not permitted in this area.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) and the OSHA Standard for cadmium (29 CFR 1910.1027), prior to the first assignment in an area where cadmium nitrate is used or stored.

Before beginning employment working with cadmium nitrate, and at regular intervals thereafter (e.g.,

annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

- ☑ Lung function test.
- ☑ Urine test for cadmium nitrate (levels should be less than 10 micrograms per liter of urine).
- ☑ Urine test for “low molecular weight proteins” to detect kidney damage.
- ☑ Complete urinalysis (UA).

If overexposure is suspected or symptoms develop, the following additional test is recommended:

- ☑ Complete blood count (CBC).
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Cigarette smoke contains some cadmium. Because it is hard for the body to eliminate cadmium, it tends to buildup in the body. Any workplace exposure will therefore add to any existing levels. Smoking or carrying cigarettes near cadmium increases release of toxic fumes. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to cadmium nitrate may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with cadmium nitrate powders.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are adequately trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to cadmium nitrate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cadmium nitrate

should be communicated to all exposed and potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cadmium nitrate, emergency shower facilities should also be provided in the immediate area.
- ☑ Workers whose clothing has been contaminated by cadmium nitrate should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to cadmium nitrate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Cadmium is a naturally occurring element. However, industrial uses place the environment at risk of exposure during transportation, storage, disposal, or destruction of cadmium compounds, including cadmium nitrate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where cadmium nitrate contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its bulk form, cadmium nitrate is considered a non-combustible solid. However, its dusts may form explosive mixtures in air and can react explosively and present a serious fire hazard. Because it is incompatible with many other common metals, extreme caution is required in handling, storage, transportation, and disposal of cadmium nitrate. These characteristics also require special consideration during any emergency situation involving a leak or spill of cadmium nitrate powder or dust.

Should cadmium nitrate ever come into contact with any incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible. The dust may be flammable and explosive when exposed to heat, flame, or by chemical reaction with other metals (zinc, selenium, tellurium, elements of sulfur).

Cadmium nitrate can enter the environment from industrial and municipal waste treatment plant discharges and from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cadmium. In fresh water, cadmium toxicity is influenced by water hardness. The harder the water, the lower the toxicity. Cadmium has high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of cadmium to plants, birds, or land animals.

☞* Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Cadmium has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of cadmium to plants, birds, or land animals.

◆ Water Solubility

Most of the cadmium compounds are slightly soluble in water. Concentrations of less than 1 milligram will mix with a liter of water.

⌚ Persistence in the Environment

Cadmium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of cadmium persistence in the aquatic or terrestrial environments.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans. The concentration of cadmium found in fish tissues is expected to be much higher than the average concentration of cadmium in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill

of cadmium nitrate dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cadmium nitrate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Water and moisture should be kept away.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If cadmium nitrate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cadmium nitrate. If cadmium nitrate powder is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources and ventilate area of spill.
- Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts). Use non-sparking tools.
- It may be necessary to dispose of cadmium nitrate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cadmium nitrate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or

environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms “cancer,” or “carcinogen” are used, public hysteria, emotion, and ignorance can run equally high. This should be carefully considered whenever developing or implementing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CADMIUM OXIDE

CdO

CAS: 1306-19-0

**IDENTIFICATION AND TYPICAL USES**

Cadmium oxide can appear as a colorless or white amorphous (without definite form or shape) powder or a brownish-red crystalline solid. Its fumes appear as odorless, tiny, brownish-yellow particulates in air. It is used in cadmium plating baths, electrodes for storage batteries, cadmium salts, as a catalyst, in ceramic glazes, in phosphors, and as a nematocide.

RISK ASSESSMENT: HEALTH**General Assessment**

There are several reports in the references of cadmium poisoning and human death. Cadmium is a confirmed human carcinogen with experimental carcinogenic, tumorigenic, mutagenic, and neoplastigenic data also being reported. Cadmium oxide can enter the body by *inhalation* of its dusts or fumes, or by *ingestion*. In humans, the toxic symptoms of acute exposure may include nausea, vomiting, diarrhea, abdominal pain, muscular ache, salivation, and shock. In addition, inhalation of its fumes and dusts can cause cough, tightness in chest, respiratory distress, congestion of the lungs, broncho-pneumonia, and pulmonary edema (fluid in the lungs), which is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours creating a false sense of security with regard to health exposure risk. Inhalation causes an excess of protein to be present in the urine (proteinuria). Exposure to its fumes or dusts of 30 minutes to amounts of as little as 50 mg/m³ can be fatal to humans. Bone demineralization similar to that of osteoporosis may occur.

Cadmium is a poison that is accumulated in the liver and kidneys. Chronic poisoning can therefore lead to liver and kidney damage. Its biological half-life in humans is estimated at approximately 20-30 years. Cadmium is also known to cause the so-called "itai, itai" disease, which is a bone disease together with kidney malfunction.

During welding or grinding operations, cadmium fumes are generated. Inhalation can cause a flu-like illness with chills, headache, aching and/or fever. This can lead to more serious illness.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cadmium oxide:

Skin: Possible irritation may occur.

Eye: Irritation and possible damage on contact.

Lung: High exposures can cause rapid and severe lung damage, with shortness of breath, chest pain, cough, and a possible buildup of fluids in the lungs (pulmonary edema), which is a medical emergency. In serious cases, death or permanent lung damage may occur.

Other: High exposure to cadmium oxide may cause nausea, cramps, salivation, vomiting, and diarrhea.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cadmium oxide and can last for months or even years:

Cancer Hazards: Cadmium, and especially cadmium oxide, is a confirmed human carcinogen. There is sufficient evidence that it causes prostate and kidney cancer in humans. It has also been shown to cause lung and testes cancer in animals.

Reproductive Hazard: Cadmium is a probable teratogen in humans. It may damage the testes (male reproductive glands) and may affect the female reproductive cycle. Cadmium oxide may cause these effects as well.

Other Chronic Effects: Repeated low level exposures can cause permanent kidney damage which can go un-

noticed for some time without proper testing. The kidney damage can lead to kidney stones and other more serious health problems. Emphysema or lung scarring (fibrosis) can occur from a single high exposure or repeated low exposures. Long-term exposure can cause anemia, loss of sense of smell, fatigue, and/or yellow staining of the teeth.

🔑 **Recommended Risk-Reduction Measures**

Cadmium is a known carcinogen. Personnel should avoid direct contact with cadmium and its compounds, especially cadmium oxide dusts or powders. If a less toxic material or compound cannot be substituted for cadmium oxide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of cadmium dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cadmium oxide. At any exposure level to a known carcinogen, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode are recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cadmium oxide. As per OSHA 29 CFR 1910.1027 (Cadmium oxide), a regulated and controlled work area must be established wherever cadmium oxide is used, handled, or stored. Unauthorized personnel are not permitted in this area.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) and the OSHA Standard for cadmium (29 CFR 1910.1027), prior to the first assignment in an area where cadmium oxide is used or stored.

Before beginning employment working with cadmium oxide, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially

high exposures should be provided the following recommended medical tests:

- ☑ Lung function test.
- ☑ Urine test for cadmium oxide (levels should be less than 10 micrograms per liter of urine).
- ☑ Urine test for “low molecular weight proteins” to detect kidney damage.
- ☑ Complete urinalysis (UA).

If overexposure is suspected or symptoms develop, the following additional test is recommended:

- ☑ Complete blood count (CBC).
- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to the delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Cigarette smoke contains some cadmium oxide. Because it is hard for the body to eliminate cadmium oxide, it tends to buildup in the body. Any workplace exposure will therefore add to any existing levels. Smoking or carrying cigarettes near cadmium oxide increases release of toxic fumes. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to cadmium oxide may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with cadmium oxide powders.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to cadmium oxide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cadmium oxide should be communicated to all exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cadmium oxide, emergency shower facilities should also be provided in the immediate area.
- ☑ Workers whose clothing has been contaminated by cadmium oxide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to cadmium oxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Cadmium is a naturally occurring element. However, industrial uses place the environment at risk of exposure during transportation, storage, disposal, or destruction of cadmium oxide compounds. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where cadmium oxide contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its bulk form, cadmium is considered a non-combustible solid. However, its dusts may create explosive mixtures in air and can present a moderate fire hazard. Because it is incompatible with many commodities, including some other common metals, extreme caution is required in handling, storage, transportation, and disposal of cadmium oxide. These characteristics also require special consideration during any emergency situation involving a leak or spill of cadmium oxide powder or dust. Should cadmium oxide ever come into contact with any incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible. Airborne dust concentrations may be flammable and explosive when exposed to heat, flame, or by chemical reaction with metals (zinc, selenium, tellurium, elements of sulfur), and acids. Cadmium oxide can enter the environment from industrial and municipal waste treatment plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cadmium oxide. In fresh water, cadmium oxide toxicity is influenced by water hardness. The harder the water, the lower the toxicity. Cadmium has high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of cadmium to plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Cadmium has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of cadmium to plants, birds, or land animals.

💧 *Water Solubility*

Most of the cadmium compounds are slightly soluble in water. Cadmium oxide is insoluble in water. Concentrations of less than 1 milligram will mix with a liter of water.

⌚ *Persistence in the Environment*

Cadmium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of cadmium oxide persistence in the aquatic or terrestrial environments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cadmium found in fish tissues is expected to be much higher than the average concentration of cadmium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of cadmium oxide dusts or powders into the environ-

ment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cadmium oxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If cadmium oxide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cadmium oxide. If cadmium oxide powder is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources and ventilate area.
- Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts). Use non-sparking tools only.
- It may be necessary to dispose of cadmium oxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cadmium oxide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also re-

sult in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," or "carcinogen" are used, public hysteria, emotion, and ignorance can run equally high. This should be carefully considered whenever developing or implementing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CADMIUM SULFATE

CdSO₄

CAS: 10124-36-4

IDENTIFICATION AND TYPICAL USES

Cadmium sulfate is a colorless to white, rhombic, crystalline solid with no odor. It is used in the making of pigments and inks, in ceramic glazes, in the manufacture of pyrotechnics, phosphorus, in fluorescent screens, in scintillation counters, in rectifiers, as an accelerator in cement formation, as a photoconductor in xerography, in transistors, in photovoltaic cells, in solar cells, and as a catalyst in photo-decomposition of hydrogen sulfide.

RISK ASSESSMENT: HEALTH

General Assessment

There are several reports in the references of cadmium poisoning and human death. Cadmium compounds (including the sulfate) are considered confirmed human carcinogens with experimental carcinogenic, tumorigenic, mutagenic, and neoplastigenic data also being reported. Cadmium sulfate can enter the body by *inhalation* of its dusts or fumes, or by *ingestion*.

In humans, the toxic symptoms of acute exposure may include headache, chills, leg cramps, nausea, vomiting, diarrhea, dry throat, dyspnea, chest and abdominal pain, muscular ache, salivation, kidney damage, extreme irritability and restlessness, and shock. In addition, inhalation of its fumes and dusts can cause metallic taste, cough, tightness in chest, respiratory distress, congestion of the lungs, pneumonitis, and bronchitis. Severe exposures may cause pulmonary edema (fluid in the lungs) which is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk. Inhalation of cadmium dust causes an excess of protein to be present in the urine. Exposure to its fumes or dusts of 30 minutes to amounts of as little as 50 mg/m³ can be fatal to humans. Ingestion causes severe nausea, salivation, choking, vomiting, diarrhea, abdominal pain, headache,

muscular cramps, vertigo (dizziness), possible convulsions, exhaustion, collapse, shock, and death.

Cadmium is a poison that is accumulated in the liver and kidneys. Chronic poisoning can therefore lead to liver and kidney damage. Its biological half-life in humans is estimated at approximately 20-30 years. Cadmium is also known to cause the so-called "itai, itai" disease, which is a bone disease together with kidney malfunction.

During welding or grinding operations, cadmium fumes are generated. Inhalation can cause a flu-like illness with chills, headache, aching and/or fever. This can lead to more serious illness.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to cadmium sulfate:

Skin: Possible irritation may occur.

Eye: Irritation and possible damage on contact.

Lung: High exposures can cause rapid and severe lung damage, with shortness of breath, chest pain, cough, and a possible buildup of fluids in the lungs (pulmonary edema), which is a medical emergency. In serious cases, death or permanent lung damage is possible. Symptoms of illness can be delayed for up to 48 hours or more, allowing overexposures to occur without warning signs.

Other: High exposure to cadmium sulfate may cause nausea, cramps, salivation, vomiting, and diarrhea.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to cadmium sulfate and can last for months or even years:

Cancer Hazards: Cadmium, and especially cadmium oxide, is a confirmed human carcinogen. There is sufficient evidence that it causes prostate and kidney cancer in humans. However, there are also conflicting studies to contradict this assertion. It has also been shown to cause lung and testes cancer in animals.

Reproductive Hazard: Cadmium sulfate is a probable teratogen in humans. It may damage the testes (male reproductive glands) and may affect the female reproductive cycle.

Other Chronic Effects: Repeated low level exposures can cause permanent kidney damage which can go unnoticed for some time without proper testing. The kidney damage can lead to kidney stones and other more serious health problems. Emphysema or lung scarring (pulmonary fibrosis) can occur from a single high exposure or repeated low exposures. Long-term exposure can cause anemia, chronic bronchitis, rhinitis with loss of sense of smell, gastrointestinal symptoms, fatigue, bone changes, and/or yellow staining of the teeth.

🔑 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cadmium sulfate dusts or powders. If a less toxic material or compound cannot be substituted for cadmium sulfate, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of cadmium sulfate dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cadmium sulfate. At any exposure level, a self-contained breathing apparatus (SCBA) or a supplied air respirator with full facepiece and operated in pressure demand or continuous flow mode are recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cadmium sulfate. As per OSHA 29 CFR 1910.1027 (Cadmium), a regulated and controlled work area must be established

wherever cadmium sulfate is used, handled, or stored. Unauthorized personnel are not permitted in this area.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cadmium sulfate is used or stored.

Before beginning employment working with cadmium sulfate, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

- Lung function test.
- Urine test for cadmium sulfate (levels should be less than 10 micrograms per liter of urine).
- Urine test for “low molecular weight proteins” to detect kidney damage.
- Complete urinalysis (UA).

If overexposure is suspected or symptoms develop, the following additional test is recommended:

- Complete blood count (CBC).
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Cigarette smoke contains some cadmium. Because it is hard for the body to eliminate cadmium, it tends to build up in the body. Any workplace exposure will therefore add to any existing levels. Smoking or carrying cigarettes near cadmium compounds increases release of toxic fumes. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, exposure to cadmium sulfate may cause additional complications. Therefore, personnel who smoke should avoid any unprotected contact with cadmium sulfate powders.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.

- ☑ Wash thoroughly immediately after exposure to cadmium sulfate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cadmium sulfate should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cadmium sulfate, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by cadmium sulfate should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to cadmium sulfate.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Cadmium is a naturally occurring element. However, industrial uses of its compounds, including cadmium sulfate, place the environment at risk of exposure during transportation, storage, disposal, or destruction of cadmium sulfate compounds. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where cadmium sulfate contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its bulk form, cadmium sulfate is considered a non-combustible solid. However, its dusts can react explosively with incompatible materials as well as create explosive mixtures with air in closed spaces. This presents a serious fire hazard. Because it is incompatible with many commodities, including some other common metals and common oxidizing agents, extreme caution is required in handling, storage, transportation, and disposal of cadmium sulfate. These characteristics also require special consideration during any emergency situation involving a leak or spill of cadmium sulfate powder or dust. Should cadmium sulfate ever come into contact with any incompatible substances either

during use, transportation, storage, or disposal, violent and even explosive reactions are possible. The dust ignites spontaneously in air and is flammable and explosive when exposed to heat, flame, or by chemical reaction with oxidizing agents, metals (zinc, selenium, tellurium, elements of sulfur), strong oxidizers, and acids (explodes on contact with hydrazoic acid).

Cadmium sulfate can enter the environment from industrial and municipal waste treatment plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cadmium sulfate. In fresh water, cadmium toxicity is influenced by water hardness. The harder the water, the lower the toxicity. Cadmium has high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of cadmium to plants, birds, or land animals.

🕒* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Cadmium has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of cadmium to plants, birds, or land animals.

💧 *Water Solubility*

Most of the cadmium sulfate compounds are slightly soluble in water. Concentrations of less than 1 milligram will mix with a liter of water.

🕒 *Persistence in the Environment*

Cadmium is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of cadmium persistence in the aquatic or terrestrial environments.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contami-

nated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cadmium found in fish tissues is expected to be much higher than the average concentration of cadmium in the water from which the fish was taken.

🕒 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of cadmium sulfate dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cadmium sulfate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If cadmium sulfate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cadmium sulfate. If cadmium sulfate powder is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of cadmium sulfate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cadmium sulfate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term “carcinogen” or “cancer” are used, public emotion, hysteria, and ignorance can run equally high. This should be carefully considered whenever developing or implementing public relations policies.

🕒 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Irritation of the respiratory system. Symptoms of cough, dyspnea, and chemical pneumonitis. Possible pulmonary edema (fluid in the lungs) may be a delayed reaction. ABSORPTION: Eye contact can cause severe irritation and can damage vision or cause blindness. Skin absorption of the dust or fume is possible, causing toxic systemic effects. INGESTION: A potential fatal poison with gastrointestinal effects. Will cause nausea and vomiting. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, skin, eyes. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Provide breathing assistance if necessary. Never attempt to give a convulsing or unconscious person anything by mouth. If victim is conscious, give 3 to 4 glasses of water to dilute, do NOT induce vomiting. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. Do NOT use water. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area and protect from physical damage. Sources of ignition are prohibited where calcium is used, handled, or stored. Keep away from incompatible materials and especially water. An inert blanket of nitrogen inside containers is suggested. | | | | |
| Other Precautions and Warnings Outside or detached storage facility is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels established. A full facepiece respirator with high efficiency particulate air (HEPA) filter may suffice. For best protection, use a supplied air respirator with a full facepiece, hood, or helmet or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Suit or Clothing |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CALCIUM

Ca

CAS: 7440-70-2

**IDENTIFICATION AND TYPICAL USES**

Calcium is an alkaline-earth element of atomic number 20, group II of the periodic system. It does not occur free in nature. It is used as an alloying agent for aluminum, copper, and lead. It is a reducing agent for beryllium, and a deoxidizer for alloys. It is also a dehydrating oil, used to in the processing of iron and its alloys, and in the manufacture of vacuum tubes. It assists in the separation of nitrogen from argon, a reducing agent in preparation of chromium metal powder, thorium, zirconium, and uranium. It is also an ingredient in fertilizer preparations.

RISK ASSESSMENT: HEALTH***General Assessment***

Calcium is a common air contaminant. It is generally considered toxic when combined with other toxic elements or compounds (such as arsenic), as an oxide or hydroxide. However, it can be harmful or even fatal if *ingested* or if *inhaled* as a mist, dust, or fume. It can also be *absorbed* through the skin in toxic amounts. When combined with any other route, absorption can present a significant health threat.

Inhalation of the dusts, mists, and especially the heated fumes of calcium can cause serious irritation of the nose, throat, and mucosa of the respiratory tract. It can cause coughing, dyspnea (difficulty breathing), and chemical pneumonitis. In severe cases, pulmonary edema (fluid in the lungs) can develop which is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours creating a false sense of security with regard to health exposure risk.

It is corrosive and irritating to body tissues, especially the skin and eyes. It may cause skin rash, irritation, and even burns. Eye contact may result in corneal damage on contact. If not removed immediately, the damage may be permanent.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium:

Skin: Irritation, rash, and possible burns.

Eye: Calcium particles and dusts can be extremely irritating to the eyes. Water content in eyes causes the formation of corrosive calcium hydroxide. Exposure can damage vision and lead to corneal damage.

Lung: Inhalation of calcium dusts may cause irritation of the mucous membranes in the respiratory tract. High exposures may cause significant irritation leading to a dangerous buildup of fluids in the lungs (pulmonary edema), which can be fatal.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to calcium and can last for months or even years:

Cancer Hazards: According to the information presented in the references, calcium metal has been tested and does not appear to present a cancer hazard. However, many of its compounds are suspected or known to cause cancer in test animals and, in some cases, humans. Carcinogenicity is thought to be due to the presence of the other elements and not specific to the calcium base.

Reproductive Hazard: According to information available in the references, calcium has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Repeated exposures can cause severe irritation of the mucous membranes in the nose, throat, and respiratory system leading to chronic chemical pneumonitis.

☉ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with calcium. If a less toxic chemical cannot be substituted for a hazardous material, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around calcium. No exposure levels have been established for calcium metal. This does not mean that exposure is without health risk. A full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist/fume pre-filter may suffice. For the best protection, use a supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium is used or stored.

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Urine and serum calcium levels.
- ☑ Lung function tests.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since

smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers exposed to lung irritants such as calcium metal dusts and fumes may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to calcium and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium should be communicated to all potentially exposed workers.
- ☑ Eye wash stations and emergency showers should be located in the immediate work area.
- ☑ Work clothing that has been contaminated with calcium should never be worn home where family members can be exposed as well. Contaminated clothing should be laundered at work or by an authorized service by personnel who have been trained in the hazards associated with exposure to calcium metal and calcium compounds.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of calcium metal. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Calcium can ignite spontaneously if exposed to air or if kept in the presence of water. It can detonate violently in contact with alkali hydroxides and may react violently in contact with oxidizers, alcohols, and halo-

gens. Reactions with water and heat produce toxic and flammable calcium hydroxide and flammable hydrogen gas. In a fire, calcium will emit toxic and poisonous gases. These characteristics require special consideration during any emergency situation involving a leak or spill of calcium.

Although calcium is an alkaline-earth element (atomic number 20), it does not occur free in nature. It can enter the environment through industrial discharge, spills, or leaks.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium.

Calcium metal has low acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of calcium exposure to plants, birds or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Calcium has low chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of calcium exposure to plants, birds or land animals.

💧 *Water Solubility*

Calcium metal is insoluble in water. It reacts in water to produce heat, calcium hydroxide (a corrosive), and flammable hydrogen gas. Concentrations of less than 1 milligram will not mix with a liter of water.

⌚ *Persistence in the Environment*

Calcium is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contami-

nated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of calcium found in fish is expected to be considerably higher than the average concentration of calcium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Do NOT use water to rinse residue. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If calcium should contact the water table, aquifer, or navigable waterway, time is of the essence. Calcium is insoluble but reactive in water, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium. If calcium is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- ☑ It may be necessary to dispose of calcium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving calcium can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: Severe irritation of the eyes, lips, mouth, throat, and the mucosa of the respiratory tract. Acetylene gas is formed in contact with moisture and can cause heart injury and CNS depression with impaired judgment, dizziness, headache, and other systemic effects. EYES & SKIN: Burns and blindness likely. Conjunctivitis, swelling of the lids, corneal ulceration, and possible degeneration to corneal opacities. Deep skin burns on contact. INGESTION: Not likely. If occurs, may cause serious mouth, esophagus, and stomach burns. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, skin, eyes. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Blindness is likely! Flush immediately with water for 30 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Provide breathing assistance if necessary. Never attempt to give a convulsing or unconscious person anything by mouth. If victim is conscious, give 1 to 2 glasses of water to dilute, do NOT induce vomiting. Treat as caustic ingestion. Get medical assistance. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. Do NOT use water. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area and protect from physical damage. Sources of ignition are prohibited where calcium carbide is used, handled, or stored. Keep away from incompatible materials and especially water. An inert blanket of nitrogen in containers is suggested. | | | | |
| Other Precautions and Warnings Outside or detached storage facility is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels established. A full facepiece respirator with high efficiency particulate air (HEPA) filter may suffice. For best protection, use a supplied air respirator with a full facepiece, hood, or helmet or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Water-proof Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. Use Vaseline barrier to protect bare or exposed skin. | | | | |

CALCIUM CARBIDEC₂Ca

CAS: 75-20-7

**IDENTIFICATION AND TYPICAL USES**

Calcium carbide appears as a grayish-black solid material with irregular-shaped lumps. When dry, there is no detectable odor. Trace amounts of moisture will cause a garlic-like odor. It is used to generate acetylene gas and oxyacetylene for welding and cutting, in acetylene generators for acetylene lamps, in the manufacture of calcium cyanamide, and chloroethylenes. It is a vinyl acetate monomer. It is used in the manufacture of acetylene chemicals, calcium, iron, lamp-black, and alloys. It is a reddening agent and is used in fire signals for marine service.

RISK ASSESSMENT: HEALTH***General Assessment***

Calcium carbide is dangerous and corrosive on contact with moisture. This characteristic creates a serious health exposure risk with regard to eye, skin, and mucous membrane contact. Human exposures occur primarily through *inhalation* and skin contact.

Because it forms corrosive calcium hydroxide and acetylene in the presence of moisture, it can cause severe and thermal caustic burns. It is especially damaging to the eyes due to the water content and exposure can cause conjunctivitis with corneal ulceration and possible degeneration to corneal opacities. Blindness is extremely possible. Skin contact will cause severe burns, especially if skin is moist (sweat). Burns can be deep and painful (up to 5 millimeters in depth).

In the presence of moisture, calcium carbide will liberate acetylene gas. If inhaled in high concentrations, acetylene can cause depression of the central nervous system (CNS) with lightheadedness, headache, dizziness, impaired judgment, and other unspecified effects. There can be inflammation of respiratory organs and mucosa leading to ulceration and scarring, and dryness, cracking, and ulceration of the lips.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium carbide:

- Skin: Irritation, inflammation, and deep, painful burns.
- Eye: Corrosive destruction to eyes and eye tissue. Moisture causes formation of caustic calcium hydroxide and can cause blindness.
- Lung: Inhalation of calcium carbide causes severe irritation of the mucous membranes in the respiratory tract. In contact with moisture, it releases acetylene gas which will effectively depress the CNS.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to calcium carbide and can last for months or even years:

Cancer Hazards: According to the information presented in the references, calcium carbide has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information available in the references, calcium carbide has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Long-term exposures may cause nail and eye lesions, with mucopurulent (mucous and pus) secretions and hyperaemia (excessive blood) of the lids and conjunctiva of the eyes.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with calcium carbide. If a less toxic chemical cannot be substituted

for a hazardous material, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around calcium carbide. No exposure levels have been established for calcium carbide metal. This does not mean that exposure is without health risk. A full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter equipped with a dust/mist/fume pre-filter may suffice. For the best protection, use a supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious, water-proof rubber gloves should be worn. A thin layer of Vaseline will afford additional protection. Moist skin must not contact calcium carbide.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium carbide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium carbide is used or stored.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Urine and serum calcium levels.
- Lung function tests.
- Consider chest X-ray following acute overexposure.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers ex-

posed to lung irritants such as calcium carbide dusts and fumes may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to calcium carbide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium carbide should be communicated to all potentially exposed workers.
- Eye wash stations and emergency showers should be located in the immediate work area.
- Work clothing that has been contaminated with calcium carbide should never be worn home where family members can be exposed as well. Contaminated clothing should be laundered at work or by an authorized service by personnel who have been trained in the hazards associated with exposure to calcium carbide metal and calcium carbide compounds.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of calcium carbide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Calcium carbide is incompatible with water. When hydrolyzed with water, impurities such as calcium phosphate or calcium arsenate may produce toxic phosgene or arsine. At high temperatures, an incandescent reaction occurs with chlorine, bromine,

iodine, lead fluoride, hydrogen chloride gas, magnesium, and heat. Addition to silver nitrate solutions precipitates explosive silver acetylide. Mixtures with iron or tin chlorides easily ignite. Reactions with water and heat produce toxic and flammable acetylene gas. In a fire, calcium carbide will emit toxic and poisonous gases. These characteristics require special consideration during any emergency situation involving a leak or spill of calcium carbide.

Calcium carbide can enter the environment through industrial discharge, spills, or leaks.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium carbide.

Insufficient data are available to evaluate the short-term effects of calcium carbide exposure to aquatic life, plants, birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of calcium carbide exposure to aquatic life, plants, birds or land animals.

💧 *Water Solubility*

Calcium carbide decomposes in water to produce calcium hydroxide and flammable acetylene gas.

🕒 *Persistence in the Environment*

Calcium carbide is non-persistent in the aquatic environment, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans who have been exposed.

The concentration of calcium found in fish is expected to be considerably higher than the average concentration of calcium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Do NOT use water to rinse residue. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If calcium carbide should contact the water table, aquifer, or navigable waterway, time is of the essence. Calcium carbide is insoluble but reactive in water, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium carbide. If calcium carbide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- ☑ It may be necessary to dispose of calcium carbide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving calcium carbide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Calpus; Caltac; Dowflake; Liquidow; Peladow; Snowmelt; Superflake (anhydrous).

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| Calcium chloride (derivation: By action of hydrochloric acid on calcium carbonate and subsequent crystallization; commercially obtained as a by-product in the Solvay soda process and other processes). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|-------------------------|----------------------------|---|-----------------------|
| Boiling Point | >2912°F (1484°C) | Specific Gravity (H ₂ O = 1) | 2.15 |
| Vapor Pressure (mm Hg) | Not Found | Molecular Weight | 110.98 |
| Vapor Density (Air = 1) | Not Found | Melting Point | 1422°F (772°C) |

Solubility

Soluble in water, acetone, alcohol, and acetic acid. Mixing with water creates exothermic reaction.

Appearance and Odor

White, deliquescent (i.e., moisture-absorbing) crystals, flakes, granules, or lumps with no odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|----------------------------|-------------------------------------|----------------------------|
| Flash Point (method used) | Not Determined | Explosive Limits in Air % by Volume | |
| | | LEL: Not Applicable | UEL: Not Applicable |
| NFPA Classification | Non-Flammable Solid | Autoignition Temperature | |
| | | Not Determined | |

Extinguishing Media

Use agent suitable to surrounding fire. Do NOT use water (reaction is exothermic). Dry chemical or foam may suffice for small fires. For large fires, try fog or regular foam.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Only use a water spray to keep fire-exposed containers cool. Do NOT get water inside containers. Do NOT release runoff from fire-fighting measures to sewers or waterways.

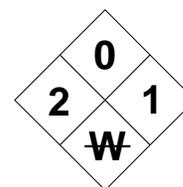

Unusual Fire and Explosion Hazards

Can release extreme heat when wet or upon contact with incompatible materials. When combined with some incompatible materials, explosion and fire can be severe.

| SECTION V - REACTIVITY DATA | | | | |
|--|---|--|------------------------------|---|
| Stability | | Conditions to Avoid Calcium chloride is stable under normal conditions of temperature and pressure. Because it will readily absorb moisture, containers must be kept tightly closed. Keep away from incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with boric acid + calcium oxide; bromine trifluoride; zinc (produces hydrogen gas); causes exothermic polymerization of vinyl ether; explodes when added to furan-2-peroxydicarboxylic acid; water. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of calcium chloride is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, calcium chloride can emit toxic/poisonous fumes and gases. These include toxic chloride fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation and slight corrosion of the mucosa of the respiratory tract. Rapid respiration with sneezing, coughing, and irritated throat. There may be burning and pain in the nasal cavity with nosebleeds and possible perforation of the nasal septum. EYES & SKIN: Skin contact causes irritation and inflammation with burns and small ulcerations. Eye contact with solutions causes burns, lachrymation, and inflammation. Possible eye discharge, skin erythema (redness), and peeling of facial skin. INGESTION: Foul taste in mouth, nausea, vomiting, G.I. tract irritation, fever, muscle twitching, and possible seizures, rapid breathing, slowed heartbeat, and death (severe cases). | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Skin, eyes, and respiratory system (mucosa). |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. <u>For inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. <u>If swallowed:</u> Provide breathing assistance if necessary. Never attempt to give a convulsing or unconscious person anything by mouth. If victim is conscious, give 1-2 glasses of water to dilute and induce vomiting with Syrup of Ipecac. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. Do NOT use water. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area. Sources of ignition are prohibited where calcium chloride is stored. Keep away from water. Storage with desiccant is recommended. | | | | |
| Other Precautions and Warnings Outside or detached storage facility is recommended. Protect from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels established. For best protection, use a supplied air respirator with a full facepiece, hood, or helmet or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CALCIUM CHLORIDECaCl₂

CAS: 10043-52-4

**IDENTIFICATION AND TYPICAL USES**

Calcium chloride appears as white, deliquescent, crystals, flakes, granules, or lumps. There is no detectable odor. It has many uses, including de-icing and dust control on roads, in drilling muds, and in dust-proofing, freeze-proofing and thawing coal, coke, stone, sand, and ore. It is used in concrete conditioning, in the paper and pulp industry, in fungicides, in refrigeration brines, as a drying and desiccating agent, as a sequestrant in foods, a firming agent in tomato canning, in tire weighting, in the manufacture of some pharmaceuticals, and in the production of electrolytic cells.

RISK ASSESSMENT: HEALTH**General Assessment**

Calcium chloride is moderately toxic by *ingestion* and *inhalation*. Skin contact with a solution of calcium chloride is also dangerous due to the corrosive and destructive nature of this compound (absorption has not been reported as an entry route). Its carcinogenic potential is not clearly understood in the references. Some mutation data have been reported.

Inhalation causes sneezing, cough, and irritation of the nose and throat. There may be lachrymation (tearing), and a burning sensation in the nasal cavity often accompanied by nosebleeds. In some cases, there may be deterioration and/or perforation of the nasal septum.

Skin contact with a concentrated solution causes irritation, inflammation, and the appearance of small ulcerations on the skin's surface. There may be erythema (redness) and possible peeling of the facial skin. Eye contact will cause tearing, irritation, and inflammation of the eyelids.

Ingestion can cause nausea, foul taste in mouth, vomiting, gastrointestinal tract irritation, fever, muscular twitching, possible seizures, rapid breathing,

slowed or diminished heartbeat, and death in cases of severe exposure.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium chloride:

Skin: Irritation, rash, and possible burns.

Eye: Irritation, inflammation, watering, and swelling.

Lung: Inhalation of calcium chloride dusts may cause irritation of the mucous membranes in the respiratory tract. There may be burning in the nasal cavity with nosebleeds and possible perforation of the nasal septum.

Other: Ingestion can cause gastrointestinal irritation with systemic reaction up to and including death.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to calcium chloride and can last for months or even years:

Cancer Hazards: According to the information presented in the references, calcium chloride has not been adequately tested for its ability to cause cancer in test animals. The data are conflicting and inconclusive in this regard. Mutation (causes genetic changes) data have been documented and many scientists believe that such chemicals may pose a cancer risk in the long-term. Additional study and research is required.

Reproductive Hazard: According to information available in the references, calcium chloride has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with calcium chloride. If a less toxic chemical cannot be substituted for a hazardous material, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around calcium chloride. No exposure levels have been established for calcium chloride. This does not mean that exposure is without health risk. A full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter equipped with a dust/mist/fume pre-filter may suffice. However, for the best protection use a supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium chloride is used or stored.

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Urine and serum calcium levels.
- ☑ Lung function tests.
- ☑ Consider chest X-ray following acute overexposure.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers ex-

posed to lung irritants such as calcium chloride dusts and fumes may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to calcium chloride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium chloride should be communicated to all potentially exposed workers.
- ☑ Eye wash stations and emergency showers should be located in the immediate work area.
- ☑ Work clothing that has been contaminated with calcium chloride should never be worn home where family members can be exposed as well. Contaminated clothing should be laundered at work or by an authorized service by personnel who have been trained in the hazards associated with exposure to calcium chloride and calcium compounds.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of calcium chloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Calcium chloride may react violently in contact with boric oxide, calcium oxide, and bromine trifluoride. Reactions with water evolves extreme heat. In contact with zinc it will produce explosive hydrogen gas. In a fire, calcium chloride will emit toxic and

poisonous gases. These characteristics require special consideration during any emergency situation involving a leak or spill of calcium chloride.

Calcium chloride can enter the environment through industrial discharge, spills, or leaks.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium chloride. Insufficient data are available to evaluate the short-term effects of calcium chloride exposure to aquatic life, plants, birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the long-term effects of calcium chloride exposure to aquatic life, plants, birds or land animals.

💧 *Water Solubility*

Calcium chloride is soluble in water, decomposing and producing heat. Concentrations of 1000 milligrams or more will mix with a liter of water.

⌚ *Persistence in the Environment*

Calcium chloride is only slightly persistent in the aquatic environment, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of calcium chloride found in fish is expected to be much lower than the average concentration of calcium chloride in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. Proper labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Do NOT use water to rinse residue. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If calcium chloride should contact the water table, aquifer, or navigable waterway, time is of the essence. Calcium chloride is soluble in water and will decompose. Therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium chloride. If calcium chloride is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak and remove all ignition sources.
- Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do NOT dry sweep (generates dangerous airborne dusts), use vacuum equipped with a high-efficiency particulate air (HEPA) filter instead. Do NOT use water to clean residue or damp mop.
- It may be necessary to dispose of calcium chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS *General Assessment*

Accidents or mishaps involving calcium chloride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CALCIUM CHROMATECaCrO₄

CAS: 13765-19-0

**IDENTIFICATION AND TYPICAL USES**

Calcium chromate can appear as a bright yellow powder, or monoclinic or rhombic crystals. It is used as a pigment in paints, cement, paper, and rubber. It is also used as a corrosion inhibitor, an oxidizing agent, a depolarizer for batteries, a coating for light metal alloys, an electroplating cleaning agent, in photochemical processing, and in the treatment of industrial wastes.

RISK ASSESSMENT: HEALTH***General Assessment***

Calcium chromate is highly toxic primarily by *inhalation*, although *ingestion* is also possible but not likely. Skin contact poses a moderate health risk (absorption has not been reported as an entry route). It is a known human carcinogen and mutagen.

Inhalation of calcium chromate dusts will result in severe and corrosive irritation to the eyes, nose, throat, bronchial tubes, and lungs. A primary target of inhaled dusts is the nasal cavity and, specifically, the nasal septum (thin tissue between the nostrils). Deterioration followed by perforation of the nasal septum is possible, especially on frequent, high, or prolonged exposures. Injury to the lungs is also possible. Specifically, pulmonary edema (fluid in the lungs) can occur which can be fatal. Symptoms of coughing, congestion, tightness in chest, and difficulty breathing may be delayed up to 48 hours creating a false sense of security with regard to health exposure risk. There may also be blood changes such as leukocytosis (increased leukocyte level in blood) and leukopenia (reduced leukocyte circulation in blood).

Skin contact will cause irritation, redness, defatting, and contact dermatitis. Tiny lesions, referred to as “chrome holes,” can also occur. These are deep but typically painless, slow healing holes in the skin that can penetrate to the joints. Eye contact will cause ir-

ritation and conjunctivitis with tearing, irritation, and inflammation of the eyelids.

Ingestion is not likely but can occur. Symptoms may include violent gastroenteritis and a possibility of circulatory collapse, chronic nephritis (inflammation of the kidney), and liver injury.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium chromate:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Irritation, conjunctivitis, inflammation, watering, and swelling.

Lung: Inhalation of calcium chromate dusts may cause irritation of the mucous membranes in the respiratory tract. There may be burning in the nasal cavity with nosebleeds and possible perforation of the nasal septum. Pulmonary edema is possible on high exposures.

Other: Ingestion can cause gastrointestinal irritation with a potential for fatal circulatory system collapse.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to calcium chromate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, calcium chromate has been shown to cause cancer and mutations in humans and animals. Nasal cancers and lung cancers have been reported.

Reproductive Hazard: According to information available in the references, calcium chromate has not

been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Hazards: Repeated, long-term skin exposures can cause the development of deep but relatively painless lesions in the skin that can progress to the joints and take long to heal. Prolonged contact can also cause lung cancer.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with calcium chromate. It is a known human carcinogen. If a less toxic chemical cannot be substituted for a hazardous material, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is required whenever working with or around calcium chromate. For low or infrequent exposures, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter equipped with a dust/mist/fume pre-filter may suffice. However, because calcium chromate is a carcinogen, the best protection is provided using a supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* selecting gloves.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium chromate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium chromate is used or stored.

Before beginning employment with calcium chromate and at regular intervals thereafter (e.g., an-

nually), the following medical testing is recommended:

- ☑ Lung function tests (establish baseline).
- ☑ Examination of the nasal septum (establish a baseline of nasal cavity condition).

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Urine and serum calcium levels.
- ☑ Lung function tests (compare to baseline).
- ☑ Examination of the nasal septum for deterioration or perforation.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposures due to the delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers exposed to lung irritants such as calcium chromate dusts and fumes may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Work areas should be posted with signs indicated a suspected human carcinogen is present. Access to the area must be controlled.
- ☑ Wash thoroughly immediately after exposure to calcium chromate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium chromate should be communicated to all potentially exposed workers.

- ☑ Eye wash stations and emergency showers should be located in the immediate work area.
- ☑ Work clothing that has been contaminated with calcium chromate should never be worn home where family members can be exposed as well. Contaminated clothing should be laundered at work or by an authorized service by personnel who have been trained in the hazards associated with exposure to calcium chromate and calcium compounds.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of calcium chromate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Calcium chromate can react with organic matter (such as paper, wood, plastics, and oil) and reducing agents (such as aluminum and sulfur) to form chromium (III). It will explosively decompose hydrazine and burns violently when mixed with boron and then ignited. In a fire, calcium chromate will emit toxic and poisonous gases. These characteristics require special consideration during any emergency situation involving a leak or spill of calcium chromate.

Calcium chromate can enter the environment through industrial discharge, spills, or leaks.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium chromate. Insufficient data are available to evaluate the short-term effects of calcium chromate exposure to aquatic life, plants, birds or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the long-term effects of calcium

chromate exposure to aquatic life, plants, birds or land animals.

💧 *Water Solubility*

Calcium chromate is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Calcium chromate is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of calcium chromate found in fish is expected to be about the same as the average concentration of calcium chromate in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. Proper labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Damp mop residue. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If calcium chromate should contact the water table, aquifer, or navigable waterway, time is of the essence. Calcium chromate is slightly soluble in water and total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or

disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium chromate. If calcium chromate is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until clean-up is complete and area can be opened for normal work.
- Ventilate area of spill and remove ignition sources.
- Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do NOT dry sweep, use HEPA vacuum instead. Use water to flush residue, then damp mop.
- It may be necessary to dispose of calcium chromate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving calcium chromate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," or "carcinogen" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered whenever developing or implementing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Vapor Pressure (mm Hg) 0 (approx.) at 69°F (20°C) | Molecular Weight (atomic weight) 80.11 |
| Vapor Density (Air = 1) Not Applicable | Melting Point 2444°F (1540°C) |

Solubility in Water

Insoluble in water (will decompose).

Appearance and Odor

Colorless or gray to grayish-black crystalline solid (sugar or sand-like powder).

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Non-combustible Solid | Autoignition Temperature Not Found |

Extinguishing Media

Do NOT use foam or water. Use dry chemical, soda ash, or lime.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous cyanide and nitric oxide fumes are produced in fire. Structural protective clothing is permeable and may not provide adequate protection. Avoid contact with skin. Decomposes in water to form acetylene and ammonia which are extremely flammable. Fight fire from distance or protected location, if possible.

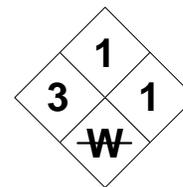

Unusual Fire and Explosion Hazards

Finely divided dusts may ignite in air and may be flammable and explosive when exposed to heat, flame, or by chemical reaction with water, moisture, or steam (forms explosive acetylene gas and ammonia).

| SECTION V - REACTIVITY DATA | | | | |
|---|--|--|------------------------------------|--|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials, primarily water. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) Reacts on contact with water. If combined with calcium carbide, creates serious fire hazard. | | |
| Hazardous Polymerization | | Conditions to Avoid Do not allow calcium cyanamide to become wet or moist. Decomposes to form acetylene and ammonia. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products When heated to decomposition, calcium cyanamide releases toxic fumes of cyanide and nitric oxide. May polymerize in water or alkaline solutions to dicyanamide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: Breathing the dusts can cause feelings of dizziness, flushed skin, and lightheadedness. A nose and throat irritant. Drinking alcohol before or after exposure can make symptoms seem worse and may cause nausea, vomiting, shock, and possibly death. ABSORPTION: Will pass through unbroken skin and enter the bloodstream. Contact may severely irritate the skin and eyes. Prolonged contact can cause skin ulcers. May cause allergy. INGESTION: A poison by ingestion. Moderately toxic to humans resulting in toxic systemic effects. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory tract, skin, eyes, vasomotor system. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, persons with existing lung dysfunction may experience effects quicker. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Provide CPR if necessary. Seek medical attention immediately. Call poison control center for advice. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in safest manner possible and deposit in sealed containers. Remove all sources of ignition. Ventilate area of spill. Use HEPA vacuum. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. Absorb any liquids containing calcium cyanamide in vermiculite, dry sand, earth, or similar material and deposit in sealed drum for disposal or reclamation. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers free from moisture. Keep away from calcium carbide. | | | | |
| Other Precautions and Warnings Reaction with water forms explosive acetylene gas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) For high exposures, use a NIOSH/MSHA approved self-contained breathing apparatus with full facepiece operated in positive pressure mode. For low exposure, use respirator equipped with particulate filter. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Apron, Boots (avoid skin contact) |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CALCIUM CYANAMIDECaCN₂

CAS: 156-62-7

**IDENTIFICATION AND TYPICAL USES**

Calcium cyanamide is a white or colorless powder in pure form and a gray or grayish-black solid (sugar or sand-like powder) in the commercial grade. It is used, primarily as a fertilizer, defoliant, and a pesticide. Also used to manufacture some calcium cyanide, melamine, dicyandiamide, and some nitrogen products. Also used in the manufacture and refining (as a hardening agent) of iron and steel.

RISK ASSESSMENT: HEALTH***General Assessment***

Calcium cyanamide is a poison by *ingestion*, *inhalation*, and skin contact (*absorption*). It is moderately toxic to humans through ingestion. It is a questionable carcinogen in animals with some experimental tumorigenic data reported. Mutation data also reported. Carcinogenic properties in humans are not known.

Breathing its fine dusts can irritate the respiratory system, especially the nose and throat. Exposed persons may feel dizzy, flushed, and lightheaded. Drinking alcohol before or within 1-2 days after of an exposure may make these symptoms seem more pronounced, and can cause nausea, vomiting, shock, and possibly death.

Contact with skin and eyes can be severely irritating. Prolonged contact can cause skin ulcers. Skin allergy can also occur. Symptoms of toxic systemic exposure (dizziness, vomiting, nausea) can also occur as a result of calcium cyanamide passing through unbroken skin and directly entering the bloodstream.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium cyanamide:

Skin: Possible irritation and skin ulcers may occur. Absorption is likely.

Eye: Severe irritation and possible damage on contact.

Lung: Exposures can cause severe irritation of the nose and throat with a potential for lung damage. Symptoms include cough and there may be congestion and shortness of breath.

CNS: Affects the vasomotor system (may cause dilation of the blood vessels) resulting in flushed skin. Other effects include dizziness and lightheadedness. There may also be vomiting, nausea, shock, and possibly death when combined with exposures to alcohol (drinking).

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to calcium cyanamide and can last for months or even years:

Cancer Hazards: According to the information in the references, the data on the cancer-causing properties of calcium cyanamide in animals are inconclusive. However, its carcinogenicity is still questioned in some studies.

Reproductive Hazard: It is not known if exposure to calcium cyanamide will adversely affect the reproductive system of males or females.

Other Chronic Effects: Calcium cyanamide may damage the nervous system, causing numbness, "pins and needles," and/or weakness in the hands and feet. Prolonged contact with skin may cause allergic reaction.

☠ Recommended Risk-Reduction Measures

Personnel should avoid direct contact with calcium cyanamide dusts or powders. If a less toxic material or compound cannot be substituted for calcium cyanamide, then *engineering controls* are the most effective method of reducing exposures. The best pro-

tection is to enclose operations and/or provide local exhaust ventilation at the site of calcium cyanamide dust release. While not always operationally feasible, isolating operations involving calcium cyanamide manufacturing can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around calcium cyanamide. At exposures above the OSHA PEL of 0.5 mg/m³ (TWA), use a MSHA/NIOSH approved respirator equipped with a particulate (dust/fume/mist) pre-filter. For high or frequent exposures, use a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium cyanamide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium cyanamide is used or stored.

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- Examination of the nervous system.
- Evaluation by a qualified allergist, including careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, drinking alcohol (beer, wine, etc.) before or within 1-2 days after exposure to calcium cyanamide can cause severe, possibly fatal reaction.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.

- Wash thoroughly immediately after exposure to calcium cyanamide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium cyanamide should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to calcium cyanamide, emergency shower facilities should also be provided in the immediate area.
- Workers whose clothing has been contaminated by calcium cyanamide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to calcium cyanamide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Because of its use as a fertilizer, pesticide, and defoliant, calcium cyanamide can be present in the environment at any given time and at a variety of levels. The environment is also at risk of exposure during transportation, storage, disposal, or destruction of calcium cyanamide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where calcium cyanamide contacts incompatible commodities can result in the release of hazardous fumes and gases (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air). In contact with water, it will form explosive acetylene gas and ammonia.

In its bulk form, calcium cyanamide is considered a non-combustible solid. However, it is a fire risk if it contains calcium carbide (most commercial grades do). Because it is incompatible with water, steam, and moisture, extreme caution is required in handling, storage, transportation, and disposal of calcium cyanamide. These characteristics also require special consideration during any emergency situation involving a leak or spill of calcium cyanamide powder or dust.

Calcium cyanamide can enter the environment from industrial and municipal discharges, through agricultural run-off, and from spills. Also, as a fertilizer, defoliant, and pesticide, it will also be present in the environment as a result of its intended use.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium cyanamide.

Calcium cyanamide caused germination decrease in agricultural crops. Insufficient data are available to evaluate the short-term effects of calcium cyanamide to aquatic organisms, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of calcium cyanamide to aquatic organisms, plants, birds, or land animals.

💧 *Water Solubility*

In environmental aquifers, calcium cyanamide is considered to be insoluble in water because it will decompose before mixing.

🕒 *Persistence in the Environment*

Calcium cyanamide is non-volatile, so very little will occur in air. In acid solutions and in most soils, it hydrolyzes to urea. It also produces hydrogen cyanamide in moist soils. In pure water or alkaline solutions, it may polymerize to dicyandiamide. Thus, it would appear calcium cyanamide has little persistence in the environment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as those of humans.

Insufficient data are available to evaluate or predict the bioaccumulation of calcium cyanamide in the aquatic environment.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of calcium cyanamide dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of calcium cyanamide should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Proper ventilation and protective equipment should be used while handling the powders or while preparing aqueous solutions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If calcium cyanamide should contact the water table, aquifer, or navigable waterway, time is of the essence. It decomposes rapidly and total remediation will not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium cyanamide. If calcium cyanamide powder is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts). If liquid solutions are spilled, absorb in vermiculite or other material and place in sealed drum for disposal or reclamation.
- ☑ It may be necessary to dispose of calcium cyanamide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving calcium cyanamide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Symptoms include cough, headache, nausea, weakness, malaise, vomiting, loss of consciousness, and death. ABSORPTION: Will pass through unbroken skin and enter the bloodstream. Large exposures can be fatal. INGESTION: A poison by ingestion. May cause toxic systemic effects and death. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory tract, skin, eyes. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, persons with existing lung dysfunction may experience effects quicker. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. Do not allow water to enter nose or mouth. For inhalation: Remove the person from exposure. Break amyl nitrate pearl in cloth and hold lightly under nose for 15 seconds; repeat 5 times at 15 second intervals. Give oxygen. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Break amyl nitrate pearl in cloth and hold lightly under nose for 15 seconds. If conscious, induce vomiting. Repeat until vomit is clear. Repeat inhalation of amyl nitrate 5 times at 15 second intervals. Provide CPR if necessary. Seek medical attention immediately. Call poison control center for advice. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in safest manner possible and deposit in sealed containers. Use HEPA vacuum. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. | | | | |
| Preferred Waste Disposal Method Destroy by oxidizing it to calcium cyanate using sodium hypochlorite or other oxidizing compounds. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers free from moisture. It is shipped in mild-steel or fiber drums. | | | | |
| Other Precautions and Warnings Protective equipment must be worn when handling or preparing aqueous solutions. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) For any exposure level use a NIOSH/MSHA approved self-contained breathing apparatus with full face-piece operated in positive pressure mode. Inhalation of dusts must be avoided. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Apron, Boots (avoid skin contact) | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CALCIUM CYANIDECa(CN)₂

CAS: 592-01-8

**IDENTIFICATION AND TYPICAL USES**

Calcium cyanide is a white crystalline solid or white powder. Its technical grade may appear as a black powder. It is used for the extraction of gold and silver from their ores, in the froth flotation of minerals, as a fumigant, and as a rodenticide. It is also used as a fumigant for greenhouses, flour mills, grain, seed, citrus trees under tents for control of scale insects, and in the manufacture of other cyanides.

RISK ASSESSMENT: HEALTH**General Assessment**

Calcium cyanide is a highly poisonous compound. The toxic routes of entry are *inhalation* and *ingestion* of its dusts, and skin contact (*absorption*). Exposure by either route in large enough doses can lead to death. Calcium cyanide reacts on exposure to moisture to release highly toxic hydrogen cyanide. Since skin and the linings of the respiratory tract and lungs, as well as the digestive system contain moisture, exposure can be lethal.

Poisonous reactions on exposure may cause early symptoms of headache, nausea, vomiting, and weakness. Loss of consciousness and death can follow. High concentrations can be rapidly fatal.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium cyanide:

Skin: Possible irritation may occur. Absorption is likely.

Eye: Irritation and possible damage on contact.

Lung: High exposures can cause rapid and severe lung damage, with shortness of breath, chest pain, cough, loss of consciousness, and death.

Other: High exposure to calcium cyanide may be rapidly fatal.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to calcium cyanide and can last for months or even years:

Cancer Hazards: According to the information in the references, the data on the cancer-causing properties of calcium cyanide are inconclusive. However, this is probably due to the fact that it is highly poisonous and long-term exposures seldom occur (death is more likely).

Reproductive Hazard: It is not known if exposure to calcium cyanide will adversely affect the reproductive system of males or females.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with calcium cyanide dusts or powders. If a less toxic material or compound cannot be substituted for calcium cyanide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of calcium cyanide dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around calcium cyanide. At any exposure level, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium cyanide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium cyanide is used or stored.

If exposure occurs, break an amyl nitrate pearl into a cloth and hold it lightly under the victim's nose for 15 seconds. This should be repeated five times, at fifteen second intervals.

For those with frequent or potentially high exposure (half the PEL or greater), or significant skin contact, the following medical tests are recommended before initial assignment and at regular time thereafter:

- Urine thiocyanate test (most accurate if performed right after exposure).

If symptoms develop or overexposure is suspected, the following should also be considered:

- Blood cyanide level. (Note: Since cigarettes contain some cyanide, smokers may show an increase in cyanide level on testing).
- Evaluation of thyroid function
- Lung function test and chest X-ray (for baseline).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, personnel who smoke should avoid any unprotected contact with calcium cyanide powders.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to calcium cyanide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information

on the health and safety hazards of calcium cyanide should be communicated to all potentially exposed workers.

- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to calcium cyanide, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by calcium cyanide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to calcium cyanide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Calcium cyanide is a naturally occurring element. However, industrial uses place the environment at risk of exposure during transportation, storage, disposal, or destruction of calcium cyanide compounds. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where calcium cyanide contacts incompatible commodities can result in the release of hazardous fumes and gases (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its bulk form, calcium cyanide is considered a non-combustible solid. However, its dusts can react violently and may present a serious fire hazard. Because it is incompatible with many commodities, including water, steam, acids, and carbon dioxide, extreme caution is required in handling, storage, transportation, and disposal of calcium cyanide. These characteristics also require special consideration during any emergency situation involving a leak or spill of calcium cyanide powder or dust.

Should calcium cyanide ever come into contact with any incompatible substances either during use, transportation, storage, or disposal, release of poisonous fumes are released and possible violent reactions are possible.

Calcium cyanide can enter the environment from industrial and municipal waste treatment plant discharges and from spills. Also, as a fumigant and insecticide, it will also enter the environment as a result of its intended use.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium cyanide. Calcium cyanide has high acute toxicity to aquatic life and terrestrial animals. Insufficient data are available to evaluate the short-term effects of calcium cyanide to plants and birds.

☞ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Calcium cyanide has high chronic toxicity to aquatic life and terrestrial animals. Insufficient data are available to evaluate or predict the long-term effects of calcium cyanide to plants and birds.

💧 *Water Solubility*

Calcium cyanide is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Calcium cyanide is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of calcium cyanide persistence in the aquatic or terrestrial environments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of calcium cyanide found in fish tissues is expected to be much higher than the average concentration of calcium cyanide in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or

spill of calcium cyanide dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of calcium cyanide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. It should be shipped in mild-steel or fiber drums. Proper ventilation and protective equipment should be used while handling the solid or while preparing aqueous solutions.

Calcium cyanide is destroyed by oxidizing it to calcium cyanate using sodium hypochlorite or other oxidizing compounds.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If calcium cyanide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium cyanide. If calcium cyanide powder is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- ☑ It may be necessary to dispose of calcium cyanide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving calcium cyanide can present a significant threat to business operations. The loss or damage of equipment or facilities can sig-

nificantly affect fiscal viability. Any incident involving a chemical containing the word “cyanide” in its description can evoke an emotional reaction from the public, even when no exposures have occurred. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CALCIUM FLUORIDECaF₂

CAS: 7789-75-5

**IDENTIFICATION AND TYPICAL USES**

Calcium fluoride appears as a white powder or as cubic, colorless crystals which may become luminous with the introduction of heat. It is used as a raw material in the production of hydrofluoric acid, as a catalyst in dehydration and dehydrogenation, as a flux in the iron and steel industry, in etching glass, and to fluoridate drinking water. Single pure crystals (99.93%) are also produced for use in spectroscopy, electronics, lasers, and high-temperature dry-film lubricants.

RISK ASSESSMENT: HEALTH**General Assessment**

Calcium fluoride is mildly toxic by *ingestion* and *inhalation*. It is considered "mildly" toxic due to its low solubility and low ionization. Its toxicity appears to result primarily from its fluorine and silica content. Its carcinogenic potential has not been adequately investigated. However, it is known to cause mutations (genetic changes) in living cells. Experimental teratogenic effects have also been reported.

Inhalation may cause an initial increase in respiration followed by coughing, choking, dyspnea, and then a decrease in the rate of respiration. Respiratory arrest and subsequent death are possible. There may be cardiac arrhythmia, hyperkalemia, and hypocalcemia which, in turn, can lead to hyperactive reflexes, and painful muscular spasms. Pulmonary lesions may occur on repeated inhalation of calcium fluoride dusts which are thought to be due to the silica content in calcium fluoride, usually 3.5%.

Ingestion causes gastrointestinal irritation with abdominal pain, difficulty swallowing, nausea, vomiting, and increased salivation which may be delayed in onset. Ingestion of large amounts can cause accumulation of fluorine deposits in bones and teeth.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium fluoride:

Skin: Irritation and possible rash.

Eye: Irritation.

Lung: Causes respiratory changes that can lead to respiratory arrest and death. There may also be cardiac arrhythmia and other effects on bones, teeth, the kidney, and electrolytes.

Other: Ingestion can cause gastrointestinal irritation with abdominal pain, nausea, and vomiting.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to calcium fluoride and can last for months or even years:

Cancer Hazards: According to the information presented in the references, calcium fluoride has not been adequately tested for its ability to cause cancer in test animals. Mutation (causes genetic changes) data have been documented and many scientists believe that such chemicals may pose a cancer risk in the long-term. Additional study and research is required.

Reproductive Hazard: According to information available in the references, calcium fluoride has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Repeated exposures may cause the development of pulmonary lesions as a result of calcium fluoride's silica content. Long-term exposures can cause bronchitis and silicosis characterized by extreme fibrosis in the lungs with shortness of breath. Fluorosis is also possible. Symptoms include brittle bones, calcification of ligaments, and

other changes in the bones and teeth. Long-term exposure may lead to liver damage and may cause blood clotting.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with calcium fluoride. If a less toxic chemical cannot be substituted for a hazardous material, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around calcium fluoride. For low exposures, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter equipped with a dust/mist/fume pre-filter may suffice. However, for the best protection use a supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium fluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium fluoride is used or stored.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Urine and serum fluorine levels.
- Lung function tests.
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

- Examination of the teeth for fluoride accumulation.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers exposed to lung irritants such as calcium fluoride dusts and fumes may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to calcium fluoride and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium fluoride should be communicated to all potentially exposed workers.
- Eye wash stations and emergency showers should be located in the immediate work area.
- Work clothing that has been contaminated with calcium fluoride should never be worn home where family members can be exposed as well. Contaminated clothing should be laundered at work or by an authorized service by personnel who have been trained in the hazards associated with exposure to calcium fluoride and calcium compounds.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of calcium fluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper

handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Calcium fluoride may react violently in contact with hot sulfuric acid to liberate toxic and corrosive hydrogen fluoride. In a fire, calcium fluoride will emit toxic and poisonous gases. These characteristics require special consideration during any emergency situation involving a leak or spill of calcium fluoride.

Calcium fluoride can enter the environment through industrial discharge, spills, or leaks.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium fluoride. Insufficient data are available to evaluate the short-term effects of calcium fluoride exposure to aquatic life, plants, birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the long-term effects of calcium fluoride exposure to aquatic life, plants, birds or land animals.

💧 *Water Solubility*

Calcium fluoride is only very slightly soluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

🕒 *Persistence in the Environment*

Calcium fluoride is only moderately persistent in the aquatic environment, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become con-

centrated in the tissues and internal organs of animals as well as humans.

The concentration of calcium fluoride found in fish is expected to be about the same as the average concentration of calcium fluoride in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. Proper labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Use damp mop to clean up residue. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If calcium fluoride should contact the water table, aquifer, or navigable waterway, time is of the essence. Calcium fluoride is slightly soluble in water. Therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium fluoride. If calcium fluoride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak and remove all ignition sources.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do NOT dry sweep, use vacuum equipped with a high-efficiency particulate air (HEPA) filter instead.

- ☑ It may be necessary to dispose of calcium fluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving calcium fluoride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CALCIUM HYDROXIDE

CaH₂O₂

CAS: 1305-62-0

IDENTIFICATION AND TYPICAL USES

Calcium hydroxide appears as odorless, colorless, hexagonal crystals or as soft white granules or powder with a slightly bitter alkaline taste. It is used in mortar, plasters, cements, calcium salts, making caustic soda, depilatory (hair removing) for hides, as a white-wash, a soil conditioner, in ammonia recovery in gas manufacture, as a disinfectant, in water softening, in the purification of sugar juices, as an accelerator for low-grade rubber compounds, in petrochemicals, as a food additive buffer and neutralizing agent, a buffering agent for celluloid, metals, and pearls, as a shell-forming agent in the poultry industry, and as an antidote in veterinary medicine for tannin intoxication.

RISK ASSESSMENT: HEALTH

General Assessment

Calcium hydroxide is mildly toxic by *ingestion* and *inhalation*. It is a strong base and in solid form is moderately caustic to human tissues on contact. Its carcinogenic and teratogenic properties have not been adequately investigated. Mutation data have been reported.

Inhalation of calcium hydroxide dust will cause irritation to the nose, throat, and respiratory system with sneezing, coughing, and dyspnea (difficulty breathing). Severe cases may develop chemical bronchitis causing congestion, cough with phlegm, and possible progression into more serious respiratory dysfunction.

Prolonged contact with skin may produce itching, burning, redness (erythema), swelling, and possible dermatitis. Eye contact causes painful irritation with lachrymation (watering or tearing). Mild burns can produce clouding of the cornea and may cause anesthesia (loss of feeling) in the eye that can last for several hours or even days following contact exposures.

Any solid materials in the eye may form difficult to remove "clumps" due to the eye's moisture content.

Ingestion causes serious gastrointestinal irritation with abdominal pain, diarrhea that may be bloody or even contain pieces of mucous membrane lining, and collapse. Death may occur within 24 hours. Survivors may experience delayed perforations to the gastrointestinal tract and/or esophagus which can cause additional and severe pain and possible hypotension (decreased blood pressure). Constriction of the esophagus may continue for several hours or days after exposure, making swallowing difficult.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium hydroxide:

- Skin: Irritation and possible rash. Dermatitis is possible, but usually not in the short-term.
- Eye: Irritation and possible clouding of the cornea and anesthesia.
- Lung: Irritation of the eyes, nose, throat, and mucosa of the respiratory tract. There may be coughing, sneezing, and dyspnea.
- Other: Ingestion is serious and can lead to death. Gastrointestinal irritation with abdominal pain and bloody diarrhea likely to occur.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to calcium hydroxide and can last for months or even years:

Cancer Hazards: According to the information presented in the references, calcium hydroxide has not been adequately tested for its ability to cause cancer in test animals. Mutation (causes genetic changes) data have been documented and many scientists believe

that such chemicals may pose a cancer risk in the long-term. Additional study and research are required.

Reproductive Hazard: According to information available in the references, calcium hydroxide has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Repeated skin exposures may cause chronic dermatitis in some individuals. Chemical bronchitis may develop in persons exposed to low doses over a prolonged period of time.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with calcium hydroxide. If a less toxic chemical cannot be substituted for a hazardous material, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around calcium hydroxide. For low exposures, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter equipped with a dust/mist/fume pre-filter may suffice. However, for the best protection use a supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium hydroxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium hydroxide is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medi-

cal tests are recommended for personnel with frequent or anticipated exposure to calcium hydroxide:

☑ Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following may also be useful:

☑ Lung function tests.

☑ Consider chest X-ray following acute overexposure.

☑ Examination by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers exposed to lung irritants such as calcium hydroxide dusts and fumes may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

☑ Always ensure that proper protective clothing is worn when using chemical substances.

☑ Wash thoroughly immediately after exposure to calcium hydroxide and at the end of the work shift or before eating, drinking, or smoking.

☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium hydroxide should be communicated to all potentially exposed workers.

☑ Eye wash stations and emergency showers should be located in the immediate work area.

☑ Work clothing that has been contaminated with calcium hydroxide should never be worn home where family members can be exposed as well. Contaminated clothing should be laundered at work or by an authorized service by personnel who have been trained in the hazards associated

with exposure to calcium hydroxide and calcium compounds.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of calcium hydroxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Calcium hydroxide causes violent decomposition of maleic anhydride and will form explosive products with nitroethane and water, nitromethane, nitroparaffins, and nitropropane. It will release ammonia when mixed with ammonia salts, and, when boiled with phosphorus, it releases mixed phosphines which can ignite spontaneously in air (pyrophoric). When heated to temperature above 1076°F (580°C), it will decompose to form calcium oxide. While it is not flammable, it can evolve toxic compounds if involved in a fire. These characteristics require special consideration during any emergency situation involving a leak or spill of calcium hydroxide.

Calcium hydroxide can enter the environment through industrial discharge, spills, or leaks.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium hydroxide.

Insufficient data are available to evaluate the short-term effects of calcium hydroxide exposure to aquatic life, plants, birds or land animals.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of calcium hydroxide exposure to aquatic life, plants, birds or land animals.

💧 Water Solubility

Calcium hydroxide is only very slightly soluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

🕒 Persistence in the Environment

Calcium hydroxide is only moderately persistent in the aquatic environment, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of calcium hydroxide found in fish is expected to be about the same as the average concentration of calcium hydroxide in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. Proper labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Use damp mop to clean up residue. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If calcium hydroxide should contact the water table, aquifer, or navigable waterway, time is of the essence. Calcium hydroxide is slightly soluble in water. Therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any op-

erations involving the use, transportation, storage, or disposal of calcium hydroxide. If calcium hydroxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak and remove all ignition sources.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do NOT dry sweep, use HEPA vacuum instead. Damp mop residue.
- ☑ It may be necessary to dispose of calcium hydroxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS General Assessment

Accidents or mishaps involving calcium hydroxide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Hazard Class and Label Requirements | No Citation | DOT Emergency Guide Code | | | |
| | | No Citation | | | |
| DOT Identification Number | No Citation | Atomic Formula | | | |
| | | CaHPO₄•2H₂O | | | |

Synonyms

Dicalcium orthophosphate; bicalcium phosphate; secondary calcium phosphate.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|--|
| Calcium phosphate, dibasic (derivation: By interaction of fluorine-free phosphoric acid with milk and lime). | PEL: 5 mg/m³ (respirable dusts) STEL: 15 mg/m³ (total dusts) | REL: Not Established STEL: Not Established | Not Determined | TLV (8-hour): 10 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|-------------------------|-------------------|---|-------------------------------------|
| Boiling Point | Decomposes | Specific Gravity (H ₂ O = 1) | 2.306 |
| Vapor Pressure (mm Hg) | Not Found | Molecular Weight | 172.09 |
| Vapor Density (Air = 1) | Not Found | Melting Point | Loses water at 228°F (109°C) |

Solubility

Slightly soluble in water. Soluble in dilute hydrochloric, nitric, and acetic acids. Insoluble in alcohol.

Appearance and Odor

White, odorless, tasteless, crystalline powder.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|----------------------------|-------------------------------------|---|
| Flash Point (method used) | Not Determined | Explosive Limits in Air % by Volume | LEL: Not Determined UEL: Not Determined |
| NFPA Classification | Non-Flammable Solid | Autoignition Temperature | Not Determined |

Extinguishing Media

Use agent suitable to surrounding fire. Dry chemical, carbon dioxide, water spray, or regular foam should be adequate for fire suppression.

Special Fire Fighting Procedures

Structural protective clothing is permeable. Be sure to stay clear of smoke, water fall-out, and water run-off. Move containers from fire if it can be done without risk. Cool exposed containers with water spray. Dike area for control and containment to prevent entry into sewers, drains, and waterways. Evacuate non-essential personnel 1500 feet from the danger area. Consider down wind conditions.

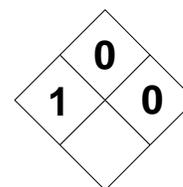

Unusual Fire and Explosion Hazards

None reported. Avoid creating dusts during response procedures.

| SECTION V - REACTIVITY DATA | | | | |
|--|---|--|--|---|
| Stability | | Conditions to Avoid Calcium phosphate is stable under normal conditions of temperature and pressure. Avoid contact with heat. Keep lids tightly closed. Avoid generating dusty conditions. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) May react in contact with strong acids (such as nitric, hydrochloric, and sulfuric). | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of calcium phosphate is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition calcium phosphate, dibasic will emit toxic and acrid smoke and fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and respiratory tract. Causes tearing. May cause pulmonary lesions on prolonged exposure. A nuisance dust. EYES & SKIN: Skin contact causes irritation. Direct eye contact causes corneal burns. INGESTION: Gastrointestinal irritation with severe pain, diarrhea, vomiting, and nausea. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, mucous membranes, G.I. system. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), gently lifting eyelids. Do not allow victim to keep eyes tightly shut. Seek medical attention. Skin contact: Immediately remove all contaminated clothing. Rinse in flooding amounts of water for 15 minutes (minimum). Wash area with large amounts of soap and water. For red or blistered skin, seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Provide breathing assistance if necessary. Contact poison control center. Unless advised otherwise, give 1-2 glasses of water and induce vomiting. Never attempt to give a convulsing or unconscious person anything by mouth. Seek medical attention immediately. DOCTOR: Treatment should be symptomatic and supportive. Monitor calcium, phosphate, and magnesium levels. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. Use wet mop to clean residues. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from excessive heat and incompatible materials. Sources of ignition are prohibited where calcium phosphate is stored. | | | | |
| Other Precautions and Warnings Protect from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) For low exposures, a full facepiece respirator with HEPA filter may suffice. For best protection, use a supplied air respirator with a full facepiece, or an SCBA operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CALCIUM PHOSPHATE, DIBASICCaHPO₄•2H₂O

CAS: 7757-93-9

**IDENTIFICATION AND TYPICAL USES**

Calcium phosphate, dibasic, appears as a white, tasteless, crystalline powder with no odor. It is used as an animal feed supplement, a food supplement, as a dentifrice, in pharmaceuticals, in the manufacture of glass, as a fertilizer ingredient, as a stabilizer for plastics, as a dough conditioner, and in yeast foods.

RISK ASSESSMENT: HEALTH***General Assessment***

Calcium phosphate is mildly toxic by *ingestion* and *inhalation*. There are no reports of carcinogenic, mutagenic, or teratogenic effects subsequent to exposure. While it is primarily characterized as a nuisance dust, there are some noted effects of exposure that must be assessed and managed if the dibasic form of calcium phosphate is used or handled in the work place.

Inhalation of calcium phosphates may cause irritation of the eyes (with tearing and redness), nose, throat, and respiratory tract. There is a possibility that inhalation may lead to the development of pulmonary lesions. However, the data are conflicting and inconclusive in this regard.

Skin contact can cause irritation with erythema (redness) and possible rash. Eye contact presents a more serious hazard since the phosphate may cause corneal burns, especially if the chemical is not removed immediately.

Ingestion can cause gastrointestinal irritation with nausea, vomiting, and diarrhea.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium phosphate, dibasic:

Skin: Irritation and possible rash.

Eye: Irritation and possible burning of the cornea.

Lung: Irritation of the eyes, nose, throat, and mucosa of the respiratory tract. There may be coughing, sneezing, and other unspecified pulmonary effects.

Other: Gastrointestinal irritation with abdominal cramps, vomiting, nausea, and diarrhea.

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to calcium phosphate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, calcium phosphate has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information available in the references, calcium phosphate has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Exposure may cause the development of pulmonary granulomatous lesions.

☞ *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with calcium phosphate. While it is classified (by NIOSH and the ACGIH) as a nuisance dust, it can pose a toxic health hazard risk on unprotected exposure. If a less toxic chemical cannot be substituted for a hazardous material, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever

working with or around calcium phosphate. For low exposures, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter equipped with a dust/mist/fume pre-filter may suffice. However, for the best protection use a supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium phosphate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium phosphate is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for personnel with frequent or anticipated exposure to calcium phosphate:

- Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following may also be useful:

- Lung function tests.
- Consider chest X-ray following acute overexposure.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers exposed to lung irritants such as calcium phosphate dusts and fumes may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to calcium phosphate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium phosphate should be communicated to all potentially exposed workers.
- Eye wash stations and emergency showers should be located in the immediate work area.
- Work clothing that has been contaminated with calcium phosphate should never be worn home where family members can be exposed as well. Contaminated clothing should be laundered at work or by an authorized service by personnel who have been trained in the hazards associated with exposure to calcium phosphate and calcium compounds.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of calcium phosphate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Calcium phosphate is a non-flammable solid that can produce irritating and acrid smoke if it is involved in a fire. It may react violently in contact with strong acids, such as nitric, sulfuric, and hydrofluoric. These characteristics require special consideration during any emergency situation involving a leak or spill of calcium phosphate.

Calcium phosphate can enter the environment through industrial discharge, spills, or leaks.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium phosphate.

Insufficient data are available to evaluate the short-term effects of calcium phosphate exposure to aquatic life, plants, birds or land animals.

Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of calcium phosphate exposure to aquatic life, plants, birds or land animals.

Water Solubility

Calcium phosphate is only very slightly soluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

Persistence in the Environment

Calcium phosphate is only moderately persistent in the aquatic environment, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of calcium phosphate found in fish is expected to be about the same as the average concentration of calcium phosphate in the water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. Proper labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Use damp mop to clean up residue. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If calcium phosphate should contact the water table, aquifer, or navigable waterway, time is of the essence. Calcium phosphate is slightly soluble in water. Therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium phosphate. If calcium phosphate is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Ventilate area of spill or leak and remove all ignition sources.
- Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do NOT dry sweep, use HEPA vacuum instead. Damp mop residue.
- It may be necessary to dispose of calcium phosphate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving calcium phosphate can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental dam-

age can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.
