FERROCENEC₁₀H₁₀Fe

CAS: 102-54-5

**IDENTIFICATION AND TYPICAL USES**

Ferrocene appears as an orange crystalline solid with a camphor-like odor. It exists as a “sandwich-like” structure with ferrous iron located at the center of two cyclopentadiene rings (see structural rendering above). This gives the molecule the properties of an aromatic hydrocarbon. It is used as an additive for fuel oils to improve efficiency of combustion (antiknock) and eliminate smoke. It is also a catalyst for accelerating vulcanization and polymerization. It is used as a coating for missiles and satellites, a high temperature lubricant, and an intermediate for high temperature polymers.

RISK ASSESSMENT: HEALTH***General Assessment***

Ferrocene is considered moderately toxic by *ingestion* and *inhalation*. It is a questionable carcinogen in animals studies with experimental tumorigenic and mutagenic data reported. Human data are limited and insufficient to evaluate or predict human cancer potential.

Inhalation of ferrocene dusts or powders can be irritating to the eyes, nose, and upper respiratory system. There may be headache and nausea. High concentrations may produce depression of the central nervous system (CNS) with symptoms of narcosis, altered respiratory rates, convulsions, and death. Prolonged exposures may lead to liver and kidney injuries. Animal studies have shown ferrocene to

stimulate blood cell formation or increase hemoglobin content in the blood. It is not known if human exposure will have this effect.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to ferrocene:

Skin: Mild irritation with possibility for rash.

Eye: Mild to moderate irritation with tearing and redness.

Lung: Irritation of the upper respiratory tract and depression of the respiratory system. There may be headache and nausea.

Other: Ingestion may cause irritation to the gastrointestinal system. There may be depression of the circulatory system and other blood effects.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to ferrocene and can last for months or even years:

Cancer Hazards: According to information presented in the references, ferrocene has been shown to produce tumors in test animals. Mutation data have also been reported. It is not known if human exposure to ferrocene will result in cancer.

Reproductive Hazard: According to information presented in the references, ferrocene has not been ade-

quately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated or long-term exposures to ferrocene may cause dermatitis and possible sensitization. It may also adversely affect the liver and kidneys.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with ferrocene. The exact nature of its human toxicity is not clearly understood by the references. Prudent risk management requires caution and a conservative approach when assessing the hazard of such chemicals.

If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ferrocene. For exposures above the PEL (15 mg/m³ total dust or 5 mgm³ respirable fraction), a full facepiece air purifying respirator equipped with a HEPA filter and dust/mist pre-filter is suggested. For high or prolonged exposures, a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ferrocene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ferrocene is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney and liver function tests.
- ☑ Nervous system evaluation.

- ☑ Evaluation by a qualified allergist with careful evaluation of exposure history and special testing (may help diagnose skin allergy).

- ☑ Complete blood count (CBC). Monitor hemoglobin levels, check for unusually high levels.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to ferrocene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ferrocene should be communicated to all exposed or potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ferrocene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of ferrocene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ferrocene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser extent, air).

Ferrocene is considered a flammable solid. It can ignite and burn vigorously. In the proper concentrations in air, its powders may ignite explosively. These characteristics require extreme caution in handling,

storage, transportation, and disposal. It is a dangerous fire hazard when exposed to heat and flame. Therefore, special consideration is required during any emergency situation involving a leak or spill of ferrocene. Should ferrocene ever come into contact with incompatible substances, especially ammonium perchlorate, either during use, transportation, storage, or disposal, an explosive reaction is likely.

Ferrocene may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ferrocene.

Insufficient data are available on the short-term effects of ferrocene exposure to aquatic life, plants, birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of ferrocene to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ferrocene is nearly insoluble in water. Concentrations of less than 100 milligrams may mix with a liter of water.

🕒 *Persistence in the Environment*

Ferrocene is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ferrocene found in fish tissue is expected to be about the same as the average con-

centration of ferrocene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ferrocene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ferrocene should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ferrocene. If ferrocene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Collect powdered materials in safest manner possible. Do NOT dry sweep (generates airborne dusts). Use HEPA vacuum instead. Damp mop residue and dispose of properly.
- It may be necessary to dispose of ferrocene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Risk Management for Hazardous Chemicals

Accidents or mishaps involving ferrocene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the words "cancer" or "carcinogen" are used, public emotion, hysteria, and ignorance can run equally high. This should be carefully considered whenever planning, developing, or implementing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such policies or procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Dust causes irritation of the eyes, nose, throat, and mucous membrane of the respiratory tract. Its vapors may cause the glottis to spasm leading to suffocation. It can also cause chemical pneumonitis and pulmonary edema (fluid in the lungs) which can cause death. SKIN & EYES: Mild irritation to the skin and eyes. INGESTION: Gastrointestinal irritation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1-A | Target Organs? Respiratory system, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If <u>swallowed:</u> Seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect dusts in safest manner possible and deposit in sealed containers. Do NOT dry sweep, use HEPA vacuum instead. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from incompatibles. Protect against physical damage. Keep away from all forms of water (moisture, steam) since ferrous chloride will almost completely dissolve in water. Keep storage facilities airtight to prevent condensation inside containers. | | | | |
| Other Precautions and Warnings None reported. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures below the PEL, use a full mask respirator with dust pre-filter. For all other exposures, use supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Polycarbonate or Butyl Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FERROUS CHLORIDEFeCl₂

CAS: 7758-94-3

**IDENTIFICATION AND TYPICAL USES**

Ferrous chloride appears as white or pale green solid crystals with no noticeable odor. It is used as a mordant in fixing dyes, in metallurgy, in the making of some pharmaceuticals, in the manufacture of ferric chloride, and in sewage treatment. It should not be confused with ferric chloride solution or ferric chloride.

RISK ASSESSMENT: HEALTH***General Assessment***

Exposure to ferrous chloride is possible through *inhalation* of its dusts or by direct *ingestion* of the solid material. The latter presents the most serious risks to human health, especially in solution form. While skin absorption has not been reported, skin contact can result in localized irritation and should be avoided. There are no data on its carcinogenic, mutagenic, or teratogenic properties. More study is required in this regard.

Inhalation of dusts can cause headache and nausea with irritation to the eyes, nose, and throat. Inhalation of vapors can be fatal as a result of spasm of the glottis and suffocation. High-level exposures to solutions containing ferrous chloride may lead to chemical pneumonia and pulmonary edema (fluid in the lungs) which can also be fatal. Development of pulmonary edema may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk.

Skin contact is irritating and is aggravated by the presence of moisture (sweat). Contact with the eyes can cause irritation.

Ingestion of ferrous chloride will cause moderate to severe irritation of the mouth, stomach, and gastrointestinal tract.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to ferrous chloride:

Skin: Localized surface irritation.

Eye: Mild irritation.

Lung: Irritation of the nose, throat, and lungs following exposure to dusts or vapors (of solution). Pulmonary edema is possible (24 to 48 hours following a high exposure to ferrous oxide solution).

Other: Ingestion may cause a variety of gastrointestinal and systemic effects.

☼ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to ferrous chloride and can last for months or even years:

Cancer Hazards: According to the information available in the references, ferrous chloride has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information available in the references, ferrous chloride has not been adequately tested for its ability to adversely affect the reproductive process in test animals.

Other Chronic Effects: No other chronic effects have been reported as a result of long-term exposure to ferrous chloride.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with ferrous chloride. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemi-

cal release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ferrous chloride. The permissible exposure level (PEL) for this chemical is extremely low (1 mg/m^3) and difficult to monitor. An air purifying respirator with a dust pre-filter may suffice. However, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode would provide optimum respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber or polycarbonate gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ferrous chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ferrous chloride is used or stored.

For those personnel with frequent or potentially high exposure (half the PEL or greater), the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- ☑ Lung function tests.
- ☑ Consider chest X-ray after acute overexposure (results may be negative if taken immediately after exposure due to delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, symptoms of exposure to ferrous chloride anhydrous may be more pronounced in smokers than in non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible exposure factors.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
- ☑ Wash thoroughly immediately after exposure to ferrous chloride anhydrous and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ferrous chloride anhydrous should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ferrous chloride, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of ferrous chloride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ferrous chloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Ferrous chloride is considered a non-combustible solid. However, it is corrosive to many metals (especially in solution) and can react vigorously with potassium, ethylene oxide, sodium, and many oxidizers and contact can cause fire or explosion. In contact with water it will nearly dissolve completely. These characteristics require special consideration during any emergency situation involving a leak or spill of ferrous chloride. Should ferrous chloride ever come into contact with these incompatible either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Ferrous chloride can enter the environment mainly through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ferrous chloride.

There is insufficient evidence to evaluate or predict the short-term effects of ferrous chloride anhydrous to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

There is insufficient evidence to evaluate or predict the long-term effects of ferrous chloride to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Ferrous chloride is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water. It will be dissolved completely in contact with water or moisture.

🕒 *Persistence in the Environment*

Ferrous chloride is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of ferrous chloride found in fish tissues is expected to be much lower than the average concentration of ferrous chloride in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and

rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ferrous chloride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Exposure to any form of water (moisture, steam) can soften the material and may eventually dissolve ferrous chloride.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If ferrous chloride should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ferrous chloride. If ferrous chloride is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.
- Collect solid materials in safest and most efficient manner possible. Do NOT dry sweep (generates airborne dusts). Use vacuum equipped with high efficiency particulate air (HEPA) filter instead. Absorbed spilled solutions in vermiculite or other material and deposit in sealed containers.
- It may be necessary to dispose of ferrous chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ferrous chloride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental dam-

age can also result in a loss of profits and loss of current as well as future business.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any safety or emergency response procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: Possible irritation of the eyes, nose, and upper respiratory tract. Chronic exposure has caused pulmonary changes (bronchitis and perialveolitis) in test animals. SKIN & EYES: Mild to moderate irritation of the eyes. Skin contact may cause no noticeable response. INGESTION: Not likely, but possible in high dusty concentrations. Throat and digestive tract irritation is possible. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Ferrovanadium dust is not known to be a skin irritant but it should still be washed off as soon as possible using soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. If swallowed: Contact poison control center. Unless advised otherwise, give 1-2 glasses of water and induce vomiting. Never give an unconscious or convulsing person anything by mouth or attempt to make such a person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all sources of ignition. Collect powdered materials in safest manner possible. Avoid generating dusts. Do NOT dry sweep. Use a HEPA vacuum and damp mop residue using non-sparking tools. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Use only non-sparking tools to open and close containers. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where ferrovanadium dust is used, handled, or stored. Protect containers from physical damage. Open-air storage (ore piles) should be kept damp to prevent dust release. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) For low exposures (up to PEL), use an organic vapor respirator with HEPA filter and dust pre-filter. For higher exposures, use a supplied-air respirator with full facepiece in continuous flow mode, or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Chemically Protective Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. Practice good housekeeping and ensure adequate dust control measures. | | | | |

FERROVANADIUM DUST

FeV

CAS: 12604-58-9

**IDENTIFICATION AND TYPICAL USES**

Ferrovandium dust appears as a dark, grayish-black, particulate (dust) when dispersed in air. It can be found in a variety of lump, crushed, and ground sizes. Ferrovandium metal is an typically contains between 50 and 80% vanadium. It is used to add vanadium to steel to produce fineness of grain, toughness, and resistance to high temperature and torsion.

RISK ASSESSMENT: HEALTH**General Assessment**

Ferrovandium dust is considered toxic by *inhalation*. There are no reports of carcinogenic, mutagenic, or teratogenic effects subsequent to exposure.

Inhalation of ferrovandium dusts or powders can be irritating to the eyes, nose, and upper respiratory system. There may be headache and nausea. Animal studies have shown ferrovandium dust to cause pulmonary damage, including bronchitis and inflammation of the lungs (perialveolitis).

Eye contact may cause irritation and, if not removed immediately may cause inflammation. Skin contact has not been shown to produce any indications of irritation or inflammation. Ingestion is not likely but can occur in extremely dusty work environments. The references contain no reports of adverse health effects resulting from ingestion, although high concentrations are likely to produce some localized irritation, especially of the mucous membrane in the throat and digestive tract.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to ferrovandium dust:

Skin: No reported effects.

Eye: Mild to moderate irritation with tearing and redness.

Lung: Irritation of the upper respiratory tract with coughing and sneezing. There may be headache and nausea.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to ferrovandium dust and can last for months or even years:

Cancer Hazards: According to information presented in the references, ferrovandium dust has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, ferrovandium dust has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated or long-term exposures to ferrovandium dust may cause pulmonary damage, including bronchitis and inflammation of the lungs (perialveolitis).

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with ferrovandium dust. The exact nature of its human toxicity is believed to be relatively low, but is not clearly understood by the references. Prudent risk management requires caution and a conservative approach when assessing the hazard of such chemicals.

If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Positive measures should be instituted to ensure dust genera-

tion is controlled. These may include wet suppression control measures, artificial humidity modification, or other suitable techniques. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around ferrovandium dust. For exposures above the PEL (1 mg/m³), a full facepiece air purifying respirator equipped with a HEPA filter and dust/mist pre-filter is suggested. For high or prolonged exposures, a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with ferrovandium dust.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where ferrovandium dust is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Lung function tests.
- Consider chest X-ray.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause emphysema and other lung disease, smokers exposed to irritating materials such as ferrovandium dust may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* health exposure risks.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- Wash thoroughly immediately after exposure to ferrovandium dust and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of ferrovandium dust should be communicated to all exposed or potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to ferrovandium dust, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of ferrovandium dust.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of ferrovandium dust. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser extent, air).

Ferrovandium dust is considered a noncombustible solid. However, airborne dust concentrations can ignite, burn vigorously, and even explode. It can form explosive concentrations as low as 1.3 gr/34 ft³ in air. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is also incompatible with strong oxidizers. Should ferrovandium dust ever come into contact with incompatible substances either during use, transportation, storage, or disposal, an explosive reaction is likely. Therefore, special consideration is required during any emergency situation involving a leak or spill of ferrovandium dust.

Ferrovandium dust may enter the environment through industrial discharges or spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to ferrovanadium dust.

Insufficient data are available on the short-term effects of ferrovanadium dust exposure to aquatic life, plants, birds or land animals.

Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of ferrovanadium dust to aquatic life, plants, birds, or land animals.

Water Solubility

Ferrovanadium dust is insoluble in water. Concentrations of less than 1 milligram will not mix with a liter of water.

Persistence in the Environment

Ferrovanadium dust is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Ferrovanadium dust is not known to accumulate in the edible tissues of fish.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of ferrovanadium dust should be segregated from incompatible chemicals (oxidizers) to minimize the risk of cross-contamination or contact.

Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If ferrovanadium dust should contact the water table, aquifer, or navigable waterway, time is of the essence. It is insoluble and total remediation may be possible. The local and/or state emergency response authorities should be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of ferrovanadium dust. If ferrovanadium dust is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Collect powdered materials in safest manner possible. Do NOT dry sweep (generates airborne dusts). Use HEPA vacuum instead. Damp mop residue and dispose of properly.
- It may be necessary to dispose of ferrovanadium dust as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving ferrovanadium dust can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such policies or procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Hazard Class and Label Requirements Not Listed | DOT Emergency Guide Code No Citation | |
| DOT Identification Number Not Listed | Chemical Formula C₁₀H₁₁F₃N₂O | |

Synonyms
[N-(3-trifluoromethylphenyl)-N',N'-dimethylurea]; Cotoran; Lanex; Herbicide C-2059; 1,1-dimethyl-3-(α , α , α -trifluoro-*m*-tolyl) urea.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Fluometuron (derivation: By reaction of dimethylamine with 3-trifluoromethylphenyl isocyanate). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point Not Found | Specific Gravity (H ₂ O = 1) Not Found |
| Vapor Pressure (mm Hg) 0 (approx.) at 69°F (20°C) | Molecular Weight (atomic weight) 232.23 |
| Vapor Density (Air = 1) Not Found | Melting Point Not Found |

Solubility
Partially to moderately soluble in water. Soluble in alcohol and acetone.

Appearance and Odor
Colorless or white, crystalline (sand-like) solid.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Non-Combustible Solid | Autoignition Temperature Not Found |

Extinguishing Media
Use extinguishing media suitable to surrounding fire.

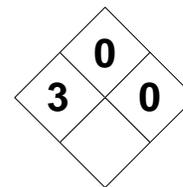

Special Fire Fighting Procedures
Wear full protective clothing and self-contained breathing apparatus (SCBA). Structural fire-fighting equipment is permeable and may not provide sufficient protection. Evacuate personnel 2500 feet from fire area. Move containers from fire area if it can be done without risk. Cool exposed containers.

Unusual Fire and Explosion Hazards
Fluometuron is a non-combustible solid. However, it may be dissolved in some flammable liquids. In sufficient quantities in air, the dusts may form an explosive or easily ignited mixture.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|--|--|--|
| Stability | | Conditions to Avoid Fluometuron is stable in closed containers under routine conditions of storage and handling. Avoid contact with heat. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) None reported. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of fluometuron is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, fluometuron emits toxic and acrid fumes and gases, including toxic fluoride and oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and respiratory tract. In high concentrations, exposure may cause changes in blood cell count (increased white, reduced red) and may lead to liver damage and altered thyroid function. ABSORPTION: Will pass through unbroken skin and enter the bloodstream. Contact may severely irritate the skin and eyes. Prolonged contact can cause allergies (sensitization). INGESTION: Moderately toxic to humans resulting in toxic systemic effects. May also cause severe gastroenteritis. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Suspected Animal | No | Group 3 | No | Respiratory system, skin, eyes, liver, thyroid. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, persons with existing lung dysfunction may experience effects quicker. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. For inhalation: Remove the person from exposure. Maintain an open airway. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Call poison control center for advice. Never give anything by mouth to an unconscious or convulsing person. Do not make an unconscious person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in safest manner possible and deposit in sealed containers. Remove all sources of ignition. Ventilate area of spill. Use HEPA vacuum. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. Absorb any liquids containing fluometuron in vermiculite, dry sand, earth, or similar material and deposit in sealed drum for disposal or reclamation. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, dry, well-ventilated area. | | | | |
| Other Precautions and Warnings Personnel required to work with or around fluometuron should be trained on its hazards. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) No exposure levels established and fluometuron is a questionable carcinogen. For best protection, use a supplied-air respirator of a SCBA with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Apron, Boots (avoid skin contact) | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FLUOMETURONC₁₀H₁₁F₃N₂O

CAS: 2164-17-2

**IDENTIFICATION AND TYPICAL USES**

Fluometuron is a colorless to white crystalline (sand-like) solid material. It is used as an herbicide to control broadleaf and grass weeds of cotton and sugarcane crops.

RISK ASSESSMENT: HEALTH**General Assessment**

Fluometuron is a moderately toxic compound by *ingestion*. It can also cause mild to serious health hazard risks by *inhalation*, and skin contact (*absorption*). It is a questionable carcinogen in animals and there is also some experimental mutagenic data reported.

Breathing its fine dusts can irritate the respiratory system, especially the nose and throat. There is evidence that exposure can lead to changes in blood cell count (increased white blood cells, decreased red blood cells). The liver and thyroid gland may also be damaged or injured.

Contact with skin and eyes can be severely irritating. Prolonged contact can cause an allergic reaction (sensitization). Any exposures after that will result in a return of allergic symptoms (rash, irritation). Ingestion may cause gastrointestinal irritation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to fluometuron:

Skin: Possible irritation and allergic reaction. Absorption is likely to occur, especially when chemical is in solution.

Eye: Severe irritation and possible damage on contact.

Lung: Irritation of the nose, throat, and respiratory tract.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to fluometuron and can last for months or even years:

Cancer Hazards: Fluometuron is a mutagen (causes genetic changes). Such chemicals may have a cancer risk and there is limited evidence that fluometuron does cause cancer in test animals. Human carcinogenicity should be considered questionable.

Reproductive Hazard: According to information presented in the references, fluometuron has not been adequately tested for its ability to cause adverse reproductive effects in test animals.

Other Chronic Effects: Fluometuron causes skin sensitization and possible allergies. If allergy develops, very low future exposures can cause itching and skin rash. Prolonged or repeated exposures may lead to damaged liver and/or changes in thyroid function. Chronic exposure may cause blood cell changes with a reduction in red blood cell count and/or an increase in white blood cell count.

🚫 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with fluometuron dusts or powders. Its carcinogenic properties in humans is not clearly understood and this alone represents a serious health hazard risk. If a less toxic material or compound cannot be substituted for fluometuron, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of fluometuron dust release. This may be practical in manufacturing operations, but is not feasible in application since it is used outdoors. While not always operationally possible, isolating operations involving fluometuron manufacturing can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around fluometuron. No exposure levels have been estab-

lished for this compound. However, this does not mean that exposure to fluometuron is without health hazard risk. For the best protection, use a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with fluometuron.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where fluometuron is used or stored.

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- Lung function tests.
- Complete blood count (CBC) to monitor for white and red blood cell count changes.
- Liver and thyroid examination and testing.
- Evaluation by a qualified allergist, including careful consideration of exposure history and special testing. Skin testing with dilute fluometuron may help diagnose skin allergy, if done by a qualified allergist.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.

- Wash thoroughly immediately after exposure to fluometuron and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of fluometuron should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to fluometuron, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by fluometuron should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to fluometuron.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Because of its use as an herbicide, fluometuron can be present in the environment at any given time and at a variety of levels. The environment is also at risk of exposure during transportation, storage, disposal, or destruction of fluometuron. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where fluometuron contacts incompatible commodities can result in the release of hazardous fumes and gases (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its powder form, fluometuron is considered a non-combustible solid. However, in sufficient quantities mixed with air, it may present an explosion or fire hazard. Also, it may be dissolved in some flammable or combustible liquids. Therefore, extreme caution is required in handling, storage, transportation, and disposal of fluometuron, and special consideration is warranted during any emergency situation involving a leak or spill of fluometuron powder or dust.

Fluometuron can enter the environment from industrial and municipal discharges, through agricultural run-off, and from spills. Also, as an herbicide, it can be present in the environment due to its intended use.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to fluometuron.

Fluometuron has high acute toxicity to aquatic life and has caused injury to various types of agricultural and ornamental crops. Insufficient data are available to evaluate or predict the short-term effects of fluometuron to birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Fluometuron has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of fluometuron to plants, birds, or land animals.

💧 *Water Solubility*

Fluometuron is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Fluometuron is moderately persistent in the water, with a half-life of 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 57% of fluometuron will eventually end up in water; approximately 41.3% will end up in air, and the remainder will be divided nearly equally between terrestrial soil and aquatic sediments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of fluometuron found in fish tissues is expected to be somewhat higher than the average concentration of fluometuron in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of fluometuron dusts or powders into the environment. The correct use labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of fluometuron should be controlled to minimize the risk of cross-contamination or contact with other materials. Proper ventilation and protective equipment should be used while handling the powders or while preparing aqueous solutions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If fluometuron should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is moderately soluble in water and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of fluometuron. If fluometuron powder is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Do NOT dry sweep (generates airborne dusts). Recommend using vacuum with a high-efficiency particulate air (HEPA) filter instead. Damp mop residue and contain for disposal. If liquid solutions are spilled, absorb in vermiculite or other material and place in sealed drum for disposal or reclamation.
- ☑ It may be necessary to dispose of fluometuron as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving fluometuron can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the words “cancer” or “carcinogen” are used, public emotion, hysteria, and ignorance can run equally high. This is a matter for careful consideration whenever developing or implementing public relation policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Extremely irritating to the lungs, throat, nose and eyes. Coughing and shortness of breath that may persist for hours after exposure. Can cause permanent damage to the lungs. Fluid can build up in the lungs (pulmonary edema), which is a medical emergency. Gastrointestinal symptoms may also occur. SKIN & EYES: Contact with the liquid can cause severe skin burns and persistent rash. The liquid can cause severe skin and eye burns (frostbite) leading to permanent damage. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, liver, kidneys. |
| Medical Conditions Generally Aggravated by Exposure Existing lung diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For red or blistered skin, seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours since pulmonary edema may be a delayed reaction. If <u>swallowed:</u> Unlikely, since fluorine is a gas. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Restrict those not involved in cleanup from entering area. Isolate area 150 feet in all directions. Ventilate area of spill or leak. If gas is leaked, stop source if possible or remove leaking cylinders to safe area outdoors and allow to empty. Report any leak in excess of 10 pounds. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Fluorine is a non-flammable gas but an extremely powerful oxidizer. Store to avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat and sunlight. Ship in steel pressure cylinders and tank cars. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where fluorine is used, handled, or stored. Heat may cause containers to build up pressure and explode. Detached facility storage is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures below the PEL, use a full facepiece respirator with fluorine gas cartridge. For higher exposures or when levels are not known, use a supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a SCBA operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious and Insulated Material | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Suit | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FLUORINEF₂

CAS: 7782-41-4

**IDENTIFICATION AND TYPICAL USES**

Fluorine is a pale-yellow to greenish colored gas with a pungent, sharp, irritating odor. It may be shipped as a compressed gas or a cryogenic liquid (at temperatures below 363°F). It is one of the most reactive non-metallic substances known and rarely occurs in the elemental state in nature. It is found in fluorspar, cryolite, and fluorapatite. It is the most electronegative element and one of the most powerful oxidizing agents known. It is primarily used in conversion of uranium tetrafluoride to uranium hexafluoride. It is also used in the manufacture of fluorochemicals (both metallic and organic). It is used in rocket fuel systems, and as a chemical intermediate, as an active constituent of fluoridating compounds used in drinking water and toothpaste, and in insecticide sprays for fruits and vegetables.

RISK ASSESSMENT: HEALTH**General Assessment**

Fluorine is a severely irritating gas, causing irritation of the eyes, nose, throat, and respiratory tract. It is considered moderately toxic to humans by *inhalation*. Human mutation data are also reported. It acts as a cellular poison, interfering with the metabolism of calcium and certain other enzyme mechanics. Its carcinogenic and teratogenic potential in humans is not known. Inhalation causes eye, nose, throat, and respiratory tract irritation with severe dyspnea (difficulty breathing) and quick progression to respiratory damage. Pulmonary edema (fluid buildup in the lungs) may occur within 24-48 hours of exposure. This is a medical emergency and can lead to death. Because of its delayed onset, personnel often neglect seeking treatment or even reporting exposure. Inhalation of excessive concentration can also cause bronchospasm, laryngospasm, and suffocation.

Escaping gas can cause frostbite. Contact with the skin or eyes may produce deep, painful burns with

possible bone involvement due to the fluoride ion's affinity for calcium.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to fluorine:

Skin: Immediate irritation and burn on contact. May cause permanent damage to skin tissue and frostbite.

Eye: Severe irritation; may cause burns and permanent damage.

Lung: Irritation of the nose, throat, and lungs following exposure. Pulmonary edema is possible (24 to 48 hours following a high exposure). It can cause tearing, choking, coughing, sputum, bloody nose, and chest pain.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to fluorine and can last for months or even years:

Cancer Hazards: Fluorine may cause mutations (genetic changes) in living cells. It has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, fluorine has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Fluorine can irritate the lungs. Repeated exposure may cause bronchitis to develop with cough, phlegm, and/or shortness of breath. Long-term exposure can cause corrosion of the teeth, inflammation of the mucous membranes, calcification of

ligaments, respiratory ailments, and liver and kidney damage. Also, osteosclerosis (hardening of bone and/or bone marrow), especially in the pelvic bones and spine, has been reported by workers occupationally or environmentally exposed for periods of 20 to 30 years.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with fluorine. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around fluorine. For low concentrations (below the PEL), an air-purifying organic vapor respirator equipped with a fluorine gas cartridge is acceptable protection. For higher concentrations, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode or a supplied-air respirator will provide greater protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, chemical resistant and thermally insulated gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with fluorine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where fluorine is used or stored.

For those personnel with frequent or potentially high exposure (half the PEL or greater), the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- ☑ Dental examination to check teeth for indications of erosion.
- ☑ Lung function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Lung function tests.
- ☑ Consider chest X-ray after acute overexposures (may be negative if taken immediately after exposure due to delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, smokers exposed to fluorine may experience symptoms more quickly and more defined than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible factors which may be causing the appearance of symptoms in the work place.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to fluorine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of fluorine should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to fluorine, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of fluorine.

RISK ASSESSMENT: ENVIRONMENT *General Assessment*

The environment is at risk of exposure during transportation, storage, disposal, or destruction of fluorine. In almost every scenario, the threat of environmental

exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Fluorine is considered a non-flammable gas. However, it is a powerful oxidizing agent and reactions with incompatible commodities can result in fire and serious explosions. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with a wide range of materials, including water, acids, oxidizers, organic compounds, and many combustible materials. These characteristics require special consideration during any emergency situation involving a leak or spill of fluorine. Should fluorine ever come into contact with incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible. It will react with water to form hydrofluoric acid which is extremely toxic and dangerously corrosive.

Fluorine is a natural element of common occurrence but, because it is so reactive, it is rarely found in its natural state. It can enter the environment through industrial and municipal discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to fluorine.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of fluorine exposure to plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Fluorine has high chronic toxicity in aquatic life. No data are available on the long-term effects of fluorine to plants, birds, or land animals.

💧 *Water Solubility*

Fluorine reacts with water to form hydrofluoric acid which is very soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Fluorine is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the amount of fluorine that will remain in air or water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Fluorine is not expected to accumulate in the edible tissues of fish since the fish will probably die first.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of fluorine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If fluorine should contact the water table, aquifer, or navigable waterway, time is of the essence. It reacts quickly in water to form hydrofluoric acid and total remediation and containment may not be possible. The local and/or state emergency response authorities should be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of fluorine.

If fluorine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of leak.
- ☑ If cryogenic liquids are spilled, cleanup may not be possible before evaporation occurs.
- ☑ If gas is leaking, stop the flow of gas. If the source is a cylinder and leak cannot be stopped in place, remove cylinder to a safe place in the open air and repair or allow to empty.
- ☑ It may be necessary to dispose of fluorine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving fluorine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Give 1-2 glasses of water and induce vomiting, repeat until vomitus is clear, unless advised otherwise. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials using HEPA vacuum. Do NOT dry sweep (generates dusts). Damp mop residues and collect for disposal. Ventilate area of spill. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire and flame away. Keep away from alkaline metals. | | | | |
| Other Precautions and Warnings A highly toxic irritant. Handle with care and use proper personal protective equipment. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) No exposure levels established. For best protection, recommend using an MSHA/NIOSH-approved supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves (avoid rubber) | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Impermeable Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FLUOROACETIC ACID

CAS: 144-49-0

**IDENTIFICATION AND TYPICAL USES**

Fluoroacetic acid is a colorless, crystalline solid. It can occur naturally in an extremely poisonous plant indigenous to South Africa known as *Gifblaar*. Its sodium salt is mixed with water and used as a powerful rodenticide.

RISK ASSESSMENT: HEALTH***General Assessment***

Fluoroacetic acid is a human poison by *ingestion* causing toxic systemic effects. It is mildly toxic by *inhalation*. Skin contact can produce localized effects (irritation and burns) but absorption has not been reported. Its carcinogenic, mutagenic, and teratogenic properties are not known.

Inhalation of fluoroacetic acid dusts or mists (from the mixed solution) can cause serious irritation to the mucosa of the eyes, nose, throat, and respiratory system. Once absorbed through the respiration process, the effects appear to target the central nervous system (CNS). There may be headache, dizziness, nausea, respiratory depression, irregular heartbeat and possible ventricular fibrillation leading to cardiac arrest and death.

Ingestion of fluoroacetic acid may cause gastrointestinal tract irritation with nausea and vomiting. Once absorbed through the digestive process, there can be adverse CNS effects with hyperactivity, muscular spasms in the hands and feet, and convulsions. This may lead to respiratory depression, rapid pulse, ventricular fibrillation, cardiac arrest, and death.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to fluoroacetic acid:

Skin: Moderate to severe irritation and possible burns at area of contact.

Eye: Severe irritation and burns. If not removed immediately, may cause damage to vision.

Lung: Irritation of the eyes, nose, throat and lungs (especially the mucus membranes).

CNS: Adverse effects on the CNS through inhalation and ingestion. Can cause death if allowed to go untreated. Cardiac arrest and respiratory depression are possible.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to fluoroacetic acid and can last for months or even years:

Cancer Hazards: According to the references, fluoroacetic acid has not been adequately tested for its ability to cause cancer in test animals. Its human carcinogenic or mutagenic properties are not known.

Reproduction: According to the references, fluoroacetic acid has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Known Effects: There are no other chronic effects of exposure to fluoroacetic acid reported in the references.

🛑 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with fluoroacetic acid. The best risk reduction measure is to use a less toxic chemical as a substitute for fluoroacetic acid. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce

exposure risk. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around fluoroacetic acid. No exposure levels have been established for fluoroacetic acid. This does not mean that exposure is without risk. It is a serious irritant and exposure can cause a number of toxic systemic effects up to and including death. For the best protection, use a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode or a supplied-air respirator with full facepiece operated in pressure demand or other positive pressure mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash or dust hazards exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted to obtain permeation studies *before* gloves are selected.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with fluoroacetic acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where fluoroacetic acid is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- Lung function tests.
- Skin testing with dilute fluoroacetic acid to help diagnose allergy (performed by a qualified allergist).
- Neurological evaluation and special testing.

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, smokers exposed to irritating substances such as fluoroacetic acid may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible factors that may be causing the appearance of exposure symptoms in the workplace.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to fluoroacetic acid and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of fluoroacetic acid should be communicated to all exposed and potentially exposed workers.
- Never eat, drink, or smoke in areas where fluoroacetic acid is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of fluoroacetic acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Fluoroacetic acid is non-flammable solid. However, if it is involved in a fire it can produce toxic and poisonous fumes and smoke. Its finely divided powders may create an explosive mixture in air, especially in confined areas. Also, because it is incompatible with a number of common alkaline metals, contact can result in violent and explosive reactions. These characteristics require special consideration during any emergency situation involving a leak or spill of fluoroacetic acid.

Fluoroacetic acid can enter the environment through its intended use as a rodenticide, from agricultural runoff, from unchecked industrial discharges into effluents, and through spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to fluoroacetic acid. Insuf-

cient data are available to evaluate or predict the short-term effects of fluoroacetic acid to aquatic life, plants, birds, or terrestrial animals.

☛ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of fluoroacetic acid to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Fluoroacetic acid is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Fluoroacetic acid is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Over 90% of fluoroacetic acid will eventually end up in water; the remainder will end up in terrestrial and aquatic sediments. It is not expected to be persistent in the air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of fluoroacetic acid found in fish tissues is expected to be somewhat higher than the average concentration of fluoroacetic acid in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of fluoroacetic acid should be segregated from incompatible alkaline metals to minimize the risk

of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If fluoroacetic acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and, therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of fluoroacetic acid. If fluoroacetic acid is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill, remove ignition sources.
- ☑ Collect spilled powders using a HEPA vacuum. Do NOT dry sweep (generates airborne dusts). Damp mop residues and collect for disposal. Absorb liquid or solution spills in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools.
- ☑ It may be necessary to dispose of fluoroacetic acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving fluoroacetic acid can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| | |
|---|--|
| Boiling Point 48°F (9°C) | Specific Gravity (H ₂ O = 1) 1.40 |
| Vapor Pressure (atmospheres) 2 at 83°F (28°C) | Molecular Weight 102.92 |
| Vapor Density (Air = 1) 3.82 | Freezing Point -211°F (-135°C) |

Solubility

Insoluble in water. Soluble in alcohol and ether.

Appearance and Odor

Colorless, heavy gas with a slight ether-like odor, especially at extremely high concentrations.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Non-Flammable | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Flammable Gas | Autoignition Temperature 972°F (522°C) |

Extinguishing Media

Fluorodichloromethane is a non-flammable gas. If it is involved in fire, use dry chemical, carbon dioxide, water spray, fog, or foam or extinguishing agent suitable to surrounding fire.

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus. Move containers from fire area if it can be done safely. Cool fire-exposed containers using water spray long after fire is out. Vapors may cause dizziness and suffocation. Liquid causes frostbite.

Unusual Fire and Explosion Hazards

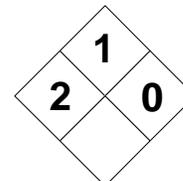

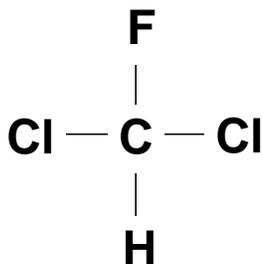

Containers may explode in fire due to buildup of excessive internal pressures. Evacuate immediately if rising sound is heard from venting device or if there is any noticeable discoloration of tank or vessel.

SECTION V - REACTIVITY DATA

| Stability | | Conditions to Avoid Fluorodichloromethane is stable in closed containers under normal conditions of handling and storage. Avoid exposures to excessive heat and contact with incompatible materials. | | |
|--|--|--|--|--|
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Fluorodichloromethane will react in the presence of chemically active metals, such as potassium, sodium, calcium, powdered aluminum, magnesium, or zinc. Contact with acid or acid fumes produces toxic gases. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of fluorodichloromethane cannot occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating fumes and gases are produced when fluorodichloromethane is involved in fire, including, phosgene, chlorine, hydrogen chloride, hydrogen fluoride, and fluorine. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: Low-level toxicity. A simple asphyxiant when oxygen levels are 15 to 16%. Produces unconsciousness at 6 to 8% oxygen. High concentrations may cause giddiness, light-headedness, disorientation, nausea, vomiting, narcosis, cardiac dysrhythmias, lowered blood pressure, and death. SKIN & EYES: Eye irritation at high concentrations. The liquid can cause frostbite burns to tissues. INGESTION: Ingestion not likely. | | | | |
| Carcinogenicity No Citation (Human) No Citation (Animal) | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, skin, eyes, cardiovascular sys. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: For frostbite, rapidly re-warm using water at 107°F (42°C) until flush returns, Do NOT use dry heat! Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance, 100% supplemental humidified oxygen, and CPR if required. Transfer to medical facility. Observe for heart disturbances. If swallowed: Not likely since it exists in liquid state only below temperatures of -211°F (-135°C). | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Evacuate area, deny entry, stay upwind. Wear protective clothing. Contact with the liquid causes frostbite. If it can be done without risk, shut off leak (a thin film of soapy solution may help detect leak). Ventilate area to avoid displacement of oxygen. If leak cannot be repaired, move container to open area (if possible), preferably outdoors, and allow to empty. Keep away from heat. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store fluorodichloromethane in the presence of incompatible materials. Store in tightly closed containers in a cool, dry, well-ventilated area. Separate empty from useable cylinders. | | | | |
| Other Precautions and Warnings Prevent physical damage to compressed gas storage cylinders. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Air purifying respirators are NOT advised for use with asphyxiating gases. Best protection is provided by a supplied-air respirator, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material (Insulated) | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Clothing or Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FLUORODICHLOROMETHANE

CAS: 75-43-4

**IDENTIFICATION AND TYPICAL USES**

Fluorodichloromethane is a heavy, colorless gas with an ether-like odor, especially at extremely high concentrations. It is used primarily as a solvent and a refrigerant, especially in the aerospace industry.

RISK ASSESSMENT: HEALTH**General Assessment**

Fluorodichloromethane is considered to have low toxicity by the *inhalation* route. It is a simple asphyxiant and can produce some irritation and mild to moderate narcotic effects in high concentrations. Its greatest risk to health is its ability to induce serious cardiac arrhythmia at high concentrations or in personnel with pre-existing heart dysfunction. Acute and chronic exposure data for humans is limited in the references.

Inhalation produces some mild irritation of the eyes, nose, throat, and respiratory tract. At high concentrations (5000 ppm), there is a possibility for liver damage. It can also produce narcotic effects at high concentrations with primary action on the central nervous system (CNS). Symptoms include giddiness, disorientation, lightheadedness, nausea and vomiting, narcosis, hypotension, potentially dangerous changes in heart function, and death. Also, inhalation of fumes produced during fire can cause eye, nose, and throat irritation, chemical pneumonitis, or pulmonary edema (fluid in the lungs), which can lead to death. Indications of asphyxia include an overwhelming feeling of "air starvation" or air hunger, and rapid-irregular breathing. There may be headache, fatigue, mental confusion, nausea and vomiting, giddiness and poor judgment, exhaustion, numbness in the legs and arms, convulsions, and death. Prolonged concentrations can lead to generalized paresthesia, ringing in the ears,

apprehension, and slurred speech. These may be followed by a marked decrease in consciousness, amnesia, and cardiac arrhythmia. Heart rhythm changes result from fluorodichloromethane's ability to increase the heart's sensitivity to adrenaline which is always present in the blood stream.

Skin contact with the compressed gas or cryogenic liquid will cause mild to severe frostbite burns. Contact with the eyes can cause extremely painful tissue destruction due to the cryogenic properties of this compound.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to fluorodichloromethane:

Skin: Irritation and possible frostbite.

Eye: Moderate to severe irritation and possible burns and frostbite.

Lung: Irritation of the mucosa. Will cause asphyxiation and associated symptoms (up to and including death) at high concentrations.

Other: A narcotic at high concentrations. Will effect the central nervous system (CNS) with narcosis (drowsiness), giddiness, and disorientation. It can also induce irregular or abnormal heart rhythm (arrhythmia).

🕒 Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to fluorodichloromethane and can last for months or even years:

Cancer Hazards: According to the information presented in the references, fluorodichloromethane has not been shown to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, there is limited evidence that exposure to fluorodichloromethane may adversely affect reproduction in test animals.

Other Chronic Effects: Low, chronic exposures may lead to liver and kidney damage and possible injury to the central nervous system. Cardiac rhythm changes may also be induced on high or prolonged exposures.

🕒 **Recommended Risk-Reduction Measures**

While fluorodichloromethane is considered to be of a low-order toxicity by inhalation, it can still pose some degree of health hazard risk. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around fluorodichloromethane. The exposure level for this chemical is extremely high (1000 ppm), and, therefore, respiratory protection may not always be necessary in well-ventilated work areas. However, when high exposure levels are predicted or prolonged exposures are anticipated, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, impervious, insulated gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with fluorodichloromethane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where fluorodichloromethane is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical protocol is suggested for those assigned to work with fluorodichloromethane:

- ☑ Electrocardiogram (EKG), to test for pre-existing cardiac rhythm dysfunction and establish baseline.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Electrocardiogram (EKG), to compare with baseline.
- ☑ Liver function tests.
- ☑ Nervous system function tests, including interviews by a qualified neurologist to evaluate any changes in personality or behavior.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to fluorodichloromethane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of fluorodichloromethane should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of fluorodichloromethane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the sur-

rounding environmental mediums (water, soil, and air).

Fluorodichloromethane is considered a non-flammable gas. However, it is incompatible with a number of common, chemically active metals and caution is required to ensure contact is prevented. It is also a chlorofluorocarbon (CFC) which is a group of halogenated hydrocarbons alleged to cause damage to the earth's protective ozone layer. Therefore, accidental release to the environment must not occur. These characteristics require special consideration during any emergency situation involving a leak or spill of fluorodichloromethane. Should fluorodichloromethane ever come into contact with incompatible substances either during use, transportation, or storage, violent and explosive reactions can occur.

Fluorodichloromethane is normally a gas. But it can also exist as a cryogenic liquid. It can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to fluorodichloromethane. This chemical is not expected to cause adverse short-term effects on aquatic life, plants, birds, or terrestrial animals.

☞ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of fluorodichloromethane to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Fluorodichloromethane is insoluble in water. It is normally a gas.

🕒 *Persistence in the Environment*

Fluorodichloromethane is virtually non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 100% of fluorodichloromethane will eventually end up in air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of fluorodichloromethane found in fish tissues is expected to be much lower than the average concentration of fluorodichloromethane in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of fluorodichloromethane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from shock, excessive heat (including the sun's rays), and damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If any liquid has spilled, contaminated soils may need to be removed for incineration and replaced with clean soil. If fluorodichloromethane should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of the aquatic environment. When such spills occur, the local and/or state emergency response authorities should be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of fluorodichloromethane.

If fluorodichloromethane is spilled or leaked, the following specific steps are recommended:

- ☑ Evacuate area and deny entry until cleanup is completed. Restrict persons not wearing protective clothing from hazard area.
- ☑ Ventilate area of spill or leak.
- ☑ If source of leak is a cylinder and it cannot be repaired in place, remove to safe location (e.g., outdoors) and allow to empty. Stay clear of area.

- ☑ It may be necessary to dispose of dichlorodifluoromethane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving fluorodichloromethane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Fluorotrichloromethane is a non-flammable gas. If it is involved in fire, use dry chemical, carbon dioxide, water spray, fog, or foam or extinguishing agent suitable to surrounding fire.

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus. Move containers from fire area if it can be done safely. Cool fire-exposed containers using water spray long after fire is out. Vapors may cause dizziness and suffocation. Liquid causes frostbite.

Unusual Fire and Explosion Hazards

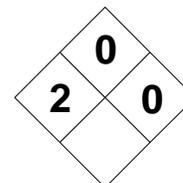

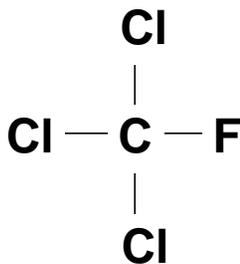

Containers may explode in fire due to buildup of excessive internal pressures. Evacuate immediately if rising sound is heard from venting device or if there is any noticeable discoloration of tank or vessel.

SECTION V - REACTIVITY DATA

| Stability | | Conditions to Avoid Fluorotrichloromethane is stable in closed containers under normal conditions of handling and storage. Avoid exposures to excessive heat and contact with incompatible materials. | | |
|--|--------------------------------------|--|---------------------------------------|--|
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Fluorotrichloromethane will react in the presence of chemically active metals, (potassium, sodium, calcium, powdered aluminum, magnesium, or zinc). Reacts violently with aluminum, barium, and lithium. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of fluorotrichloromethane cannot occur. It will attack some forms of plastic, rubber, and coatings. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating fumes and gases are produced when fluorotrichloromethane is involved in fire, including CO₂, phosgene, chlorine, carbonyl fluoride, hydrogen chloride, hydrogen fluoride, and fluorine. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: High concentrations cause narcosis and anesthesia. Systemic effects include dizziness, lightheadedness, drowsiness (narcosis), disorientation, conjunctival irritation, fibrosing alveolitis, bronchospasm, upper respiratory tract irritation, cardiac arrhythmia, and liver changes. Peripheral neuropathy may also occur. | | | | |
| SKIN & EYES: Eye irritation at high concentrations. The liquid causes frostbite burns to tissues. There may be dryness, cracking, redness, contact dermatitis, and secondary infection. | | | | |
| INGESTION: Ingestion is not likely but can occur. Causes necrosis and stomach perforations. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| No Citation (Human) No Citation (Animal) | No | No | 29 CFR 1910.1000 Table Z-1 | Respiratory system, skin, eyes, CNS, CVS. |
| Medical Conditions Generally Aggravated by Exposure Cardiovascular diseases and skin diseases (dermatitis) may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: For frostbite, rapidly re-warm using water at 107°F (42°C) until flush returns, Do NOT use dry heat! Do NOT rub affected area. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance, 100% supplemental humidified oxygen, and CPR if required. Transfer to medical facility. Observe for heart disturbances. If swallowed: Contact poison control center. Unless advised otherwise, give 1-2 glasses of water and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Evacuate area, deny entry, stay upwind. Wear protective clothing. Absorb any liquid spills with vermiculite and deposit in sealed drums. Ventilate area to avoid displacement of oxygen. Contact with the liquid causes frostbite. If it can be done without risk, shut off leak. If leak cannot be repaired, move container to open area (if possible), preferably outdoors, and allow to empty. Keep away from heat. | | | | |
| Preferred Waste Disposal Method | | | | |
| Rotary kiln and fluidized bed incineration with acid scrubber to remove halo acids. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store fluorotrichloromethane in the presence of incompatible materials. Store in tightly closed containers in a cool, dry, well-ventilated area. Separate empty from useable cylinders. | | | | |
| Other Precautions and Warnings | | | | |
| Prevent physical damage to compressed gas storage cylinders. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| Air purifying respirators are NOT advised for use with asphyxiating gases. Best protection is provided by a supplied-air respirator, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | | Other Protective Clothing | |
| Polycarbonate, Viton, or Polyvinylchloride | Chemical Goggles or Face Mask | | Protective Clothing or Apron | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FLUOROTRICHLOROMETHANECl₃F

CAS: 75-69-4

**IDENTIFICATION AND TYPICAL USES**

Fluorotrichloromethane is colorless to water-white liquid with a very faint, ether-like odor. It can also exist as a gas above 75°F (24°C). It is used as an industrial solvent and degreasing agent, in fire extinguishers, in electric insulation, in the production of polymeric resin, as a chemical intermediate, and as a blowing agent. It was formerly used in aerosol propellants but was banned from this use in 1978 in the United States. It is alleged to damage (deplete) the stratospheric ozone.

RISK ASSESSMENT: HEALTH**General Assessment**

Fluorotrichloromethane is considered to have moderate toxicity by the *inhalation* route. It is a simple asphyxiant and can produce some irritation and mild to moderate narcotic effects in high concentrations. It can also cause physical damage and irritation to tissues and mucosa. Its greatest risk to health is its ability to induce serious cardiac arrhythmia at high concentrations or in personnel with pre-existing heart dysfunction.

Inhalation causes dizziness, narcosis (drowsiness), lightheadedness, disorientation, irritation of conjunctival tissues, bronchospasm, upper respiratory tract irritation (including the nose and throat), cardiac arrhythmia, and changes in the liver. Peripheral neuropathy has also been reported. Death can occur from respiratory depression or cardiac sensitization (this chemical has the ability to increase the heart's sensitivity to adrenaline which is always present in the blood stream).

Skin contact with the compressed gas or cryogenic liquid will cause mild to severe frostbite burns. Con-

tact with the eyes can cause extremely painful tissue destruction due to the cryogenic properties of this compound.

Since fluorotrichloromethane can exist as a liquid at room temperatures, ingestion is possible. If swallowed, symptoms of necrosis (tissue destruction) and stomach perforations may occur.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to fluorotrichloromethane:

Skin: Irritation and possible frostbite.

Eye: Moderate to severe irritation and possible burns and frostbite.

Lung: Irritation of the mucosa. May cause bronchospasm, cough, and congestion or tightness in chest.

Other: A narcotic at high concentrations. Will effect the central nervous system (CNS) with narcosis (drowsiness), giddiness, and disorientation. It can also induce irregular or abnormal heart arrhythmia.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to fluorotrichloromethane and can last for months or even years:

Cancer Hazards: According to the information presented in the references, fluorotrichloromethane has not been shown to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, fluorotrichloromethane has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Low, chronic exposures may lead to liver damage and possible injury to the eyes and lungs. Cardiac rhythm changes may also be induced on high or prolonged exposures, although this is conjecture in the references and cannot be substantiated with human or animal studies. Prolonged skin contact may cause dryness, cracking, redness, secondary infection, and contact dermatitis.

🕒 **Recommended Risk-Reduction Measures**

If a less toxic chemical cannot be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around a chemical such as fluorotrichloromethane. The exposure level for this chemical is extremely high (1000 ppm) and, therefore, respiratory protection may not always be necessary in well-ventilated work areas. However, when high exposure levels are predicted or prolonged exposures are anticipated, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, impervious polyvinylchloride, Viton, or polycarbonate gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around fluorotrichloromethane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where fluorotrichloromethane is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical protocol is suggested for those assigned to work with fluorotrichloromethane:

- ☑ Electrocardiogram (EKG), to test for pre-existing cardiac rhythm dysfunction and establish baseline.
- ☑ Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Electrocardiogram (EKG), to compare with baseline.
- ☑ Liver function tests.
- ☑ Lung function tests (compare with baseline).
- ☑ Nervous system function tests, including interviews by a qualified neurologist to evaluate any changes in personality or behavior.
- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to fluorotrichloromethane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of fluorotrichloromethane should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.
- ☑ Work clothing that has been contaminated with fluorotrichloromethane should never be worn home where family members can be exposed. It should be laundered only by personnel who have been briefed on its hazards.

RISK ASSESSMENT: ENVIRONMENT *General Assessment*

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of fluorotrichloromethane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Fluorotrichloromethane is considered to be a non-flammable gas (or liquid above 75°F). However, it is incompatible with a number of common, chemically active metals and caution is required to ensure contact is prevented. It is also a chlorofluorocarbon (CFC) which is a group of halogenated hydrocarbons alleged to cause damage to the earth's protective ozone layer. Therefore, accidental release to the environment must not occur. These characteristics require special consideration during any emergency situation involving a leak or spill of fluorotrichloromethane. Should fluorotrichloromethane ever come into contact with incompatible substances either during use, transportation, or storage, violent and explosive reactions can occur.

Fluorotrichloromethane can exist as a gas or a liquid. Both can damage the environment. It can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to fluorotrichloromethane.

Fluorotrichloromethane has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of exposure to plants, birds, or terrestrial animals.

☪ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Fluorotrichloromethane has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of exposure to fluorotrichloromethane on plants, birds, or terrestrial animals.

◆ *Water Solubility*

Fluorotrichloromethane is nearly insoluble in water. Concentrations of 100 milligrams or less may mix with a liter of water.

⌚ *Persistence in the Environment*

Fluorotrichloromethane is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. If the gas reaches the atmosphere, it is very stable and is expected to remain in the troposphere for a very long time (half-life in troposphere is between 50 and 200 years).

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Bioaccumulation of fluorotrichloromethane in the edible tissues of fish is not expected to occur.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of fluorotrichloromethane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from shock, excessive heat (including the sun's rays), and damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If any liquid has spilled, contaminated soils may need to be removed for incineration and replaced with clean soil. If fluorotrichloromethane should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of the aquatic environment. When such spills occur, the local and/or state emergency response authorities should

be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of fluorotrichloromethane. If fluorotrichloromethane is spilled or leaked, the following specific steps are recommended:

- ☑ Evacuate area and deny entry until cleanup is completed. Restrict persons not wearing protective clothing from hazard area.
- ☑ Ventilate area of spill or leak and remove all ignition sources.
- ☑ If source of leak is a cylinder and it cannot be repaired in place, remove to safe location (e.g., outdoors) and allow to empty. Stay clear of area. If liquids are released, absorb in vermiculite or other material and dispose of in sealed drums.
- ☑ It may be necessary to dispose of dichlorodifluoromethane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving fluorotrichloromethane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔍 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies that deal with public relations should be developed, approved, and implemented long before any need for such arises.

FORMALDEHYDE

HCHO

CAS: 50-00-0

**IDENTIFICATION AND TYPICAL USES**

Formaldehyde is a nearly colorless gas with a pungent, suffocating odor. It is often used in an aqueous solution. It is used in the manufacture of phenolic resins, cellulose esters, artificial silk, dyes, explosives, and organic chemicals. Also used as a germicide, fungicide, and disinfectant. It has uses in tanning products, in adhesives, in waterproofing fabrics, for tonic and chrome printing in photography, in cosmetics, as embalming fluid, in foam insulation and wood preservatives, as a chemical intermediate, as a stabilizer in gasoline, as a corrosion inhibitor in the metal industry, a starch modifier, in medicines (for athletes foot medicine and cough drops), and treating skin diseases in animals.

RISK ASSESSMENT: HEALTH**General Assessment**

Formaldehyde presents a moderate to severe health hazard risk. It is a primary irritant of the eyes, skin, and respiratory system. It is mutagenic (causes changes in cell structure), teratogenic (adversely affects fetal development), is carcinogenic (cancer-causing) in animals and is suspected to cause cancer in humans as well. Exposure occurs through all routes of exposure (*ingestion, inhalation, and absorption*).

Inhalation causes lachrymation (tearing), olfactory changes (numbing of the sense of smell), burning of eyes, nose, and throat, dry and sore throat, sneezing, coughing, headache, feeling of thirst, and disturbed sleep. There may be listlessness, dyspnea, loss of body weight, inflammation in the nasal tissues, and pathological changes in the nose, larynx, trachea, and bronchi. Respiratory irritation may progress to severe injury, including pulmonary edema (fluid in lungs), chemical pneumonitis, and death. Symptoms of pulmonary edema may be delayed up to 48 hours creating a false sense of security with regard to health exposure risk.

Skin contact with the liquid causes moderate to severe irritation with redness and a possibility for burning, drying, cracking, scaling, and blistering. The liquid may pass through intact skin to cause toxic systemic effects. When combined with inhalation or ingestion exposures, the results can be fatal. Skin allergy may develop. Eye contact will result injuries up to and including permanent corneal opacity and vision loss.

Ingestion causes immediate burns to the mouth, esophagus, and stomach. There may be abdominal pain and cramps, nausea and vomiting, bloody diarrhea, digestive hemorrhage, and ulceration or perforation of the stomach.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to formaldehyde:

- Skin:** Irritation and rash or burning sensation on contact. Absorption of the liquid is possible.
- Eye:** Burns leading to permanent damage.
- Lung:** Irritation causing coughing and/or shortness of breath. Higher exposures can cause a buildup of fluid in the lungs (pulmonary edema), which is a medical emergency.
- CNS:** Systemic effects of exposure include CNS depression with symptoms of metabolic acidosis, vertigo, convulsions, stupor, and coma. Death may occur due to respiratory failure.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to formaldehyde and can last for months or even years:

Cancer Hazards: Formaldehyde is a probable carcinogen in humans since it has been shown to cause cancer

in animals. Formaldehyde also causes mutations (genetic changes). Such chemicals may have a cancer or reproductive risk. Formaldehyde may be a teratogen in humans since it has been shown to cause birth defects in animals.

Reproductive Hazards: According to information presented in the references, exposure to formaldehyde can adversely affect the reproductive process causing pathological changes in the ovaries and subsequent changes in the menstrual cycle. It may also cause low birth weight children (results of research in this area are conflicting and inconclusive).

Sensitivity: Exposure to the skin may result in allergy (sensitization). If allergy develops, very low future exposure can result in skin irritation and rash. Repeated exposure can cause chronic irritation of the eyes and lungs.

🔹 **Recommended Risk-Reduction Measures**

Formaldehyde is a suspected human carcinogen. Personnel should avoid direct contact with formaldehyde. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around formaldehyde. For exposures to any level, use a supplied-air respirator operated in positive pressure mode or use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, polyethylene, butyl, and nitrile rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with formaldehyde.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where formaldehyde is used or stored. OSHA 29 CFR 1910.1048 (Formaldehyde) provides additional information on personnel training requirements.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically pump liquid formaldehyde from drums or other storage containers to process containers.
- ☑ Specific engineering controls are recommended for formaldehyde by NIOSH. Refer to the NIOSH criteria document: *Occupational Exposure to Formaldehyde* (Publication Number 77-126). Also refer to OSHA 29 CFR 1910.1048 (Formaldehyde) for additional engineering and administrative control requirements.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to formaldehyde and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of formaldehyde should be communicated to all potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where formaldehyde is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of formaldehyde. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Formaldehyde is considered a highly flammable gas. As a liquid, it is a Class III combustible. It is

extremely volatile and presents a serious fire and explosion hazard when exposed to heat or in contact with incompatible materials. Rail cars and storage tanks are subject to boiling liquid expanding vapor explosion (BLEVE) if involved in fire. These characteristics require special consideration during any emergency situation involving a leak or spill of formaldehyde. Should formaldehyde ever come into contact with incompatible substances such as oxidizers, acids, alkalies, phenols, or permanganates, either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible. It polymerizes readily in both the gaseous and liquid states and slowly oxidizes in air to formic acid.

The proper disposal/destruction method for formaldehyde is to burn it in a chemical incinerator equipped with an afterburner and air scrubber (permitted facilities only).

Formaldehyde can enter the environment through manufacturing processes, unchecked waste discharges into effluents, and through spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to formaldehyde.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of formaldehyde to terrestrial animals.

Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Formaldehyde has high chronic toxicity in aquatic life. It has caused cancer and other chronic effects in laboratory animals (rodents). Birds and terrestrial animals exposed to formaldehyde may show similar effects. No data are available on the long-term effects of formaldehyde on plants, birds, or land animals.

Water Solubility

Formaldehyde is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

Persistence in the Environment

Formaldehyde is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Approximately 99% of formaldehyde will eventually end up in air; the rest will end up in water.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of formaldehyde found in fish tissues is expected to be about the same as the average concentration of formaldehyde in water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of formaldehyde should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Maximum storage temperatures should not exceed 83°F/28°C (30% solution with 0.05% methanol) or 29°F/-5°C (solutions 15% methanol) to inhibit polymerization. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If formaldehyde should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of formaldehyde. If formaldehyde is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove all ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air and repair or allow cylinder to empty.
- ☑ Keep formaldehyde out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- ☑ It may be necessary to dispose of formaldehyde as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving formaldehyde can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental dam-

age can also result in a loss of profits and loss of current as well as future business.

Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public hysteria, emotion, and ignorance can run equally high. This should be carefully considered whenever developing or implementing public relation policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Irritation of the eyes and mucosa of the upper respiratory tract. Excessive inhalation of vapor can cause headache, drowsiness, fatigue, nausea, acidosis, abdominal spasms, and other effects on the central nervous system (CNS) including loss of consciousness. ABSORPTION: Skin absorption can compound effects of inhalation. Skin eruptions can occur. INGESTION: Central nervous system (CNS) depression. Toxic to liver and kidney. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 (Table Z-1) | Target Organs? Respiratory system, skin, eyes, CNS, repro. system. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. <u>Seek medical assistance.</u> For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Keep victim warm and at rest. Treat symptomatically and supportively. If <u>swallowed:</u> Unlikely to occur. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals. Store in tightly closed containers in a cool, dark, well-ventilated area. Keep away from heat, flame, and moisture. Aluminum or stainless steel containers are recommended for shipping and storing formamide. | | | | |
| Other Precautions and Warnings Bulk storage facilities should be equipped with air vents and dryers to prevent moist air from prolonged contact with stored formamide. Copper and brass materials should be avoided. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposures above the PEL (20 ppm): MSHA/NIOSH-approved full facepiece respirator with organic vapor cartridge. For higher exposures: Supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FORMAMIDECH₃NO

CAS: 75-12-7

**IDENTIFICATION AND TYPICAL USES**

Formamide is a clear, colorless, viscous (oily), hygroscopic liquid with a slight ammonia-like odor. It is used in the manufacture of formic esters and hydrocyanic acid by catalytic dehydration. It is also used as an ionizing solvent, as a softener for animal glues, paper, and water-soluble gums.

RISK ASSESSMENT: HEALTH**General Assessment**

Formamide is a human poison by skin contact (*absorption*) and by *inhalation*. Although ingestion is unlikely, it can occur with moderately toxic results. Its carcinogenic properties have not been adequately investigated. However, it has been shown to cause mutations (genetic changes) in laboratory experiments with test animals. It has also demonstrated experimental teratogenic (fetal changes) and reproductive effects. Human data in this regard are non-specific and inconclusive.

Inhalation causes immediate irritation to the eyes, nose, throat, and mucous membranes lining the respiratory tract. High concentrations can cause drowsiness, fatigue, nausea, vomiting, acidosis, loss of consciousness, and other indications of central nervous system depression.

Skin contact cause surface irritation, skin eruptions, redness, blistering, and associated pain. Because it is absorbed readily through intact skin, it can compound the effects of inhalation to life-threatening proportions.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to formamide:

Skin: Irritation and rash or burning sensation on contact. Absorption is likely and the systemic effects are expected to be moderate to severe.

Eye: Irritation and redness. Possible inflammation of the conjunctiva.

Lung: Irritation of the nose, throat, and mucosa of the upper respiratory tract.

CNS: Inhalation of high concentrations of the vapor may cause drowsiness, fatigue, nausea, acidosis, and even loss of consciousness. These symptoms indicate CNS depression.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to formamide and can last for months or even years:

Cancer Hazards: It has been shown that formamide causes mutations (genetic changes) in test animals. Such chemicals may have a cancer or reproductive risk. There are no reports that formamide causes cancer in animals. Additional study is required in this area with regard to human exposures.

Reproductive Hazards: Formamide may be a teratogen in humans since it has been shown to cause birth defects in animals. Reproductive effects have also been demonstrated.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with formamide. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around formamide. For low-level or infrequent exposures (over the PEL of 20 ppm), an organic vapor respirator may suffice. For higher or more frequent exposures, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode or a supplied-air respirator are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with formamide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where formamide is used or stored.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of liquids between containers is recommended.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to formamide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of formamide should be communicated to all exposed or potentially exposed workers.
- Never eat, drink, or smoke in areas where formamide is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of formamide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Formamide is considered a Class 111B combustible liquid. It presents a moderate fire hazard when exposed to heat or sources of ignition. It is also hygroscopic (will absorb moisture). It will attack lead, copper, and brass materials. These characteristics require special consideration during any emergency situation involving a leak or spill of formamide. Should formamide ever come into contact with incompatible substances such as oxidizers, acids, bases, iodine, pyridine, or sulfur trioxide, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Formamide can enter the environment through manufacturing, unchecked discharge into effluents, and through spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to formamide.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of formamide to terrestrial animals.

☪ Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Formamide has high chronic toxicity in aquatic life. No data are available on the long-term effects of formamide to plants, birds, or land animals.

💧 Water Solubility

Formamide is highly soluble in water. Concentrations of 1000 milligrams will mix with a liter of water.

⌚ Persistence in the Environment

Formamide is moderately persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. It is expected to have high mobility in soil, especially dry soil.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of formamide found in fish tissues is expected to be about the same or lower than the average concentration of formamide in water from which the fish was taken.

🚫 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of formamide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If formamide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of formamide. If formamide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Responders must wear appropriate personal protective equipment (PPE), including self-contained breathing apparatus (SCBA).
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. If non-sparking tools are used, avoid copper, brass, or lead since formamide will attack these metals. Suggest plastic or rubber materials.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak can not be stopped in place, remove leaking cylinder to a safe place in the open air and repair or allow cylinder to empty.
- ☑ Keep formamide out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- ☑ It may be necessary to dispose of formamide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving formamide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Always remember that anytime the term “reproductive hazard” is used, public emotion, hysteria, and ignorance can run equally high. This should be seriously considered whenever developing or implementing public relations policies.

🚫 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in

the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X | |
| Health Hazards INHALATION: Vapors cause irritation to the upper respiratory tract with coughing, dyspnea, headache, bronchitis, weakness, tearing, nasal discharge, and nausea. SKIN & EYES: Eye contact causes scarring of the cornea. Skin contact causes burns, blistering, local necroses, and membrane ulceration. Sensitization may occur. INGESTION: Severe poisoning, kidney damage, salivation, bloody vomiting, burning in mouth, pain, and diarrhea. Severe cases may cause shock, dyspnea, circulatory collapse, and death. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, kidneys, liver. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis); Renal or liver disorders. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Inhaling a 5% sodium bicarbonate in water aerosol may reduce effects. If <u>swallowed:</u> Seek medical attention, contact poison control center. Do NOT induce vomiting. Give milk or water to drink to dilute followed by milk of magnesia or aluminum hydroxide. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other material, collect using non-sparking tools, and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Formic acid is a combustible liquid. Avoid contact with strong oxidizers such as chlorine since violent reactions occur. Store in tightly closed containers in cool, well-ventilated area away from heat. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where formic acid is used, handled, or stored. Detached facility storage is preferred. Electrically ground and bond all containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use half-mask respirator with acid cartridge for low or transient exposures (cartridge should be designed to protect against acid vapor or mist). For higher exposures, use a supplied-air respirator or a self-contained breathing apparatus operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Acid resistant synthetic rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FORMIC ACID

CAS: 64-18-6

**IDENTIFICATION AND TYPICAL USES**

Formic acid is a colorless liquid with pungent, penetrating, and irritating odor. It is often used in aqueous solution of 90% formic acid or in a 98% (glacial) solution). It is used the dyeing and finishing of textiles, in the manufacture of fumigants, in the treatment of leathers, as a solvent for perfumes and lacquers, in electroplating operations, in the coagulation of rubber latex, as an aid in regenerating old rubber, in chemical analysis, as a decalcifier, as an antiseptic in brewing, in silvering glass products, in ore flotation, as an animal feed additive, a food preservative, and as a flavor adjunct. It is also used in vinyl resin plasticizers.

RISK ASSESSMENT: HEALTH**General Assessment**

Exposure to formic acid is possible through *inhalation* of its vapors and by *ingestion*. Although it is considered to be of moderate to severe toxicity, it is a highly caustic and, therefore, corrosive compound. There are no reports on its carcinogenic, mutagenic, or teratogenic properties.

Inhalation produces severe irritation of the eyes, nose, and respiratory tract with coughing, dyspnea (labored breathing), bronchitis, headache, and total body weakness. There may be tearing, nasal discharge, throat irritation, and nausea.

Skin contact causes severe burning with possible vesiculation. Its extremely corrosive properties cause immediate burns, membrane ulceration, skin blistering, and local necrosis (tissue destruction) upon contact. Skin sensitization may also occur. Eye contact causes damage and the possibility of permanent corneal scarring.

Ingestion is extremely dangerous, even life-threatening. It causes severe poisoning, kidney damage, salivation, bloody vomiting, burning sensation on the mouth, acute tissue damage, diarrhea with pain,

shock, breathing difficulties, circulatory collapse and death.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to formic acid:

Skin: Irritation/rash or burning feeling on contact with redness, blistering and vesiculation, and localized tissue destruction.

Eye: Severe irritation; may cause burns and damage with permanent corneal scarring.

Lung: Severe irritation of the mucous membranes in the nose, throat, and lungs following exposure.

CNS: Inconclusive (possible lethargy, weight loss).

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to formic acid and can last for months or even years:

Cancer Hazards: According to information presented in the references, formic acid has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, formic acid has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Skin contact causes irritation and burns. There may be some lasting effects of chronic exposures such as sensitization. Once an individual becomes "sensitized," even the slightest future exposures can cause an allergic reaction.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with formic acid. It is extremely corrosive and moderately toxic to

humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around formic acid. A self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. For low concentrations (near the 5 ppm exposure limit), an acid gas cartridge respirator (equipped with a mist/vapor filter) is acceptable protection. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with formic acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where formic acid is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

- Lung function tests (look for chronic respiratory diseases).
- Kidney and liver function tests.

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

- Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).
- If formic acid is ingested, contact poison control center. Unless advised otherwise and victim is conscious and alert, give 1-2 glasses of water or milk to dilute followed by milk of magnesia or aluminum hydroxide. Do NOT induce vomiting!

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to formic acid and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of formic acid should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of formic acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Formic acid is considered a combustible liquid. It is also extremely corrosive to many materials. It is incompatible with oxidizing agents and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of formic acid.

Should formic acid ever come into contact with incompatible substances such as oxidizers, caustics, or acids either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Formic acid can enter the environment mainly through industrial discharges or spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to formic acid.

Insufficient data are available on the short-term effects of formic acid exposure to aquatic life, plants, birds, or land animals.

☼ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available on the long-term effects of formic acid to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Formic acid is highly soluble in water. Concentrations of over 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Formic acid is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of formic acid found in fish tissues is expected to be about the same as the average concentration of formic acid in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of formic acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If formic acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of formic acid. If formic acid is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Use non-sparking tools to cleanup area.
- ☑ Remove all ignition sources.
- ☑ Ventilate area or spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Neutralize remaining residue with soda ash or sodium bicarbonate. Do not flush to drains, sewers, or waterways.
- ☑ It may be necessary to dispose of formic acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving formic acid can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be

pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

ABSORPTION: Skin contact causes dryness and irritation. Possible sensitizer. Absorption is likely. Eye contact causes tearing and irritation. INGESTION: Gastrointestinal tract irritation, vomiting, nausea, and congestion. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? CNS, skin, eyes, lungs, mucous membranes. |
| Medical Conditions Generally Aggravated by Exposure Chronic pulmonary disease may be aggravated by exposure to furan. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects (pulmonary edema). If swallowed: Seek medical attention immediately. Give 1-2 glasses of water and induce vomiting. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb spills in vermiculite or other material and deposit in sealed containers. Ventilate area of spill or leak. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by applicable environmental regulations. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with strong oxidizers, since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat. Electrically ground and bond all equipment. | | | | |
| Other Precautions and Warnings Sources of ignition (heat, flame, cigarettes, incompatibles) are prohibited where furan is used, handled, or stored. Bulk storage of furan is not recommended. Protect containers from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure limits have been established. Use a supplied-air respirator with full facepiece operated in continuous flow mode, or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Boots; Aprons; Gauntlets | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FURANC₄H₄O

CAS: 110-00-9

**IDENTIFICATION AND TYPICAL USES**

Furan is a clear, colorless liquid with an ethereal odor. The liquid turns brown on standing. The color change can be retarded if a small amount of water is added. Furan is used as an intermediate in organic synthesis, especially for pyrrole, tetrahydrofuran, and thiophene. Also in the formation of lacquers and solvent for resins. Furan is a common constituent of some foods.

RISK ASSESSMENT: HEALTH**General Assessment**

Furan is a highly toxic compound. It is a poison by *inhalation*, *ingestion*, and is moderately toxic by skin contact (*absorption*). While its carcinogenic properties have not been adequately investigated, mutation data have been reported.

Inhalation of furan can cause dizziness, suffocation, fatigue, headache, vomiting, bronchial congestion, low blood pressure, suffocation, and a possibility of pulmonary edema (fluid in the lungs), which is a medical emergency and can lead to death. Symptoms may be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk. Furan is a central nervous system (CNS) depressant that may cause respiratory arrest and death.

Skin contact with the liquid or vapor can cause irritation and redness. Burning and watering of eyes have been reported on contact with the vapors of furan. If ingested, there can be gastrointestinal congestion along with many of the systemic (CNS) effects noted for inhalation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to furan:

Skin: Irritation with burning, itching, redness, and possible swelling.

Eye: Severe irritation of the conjunctiva with burning, itching, and watering.

Lung: Irritation of the bronchial tubes and other members of the respiratory tract. May cause pulmonary edema (fluid in the lungs) at high exposures, which can be fatal.

CNS: Narcotic effects at high concentrations with dizziness, fatigue, headache, weakness, and other symptoms of CNS depression.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to furan and can last for months or even years:

Cancer Hazards: Furan may cause mutations (genetic changes) in living cells. The data on its carcinogenicity are inconclusive.

Reproductive Hazard: According to the references, furan has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Long-term exposures to low levels of furan may lead to liver damage and may result in permanent lung damage.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with furan. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned

above, but is still advisable whenever working with or around furan. No exposure levels have been established for this chemical. However, this does not mean that exposure is without risk. For the best protection, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in continuous flow or positive pressure mode are recommended. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and a rubber apron should also be worn. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with furan.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where furan is used or stored.

Before beginning employment, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for personnel working with or around furan:

- Liver function tests.
 - Checks for blood pressure and pulse rate changes.
- If symptoms develop or overexposure is suspected, the following additional tests are recommended:
- Lung function tests.
 - Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to the delayed onset of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, emphysema, and other respiratory dysfunction, smokers may develop exposure symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible exposure factors when assessing health exposure risk.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to furan and at the end of the work shift or before eating, drinking, or smoking. Avoid contact with direct sunlight.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of furan should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to furan, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of furan. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Furan is considered a Class 1A flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and low boiling point present a dangerous fire and explosion risk. Also, because it is incompatible with many common oxidizers and acids, extreme caution is required in handling, storage, transportation, and disposal of furan. If it becomes unstable, it may form shock-sensitive and explosive peroxides in air. These characteristics also require special consideration during any emergency situation involving a leak or spill of furan crystals. Should furan ever come into contact with incompatible substances either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Furan can enter the environment from non-point sources, as well as industrial and municipal discharges, and from accidental spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to furan.

Insufficient data are available to evaluate or predict the short-term effects of furan to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of furan to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Furan is not soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

🕒 *Persistence in the Environment*

Furan is moderately persistent in water, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of furan found in fish tissues is expected to be higher than the average concentration of furan in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of furan into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of furan should be segregated from incompatible chemicals to minimize the risk of cross-

contamination or contact. To prevent static sparks, all containers and equipment used in shipping, receiving, or transferring operations, should be grounded and bonded. Storage facilities should be designed with proper fire protection and prevention.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If furan should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of furan. If furan is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite or other similar material and place in sealed drums for disposal. Use non-sparking tools and avoid skin contact.
- ☑ It may be necessary to dispose of furan as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving furan can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in

the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

FURFURALC₅H₄O₂

CAS: 98-01-1

**IDENTIFICATION AND TYPICAL USES**

Furfural is a clear, colorless, oily liquid that turns reddish brown on exposure to air and light. It has an almond-like odor similar to benzaldehyde. It is used in solvent refining of lubricating oils, butadiene, rosin, and other organic materials, as a solvent for nitrocellulose, cellulose acetate, shoe dyes, as an intermediate for tetrahydrofuran and furfuryl alcohol; in phenolic and furan polymers, as a wetting agent in the manufacture of abrasive wheels and brake linings, as a weed killer, a fungicide, in road construction materials, in the production of lysine, in the refining of rare earth and metals, in flavoring, and as an analytical reagent.

RISK ASSESSMENT: HEALTH**General Assessment**

Furfural is a human poison by *ingestion* and is considered moderately toxic by *inhalation* and skin contact (*absorption*). While its carcinogenic and teratogenic properties have not been adequately investigated, mutation data have been reported.

Inhalation of furfural can cause dangerous irritation of the mucous membranes of the respiratory system. It can cause numbness of the tongue and loss of the sense of taste. There may be headache, itching throat, eye irritation, difficulty in breathing, and a possibility of pulmonary edema (fluid in the lungs), which is a medical emergency and can lead to death. Symptoms of pulmonary edema can be delayed up to 48 hours creating a false sense of security with regard to health exposure risk. Furan is also a central nervous system (CNS) depressant that may cause respiratory arrest and death.

Skin contact with the liquid or vapor can cause irritation and redness. Repeated contact may cause skin discoloration to a yellow-brown. It can absorb

quickly through the skin to further compound the effects of exposure by other routes (e.g., inhalation). Eye contact causes burning and watering of eyes and may result in damage. If ingested, there can be severe headache and unspecified gastrointestinal effects.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to furfural:

- Skin: Irritation with itching, redness, and possible staining. Absorption is likely.
- Eye: Severe irritation of the conjunctiva with burning, itching, and watering.
- Lung: Irritation of the mucous membrane of the respiratory system. May cause pulmonary edema (fluid in the lungs) at high exposures, which can be fatal.
- CNS: Narcotic effects at high concentrations with dizziness, fatigue, headache, weakness, and other symptoms of CNS depression.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to furfural and can last for months or even years:

Cancer Hazards: Furfural may cause mutations (genetic changes) in living cells. The data on its carcinogenicity are inconclusive.

Reproductive Hazard: According to the references, furfural has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Long-term exposure causes eczema, allergic sensitization, and photosensitization in some individuals. Once allergy develops, even the

slightest future exposures can cause recurrence of symptoms.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with furfural. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around furfural. The exposure level for this chemical is relatively low (5 ppm) and may be difficult to monitor. For the best protection, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in continuous flow or positive pressure mode are recommended. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and a rubber apron should also be worn. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with furfural.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where furfural is used or stored.

Before beginning employment, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for personnel working with or around furfural:

- ☑ Liver function tests.
- ☑ Checks for blood pressure and pulse rate changes.

If symptoms develop or overexposure is suspected, the following additional tests are recommended:

- ☑ Lung function tests.
- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to the delayed pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, emphysema, and other respiratory dysfunction, smokers may develop exposure symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible exposure factors when assessing health exposure risk in the work place.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to furfural and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of furfural should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to furfural, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of furfural. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Furfural is considered a Class 111A flammable liquid (per OSHA 29 CFR 1910.106). Its moderately low flash point presents a fire and explosion hazard risk. Also, because it is incompatible with many common oxidizers and acids, extreme caution is required in handling, storage, transportation, and dis-

posal of furfural. It is unstable in the presence of light, air, heat, and can polymerize violently. These characteristics also require special consideration during any emergency situation involving a leak or spill of furfural crystals. Should furfural ever come into contact with incompatible substances either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is highly possible.

Furfural can enter the environment from non-point sources, as well as industrial and municipal discharges, and from accidental spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to furfural.

Insufficient data are available to evaluate or predict the short-term effects of furfural to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of furfural to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Furfural is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Furfural is moderately persistent in water, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans who have consumed contaminated animal tissues.

The concentration of furfural found in fish tissues is expected to be higher than the average concentration of furfural in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of furfural into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of furfural should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. To prevent static sparks, all containers and equipment used in shipping, receiving, or transferring, should be grounded and bonded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If furfural should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of furfural. If furfural is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite or other similar material and place in sealed drums for disposal. Use non-sparking tools and avoid skin contact.
- ☑ It may be necessary to dispose of furfural as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving furfural can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

ABSORPTION: Dryness, irritation, possible dermatitis. Absorption is likely with effects of inhalation. INGESTION: Gastrointestinal irritation and the systemic effects of inhalation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, skin, CNS, eyes. |
| Medical Conditions Generally Aggravated by Exposure Chronic pulmonary disease and skin diseases may be aggravated by exposure to furfuryl alcohol. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For red or blistered skin, contact physician. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Give glass of water. Do NOT induce vomiting. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Disperse unignited vapors with water spray. Absorb spills in vermiculite or other material and deposit in sealed containers. Ventilate area of spill or leak. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in steel or baked phenolic-lined containers in cool, well-ventilated area away from heat. Do not keep more than six months supply. Storage under inert (nitrogen) atmosphere is recommended. | | | | |
| Other Precautions and Warnings Protect containers from physical damage. Electrical grounding and bonding is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposure over the PEL (50 ppm), use an air-purifying respirator. For higher exposures, use a supplied-air respirator with full facepiece operated in continuous flow mode, or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Rubber Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Boots; Aprons; Gauntlets | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

FURFURYL ALCOHOLC₅H₆O₂

CAS: 98-00-0

**IDENTIFICATION AND TYPICAL USES**

Furfuryl alcohol is a clear, colorless, mobile liquid that turns brownish-black on exposure to air. It has a strong ether-like odor and bitter taste. It is used as a wetting agent, in furan polymers, in corrosion-resistant sealants and cements, in foundry cores, in modified urea-formaldehyde polymers, as a penetrant, a solvent for dyes and resins, and as a flavoring agent (food and feed). The polymer is used as a mortar for bonding acid-proof brick and chemical masonry.

RISK ASSESSMENT: HEALTH**General Assessment**

Furfuryl alcohol is a human poison by *ingestion* and is considered moderately toxic by *inhalation* and skin contact (*absorption*). While its carcinogenic and teratogenic properties have not been adequately investigated, mutation data have been reported.

Inhalation of furfuryl alcohol can cause dangerous irritation of the eyes, nose, and mucous membranes of the respiratory system. It can cause central nervous system (CNS) depression with excitability, hot-flushed skin, excessive talking, drunken behavior, staggering and loss of coordination, headache, mental confusion, visual disturbances, fatigue, nausea and vomiting, diarrhea, diuresis, lower body temperatures, pale skin color, and dizziness. High exposures can lead to stupor, loss of consciousness, coma, and death.

Skin contact results initially in a cooling sensation at the sight of contact. Since it will effectively remove the protective oily layer on the skin's surface, there will be drying, cracking, redness, and possible progression to dermatitis. Eye contact causes immediate stinging and burning with tearing, inflammation of surrounding tissues, and a painful sensitivity to light. If absorption occurs, it will compound the systemic

effects caused by other simultaneous exposures (inhalation or ingestion).

Ingestion causes gastrointestinal irritation and many of the same systemic effects caused by inhalation, particularly those affecting the CNS.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to furfuryl alcohol:

Skin: Irritation with dryness, cracking, and a possibility for secondary infection and dermatitis. Absorption is possible.

Eye: Severe irritation of the eye tissue with burning, itching, and watering.

Lung: Irritation of the mucosa of the respiratory system. Can cause cough and itchy throat.

CNS: A powerful depressant of the central nervous system with symptoms similar to that of intoxication. High exposures can be fatal.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to furfuryl alcohol and can last for months or even years:

Cancer Hazards: Furfuryl alcohol may cause mutations (genetic changes) in living cells. The data on its carcinogenicity are inconclusive.

Reproductive Hazard: According to the references, furfuryl alcohol has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged or repeated skin contact may lead to dermatitis in some individuals.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with furfuryl alcohol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around furfuryl alcohol. An air purifying respirator with an organic vapor cartridge may provide adequate protection for low or infrequent exposures above the PEL (50 ppm). For the best protection, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in continuous flow or positive pressure mode are recommended. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and a rubber apron should also be worn. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with furfuryl alcohol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where furfuryl alcohol is used or stored.

Before beginning employment, and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for personnel working with or around furfuryl alcohol:

- ☑ Lung function test (establish baseline).
 - ☑ Checks for blood pressure and pulse rate changes.
- If symptoms develop or overexposure is suspected, the following additional tests are recommended:
- ☑ Lung function tests (compare to baseline).
 - ☑ Complete neurological evaluation to check for nervous system disorders.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a

substitute for controlling exposures. Also, because smoking can cause heart disease, emphysema, and other respiratory dysfunction, smokers may develop exposure symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible exposure factors when assessing health exposure risk in the work place.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to furfuryl alcohol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of furfuryl alcohol should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to furfuryl alcohol, emergency shower facilities should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of furfuryl alcohol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Furfuryl alcohol is considered a Class 111A flammable liquid (per OSHA 29 CFR 1910.106). Its moderately low flash point presents a fire and explosion hazard risk. Also, because it is incompatible with many common oxidizers and acids, extreme caution is required in handling, storage, transportation, and disposal of furfuryl alcohol. It can polymerize violently in contact with many organic acids (such as formic

and nitric acid). These characteristics also require special consideration during any emergency situation involving a leak or spill of furfuryl alcohol crystals. Should furfuryl alcohol ever come into contact with incompatible substances either during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is highly possible.

Furfuryl alcohol can enter the environment from industrial and municipal discharges, and from accidental spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to furfuryl alcohol.

Insufficient data are available to evaluate or predict the short-term effects of furfuryl alcohol to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of furfuryl alcohol to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Furfuryl alcohol is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Furfuryl alcohol is moderately persistent in water, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of furfuryl alcohol found in fish tissues is expected to be higher than the average concentration of furfuryl alcohol in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of furfuryl alcohol into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of furfuryl alcohol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. To prevent static sparks, all containers and equipment used in shipping, receiving, or transferring operations, should be electrically grounded and bonded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If furfuryl alcohol should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of furfuryl alcohol. If furfuryl alcohol is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Absorb liquids in vermiculite or other similar material and place in sealed drums for disposal. Use non-sparking tools and avoid skin contact.
- It may be necessary to dispose of furfuryl alcohol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving furfuryl alcohol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Extremely irritating to the eyes, nose, throat, and respiratory system. Inhaled dusts may also cause bronchial irritation and inflammation of associated mucosa. EYES & SKIN: Skin and eye contact can result in irritation. Absorption is not reported. Prolonged eye contact may cause corneal abrasions. INGESTION: Poisonous by ingestion with experimental reproductive effects. Irritation of the gastrointestinal tract with abdominal cramps and nausea likely. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately flush area with large amounts of water. For red or blistered skin, wash with soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Contact poison control center. Never attempt to give anything by mouth to an unconscious or convulsing person. Seek medical attention. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in safest manner possible. Do NOT dry sweep (generates dusts). Use a HEPA vacuum instead. Absorb solution spills in vermiculite or similar materials and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Avoid contact with potassium chlorite. Store in tightly closed containers in cool, well-ventilated area away from heat. | | | | |
| Other Precautions and Warnings Avoid generating dusty conditions in storage areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels have been established for gallic acid. It is suspected to cause reproductive effects. An air purifying respirator with acid cartridge and a HEPA filter may suffice. However, better protection is provided by a supplied-air respirator with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Acid resistant synthetic rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

GALLIC ACID

CAS: 149-91-7

**IDENTIFICATION AND TYPICAL USES**

Gallic acid appears as colorless or slightly yellow crystalline needles or prisms. It is used in photography, in writing ink, in dyeing, in the manufacture of pyrogallol, as a tanning agent and in the manufacture of tannins, in the manufacture of paper, in pharmaceuticals, in engraving and lithography, and as an analytical reagent.

RISK ASSESSMENT: HEALTH**General Assessment**

Exposure to gallic acid is possible through *inhalation* of its dusts and by *ingestion*. The data in the references are limited regarding its specific toxicity. However, reproductive effects have been reported in test animals and mutation data have also been reported. There are no reports of animal or human carcinogenicity.

Inhalation of gallic acid dusts will cause irritation of the eyes, nose, throat, and mucous membranes of the upper respiratory tract. Bronchial tube irritation may also occur with progression to bronchitis if exposures continue.

Skin and eye contact can result in mild to moderate irritation. If allowed to remain in contact with the eye for prolonged periods, corneal abrasions may occur. Ingestion may cause systemic poisoning with abdominal cramps and possible nausea and vomiting.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to gallic acid:

Skin: Irritation/rash or burning feeling on contact.

Eye: Severe irritation; may cause burns and damage.

Lung: Irritation of the nose, throat, and lungs following exposure.

Other: Ingestion causes gastrointestinal irritation.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to gallic acid and can last for months or even years:

Cancer Hazards: According to information presented in the references, gallic acid has not been adequately tested for its ability to cause cancer in animals. Mutation data have been reported and some scientists believe that long-term exposure to mutagens may pose a cancer risk. There is no indication that exposure to gallic acid will have this effect. Additional research is required.

Reproductive Hazard: There is limited evidence to show that exposure to gallic acid causes adverse reproductive effects in laboratory animals.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with gallic acid. The exact nature of its toxicity is not clearly understood in the references. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever

working with or around gallic acid. No exposure levels have been established for gallic acid. This does not mean that exposure is without health risk. Prudent risk management may require a conservative approach to respiratory protection until further data are known about gallic acid. For transient exposures, an air-purifying respirator equipped with an acid cartridge, a HEPA filter, and a dust/mist pre-filter may suffice. Greater protection is obtained using a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash/dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with gallic acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where gallic acid is used or stored. Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to gallic acid and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of gallic acid should be communicated to all exposed or potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of gallic acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser degree, air).

Gallic acid is considered a non-combustible solid. It may be corrosive, especially when mixed in solution. It is incompatible with potassium chlorite and contact can cause violent reaction, including fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of gallic acid.

Gallic acid can enter the environment mainly in industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to gallic acid.

Insufficient data are available to evaluate or predict the short-term effects of gallic acid exposure to aquatic life, birds, plants, or land animals.

☪ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of gallic acid exposure to aquatic life, birds, plants, or land animals.

💧 Water Solubility

Gallic acid is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

⌚ Persistence in the Environment

Gallic acid is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

There is no information in the references on the expected bioaccumulation of gallic acid in the edible tissues of fish.

🔍 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of gallic acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If gallic acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of gallic acid. If gallic acid is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area of spill.
- ☑ Collect all powdered materials in safest and most convenient manner possible and deposit in sealed drums for disposal. Do NOT dry sweep

(generates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter instead. Damp mop residue and collect for disposal. Absorb any solution spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.

- ☑ It may be necessary to dispose of gallic acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving gallic acid can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔍 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

GALLIUM ARSENIDE

AsGa

CAS: 1303-00-0

**IDENTIFICATION AND TYPICAL USES**

Gallium arsenide appears as a dark gray, cubic, crystalline solid. It has no noticeable odor when dry but may have a slight odor like garlic when moist. It is used as a semiconductor in light-emitting diodes for telephone dials, injection lasers, solar cells, magneto-resistance devices, thermistors, and microwave generation. Also used in medical lasers and in transistors for military electronics equipment (radar-jamming devices).

RISK ASSESSMENT: HEALTH**General Assessment**

Gallium arsenide is toxic by *inhalation* and *ingestion* due to its arsenic content. Skin contact causes some topical risk but absorption has not been reported. Arsenic is a suspected human teratogen (cause birth defects), a known carcinogen (causes cancer), and a confirmed mutagen (causes genetic changes). Arsenic has also been shown to accumulate in the body over prolonged periods of exposure. Gallium itself is poorly absorbed in the body but may cause bone marrow depression and dermatitis.

Inhalation of gallium dusts result in the release of arsenic into the body. This can cause irregular heart contractions and serious (life-threatening) lung injury. Pulmonary edema (fluid in the lungs) can develop up to 48 hours after exposure. This is a medical emergency and can lead to death. Because of the delayed development, victims may experience a false sense of security with regard to health exposure risk. Other symptoms of exposure include central nervous system (CNS) effects with peripheral neuropathy, delirium, headache, convulsions, muscle cramps, and paresthesia (tingling of the skin). Death can occur from cardiovascular collapse, kidney failure, or pulmonary edema. Gastrointestinal symptoms include vomiting, nausea, and abdominal pains. There may also be intravascular breakage of red blood cells resulting in

reversible kidney failure. There may be jaundice and liver damage as well as weakness, anorexia, gastrointestinal disturbances, liver damage, and injury to the nervous system on prolonged contact.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to gallium arsenide:

Skin: May cause severe irritation, redness, rash, and possible dermatitis.

Eye: Severe irritation and possible damage.

Lung: Dusts will irritate the lungs causing cough and phlegm. There may be a dangerous buildup of fluid in the lungs (pulmonary edema) which can be fatal.

CNS: Serious depression of the central nervous system with effects ranging from headache to delirium, convulsions, coma, and death.

☪ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to gallium arsenide and can last for months or even years:

Cancer Hazards: According to the references, gallium arsenide has not been tested for its ability to cause cancer in animals. However arsenic and arsine, both of which are produced by gallium arsenide once it enters the body, are known carcinogens. It is highly probable that gallium arsenide is also a human carcinogen.

Reproductive Hazard: According to the references, gallium arsenide has not been tested for its ability to affect reproduction. Arsenic, a derivative of gallium arsenide, is a known teratogen.

Other Chronic Effects: Repeated exposure can cause nerve damage with “pins and needles” effect, burning,

numbness, and later weakness of arms and legs. Repeated skin contact can cause thickened skin and/or patchy areas of darkening and loss of pigment. Some persons develop white lines on the nails. Repeated exposures can also damage the liver, cause narrowing of the blood vessels, or interfere with the bone marrow's ability to make red blood cells. Chronic exposure may cause anorexia, general weakness, gastrointestinal disturbances, and peripheral neuropathy.

🔊 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with gallium arsenide dusts or powders. If a less toxic material or compound cannot be substituted for gallium arsenide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of gallium arsenide dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around gallium arsenide. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection, especially when exposures levels are unknown. However, for low or infrequent exposure, an MSHA/NIOSH-approved full facepiece respirator with a high efficiency particulate air (HEPA) filter can be used. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, protective rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with gallium arsenide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where gallium arsenide is used or stored.

Before beginning employment working with gallium arsenide, and at regular intervals thereafter (e.g., annually), those personnel with frequent or potentially high exposures should be provided the following recommended medical tests:

Lung function test.

- Obtain baseline arterial blood gases.
- Complete blood count.
- Test for urine arsenic (may not be accurate within 2 days of eating shellfish or fish; most accurate at the end of a work shift) should not be greater than 100 micrograms per gram creatinine in the urine.

Liver and kidney function tests.

If symptoms develop or over exposure is suspected, the following additional tests may be helpful:

- Lung function tests.
- Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed development of pulmonary edema).
- Evaluation by a qualified allergist with careful consideration of exposure history and special tests (may help diagnose allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease as well as lung cancer, emphysema, and other known respiratory problems, smokers exposed to gallium arsenide may experience symptoms much more quickly and with more pronounced indications than non-smokers under the same conditions of exposure.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to gallium arsenide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of gallium arsenide should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to gallium arsenide,

emergency shower facilities should also be provided.

- ☑ Workers whose clothing has been contaminated by gallium arsenide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to gallium arsenide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of gallium arsenide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where gallium arsenide contacts incompatible commodities can result in fire, explosion (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

In its powdered form, gallium arsenide is considered a non-combustible solid. However, it can react explosively and present a serious fire hazard. Because it is incompatible with many commodities, including steam, acids, and acid fumes, extreme caution is required in handling, storage, transportation, and disposal of gallium arsenide. These characteristics also require special consideration during any emergency situation involving a leak or spill of gallium arsenide powder or dust. Should gallium arsenide ever come into contact with incompatible substances either during use, transportation, storage, or disposal, violent and even explosive reactions are possible.

Gallium arsenide can enter the environment from industrial and municipal waste treatment plant discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to barium.

The main ecological hazard of gallium arsenide is due to its arsenic derivative.

Arsenic has high acute toxicity to aquatic life, birds, and land animals. Except where soil arsenic content is high (e.g., around smelters and where arsenic-based pesticides are known to have been used),

arsenic does not accumulate in plants to toxic levels. Where soil content is high, growth of crops and crop yields can be decreased.

☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Gallium arsenide has high chronic toxicity to aquatic life and moderate chronic toxicity to birds and land animals.

💧 *Water Solubility*

Gallium arsenide is insoluble in water (decomposes). As arsenic, concentrations of less than 1 milligram will mix with a liter of water.

⌚ *Persistence in the Environment*

Gallium arsenide is highly persistent in water as arsenic, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of gallium arsenide found in fish tissues as arsenic is expected to be much higher than the average concentration of arsenic in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of gallium arsenide dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of gallium arsenide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If gallium arsenide should contact the water table, aquifer, or navigable waterway, time is of the essence. It decomposes in water and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of gallium arsenide. If gallium arsenide powder is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area.
- Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts).
- It may be necessary to dispose of gallium arsenide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving gallium arsenide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public hysteria, emotion, and ignorance can run equally high. This must

be carefully considered whenever developing or implementing public relations policies.

U Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Medical Conditions Generally Aggravated by Exposure None identified. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 48 hours for lung effects. If swallowed: Seek medical attention immediately. Do not induce vomiting due to possible aspiration of vomitus/chemical into the lungs. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Wear SCBA respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Stop leak if it can be done without risk. Provide maximum explosion-proof ventilation. Absorb with vermiculite or other similar material and deposit in sealed containers. Use non-sparking tools during cleanup. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well ventilated location. Keep away from sources of heat. | | | | |
| Other Precautions and Warnings Sources of ignition (open flame or smoking), are prohibited where gasoline is used or stored. Metal containers should be bonded and grounded during transfer operations. Bulk storage not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use a MSHA/NIOSH-approved air-purifying organic vapor respirator, a powered air purifying respirator, or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Neoprene or Polyvinyl Alcohol Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron if Splash is Likely | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

GASOLINE

Formula varies with grade

CAS: 8006-61-9

IDENTIFICATION AND TYPICAL USES

Gasoline is a clear or colored (with dye), mobile, aromatic, volatile liquid with a characteristic odor. It is a mixture of volatile hydrocarbons suitable for use in a spark-ignited internal combustion engine. It has an octane number of at least 60. Octane numbers of 90 or slightly lower are almost chiefly used as automotive fuels and octane numbers higher than 100 are aviation fuels. Other variations and formulations exist for *anti-knock gasoline*, *cracked gasoline*, *lead-free gasoline*, *natural gasoline*, *polymer gasoline*, *pyrolysis gasoline*, *reformed gasoline*, *straight-run gasoline*, and *white gasoline*.

RISK ASSESSMENT: HEALTH

General Assessment

Gasoline is considered moderately poisonous by *inhalation* of its vapors or by *ingestion* of the liquid. Skin contact will also cause localized damage at site of contact. When large quantities are in contact with skin, toxic amounts may be absorbed. It is suspected to cause cancer in animals but there is inadequate evidence to rate its human carcinogenic potential. Its teratogenic and mutagenic properties have not been reported in the references.

Inhalation of the gasoline vapors can cause mild to severe irritation of the eyes, nose, throat, and respiratory tract mucosa. Systemic effects include cough, conjunctiva irritation, flushing of the face, headaches, and blurred vision. High concentrations even for short periods can cause potentially fatal pulmonary edema (fluid in the lungs). Symptoms of coughing, wheezing, congestion, tightness in chest, and dyspnea may be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk. Inhalation can also lead to depression of the central nervous system (CNS) with symptoms of intoxication, hallucination, mental confusion, staggering gait or

stupor, slurred speech, loss of consciousness and possible convulsions.

Skin contact may cause dermatitis and absorption can occur with harmful effects. It is a comparatively strong irritant, producing erythema, and burning, and, in severe cases, edema and even blistering. Contact dermatitis is possible, as is secondary infection. Eye contact can cause irritation of the conjunctiva with redness, swelling, tearing, and localized inflammation of eye tissues.

Ingestion may cause nausea, vomiting, headaches, dizziness, gastrointestinal irritation, blurred vision, drunkenness, fever, drowsiness, confusion, cyanosis, and symptoms of CNS depression similar to that caused by inhalation. If vomiting occurs, aspiration of the liquid into the lungs can cause choking, difficulty breathing or shortness of breath (dyspnea), tachypnea (rapid respiration), tachycardia (rapid heartbeat), fever, bronchitis, and pneumonitis.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to gasoline:

- Skin: Irritation with potential for redness, blistering, burning, and absorption.
- Eye: Severe irritation, conjunctivitis, redness, possible pain, and visual disturbances.
- Lung: Nose, throat, and respiratory tract irritation causing difficulty in breathing, possible pulmonary edema on high exposure (a medical emergency) which can be fatal.
- CNS: Inebriation, dizziness, stupor, hallucinations, slurred speech, mental confusion, loss of consciousness, and possible convulsions.
- Other: Acute exposure can also lead to acute hemorrhage of the pancreas, fatty degeneration of

the liver and kidneys, congestion of the spleen.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to gasoline and can last for months or even years:

Cancer Hazards: Gasoline is a suspected carcinogen in animal studies. Its ability to cause cancer in humans has not been adequately determined. The IARC states insufficient evidence exists for a human carcinogenic determination.

Reproductive Hazard: There is no evidence in the references to indicate that exposure to gasoline causes any adverse effects to reproduction.

Other Chronic Effects: Chronic inhalation of gasoline vapors can cause loss of appetite, nausea, weight loss, insomnia, hyperesthesia, motor weakness, muscular degeneration, diminished tendon reflexes, and loss of coordination. Repeated skin contact causes blistering, drying, and lesions.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with or exposure to gasoline. Occupational poisoning occurs most commonly by inhalation. Substitution is not usually an option with gasoline since its use is quite specific. However, a less toxic material or compound should be used in place of gasoline whenever possible. If substitution cannot be done, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of gasoline release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around gasoline. An MSHA/NIOSH-approved air-purifying respirator with an organic vapor cartridge, a supplied-air respirator operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand are the appropriate methods of respiratory protection when exposure to gasoline is anticipated. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, neoprene or polyvinyl alcohol gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with gasoline.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where gasoline is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered:

Lung function tests (establish baseline).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

Lung function tests (compare to baseline).

Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed development of pulmonary edema).

Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory disorders, smokers exposed to gasoline may experience symptoms more rapidly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible risk factors.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances and that personnel have been trained on its use, care, and maintenance.

Wash thoroughly immediately after exposure to gasoline and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of gasoline

should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to gasoline, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by gasoline should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to gasoline.
- ☑ Where possible, automatically transfer liquids containing gasoline from drums or other containers to process containers. Always ground and bond all containers and equipment. Use non-sparking tools.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of gasoline. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Gasoline is a moderately flammable liquid. Because of its extremely low flash point and high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). It is a dangerous fire hazard and moderate explosion hazard when exposed to heat or flame. It is incompatible with commonly encountered oxidizers and some acids (such as nitric). Caution is always required in handling, storage, transportation, and disposal of gasoline. Emergency responders should be made aware of the presence of gasoline at any emergency response situation.

Gasoline can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to gasoline. Gasoline has high acute toxicity to aquatic life. It can cause death in plants and roots and membrane damage in leaves of various agricultural crops. Insufficient data are avail-

able to evaluate the short-term effects of gasoline on birds or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Gasoline has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of gasoline to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Gasoline is not soluble in water. Concentrations of 1 milligram will not mix with a liter of water.

⌚ *Persistence in the Environment*

Gasoline is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.5% of gasoline will eventually end up in air; the rest will end up in water.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of gasoline found in fish tissues is expected to be somewhat higher than the average concentration of gasoline in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of gasoline into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of gasoline should be segregated from other chemicals and materials to minimize the risk of cross-contamination. Facilities should be designed to meet explosion-proof requirements.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous

materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If gasoline should contact the water table, aquifer, or navigable waterway, time is of the essence. It is not soluble and total remediation may be possible. In general, gasoline will float on the surface and may be captured if response actions are prompt. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of gasoline.

If gasoline is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Absorb liquids in vermiculite, sand, earth, or similar material and deposit in sealed drum. Use non-sparking tools during cleanup procedures.
- ☑ Ventilate area of spill or leak. Container should be removed to safer area if it can be done without increasing the risk.
- ☑ Use water spray to knock down vapors.
- ☑ It may be necessary to dispose of gasoline as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving gasoline can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," or "carcinogen" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered when developing or implementing any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Seek medical attention immediately. Never attempt to give an unconscious and convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Ventilate area. Evacuate non-essential personnel. Collect powdered materials in safest manner possible. Do NOT dry sweep. Use HEPA vacuum instead. Have water source available to fight any surrounding fires. Emergency personnel must avoid contact with airborne dusts. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in closed containers in cool, dry, well-ventilated area away from heat. Avoid handling activities that create dusty conditions. Respiratory protection should be worn by all personnel involved in handling and storage operations. | | | | |
| Other Precautions and Warnings Keep away from incompatible materials since violent reactions can easily occur. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL has not been established. An air-purifying respirator with a HEPA filter and dust/mist pre-filter is the minimum suggested protection. Recommend using a powered supplied-air respirator with full facepiece operated in pressure demand mode. Greater protection is obtained from a self-contained breathing apparatus (SCBA) with full facepiece in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Rubber | | Eye Protection Chemical/Dust Goggles and/or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

GERMANIUM

Ge

CAS: 7440-56-4

**IDENTIFICATION AND TYPICAL USES**

Germanium is a non-metallic element of atomic number 32, atomic weight of 72.59, valences of 2,4, group IVA of the periodic system. It appears as a grayish-white metalloid, crystalline, and brittle solid. It is used in solid-state electronic devices such as transistors and diodes. Also used in semiconductor applications, in brazing alloys, in phosphors, in gold and beryllium alloys, and in infrared-transmitting glass.

RISK ASSESSMENT: HEALTH***General Assessment***

Germanium is considered moderately toxic by *inhalation* and *ingestion*. Human and animal data are lacking in the references. There is no information on the carcinogenic, teratogenic, or mutagenic properties of germanium. However, some germanium compounds, such as tributyl germanium and germanium tetrachloride are known mutagens and dimethyl germanium is a confirmed teratogen.

Inhalation of large concentrations of germanium dusts will cause irritation to the eyes, nose, throat, and respiratory tract. Eye irritation can progress to conjunctivitis. Inhaled dusts are rapidly absorbed through the respiration process. Once in the body, the effects are considered toxic, systemic, but are not clearly specified in the references. It does have a close chemical relationship with arsenic and caution is suggested in its use and handling.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to germanium:

- Skin:** Irritation and possible rash in some individuals.
- Eye:** Mild to moderate irritation that may progress to conjunctivitis.

Lung: Irritation of the mouth, nose, and throat causing coughing and/or shortness of breath.

Other: Ingestion of the dusts may cause throat and stomach irritation with unspecified gastrointestinal effects.

☠ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to germanium and can last for months or even years:

Cancer Hazards: According to information presented in the references, germanium has not been adequately tested for its ability to cause cancer in test animals. Some compounds, such as germanium tetrachloride, are known mutagens.

Reproductive Hazards: There are no reports to support any claims of reproductive hazards following exposure to germanium. However, some germanium compounds (such as dimethyl germanium) are known teratogens.

☠ *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with germanium dusts and powders. Although the toxicity of the base element is not clearly understood in the references, many germanium compounds are known to cause moderate to severe toxic health effects. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. Because germanium can be highly reactive, explosion-proof ventilation is recommended. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with germanium. No exposure level has been established for elemental germa-

nium. However, this does not mean that exposure is entirely risk free. An MSHA/NIOSH-approved air-purifying respirator equipped with a high-efficiency particulate air (HEPA) filter and a dust/mist pre-filter may suffice. The best protection is obtained using a powered supplied-air respirator operated in continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever an airborne dust hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious protective gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with germanium.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where germanium is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Consider chest X-ray after acute overexposure.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory disorders, smokers exposed to germanium may experience symptoms more rapidly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible risk factors.

Other methods to reduce exposure to chemicals include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- Wash thoroughly immediately after exposure to germanium and at the end of the work shift or before eating, drinking, or smoking. Work clothing contaminated with germanium should never be taken home for laundering (fire hazard). Only personnel trained in the hazards of exposure should launder contaminated clothing.
- Safety shower and eyewash stations should be readily available in work areas where germanium is used or stored.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of germanium should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of germanium. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (primarily air, but water and soil may also be contaminated depending upon the condition of the spill).

Germanium is considered to be a dangerous, reactive material. It can react explosively when heated with potassium chlorate or potassium nitrate. It can react violently with nitric acid and will ignite on contact with chlorine or bromine plus heat. It will react incandescently when heated with oxygen or potassium hydroxide. It is incompatible with aqua regia, concentrated sulfuric acid, fused alkalis, nitrates and carbonates, halogens, and oxidants. These characteristic require special consideration during any emergency involving a leak or release of germanium gas.

Germanium can be present naturally and can enter the environment through spills or leaks. Unchecked discharges from industrial sources are also possible.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to germanium.

Insufficient data are available to accurately evaluate or predict the short-term effects of germanium exposure to aquatic life, plants, birds, or land animals.

Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term (chronic) effects of germanium to aquatic life, plants, birds, or land animals.

Water Solubility

Germanium is insoluble in water. Concentrations of 1 milligram will not mix with a liter of water.

Persistence in the Environment

Germanium is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually all of germanium will end up in terrestrial soil and aquatic sediments.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of germanium found in fish tissues is expected to be somewhat higher than the average concentration of germanium in the water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of germanium should be segregated from sources or heat or ignition and kept away from incompatible materials. Containers should be kept closed and in a cool, dry, well-ventilated area. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Contaminated soils should be removed and replaced with clean soils. Cleanup should be attempted only by those trained in proper containment procedures. If germanium should contact the water table, aquifer, or navigable waterway, time is of the essence. It is insoluble in water and total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of germanium. If germanium is spilled or leaked, the following steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Collect powdered materials in safest manner possible. Do NOT dry sweep (generates airborne dusts). Use a vacuum equipped with a high-efficiency particulate air (HEPA) filter instead. Dispose of in sealed containers.
- It may be necessary to dispose of germanium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving germanium can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surround-

ing an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

GERMANIUM CHLORIDEGeCl₄

CAS: 10038-98-9

**IDENTIFICATION AND TYPICAL USES**

Germanium chloride appears as a colorless, mobile liquid that may fume in air. It has a peculiar acidic odor that can be distinguished from that of concentrated hydrochloric acid. It is used primarily in the semi-conductor industry.

RISK ASSESSMENT: HEALTH***General Assessment***

Germanium chloride is toxic by *ingestion* and can also cause toxic effects on *inhalation*. Skin contact will produce localized damage to tissues and may be destructive, depending upon the skin's surface moisture. There are no reports in the references of any carcinogenic, mutagenic, or teratogenic response following exposure to germanium chloride.

Inhalation may cause pneumonitis, nasopharyngitis, tracheobronchitis, dyspnea, chronic cough, and shortness of breath. Germanium chloride produces chronic systemic disease that primarily affects the lungs. High concentrations can also cause a dangerous (life-threatening) buildup of fluids in the lungs in a condition known as pulmonary edema. Symptoms may be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk.

Ingestion causes irritation of the mouth and stomach. Eye contact causes conjunctival irritation. Germanium chloride can react with the water content of the eyes to cause corrosive destruction of tissues.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to germanium chloride:

Skin: Severe irritation and possible burns. Localized and corrosive skin destruction may also

be possible, depending on moisture levels (sweat).

Eye: Severe irritation, itching, and burning on contact. Damage may be severe and permanent, depending on length of contact time.

Lung: Overexposure can severely irritate the airways and lungs, causing nasal discharge, tightness in the chest, cough, shortness of breath, and/or fever. Future exposures can cause further attacks. High acute exposures can lead to pneumonitis or life-threatening pulmonary edema. Symptoms may be delayed for hours or even days following exposure.

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to germanium chloride and can last for months or even years:

Cancer Hazards: According to information presented in the references, germanium chloride has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: There is no evidence in the published studies to show that germanium chloride has the ability to adversely affect reproduction.

Other Chronic Effects: There are no other chronic effects reported in the references for germanium chloride.

🛡 *Recommended Risk-Reduction Measures*

The specific toxicity of germanium chloride is not clearly understood in the references. Personnel should avoid direct contact with germanium chloride. If a less toxic material or compound cannot be substituted for germanium, then *engineering controls* are the most effective method of reducing exposure risk. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of germanium

chloride release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around germanium chloride. No exposure levels have been established for this compound. This does not mean that exposure to germanium chloride is without health hazard risk. A MSHA/NIOSH approved supplied-air respirator operated in positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in continuous flow or other positive pressure mode are the recommended methods of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with germanium chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where germanium is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered for those with frequent or potentially high exposures:

- Lung function tests (spirometry and gas transfer testing).
- Chest X-ray.
- Careful physical examination of the skin and lungs.

If symptoms develop or overexposure is suspected, the following may be useful:

- Consider chest X-ray after acute exposure.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical histories are extremely important when assessing exposure risk. Also, since smoking can cause heart disease, emphysema, and other lung diseases, smokers exposed to irritating substances such as germanium chloride may experience symp-

toms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible factors which may be causing the appearance of exposure symptoms in the workplace.

Other methods to reduce exposure include:

- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its correct use and care.
- Wash thoroughly immediately after exposure to germanium chloride and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of germanium chloride should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to germanium chloride, emergency shower facilities should also be provided in the immediate work area.
- Workers whose clothing has been contaminated by germanium chloride should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to germanium chloride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of germanium chloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Germanium chloride is generally non-combustible. However, it can react violently in contact with water or steam and caution is always required in handling, storage, transportation, and disposal of germanium chloride. When heated to decomposition in air it emits very toxic fumes of chloride. Emergency responders should be made aware of the presence of germanium chloride at any emergency response situation.

Germanium chloride may enter the environment through industrial discharge and municipal operations, and from accidental spills or leaks.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to germanium chloride.

Insufficient data are available to evaluate or predict the acute (short-term) effects of germanium chloride to aquatic life, birds, plants or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the chronic (long-term) effects of germanium to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Germanium chloride reacts violently in contact with water or moisture to produce toxic and corrosive fumes.

🕒 *Persistence in the Environment*

Germanium chloride will decompose in violent reaction with water and is virtually non-persistent in the aquatic environment, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

There is no data on the bioaccumulation of germanium chloride in aquatic organisms. However, since it is known to react violently in water to form other toxic and corrosive materials, it is highly probable that bioaccumulation will not occur. More research is required.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of germanium chloride into the environment. Labels on all containers, trucks, and rail cars must accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the risks to the environment and personnel.

Storage of germanium chloride should be segregated from other chemicals and materials to minimize the risk of cross-contamination. Germanium chloride must be stored to avoid contact with water and moisture since violent reactions can occur. Containers should be protected from physical damage and stored to avoid contact with heat.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If germanium chloride should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of germanium chloride.

If germanium chloride is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- Absorb liquid spills with vermiculite or other material and place in sealed drums for disposal.
- Ventilate area of spill or leak.
- It may be necessary to dispose of germanium chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving germanium chloride can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public ex-

posures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Extinguishing Media

Stop flow of gas, if possible. Allow to burn, do not attempt to extinguish since combustion of germanium tetrahydride reduces the possibility of explosions due to the formation of unstable air mixtures.

Special Fire Fighting Procedures

Germanium tetrahydride is a dangerous fire and explosion hazard. The gas is pyrophoric and may spontaneously ignite in air. Poisonous gases are produced in fire. Wear self-contained breathing apparatus. Use water spray to keep containers cool.

Unusual Fire and Explosion Hazards

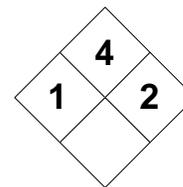

Fire-exposed containers can explode violently in fire. They should be moved from fire areas if it can be done without risk. Cooling water should be applied from a safe distance if possible.

| SECTION V - REACTIVITY DATA | | | | |

| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system; liver; kidneys; CNS; skin; eyes. |
| Medical Conditions Generally Aggravated by Exposure Respiratory function impairments (bronchitis, asthma, etc.); Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. Observation for 24 - 48 hours for lung effects and seizures. If <u>swallowed:</u> Unlikely. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Ventilate area. Leaking gas can ignite spontaneously. Evacuate non-essential personnel. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, clear area and allow to empty. Have water source available to fight any surrounding fires. Stay clear and allow to burn until out. Emergency personnel must avoid contact with vapors and gases. | | | | |
| Preferred Waste Disposal Method None specified in the references (incineration of a gas may be the only alternative). | | | | |
| Precautions to be Taken in Handling and Storage Do not store in open air since violent and explosive fire may occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from sunlight. Keep away from ignition sources such as fire, sparks, and flame. | | | | |
| Other Precautions and Warnings Bulk storage of germanium tetrahydride is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL is low and difficult to monitor (0.2 ppm). Recommend using a powered supplied-air respirator with full facepiece operated in pressure demand mode. Greater protection is obtained from a self-contained breathing apparatus (SCBA) with full facepiece in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious and Thermal Rubber | | Eye Protection Chemical Goggles and/or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

GERMANIUM TETRAHYDRIDE

GeH₄

CAS: 7782-65-2

IDENTIFICATION AND TYPICAL USES

Germanium tetrahydride is a colorless gas with a pungent odor, normally shipped as a compressed gas. It is used primarily as a doping agent for solid-state electronic components.

RISK ASSESSMENT: HEALTH

General Assessment

Germanium tetrahydride gas is a severe irritant of the eyes, respiratory tract, and skin. As a gas, it is primarily toxic by *inhalation*. If the compressed gas should contact the skin or eyes, burning and irritation is likely to occur although absorption as an exposure route has not been reported. Ingestion is not likely to occur. There are no reports of carcinogenic, teratogenic, or mutagenic indications.

Inhalation of large concentrations causes dyspnea (difficulty breathing), bronchospasm, chest pain, congestion, and pulmonary edema, which may be fatal. Development of pulmonary edema may be delayed up to 48 hours after exposure, thereby creating a false sense of security with regard to health exposure risk. There may also be seizures following exposure to germanium tetrahydride gas. Germanium tetrahydride is a hemolytic agent which means it can induce hemolysis, a breakdown of the red blood cells with a liberation of hemoglobin. Liver and kidney damage are also possible (positive animal studies).

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to germanium tetrahydride:

Skin: Irritation and burning on contact with the cold compressed gas.

Eye: Burns which may cause damage to the eye and surrounding tissues.

Lung: Irritation of the mouth, nose, and throat causing coughing and/or shortness of breath. Higher exposures can lead to pulmonary edema.

CNS: Data on the acute effects of germanium tetrahydride on the central nervous system are inconclusive. However, animal studies have shown some indication of seizure activity at high concentrations.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to germanium tetrahydride and can last for months or even years:

Cancer Hazards: According to information presented in the references, germanium tetrahydride has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazards: There are no reports to support any claims of reproductive hazards following exposure to germanium tetrahydride.

Other Chronic Effects: Germanium tetrahydride is a hemolytic agent and repeated or prolonged exposure may damage the blood, liver, and kidneys.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with germanium tetrahydride gas. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. Because germanium tetrahydride is a highly flammable and reactive gas, explosion-proof ventilation is required. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with germanium tet-

rahydride. The exposure level is extremely low (0.2 ppm) and difficult to accurately monitor. The best protection is obtained using a powered supplied-air respirator operated in continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious, thermal protective gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with germanium tetrahydride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where germanium tetrahydride is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Consider chest X-ray after acute overexposure (may be negative if taken immediately following exposure due to delayed development of pulmonary edema).
- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory disorders, smokers exposed to germanium tetrahydride may experience symptoms more rapidly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible risk factors.

Other methods to reduce exposure to chemicals include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to germanium tetrahydride and at the end of the work shift or before eating, drinking, or smoking. Work clothing contaminated with germanium tetrahydride should never be taken home for laundering (fire hazard). Only personnel trained in the hazards of exposure should launder contaminated clothing.
- Safety shower and eyewash stations should be readily available in work areas where germanium tetrahydride is used or stored.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of germanium tetrahydride should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of germanium tetrahydride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (primarily air, but water and soil may also be contaminated depending upon the condition of the spill).

Germanium tetrahydride is considered to be a dangerous, reactive, and explosive flammable gas. It is pyrophoric, which means it can ignite spontaneously on exposure to air and burn vigorously. This characteristic requires special consideration during any emergency involving a leak or release of germanium tetrahydride gas.

Germanium tetrahydride can enter the environment through spills or leaks. Unchecked emissions from industrial sources are also possible.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to germanium tetrahydride.

As a gas, germanium tetrahydride may not be expected to pose a serious threat to aquatic life. However, insufficient data are available to accurately evaluate or predict the short-term effects of germanium tetrahydride exposure to aquatic life, plants, birds, or land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term (chronic) effects of germanium tetrahydride to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Germanium tetrahydride is insoluble in water. Concentrations of 1 milligram will not mix with a liter of water.

⌚ *Persistence in the Environment*

Germanium tetrahydride is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of germanium tetrahydride will eventually end up in the air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Germanium tetrahydride is not expected to accumulate in the edible tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react

properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of germanium tetrahydride should be segregated from sources of heat or ignition. Containers should be air-tight and enclosed. Buildings designated for storage should be equipped with appropriate explosion-proof design as well as the proper fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of germanium tetrahydride. If germanium tetrahydride is spilled or leaked, the following steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak using maximum explosion-proof equipment.
- ☑ If possible, stop flow of leaking liquid or gas. Gas will spontaneously ignite in contact with air. Remove all combustible materials from the area and have extinguishing equipment available. Use water spray to knock down vapors. Once germanium tetrahydride gas is ignited, it may be best to let it burn since combustion will reduce the likelihood of explosions of unstable germanium tetrahydride mixtures in air.
- ☑ Keep germanium tetrahydride out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving germanium tetrahydride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits

that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Eye, nose, and throat irritant. Causes headache, nasal inflammation and nosebleeds, tightness in chest, delayed asthma, nausea, vomiting, and possible liver damage. ABSORPTION: Skin contact can result in irritating rash and skin staining. Can cause severe eye burns leading to permanent damage. Can result in delayed dermatitis. Absorption is likely. INGESTION: Stomach irritation and possible hemorrhage, ulceration, and perforation of the stomach and esophagus. | | | | |
| Carcinogenicity No Evidence Human Confirmed Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system; skin; eyes; liver (possibly). |
| Medical Conditions Generally Aggravated by Exposure Any conditions that deplete glutathione or inhibit aldehyde dehydrogenase may be aggravated. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 30 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water to dilute and induce vomiting. Never attempt to give an unconscious or convulsing person anything by mouth. Never attempt to make such a person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Dissolve in a combustible solvent and burn in a chemical incinerator (with afterburner and scrubber). | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals. Store in tightly closed containers in a cool, dark, well-ventilated area. Keep fire and flame away. | | | | |
| Other Precautions and Warnings Prevent physical damage to containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) The NIOSH exposure ceiling is low and difficult to monitor (0.2 ppm). For relatively low or infrequent exposures, use an MSHA/NIOSH-approved full-facepiece respirator with organic vapor cartridge. For best protection, especially at high exposures or during emergencies, use a supplied-air respirator or a self-contained breathing apparatus with full facepiece and operated in a positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

GLUTARALDEHYDE

CAS: 111-30-8

**IDENTIFICATION AND TYPICAL USES**

Glutaraldehyde is a colorless to pale-yellow liquid with a pungent, fruity, rotten apple-like odor. It can also appear as a colorless, crystalline solid at temperatures below 7°F (-14°C). It is used as a leather tanning agent, as a tissue fixative, a cross-linking agent for proteins, in X-ray processing solutions and film emulsions, as a disinfectant in hospitals (2% solution), in embalming fluids (25% solution), in pharmaceuticals as a therapeutic treatment for warts (up to 10% solution), and as a preservative in certain cosmetic products. It is also used as a chemical intermediate for adhesives, sealants, and electrical products.

RISK ASSESSMENT: HEALTH**General Assessment**

Glutaraldehyde is a poison by *ingestion* and is considered moderately toxic by *inhalation* and skin contact (*absorption*). While it is not currently listed as a carcinogen, animal mutation data have been reported. It is also an experimental teratogen causing reproductive effects in some test animals.

Because of its relatively low vapor pressure, the potential for inhalation exposures is considered to be equally low. However, respiratory irritation and other effects have been recorded. Inhalation may also cause headache, nasal inflammation with accompanying nose bleeds, tightness in chest, difficulty breathing, nausea, and vomiting. Liver damage (hepatitis) has occurred following inhalation studies conducted with animals.

Skin contact results in severe irritation and may cause brown staining to develop on the skin's surface at the point of contact. If glutaraldehyde should contact the eye, severe irritation and possible ocular damage may occur.

Ingestion causes mouth and stomach irritation. High concentrations can lead to hemorrhage, ulceration, and perforation of the stomach and esophagus.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to glutaraldehyde:

Skin: Irritation and rash or burning sensation on contact with subsequent brown staining of the skin's surface.

Eye: Burns leading to ocular damage that may be permanent.

Lung: Irritation causing coughing and/or shortness of breath. May cause nasal inflammation and nosebleeds.

Other: Ingestion causes serious irritation to the gastrointestinal tract with a possibility for hemorrhage and ulcerations in vital organs and organ members.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to glutaraldehyde and can last for months or even years:

Cancer Hazards: Glutaraldehyde causes mutations (genetic changes). Such chemicals may have a cancer risk. There is limited evidence that glutaraldehyde causes cancer in animals. More research is required with regard to human carcinogenic potential.

Reproductive Hazards: According to information presented in the references, glutaraldehyde may be a teratogen in humans since it has been shown to cause birth defects and adversely affect the reproductive process in test animals.

Other Chronic Effects: Animal studies show that prolonged exposure to glutaraldehyde may cause liver damage (hepatitis). It is not known if it will have this effect on humans. Dermatitis and asthma may develop in some individuals (sensitization).

☘ Recommended Risk-Reduction Measures

Personnel should avoid direct contact with glutaraldehyde. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around glutaraldehyde. For low or infrequent exposures, a full facepiece respirator equipped with an organic vapor cartridge may provide appropriate protection. However, the NIOSH exposure ceiling is low and difficult to accurately monitor (0.2 ppm). The best protection is provided using a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure or continuous flow mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn. Rubber products may not provide suitable protection. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with glutaraldehyde.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where glutaraldehyde is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be helpful:

- ☑ Lung function tests, to include forced vital capacity (FVC) and forced expiratory volume (FEV).
- ☑ Monitor liver function tests and blood gases for indications of acidosis.
- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical

tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory disorders, smokers exposed to glutaraldehyde may experience symptoms more rapidly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible risk factors.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to glutaraldehyde and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of glutaraldehyde should be communicated to all exposed workers.
- ☑ Never eat, drink, or smoke in areas where glutaraldehyde is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of glutaraldehyde. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Glutaraldehyde is considered a non-combustible liquid. However, it will readily oxidize when exposed to air and can polymerize on exposure to alkaline solutions or when heated. It is incompatible with a number of commonly encountered materials, such as strong oxidizers and strong bases. Alkaline solutions of glutaraldehyde react with alcohol, ketones, amines, hydrazines, and proteins. These characteristics require special consideration during any emergency situation involving a leak or spill of glutaraldehyde. Should glutaraldehyde ever come into contact with any of these incompatible substances either during

use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for glutaraldehyde is to combine it with a combustible solvent and burn it in a chemical incinerator equipped with an afterburner and air scrubber. Glutaraldehyde can enter the environment through manufacturing, unchecked discharge into effluents, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to glutaraldehyde. This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of glutaraldehyde to plants, birds, or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Glutaraldehyde has high chronic toxicity in aquatic life. No data are available on the long-term effects of glutaraldehyde to plants, birds, or land animals.

💧 *Water Solubility*

Glutaraldehyde is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Glutaraldehyde is moderately persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Approximately 73% of glutaraldehyde will eventually end up in air; the rest will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of glutaraldehyde found in fish tissues is expected to be about the same as the average concentration of glutaraldehyde in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of glutaraldehyde should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If glutaraldehyde should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of glutaraldehyde. If glutaraldehyde is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ Keep glutaraldehyde out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).

- ☑ It may be necessary to dispose of glutaraldehyde as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving glutaraldehyde can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "reproductive hazard" is used, public emotion, hysteria, and ignorance can run equally high. This requires careful consideration during the development an implementation of public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Carcinogenicity No Evidence Human No Evidence Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, kidneys. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately flood area with water for 15 minutes. Then wash affected areas with soap and water. Inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility, if required. If swallowed: Contact poison control center. Rinse victim's mouth with water. Unless advised otherwise by poison control center and victim is conscious and alert, give 2-3 glasses of water to drink to dilute and then induce vomiting repeatedly until vomitus is clear. Never give anything by mouth to an unconscious or convulsing person. Never try to make an unconscious or convulsing person vomit. Seek medical attention immediately. Keep victim warm and at rest. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all sources of ignition. Ventilate area of spill. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. Absorb in vermiculite or other suitable material and dispose of in sealed drums. Do NOT release to sewers, storm drains, surface waters, or soils. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, dry, well-ventilated area away from heat and incompatibilities. Material is hygroscopic and will absorb moisture from the air. Ensure air-tight seals on all containers. | | | | |
| Other Precautions and Warnings Prevent static sparks by grounding and bonding all containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above the permissible limit of 5 mg/m³ (respirable fraction), use an MSHA/NIOSH-approved half-mask respirator with an organic vapor cartridge and equipped with a dust/mist pre-filter. For higher concentrations, or in emergencies, use a self-contained breathing apparatus in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Rubber (test for adequacy) | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron, Boots (avoid skin contact) | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

GLYCERIN

CAS: 56-81-5

**IDENTIFICATION AND TYPICAL USES**

Glycerin is a clear, colorless, or pale-yellow odorless, syrupy liquid with a sweet, warm taste. It may appear as a colorless solid at temperatures below 64°F (18°C). It has a wide range of uses, including: used in alkyd resins, in dynamite, in ester gums, in pharmaceuticals, in perfumery, as a plasticizer for the regeneration of cellulose, in cosmetics, in foodstuffs, in conditioning of tobacco, in certain liquors, as a solvent, in printer's ink rolls, in polyurethane polyols, as an emulsifying agent, in rubber stamp and copying inks, as a binder for cements and mixes, in special soaps, as a lubricant and softener, as a bacteriostat, a penetrant, in hydraulic fluid, as a humectant, in the fermentation of nutrients, and in anti-freeze mixtures.

RISK ASSESSMENT: HEALTH**General Assessment**

Glycerin is a relatively non-toxic material. However, it is considered mildly toxic by *ingestion*. Although inhalation and skin contact can also cause some reaction, they are not normally thought of as exposure routes. While there is no indication that exposure will cause any carcinogenic effects on long-term exposure, human mutation data have been reported. It has also been shown to adversely affect reproduction in experimental testing with animals.

In the form of mist, glycerin is a nuisance particulate and an inhalation irritant. It can cause mild irritation of the eyes, nose, throat, and respiratory tract. Eye and skin contact can result in irritation.

Ingestion causes the most noticeable and severe systemic effects. It can cause headache, nausea, and vomiting. It may also cause kidney damage.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to glycerin:

- Skin: Local irritation at contact site.
- Eye: Irritation and possible inflammation.
- Lung: Irritation of the nose, throat, and respiratory tract.
- Other: Ingestion causes headache, nausea, vomiting, and diarrhea.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to glycerin and can last for months or even years:

Cancer Hazards: According to information presented in the references, glycerin has not been shown to cause cancer in test animals. Human mutation data have been reported and many scientists believe that exposure to mutagenic substances may present a cancer hazard in the long-term. Additional study is required before any determinations can be made in this regard for glycerin.

Reproductive Hazard: Glycerin has been shown to cause adverse reproductive effects in laboratory experiments. It is not known if it will have this effect in humans exposed to glycerin.

Other Chronic Effects: Long-term exposure may cause kidney injury or damage.

🛡 Recommended Risk-Reduction Measures

Glycerin presents a relatively low to moderate health hazard risk. However, personnel should still avoid direct contact with glycerin. If a less toxic material or compound cannot be substituted for glycerin, then *en-*

Engineering controls are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of glycerin release. While not always operationally possible, isolating operations involving glycerin manufacturing or use can also reduce exposure. Personnel must follow proper industrial hygiene and good housekeeping work practices. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around glycerin. At exposures above the PEL (5 mg/m³, respirable fraction or 15 mg/m³ total mist), an MSHA or NIOSH half-mask respirator equipped with an organic vapor cartridge and a dust/mist pre-filter may suffice. For higher exposures or when the exposure levels are unknown (as in an emergency), a powered supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode are recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. Skin contact must not occur. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with glycerin.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where glycerin is used or stored.

Before beginning initial assignments with this chemical and at regular intervals thereafter (e.g., annually), the following medical protocol are recommended:

- ☑ Lung function tests (establish initial baseline and compare thereafter).
- ☑ Liver and kidney function tests (establish initial baseline and compare thereafter).

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- ☑ Lung function tests (compare to initial and subsequent baseline tests).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and other respiratory problems, personnel who smoke may show symptoms of exposure much quicker and more pronounced than those who do not. Prudent risk management requires careful consideration of *all* possible and potential exposure risk factors to ensure proper implementation of control measures and management of the exposure risk.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in the proper use, care, and maintenance of their protective equipment.
- ☑ Wash thoroughly immediately after exposure to glycerin and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of glycerin should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to glycerin, emergency shower facilities should also be provided in the immediate work area.
- ☑ Workers whose clothing has been contaminated by glycerin should change into clean clothes *before* leaving work. Contaminated work clothing should never be worn home where family members can be contaminated. The clothing should be laundered only by individuals who have been informed of the hazards of exposure to glycerin.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of glycerin. In almost every scenario, the threat of environmental

exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where glycerin contacts incompatible commodities can result in violent and even explosive reactions (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Glycerin is considered a Class 111A combustible liquid (per OSHA 29 CFR 1910.106). It can ignite when exposed to heat and support the burning of other materials in fire. Mixtures with hydrogen peroxide are highly explosive. It will ignite on contact with potassium permanganate and calcium hypochlorite. When mixed with nitric acid plus sulfuric acid, it forms the highly explosive glycerol nitrate. Mixtures with other oxidizers, and some acids can result in the formation of highly toxic and explosive compounds. Therefore, extreme caution is required in handling, storage, transportation, and disposal of glycerin. It is hygroscopic (will absorb moisture from the air to form other materials). These characteristics also require special consideration during any emergency situation involving a leak or spill of glycerin.

Glycerin may enter the environment through industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to glycerin.

Insufficient data are available on the short-term effects of glycerin to aquatic life, plants, land animals, and birds.

☞ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of glycerin to aquatic life, plants, birds, and land animals.

💧 *Water Solubility*

Glycerin is highly soluble in water. Concentrations of 1000 milligrams and even more will readily mix with a liter of water.

⌚ *Persistence in the Environment*

Glycerin is moderately persistent in the water, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of glycerin found in fish tissues is expected to be about the same as the average concentration of glycerin in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of glycerin should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Storage facilities should be equipped with the proper fire protection equipment (sprinklers, alarms, extinguishers). To prevent static sparks, all equipment and containers used in shipping, receiving, or transferring should be electrically grounded and bounded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Contaminated soils should be removed for incineration and replaced with clean soils. Cleanup should be attempted only by those trained in proper spill containment procedures. If glycerin should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is highly soluble in water and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of glycerin. If glycerin is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of leak or spill.
- ☑ Absorb liquids in vermiculite or other compatible material and dispose of in sealed drums for disposal. Do NOT allow material or run off to contact waterways or enter sewers.
- ☑ It may be necessary to dispose of glycerin as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving glycerin can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

|---------------------------------|----------------------------|---|
| Stability | | Conditions to Avoid Glycerol α- monochlorohydrin is an unstable liquid. However, the commercial product is often a stable mixture of two isomers. Keep away from incompatible materials, heat, and flame. |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Strong acids, such as nitric, sulfuric, and especially perchloric (forms a sensitive explosive product more powerful than glyceryl nitrate). In the presence of a catalyst, it can produce propylene oxide, a carcinogen. |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of glycerol α- monochlorohydrin is not expected to occur. |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products At high temperatures, glycerol α-monochlorohydrin decomposes and may produce poisonous gases, including toxic oxides of carbon and corrosive acrolein gas. |

SECTION VI - HEALTH HAZARD DATA

| | | | |
|-----------------------------------|------------------|------------------------|-----------------|
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin/eye)? | Ingestion? X |
|-----------------------------------|------------------|------------------------|-----------------|

Health Hazards

INHALATION: Irritation to the eyes, nose, throat, and respiratory system. Causes toxic systemic effects such as headache, nausea, vomiting, diarrhea, and symptoms of central nervous system (CNS) depression such as drowsiness (narcosis). Possible thyroid tumors.

SKIN & EYES: Irritation to skin with absorption likely. Causes toxic systemic effects with target on the liver, kidneys, and CNS. Eye contact may cause moderate to severe irritation.

INGESTION: Causes headache, nausea, vomiting, and diarrhea. Gastrointestinal irritation is likely.

| | | | | |
|---|--------------------------|---|------------------------------|--|
| Carcinogenicity Questioned Human Suspected Animal | NTP Listed? No | IARC Cancer Review Group? Not Found | OSHA Regulated? No | Target Organs? Respiratory system, eyes, skin, CNS, thyroid. |
|---|--------------------------|---|------------------------------|--|

Medical Conditions Generally Aggravated by Exposure

None reported.

Emergency and First-aid Procedures

Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes, seek medical attention. **Skin contact:** Remove all contaminated clothing. Immediately flood area with water for 15 minutes. Then wash affected areas with soap and water. **Inhalation:** Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility, if required. **If swallowed:** Contact poison control center. Never attempt to give anything by mouth to an unconscious or convulsing person. Never try to make an unconscious or convulsing person vomit. Seek medical attention immediately. Keep victim warm and at rest.

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled

Remove all sources of ignition. Ventilate area of spill. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. Absorb in vermiculite or other suitable material and dispose of in sealed drums. Do NOT release to sewers, storm drains, surface waters, or soils.

Preferred Waste Disposal Method

Burn in chemical incinerator equipped with afterburner and scrubber.

Precautions to be Taken in Handling and Storage

Store in tightly closed containers in cool, dry, well ventilated area away from heat and incompatibilities. Avoid contact with material during storage and shipping operations. Use protective equipment.

Other Precautions and Warnings

Prevent static sparks by grounding and bonding all containers.

SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT

Respiratory Protection (*specify type*)

No exposure levels have been established. For any exposure to a possible carcinogen, use a NIOSH-approved supplied-air respirator operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or some other positive pressure mode.

Ventilation

Local exhaust (preferred) at site of chemical work or general ventilation.

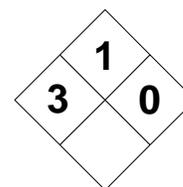

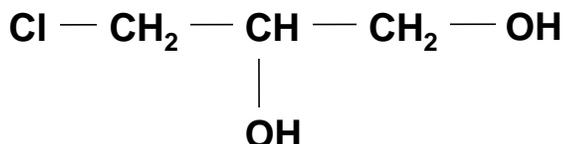

| | | |
|---|--|--|
| Protective Gloves Impervious Rubber (test for adequacy) | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron, Boots (avoid skin contact) |
|---|--|--|

Work/Hygiene Practices

Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals.

GLYCEROL α -MONOCHLOROHYDRIN

CAS: 96-24-2

**IDENTIFICATION AND TYPICAL USES**

Glycerol α -monochlorohydrin is a clear, colorless, slightly viscous, unstable liquid with a faint, pleasant, chloroform-like odor and sweet taste. It is used in the synthesis of glycerol esters, amines, and other derivatives, as a general solvent, as an intermediate in organic synthesis, in the formulation of paints, varnishes, lacquers, as a water color binder, in photographic lacquers, to lower the freezing point of dynamite, and as a rodent chemosterilant.

RISK ASSESSMENT: HEALTH***General Assessment***

Glycerol α -monochlorohydrin is a highly toxic chemical by *inhalation* and *ingestion*. It is suspected to cause carcinogenic effects in test animals and is a strong teratogen, causing serious adverse reproductive effects in experimental tests.

Inhalation causes irritation of the eyes, nose, throat, and respiratory system. Once absorbed through the respiration process, its toxic effects appear to focus directly on the reproductive system causing spermatogenesis, and possible injury to the sperm duct and testes. Skin contact causes mild to severe irritation with possible redness and rash. It is also a severe eye irritant. Ingestion can lead to gastrointestinal irritation and possibly systemic effects similar to that of inhalation exposure.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to glycerol α -monochlorohydrin:

Skin: Local irritation at contact site.

Eye: Severe irritation and possible inflammation.

Lung: Irritation of the nose, throat, and respiratory tract.

Other: Ingestion causes headache, nausea, vomiting, and diarrhea. Short-term effects can lead to narcosis (drowsiness) and other symptoms of CNS depression.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to glycerol monochlorohydrin and can last for months or even years:

Cancer Hazards: According to information presented in the references, glycerol α -monochlorohydrin has been shown to cause cancer in test animals. It appears to give rise to thyroid cancer in test animals. It is not known if it will have this effect on humans.

Reproductive Hazard: Glycerol α -monochlorohydrin has been shown to cause adverse reproductive effects in laboratory experiments. These include spermatogenesis-type effects to the testes, sperm duct, and Cowper's gland. It is not known if this effect will occur in humans exposed to glycerol α -monochlorohydrin.

Other Chronic Effects: Long-term exposure may cause weight loss and other chronic effects related to CNS depression.

🛡 *Recommended Risk-Reduction Measures*

Glycerol α -monochlorohydrin presents an extremely high health hazard risk. Personnel should avoid direct contact with glycerol α -monochlorohydrin. If a less toxic material or compound cannot be substituted for glycerol α -monochlorohydrin, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of

glycerol α -monochlorohydrin release. While not always operationally possible, isolating operations involving glycerol α -monochlorohydrin manufacturing or use can also reduce exposure. Personnel must follow proper industrial hygiene and good housekeeping work practices. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around glycerol α -monochlorohydrin. No exposure levels have been established for this chemical. However, this does not mean that exposure is without health hazard risks. At any exposure level to a suspect or probable carcinogen, an MSHA or NIOSH-approved powered supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. Skin contact must not occur. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with glycerol α -monochlorohydrin.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where glycerol α -monochlorohydrin is used or stored.

Before beginning initial assignments with this chemical and at regular intervals thereafter (e.g., annually), the following medical protocols are recommended:

- Lung function tests (establish initial baseline and compare thereafter).
- Thyroid function tests (establish initial baseline and compare thereafter).

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- Lung function tests (compare to initial and subsequent baseline tests).
- Thyroid function tests (compare to baseline).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in the proper use, care, and maintenance of their protective equipment.
- Wash thoroughly immediately after exposure to glycerol α -monochlorohydrin and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of glycerol α -monochlorohydrin should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to glycerol α -monochlorohydrin, emergency shower facilities should also be provided in the work area.
- Workers whose clothing has been contaminated by glycerol α -monochlorohydrin should change into clean clothes *before* leaving work. Contaminated work clothing should never be worn home where family members can be contaminated. The clothing should be laundered only by individuals who have been informed of the hazards of exposure to glycerol α -monochlorohydrin.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of glycerol α -monochlorohydrin. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where glycerol α -monochlorohydrin contacts incompatible commodities can result in violent and even explosive reactions

(depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Glycerol α -monochlorohydrin is considered a combustible liquid. It can ignite when exposed to heat and support the burning of other materials in fire. It will react in contact with perchloric acid to form a sensitive explosive product. Therefore, extreme caution is required in handling, storage, transportation, and disposal of glycerol α -monochlorohydrin. Its physical hazards also require special consideration during any emergency situation involving a leak or spill of glycerol α -monochlorohydrin.

Glycerol α -monochlorohydrin may enter the environment through industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to glycerol α -monochlorohydrin.

Insufficient data are available on the short-term effects of glycerol α -monochlorohydrin to aquatic life, plants, land animals, and birds.

☞ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of glycerol α -monochlorohydrin to aquatic life, plants, birds, and land animals.

💧 *Water Solubility*

Glycerol α -monochlorohydrin is highly soluble in water. Concentrations of 1000 milligrams and even more will readily mix with a liter of water.

⌚ *Persistence in the Environment*

Glycerol α -monochlorohydrin is moderately persistent in the water, with a half-life between and 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of glycerol α -monochlorohydrin found in fish tissues is expected to be about the same as the average concentration in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of glycerol α -monochlorohydrin should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Storage facilities should be equipped with the proper fire protection equipment (sprinklers, alarms, extinguishers). To prevent static sparks, all equipment and containers used in shipping, receiving, or transferring should be electrically grounded and bonded. Workers must ensure that all necessary steps are taken to preclude the possibility of accidental spill or discharge into the environment.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Contaminated soils should be removed for incineration and replaced with clean soils. Cleanup should be attempted only by those trained in proper spill containment procedures. If glycerol α -monochlorohydrin should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is highly soluble in water and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of glycerol α -monochlorohydrin. If glycerol α -monochlorohydrin is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.

- ☑ Remove all ignition sources.
- ☑ Ventilate area of leak or spill.
- ☑ Absorb liquids in vermiculite or other compatible material and dispose of in sealed drums for disposal. Do NOT allow material or runoff to contact waterways or enter sewers.
- ☑ It may be necessary to dispose of glycerol α -monochlorohydrin as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving glycerol α -monochloro-hydrin can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered when developing or implementing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

GLYCIDOLC₃H₆O₂

CAS: 556-52-5

**IDENTIFICATION AND TYPICAL USES**

Glycidol is a clear, colorless liquid with no odor. It is used as a stabilizer for natural oils and vinyl polymers, as a de-emulsifier, and as a leveling agent for dyes.

RISK ASSESSMENT: HEALTH**General Assessment**

Glycidol is toxic to humans by *inhalation* and by *ingestion*. It is also readily *absorbed* through intact skin to cause toxic effects. If absorption occurs in combination with other exposure routes, it can seriously compound the overall effects of exposure. The references regarding long-term toxicity are conflicting and inconclusive. Some indicate that no cumulative toxic effects are documented while others consider glycidol an experimental teratogen causing reproductive effects with human mutation data also reported. From the limited data available on this chemical, it would appear that the human health hazard exposure risk is primarily respiratory irritation, stimulation of the central nervous system followed by its depression.

Inhalation of glycidol vapors will cause irritation of the eyes, nose, and throat. Prolonged exposures to high concentrations will cause narcosis with symptoms of drowsiness and fatigue. The liquid is moderately irritating to the skin and a severe eye irritant. Ingesting glycidol will cause gastrointestinal irritation and may result in CNS depression.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to glycidol:

Skin: Liquid can pass through unbroken skin. Contact can cause severe irritation and possible burns with redness and swelling.

Eye: Severe irritation and possible corneal damage.

Lung: Irritation of the nose and throat.

CNS: A central nervous system depressant. Symptoms include narcosis with drowsiness and fatigue.

Other: Ingestion can irritate the gastrointestinal tract and also lead to CNS depression.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to glycidol and can last for months or even years:

Cancer Hazards: According to information presented in the references, glycidol has not been adequately tested for its ability to cause cancer in test animals. Human mutation data have been reported. Some scientists believe that long-term exposure to such chemicals may pose a cancer risk. More research is required before any determination can be made on the carcinogenic properties of glycidol.

Reproductive Hazard: Experimental studies have shown that exposure to glycidol may adversely affect reproduction and cause teratogenic effects. There are no human data on reproductive health risks.

Other Chronic Effects: There are no reports to conclude that any other chronic effects result from long-term exposure to glycidol.

🛡 Recommended Risk-Reduction Measures

The hazards to human health posed by exposure to glycidol are not clearly understood in the references. Personnel should avoid direct contact with glycidol. If a less toxic material or compound cannot be substituted for glycidol, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide

local exhaust ventilation at the site of glycidol release. While not always operationally possible, isolating operations involving glycidol manufacturing or use can also reduce exposure. Personnel must follow proper industrial hygiene and good housekeeping work practices. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around glycidol. At exposures above the PEL, an MSHA or NIOSH-approved organic vapor respirator may suffice. For higher exposure levels or when the level is not known (as in an emergency), a powered supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand are recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. Skin contact must not occur. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with glycidol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where glycidol is used or stored.

Before beginning initial assignments with this chemical and at regular intervals thereafter (e.g., annually), the following medical protocol is recommended:

- Lung function tests (establish initial baseline and compare thereafter).

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- Lung function tests.
- Evaluation of central nervous system function.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and other respiratory problems, personnel who smoke may show symptoms of exposure much quicker and more pronounced than those who do not. Prudent risk man-

agement requires careful consideration of *all* possible and potential exposure risk factors to ensure proper implementation of control measures and management of the exposure risk.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to glycidol and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of glycidol should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to glycidol, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by glycidol should change into clean clothes *before* leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to glycidol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of glycidol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where glycidol contacts incompatible commodities can result in violent and even explosive reactions (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Glycidol is considered a Class IIIA combustible liquid (per OSHA 29 CFR 1910.106). Its moderate flash point and boiling point present a fire risk in the presence of an ignition source, heat, or flame. Also, it can explode when heated in the presence of strong acids, bases, metals (copper, zinc), and metallic salts

(aluminum chloride, iron (III) chloride, tin (IV) chloride). Therefore, extreme caution is required in handling, storage, transportation, and disposal of glycidol. These characteristics also require special consideration during any emergency situation involving a leak or spill of glycidol.

The proper disposal method is to burn glycidol in a chemical incinerator equipped with an afterburner and air scrubber.

Glycidol may enter the environment through industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to glycidol.

Insufficient data are available to evaluate or predict the short-term effects of glycidol to aquatic life, plants, land animals, and birds.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of glycidol to aquatic life, plants, birds, and land animals.

💧 *Water Solubility*

Glycidol is completely soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Glycidol is moderately persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans exposed to chemical substances.

There is no information in the references on the bioaccumulation of glycidol in the edible tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of glycidol should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Storage facilities should be equipped with the proper fire protection equipment (sprinklers, alarms, extinguishers). Proper ventilation and protective equipment should be used while handling glycidol. Non-sparking tools should be provided and used to ensure the prevention of sparks. Also, all equipment and containers used in shipping, receiving, or transferring should be electrically grounded and bonded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If glycidol should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is highly soluble in water and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of glycidol. If glycidol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Absorb liquids in vermiculite or other compatible material and dispose of in sealed drums.
- ☑ It may be necessary to dispose of glycidol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving glycidol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "reproductive hazard" is used, public emotion, hysteria, and ignorance can run equally high. This must be a consideration when developing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Vapor Density (Air = 1) Not Found | Freezing Point <-80°F (<-72°C) |

Solubility

Soluble in water, ethanol and ether, insoluble in benzene and chloroform.

Appearance and Odor

Colorless to water white, mobile, odorless oil with a sweetish taste.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Combustible Liquid | Autoignition Temperature Not Determined |

Extinguishing Media

Dry chemical, carbon dioxide, water spray, fog, or foam.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire. Do not release water runoff to sewers or waterways; dike and contain for collection and disposal.

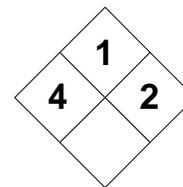

Unusual Fire and Explosion Hazards

Containers may explode in fire due to excessive buildup of internal pressure. Evacuate immediately if rising sound is heard from venting device or fire is causing discoloration on sides of tank.

| SECTION V - REACTIVITY DATA | | | | |
|---|--------------------------|--|--------------------------------|--|
| Stability | | Conditions to Avoid Undergoes spontaneous, violent, and possibly explosive decomposition at room temperature and under normal or routine conditions of storage and handling. Do not store for prolonged periods of time. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Even small traces of alkali can cause violent polymerization. | | |
| Hazardous Polymerization | | Conditions to Avoid Hazardous polymerization can occur. Signs of tarry formation or a dark red precipitate will usually precede explosion. Avoid polymerization by adding a stabilizer (phosphoric acid). | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products When heated to decomposition, glycolonitrile emits highly toxic fumes of nitrogen oxide and cyanide fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: At high concentrations, causes chemical asphyxia, nausea, vomiting, and tightness of chest. Hydrolysis causes release of cyanide. Causes pulse and breathing obstruction. CNS depression with giddiness, confusion, convulsions, dyspnea, weakness. ABSORPTION: Skin contact can result in irritating rash. Can cause severe eye burns and/or irritation. Will pass through intact skin and can cause serious effects, up to and including death. INGESTION: Abdominal pain, nausea, vomiting. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, eyes, skin, CVS, CNS. |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Glycolonitrile can cause fatal cyanide poisoning. If <u>swallowed:</u> Seek medical attention immediately. Do not give anything by mouth to an unconscious or convulsing person. <u>DOCTOR:</u> Diagnostic signs include bradycardia and absence of cyanosis. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Remove all ignition sources. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by SARA III, if applicable. | | | | |
| Preferred Waste Disposal Method Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with alkali materials in tightly closed containers in cool, dry, well-ventilated area away from heat and sources of ignition. Prevent damage to storage containers. | | | | |
| Other Precautions and Warnings Regularly monitor the level of polymerization inhibitor to prevent polymerization. Prior to working with glycolonitrile, personnel should be trained on its proper handling and storage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) NIOSH ceiling limit is low and difficult to monitor. A cyanide gas respirator may suffice. For best protection, use an approved supplied-air respirator in continuous mode or use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron or Suit |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

GLYCOLONITRILEHOCH₂CN

CAS: 107-16-4

**IDENTIFICATION AND TYPICAL USES**

Glycolonitrile is a colorless to water-white, mobile, odorless oil with a sweet taste. It is used as a solvent, a chemical intermediate, and as a component of synthetic resins.

RISK ASSESSMENT: HEALTH**General Assessment**

Glycolonitrile causes headache, dizziness, and nausea. At extremely high concentrations, it can cause convulsions, coma, and death. No data exist on the chemical's carcinogenicity in humans. The toxic effects of glycolonitrile are attributed to the metabolic release of cyanide, which in turn acts by inhibiting cytochrome oxidase and thus impairs cellular respiration.

Human exposure to glycolonitrile can occur through three routes of entry into the body: *inhalation*, *absorption*, and *ingestion*. At high concentrations, glycolonitrile can produce severe adverse effects. The target organs are the eyes, skin, lungs, central nervous system (CNS), and the cardiovascular system (CVS). In humans, inhalation of glycolonitrile vapors can result in asphyxia, nausea, vomiting, and tightness of the chest. These effects will most like manifest several hours after exposure. There can be weak and rapid pulse, irregular heartbeat, bright pink coloration of the skin, dilated pupils, dizziness, difficulty breathing, anxiety, and possible lockjaw. Symptoms may progress to convulsions, paralysis, coma, and cardiac arrhythmia. Death can occur within minutes or hours due to respiratory failure. It is excreted in the urine as a cyanate. The blood cyanide concentration does not always show any significant increase in cyanide at low exposure concentrations. Ingestion of glycolonitrile results in gastrointestinal pain, nausea, vomiting, stupor, convulsion, and weakness. Large doses can be fatal. Skin contact results in absorption and systemic effects. There can be redness, swelling, blistering, and inflammation. Severe eye irritation is likely.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to glycolonitrile. (Note: Exposure can cause fatal cyanide poisoning. Symptoms of flushing of face, chest tightness, nausea, and vomiting, weakness, and shortness of breath may lead to death. These reactions may begin minutes to hours after an overexposure).

Skin: Irritation/rash on contact (contact dermatitis) with redness, swelling, and blistering.

Eye: Severe irritation, conjunctivitis, damage.

Lung: Irritation of the nose, throat, and lungs following exposure.

CNS: Inhalation of high concentrations of the vapor may cause sleepiness, dizziness, loss of consciousness, coma, respiratory failure, and death.

⚙ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to glycolonitrile and can last for months or even years:

Cancer Hazards: According to the references, glycolonitrile has not been tested for its ability to cause cancer in animals. Chronic effects of high exposures have not been documented in humans.

Reproductive Hazard: According to the references, glycolonitrile has not been significantly tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated exposures may affect the thyroid gland. High exposures may damage the nervous system.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with glycolonitrile. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The

best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around glycolonitrile. The NIOSH 15-minute ceiling is relatively low and difficult to monitor (2 ppm). For low or infrequent exposures, a cyanide gas respirator may provide suitable protection. However, for high concentrations, or when the exposure level is unknown (as in an emergency), a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with glycolonitrile.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where glycolonitrile is used or stored.

Medical testing of personnel with frequent or potentially high exposure, should be offered before beginning work and at regular intervals thereafter. These tests should include:

- Lung function (pulmonary function) test.

If symptoms develop or overexposure is suspected, the following tests may be useful:

- Blood cyanide test and/or urine thiocyanate test (currently, a blood cyanide level over 0.1 mg/l or urine thiocyanate over 20 mg/l indicates overexposure).
- Maintain close medical surveillance. Slow release of cyanide from absorbed glycolonitrile may cause delayed symptoms.
- Liver and kidney function tests.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to glycolonitrile and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of glycolonitrile should be communicated to all exposed or potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of glycolonitrile. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Glycolonitrile is considered a combustible liquid and a poison. It reacts with trace levels of alkalis to polymerize violently and contact under closed conditions can cause explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of glycolonitrile and caution is also required to ensure separation from incompatible materials during use, transportation, or storage, since the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for glycolonitrile is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

Glycolonitrile can enter the environment through manufacturing effluents, municipal waste treatment discharges, and spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to glycolonitrile.

This chemical has slight acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of glycolonitrile to plants, birds, or terrestrial animals.

☪ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Glycolonitrile has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of glycolonitrile to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Glycolonitrile is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Glycolonitrile is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of glycolonitrile found in fish tissues is expected to be about the same as the average concentration of glycolonitrile in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of glycolonitrile should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Glycolonitrile will polymerize violently but can be kept stable with an inhibitor (such as phosphoric acid). The inhibitor is usually expended quickly. It is therefore important to institute a consistent monitoring program of inhibitor levels to prevent polymerization.

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If glycolonitrile should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of glycolonitrile. If glycolonitrile is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of glycolonitrile as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving glycolonitrile can present a significant threat to business operations. The loss or damage of equipment or facilities can signifi-

cantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Eye, nose, and throat irritant. Slight smarting of the respiratory tract; the effect appears to be temporary. EYES & SKIN: Skin contact can result in irritating rash or inflammation. Can cause severe eye burns or severe irritation. May stain the skin yellow. INGESTION: Little data available. May cause somnolence and gastrointestinal irritation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 (Table Z-1) | Target Organs? Respiratory system; skin; eyes. |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. <u>Seek medical assistance.</u> For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Unless advised otherwise, give victim milk or water. Never attempt to give an unconscious or convulsing person anything by mouth. Do not make a convulsing or unconscious person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Collect solid materials using HEPA vacuum. Do NOT dry sweep. Ventilate area of spill. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Mix with a combustible solvent and burn in a chemical incinerator with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals. Store in tightly closed (air-tight) containers in a cool, dry, well-ventilated area. Keep fire, flame, and heat away (including radiant heat). Keep away from water sources. Do NOT allow exposure to air. | | | | |
| Other Precautions and Warnings Bulk storage of glyoxal is not recommended. Nitrogen or other inert gas should be used as an "inert blanket" over glyoxal in storage containers. Prevent damage to containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels established. Recommend using a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

GLYOXAL

CAS: 107-22-2

**IDENTIFICATION AND TYPICAL USES**

Glyoxal is a yellowish liquid or, in solid form, a pale yellow prism that becomes white. It has a mild odor. Its vapor has a green color and burns with a violet flame. It is used in the production of permanent-press fabrics and in the dimensional stabilization of rayon and other fabrics. It is also used as an insolubilizing agent for compounds containing polyhydroxyl groups (polyvinyl alcohol, starch, and cellulose materials), insolubilizing of proteins (casein, gelatin, and animal glue); in embalming fluids; in leather tanning; in paper coatings with hydroxycellulose; and as a reducing agent in dyeing textiles.

RISK ASSESSMENT: HEALTH**General Assessment**

Glyoxal is moderately toxic by *ingestion* and skin contact (although absorption through the skin has not been reported as an entry route). *Inhalation* of its vapors can also pose a moderate health hazard risk. There are no data regarding its carcinogenic or teratogenic capabilities. Mutation data, however, have been recorded.

Glyoxal vapors are irritating to the skin and eyes and inhalation will cause irritation to the respiratory tract and may lead to symptoms of cough, sore throat, and congestion. It will severely irritate the eyes on contact. If not removed immediately, damage may occur to the cornea and surrounding tissue. Ingestion of this compound may cause somnolence and gastrointestinal pain with nausea and possible vomiting.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to glyoxal:

Skin: Irritation and rash or burning sensation on contact.

Eye: Severe irritation and possible corneal damage.

Lung: Irritation causing coughing and/ congestion

Other: Ingestion of high concentrations may lead to somnolence and symptoms of gastrointestinal pain.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to glyoxal and can last for months or even years:

Cancer Hazards: According to information presented in the references, glyoxal has not been adequately tested for its ability to cause cancer in test animals. Glyoxal has been shown to cause mutations (genetic changes). Such chemicals may have a cancer risk on long-term exposure. There is no evidence to indicate that glyoxal will cause cancer in humans or animals. More research is required.

Reproductive Hazard: According to information presented in the references, glyoxal has not been adequately tested for its ability to adversely affect reproduction in test animals.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with glyoxal. While its toxicity in humans is thought to be relatively low, the specific nature of its toxic effects is not clearly understood in the references. This fact alone warrants extreme caution when working with or around glyoxal. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around glyoxal. No exposure limits have been developed for glyoxal. This does not mean that exposure is without health hazard risk. For the best protection, use a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated pressure demand or other positive pressure mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with glyoxal.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where glyoxal is used or stored.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- ☑ Wash thoroughly immediately after exposure to glyoxal and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of glyoxal should be communicated to all potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where glyoxal is used, handled, or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of glyoxal. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Glyoxal is considered a non-combustible liquid. However, it is highly unstable at room temperature and can polymerize violently on standing or when mixed with water. Polymerization is exothermic (liberates heat) and can become explosive if uncontrolled. Reactions with strong acids, bases, and oxidizers can also become extremely violent. It is a powerful reducing agent and may explode on contact with air. During storage for long periods, it may spontaneously polymerize and ignite. These characteristics require special consideration during any emergency situation involving a leak or spill of glyoxal. Should glyoxal ever come into contact with incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for glyoxal is to mix it with a combustible solvent and then burn it in a chemical incinerator equipped with an afterburner and air scrubber.

Glyoxal can enter the environment through manufacturing, unchecked discharge into effluents, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to glyoxal. Insufficient data are available to evaluate or predict the short-term effects of glyoxal to aquatic life, birds, plants, or terrestrial animals.

☪ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to properly evaluate or predict the chronic (long-term) effects of glyoxal to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Glyoxal is highly reactive and decomposes in water.

Persistence in the Environment

Glyoxal decomposes violently in water and, therefore, is not expected to persist in the aquatic environment or settle in aquatic sediments. It reacts on standing and may explode on contact with air.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Glyoxal is not expected to accumulate in the edible tissues of fish.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of glyoxal should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Glyoxal should be kept away from water and stored in air-tight containers. An inert nitrogen purge or “blanket” inside containers is recommended to prevent the condensation of moisture or contact with air.

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If glyoxal should contact the water table, aquifer, or navigable waterway, time is of the essence. It will violently decompose in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of glyoxal. If glyoxal is

spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources and ventilate area.
- Proceed with caution during cleanup. Glyoxal may cause violent explosions during spill conditions. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered materials using HEPA vacuum. Do NOT dry sweep.
- It may be necessary to dispose of glyoxal as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving glyoxal can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

GRAPHITE

C

CAS: 7440-44-0 (synthetic graphite)

CAS: 7782-42-5 (natural graphite)

**IDENTIFICATION AND TYPICAL USES**

Graphite is a steel gray to black, greasy-feeling, odorless solid that can appear as a soft, greasy, black powder, in scales, or in sheets. It is the crystalline form of carbon and exists in two forms: natural graphite and synthetic graphic. Natural graphite is used to make lead pencils, stove polishes, matches, explosives, and refractory crucibles. It is also a lubricant in nuclear piles and is used to re-carbonize steel, in electroplating, in the manufacture of electrodes, and in other electrical equipment. Synthetic graphite is used as an adsorbent and in water purification.

RISK ASSESSMENT: HEALTH***General Assessment***

Graphite is generally considered a “nuisance dust” or “inert” dust in its synthetic form because it is not expected to cause any chronic, irreversible, or long-term lung damage. However, natural graphite has been known to cause chronic lung damage and, therefore, cannot be classified in the same manner. Also, if either version of graphite happens to contain more than 1% quartz (crystalline silica), then the established exposure limits *do not* apply and more research must be performed on the health hazard risks associated with the material.

Primary exposure route is through *inhalation*. Ingestion is not likely to occur and skin or eye contact produces very few noticeable effects.

Inhaling synthetic graphite dusts may produce only minor but reversible respiratory irritation. Inhaling the dusts of natural graphite can cause cough, dyspnea, black sputum, decreased pulmonary function, and lung fibrosis (depending on silica content of dust). In high concentrations, it may cause pneumoconiosis and anthracosilicosis.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to graphite:

Skin: No effect, to mild surface irritation.

Eye: Mild to moderate irritation.

Lung: Irritation of the mouth, nose, and throat causing coughing, dyspnea, black sputum, decreased respiratory function, and respiratory irritation.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to graphite and can last for months or even years:

Cancer Hazards: According to information presented in the references, graphite has not been shown to cause cancer in test animals.

Reproductive Hazards: There are no reports to support any claims of reproductive hazards following exposure to graphite.

Other Chronic Effects: Long-term or repeated inhalation exposure to natural graphite dusts may lead to pneumoconiosis and anthracosilicosis.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with graphite dusts and powders. Although the toxicity of the synthetic material is considered relatively low, the natural version has been shown to cause moderate toxic systemic effects. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective

than the controls mentioned above, but is still advisable whenever working with graphite. A half-mask respirator equipped with a high-efficiency particulate air (HEPA) filter and dust pre-filter should provide adequate protection at low-level exposures. Better protection is obtained using an MSHA/NIOSH-approved powered supplied-air respirator operated in continuous flow mode or a self-contained breathing apparatus (SCBA) operated in pressure demand mode. A full facepiece, face shield, or chemical/dust goggles would provide additional protection for the eyes. Whenever an airborne dust hazard exists, a protective apron should be worn. It is common to find graphite in a fine powder form which has a tendency to get under fingernails and into skin pores. To prevent hand and skin exposures, impervious protective gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with graphite.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where graphite is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Consider chest X-ray after acute overexposure.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory disorders, smokers exposed to graphite may experience symptoms more rapidly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible risk factors.

Other methods to reduce exposure to chemicals include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- Wash thoroughly immediately after exposure to graphite and at the end of the work shift or before eating, drinking, or smoking. Work clothing contaminated with graphite should never be taken home for laundering. Only personnel trained in the hazards of exposure to chemical substances should launder contaminated clothing.
- Safety shower and eyewash stations should be readily available in work areas where graphite is used or stored.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of graphite should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of graphite. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (air, water, and soil).

Graphite is considered to be a combustible solid, but it is difficult to ignite or sustain combustion once fire or ignition source is removed. Its powders or dusts in mixture with air may present a greater combustion hazard. Hazardous reactions occur when graphite comes into contact with very strong oxidizers, such as fluorine, chlorine trifluoride, and potassium peroxide. These characteristic require special consideration during any emergency involving a leak or release of graphite powder.

Graphite can be present naturally in the environment. High-grade natural graphite is mined in Canada, Ceylon, Germany, Madagascar, and Sri Lanka. It can also enter the environment through spills or leaks and unchecked discharges from industrial sources.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to graphite.

Insufficient data are available to accurately evaluate or predict the short-term effects of graphite exposure to aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term (chronic) effects of graphite to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Graphite is insoluble in water. Concentrations of 1 milligram will not mix with a liter of water.

🕒 *Persistence in the Environment*

Graphite is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually all of graphite will eventually end up in terrestrial soil and aquatic sediments.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of graphite found in fish tissues is expected to be somewhat higher than the average concentration of graphite in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of graphite should be segregated from sources or heat or ignition and kept away from incom-

patible materials. Containers should be kept closed and in a cool, dry, well-ventilated area. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Dusty conditions in storage areas should be avoided. All personnel should be briefed on the hazards of graphite powders.

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Contaminated soils should be removed and replaced with clean soils. Cleanup should be attempted only by those trained in proper containment procedures. If graphite should contact the water table, aquifer, or navigable waterway, time is of the essence. It is insoluble in water and total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities should be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of graphite.

If graphite is spilled or leaked, the following steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Avoid generating airborne dusts during cleanup operations.
- ☑ Collect powdered materials in safest manner possible. Hold for reclamation or arrange for disposal. Do NOT dry sweep (generates airborne dusts). Use a vacuum equipped with a high-efficiency particulate air (HEPA) filter instead. Damp mop residue and collect for disposal. Place in sealed containers.
- ☑ It may be necessary to dispose of graphite as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations on the disposal requirements for graphite.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving graphite can present a significant threat to business operations. The loss or

damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

HAFNIUM

Hf

CAS: 7440-58-6

**IDENTIFICATION AND TYPICAL USES**

Hafnium is a steel-gray, shining, lustrous, ductile solid that appears in the form of powder or dusts. It is metallic element of atomic number 72, group IVB of the periodic table, atomic weight 178.49, valances 2, 3, 4, with 6 stable isotopes. Used in control rods in water-cooled nuclear reactors, in light bulb filaments, in electrodes, special glasses, and as a “getter” in vacuum tubes.

RISK ASSESSMENT: HEALTH***General Assessment***

Hafnium is a human poison by an unspecified route. The exposure routes are *inhalation* and *ingestion*. However, since it is not significantly soluble in water, it is not absorbed efficiently by ingestion. There are no data on its carcinogenic, mutagenic, and teratogenic capabilities.

Inhalation of hafnium dusts and powders will cause irritation of the nose, throat, respiratory tract, and associated mucous membranes. It has been known to cause liver damage in test animals. Skin contact results in surface irritation and may lead to dermatitis. The powders can irritate the eyes. Ingestion causes unspecified gastrointestinal effects.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to hafnium:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Hafnium particles can irritate the eyes and may cause damage to vision if not quickly removed.

Lung: Inhalation of the dusts and fumes can irritate the nose, mouth, throat, lungs, and mucosa of the respiratory tract.

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to hafnium and can last for months or even years:

Cancer Hazards: According to information presented in the references, hafnium has not been shown to cause cancer in test animals. Liver damage has occurred in test animals, but no correlation to human exposure has been documented.

Reproductive Hazard: According to information available in the references, hafnium has not been tested for its ability to adversely affect reproduction in humans.

Other Chronic Effects: Possible liver damage and skin allergy on long-term exposure to hafnium.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with hafnium. The exact nature of its human toxicity is not clearly understood in the references. If the specific hafnium compound in question is unknown, adequate risk management dictates that it be handled and treated as though it posed a serious risk to human health. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hafnium. For exposure to hafnium at levels above the OSHA PEL (0.5 mg/m³), an MSHA/NIOSH-approved respirator with a high

efficiency particulate air (HEPA) filter is recommended. For higher exposures, or exposures to unknown levels (as in an emergency), use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hafnium.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hafnium is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the PEL or greater, or significant skin contact), the following medical tests are recommended:

- Lung function tests.
- Chest X-ray.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Liver and lung function tests.
- Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to hafnium may be more pronounced in smokers than in non-smokers. Prudent risk management requires proper consideration of *all* possible factors that may be causing exposure symptoms in the workplace.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release.

If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are adequately trained on the use, care, and maintenance of their personnel protective equipment.
- Wash thoroughly immediately after exposure to hafnium and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hafnium should be communicated to all potentially exposed workers.
- Where possible, automatically transfer hafnium from drums or other storage containers to process containers. Avoid contact with air and do not generate airborne dusts.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hafnium. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hafnium powder will explode spontaneously in air. It will ignite and is potentially explosive in contact with heat, friction, and sparks, or when heated in the presence of nitrogen, phosphorous, oxygen, sulfur, non-metals, or halogens. It may explode on contact with hot nitric acid and other oxidants. It is also incompatible with strong oxidizers (such as chlorine) and violent reactions can occur on contact. These characteristics require special consideration during any emergency situation involving a leak or spill of hafnium.

Hafnium can occur in the environment as a natural element in certain ores in the earth's crust. It can also enter the environment through industrial and municipal discharges, or from spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hafnium.

Insufficient data are available to evaluate the short-term effects of hafnium exposure to aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of hafnium exposure to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Elemental hafnium and most of its compounds are insoluble in water. Concentrations of less than 1 milligram will not mix with one liter of water.

🕒 *Persistence in the Environment*

Hafnium and its compounds are highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hafnium found in fish is expected to be somewhat higher than the average concentration of hafnium in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hafnium should be segregated from incompatible chemicals to minimize the risk of cross-

contamination or contact. Bulk storage of hafnium should be avoided. Conditions which can generate dusty conditions must be avoided. Storage facilities should be designed with proper fire suppression and protection equipment. Containers must be protected from exposure to heat and from physical damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum method to reduce dust during cleanup. Do not dry sweep (generates airborne dusts and friction). *Carefully* and *slowly* use a vacuum equipped with a high efficiency particulate air (HEPA) filter, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed and replaced with clean soil. If hafnium should contact the water table, aquifer, or navigable waterway, time is of the essence. Hafnium is not soluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hafnium. If hafnium is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- ☑ It may be necessary to dispose of hafnium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hafnium can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious

Risk Management for Hazardous Chemicals

expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? X |
| Health Hazards INHALATION: Inhalation causes nausea, hepatitis, and fever. An intoxicant and central nervous system (CNS) depressant. Causes confusion, drowsiness, dizziness, analgesia, anesthesia, cardiac arrhythmia, liver and kidney damage, decreased hearing and visual performance, cyanosis, and (in animals) reproductive effects. SKIN & EYES: A severe eye and skin irritant. INGESTION: CNS symptoms similar to that of inhalation. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | No | Reviewed Inadequate Evidence | No | Eyes, skin, resp. sys. liver, kidney, CVS, CNS, repro. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, liver, kidney, heart, and respiratory problems may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of warm water (104°F). Do NOT rub affected area or use dry heat. Seek medical attention immediately. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed</u>: Seek medical attention immediately. Give conscious and alert person 1-2 glasses of water and induce vomiting until vomitus is clear. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear SCBA respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Stop leak if it can be done without risk. Spilled liquids are likely to evaporate quickly. Absorb with vermiculite and place in sealed container. | | | | |
| Preferred Waste Disposal Method Mix with a combustible solid and burn in chemical incinerator equipped with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, dark, well-ventilated location. Do NOT use plastic containers. | | | | |
| Other Precautions and Warnings Ensure adequate ventilation in storage areas. Avoid vapor inhalation and use appropriate personal protective equipment if necessary. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use an MSHA/NIOSH-approved air purifying respirator (cartridge type) or use a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron if Splash is Likely | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HALOTHANECF₃CHBrCl

CAS: 151-67-7

**IDENTIFICATION AND TYPICAL USES**

Halothane is a colorless, clear, highly volatile liquid with a sweet, pleasant odor. It is used as an inhalation anesthetic and may contain 0.01% thymol as a stabilizer.

RISK ASSESSMENT: HEALTH**General Assessment**

Halothane is moderately toxic by *inhalation* and *ingestion*. If *injected* (intravenous administration) directly into the body, it can also produce serious and life-threatening effects. Although it has not been listed as a carcinogen, its carcinogenic properties have been questioned and the results are inconclusive. It is a known human mutagen (causes genetic changes) and has produced adverse reproductive and teratogenic effects in animal studies.

Inhalation causes nausea, vomiting, hepatitis, and fever. Other toxic effects by inhalation, ingestion, or injection include increased body temperature, cyanosis, central nervous system (CNS) depression with drowsiness, dizziness, excitement, confusion, amnesia, analgesia, anesthesia, and respiratory depression. There may also be kidney damage and liver dysfunction with either hepatitis or tissue necrosis. The cardiovascular system (CVS) effects may include potentially fatal heart disturbances and arrhythmia, depression, and dilated blood vessels (vasodilatation). There may also be adverse effects and decreased performance in the senses of hearing and sight. Although rare, halothane may be sensitized in some individuals. In its uses as an inhalation anesthetic in the health care industry, anesthetists appear to show a higher than normal frequency of hepatitis, allergies, intolerance to alcohol, and the use of sedative analgesics than the general population.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to halothane:

Skin: Irritation with potential for redness.

Eye: Severe irritation, burning feeling, pain.

Lung: Nose, throat, and respiratory tract irritation.

CNS: Headaches, lightheadedness, dizziness, confusion, excitement, drowsiness, intoxication, anesthesia, amnesia, analgesia, respiratory depression.

CVS: Cardiac arrhythmia, depression of the cardiovascular system, vasodilatation, death.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to halothane and can last for months or even years:

Cancer Hazards: Halothane has been tested by the IARC for its ability to cause cancer in test animals and the results were inconclusive. It has been shown to cause mutations (genetic changes in living cells) in humans. Some scientists believe that long-term exposure to mutagens may also pose a cancer risk. More research is required in this regard.

Reproductive Hazard: According to information presented in the references, halothane has shown to cause adverse reproductive and teratogenic effects in laboratory test animals. It is not known if human exposure will have this effect. There is some evidence to show that there is an increased incidence of spontaneous abortions and congenital abnormalities of offspring among operating room personnel.

Other Chronic Effects: Long-term exposure may lead to liver and kidney damage. Such damage has been demonstrated in animals; there has been a reported increase in hepatitis in operating room personnel. Also, this chemical may sensitize some individuals. Later re-exposure can cause a hypersensitive reaction leading to hepatitis, liver function failure, and death.

☉ **Recommended Risk-Reduction Measures**

Exposure to halothane presents a serious and even life-threatening risk to human health. Personnel should therefore avoid direct contact with halothane. Occupational poisoning occurs most commonly by inhalation. In most instances, a less toxic material or compound cannot be substituted for halothane in surgical and other health care applications. Therefore, *engineering controls* are the most effective method of reducing exposures. The best protection for workers is to ensure controlled administration of halothane and, wherever possible, enclose operations or provide adequate local exhaust ventilation at the site of halothane release. In surgical settings, the work area must be isolated from other areas for sterilization purposes. This will also reduce the likelihood of personnel exposure (only those in the room are at risk). Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around halothane. In the operating room, this is usually not feasible. But in manufacturing and production of halothane, respiratory protection is essential. Caution should be exercised when selecting respiratory protection since it is not known if exposure to halothane will cause cancer in humans. For exposure over the NIOSH ceiling (2 ppm), an MSHA/NIOSH-approved air-purifying respirator with organic vapor cartridge(s) should be used. For exposures to higher concentrations, or when the concentration is unknown, use a supplied-air respirator with full facepiece and mask operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made. Halothane will attack some forms of rubber and plastic. This must also be considered when selecting personal protective equipment.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with halothane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where halothane is used or stored.

If symptoms develop or overexposure is suspected, the following recommended medical tests should be considered:

- ☑ Liver and kidney function tests.
- ☑ Special 24-hour electrocardiogram (EKG) using the Holter Monitor to evaluate for irregular heart-beat.
- ☑ Interview for brain effects, including recent changes in memory, mood (irritability, withdrawal), and concentration. Look for headaches, malaise, and altered sleeping patterns. Cerebellar, autonomic, and peripheral nervous system evaluation should be considered. Positive or borderline cases should be referred for further neuropsychological testing.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its proper use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to halothane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of halothane should be communicated to all exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is

a possibility of skin exposure to halothane, emergency shower facilities should also be provided in the immediate area.

- ☑ Workers whose clothing has been contaminated by halothane should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to halothane.
- ☑ Where possible, automatically transfer liquids containing halothane from drums or other containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of halothane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Halothane is non-combustible liquid. It has been known to attack some rubbers and plastics. If involved in fire, halothane can emit highly toxic fumes of chloride, fluoride, and bromide. Caution is always required in handling, storage, transportation, and disposal of halothane. Emergency responders should be made aware of the presence of halothane at any emergency response situation.

Halothane can enter the environment from industrial effluents and emissions, and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to halothane.

Insufficient data are available on the short-term effects of halothane on aquatic life, plants, birds, or land animals.

☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed

animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of halothane to aquatic life, plants, birds, or terrestrial animals.

💧 *Water Solubility*

Halothane is nearly insoluble in water. Concentrations between 1 and 100 milligrams may mix with a liter of water.

⌚ *Persistence in the Environment*

Halothane is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.8% of halothane will eventually end up in air; the remainder will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of halothane found in fish tissues is expected to be about the same as the average concentration of halothane in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of halothane into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of halothane should be segregated from other chemicals and materials (especially rubber and plastic) to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If halothane should contact the water table, aquifer, or navigable water-

way, time is of the essence. It is insoluble but highly volatile and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of halothane.

For disposal, halothane may be mixed with a combustible solvent and burned in a chemical incinerator equipped with an afterburner and scrubber to remove the haloacids.

If halothane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Absorb liquids in vermiculite, sand, earth, or similar material and deposit in sealed drum.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of halothane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving halothane can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "reproductive hazard" is used, public emotion, ignorance, and hysteria can run equally high. This must be carefully considered during the development of any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific

training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|--|------------------------------------|
| Characterization Gas | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name Helium (compressed); Helium (refrigerated liquid) | Chemical Abstract Service (CAS) Number 7440-59-7 | |
| DOT Hazard Class and Label Requirements Non-Flammable Gas | DOT Emergency Guide Code 15 | |
| DOT Identification Number UN1046 (compressed) UN1963 (refrigerated liquid) | Atomic Formula He | |
| Synonyms None. | | |

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Helium (derivation: From natural gas, by liquefaction of all other components, followed by purification over activated charcoal). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point -452°F (-269°C) | Specific Gravity (H ₂ O = 1) 0.15 at -454°F (-270°C) |
| Vapor Pressure (atmospheres) 2.61 (critical pressure) | Atomic Weight 4.00 |
| Vapor Density (Air = 1) 0.138 | Freezing Point -458°F (-272°C) |

Solubility

Very slightly soluble in water; insoluble in alcohol. Rate of diffusion through solids is three times that of air.

Appearance and Odor

Colorless, odorless, tasteless gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Combustible Gas | Autoignition Temperature Not Determined |

Extinguishing Media

Use extinguishing media suitable to surrounding fires. Helium will not ignite.

Special Fire Fighting Procedures

Fire can produce toxic fumes: wear full protective clothing and self-contained breathing apparatus (SCBA). Contact with the liquid may cause frostbite. Heat will build pressure and may rupture closed storage containers. Keep fire-exposed containers cool with water spray. Containers should never reach temperatures of 125°F (52°C).

Unusual Fire and Explosion Hazards

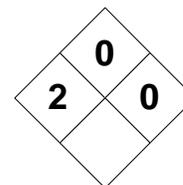

Helium cylinders may explode in the heat of fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|---|------------------------------|---|
| Stability | | Conditions to Avoid Helium is stable in closed cylinders under routine conditions of handling and storage. Keep away from heat and other gases. It can condense and solidify other gases. Use metal containers made for cryogenics. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) Helium is a monatomic, chemically inactive, simple asphyxiant gas that is lighter than air. Some steels and other materials will become brittle in contact with the compressed gas or the refrigerated liquid. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of helium is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products None reported. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: An asphyxiant gas. Initial symptoms are those of oxygen starvation. Feeling of "air hunger," diminished mental alertness, headache, dullness, shortness of breath, and an impairment in muscle coordination. Continued exposures lead to faulty judgment, depression of senses, rapid fatigue, unconsciousness, convulsions, coma, and death. SKIN & EYES: Contact with the compressed gas or refrigerated liquid can cause frostbite and burns. INGESTION: Not likely since helium is a gas at normal working (room) temperatures. | | | | |
| Carcinogenicity No Evidence Human No Evidence Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system; skin; eyes, CNS. |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures Eye contact (liquid): Immediately flush with large amounts of tepid water for 15 minutes (minimum), occasionally lifting eyelids; seek medical attention. Skin contact (liquid): Remove all contaminated clothing. Immediately flush area with large amounts of tepid water. Do NOT rub! Seek medical assistance. For inhalation: Remove the person from exposure. Emergency responders must be protected from inert atmospheres. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Treat frozen tissues and protect the airway. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. Ensure response personnel are properly protected with self-contained breathing apparatus (SCBA). | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dry, well-ventilated area away from heat, direct sunlight, or other hot areas (water lines, vent pipes). Ensure proper storage and handling precautions are in place whenever working with compressed gas cylinders. | | | | |
| Other Precautions and Warnings Containers may explode in fire or under conditions of extreme heat. Protect cylinders from physical damage. Use pressure relief on liquid containers. Periodically check vent valves for blockage (ice). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) No exposure limits have been established. Helium is a simple asphyxiant. Do NOT use cartridge-type respirators (ineffective for this type of gas). Use a powered supplied-air respirator or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious, Thermal Insulated Gloves | Eye Protection Chemical Goggles and/or Face Mask | Other Protective Clothing Protective Boots, Gauntlets, Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HELIUM

He

CAS: 7440-59-7

**IDENTIFICATION AND TYPICAL USES**

Helium is a colorless, odorless, and tasteless gas. It is used to pressurize rocket fuels, in welding, to create an inert atmosphere (in growing germanium and silicon crystals), inflating weather and research balloons, as a heat-transfer medium, in leak detection, in chromatography, in cryogenic research, in magnetohydrodynamics, in the manufacture of luminous signs, for geological dating, in aerodynamic research, in lasers (usually with neon), and in diving and space vehicle breathing equipment. It may also be used as a coolant for nuclear fusion power plants and in some electrical systems.

RISK ASSESSMENT: HEALTH***General Assessment***

Helium is a simple asphyxiant gas. As such, its primary route of entry into the body is through *inhalation*. While it does not pose a significant physiological effect (i.e., no systemic poisoning or toxicity), it can displace oxygen levels to below that which is necessary to sustain life. Skin contact with the liquid can be destructive to tissues due to the extremely cold temperatures, but absorption is not a likely exposure route. Since helium usually exists as a gas at room temperatures, ingestion is not likely to occur either.

Inhalation of helium gas can cause headache, dullness, shortness of breath, and the symptoms of asphyxiation. These include rapid respiration and a feeling of "air hunger" or air starvation followed by a decrease in mental alertness, and impaired muscular coordination. If exposure continues, there can be nausea, vomiting, prostration, unconsciousness, coma, and death.

Skin or eye contact with the vapor poses no serious threat. The vapors have not been shown to cause any physiological response. However, if the liquid should contact either the skin or the eyes, there can be serious irritation, burns, tissue damage, and frostbite.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to helium:

Skin: Liquid threat only. Redness, pain, swelling, blisters, and severe frostbite.

Eye: Liquid threat only. Causes frostbite, redness, irritation, severe pain, and blurred vision.

Lung: Vapor is non-irritating and therefore poses no threat of damage to the lungs. However, in high concentrations, helium can lead to symptoms of asphyxiation and oxygen deprivation up to and including death.

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to helium and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to helium does not lead to carcinogenic effects (it is a simple asphyxiant).

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: None reported.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with helium. If another gas cannot be substituted for a helium, then *engineering controls* are the most effective method of reducing exposures. The best protection is to separate operations and provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with helium. Air-purifying respirators (e.g., the cartridge-type or gas masks) cannot be used with helium. These respirators only purify the air and can do nothing to protect in oxygen deficient atmospheres. A powered air-supplied respirator

operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber or leather apron should be worn. To prevent hand and skin exposures with the liquid, thermal insulated gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with helium.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where helium is used or stored.

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, consider installing automatic sensors that warn personnel of dropping oxygen levels and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Safety shower and eyewash stations should be readily available in work areas where helium is used or stored.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of helium should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of helium. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in the contamination of the sur-

rounding environmental mediums (mostly air but, depending upon the spill, water and soil may be affected).

Helium is a non-flammable, non-combustible, non-explosive, and chemically inactive, inert gas. It presents no fire hazard. However, it can cause other gases to condense and solidify. It causes the condensation of oxygen from the air on non-insulated surfaces. Liquid oxygen is a fire hazard. Ice formation inside valves, vents, or critical components can be hazardous to equipment operation and to personnel. Also, because of its ability to displace oxygen, helium requires special consideration during any emergency involving a leak or release of helium gas or liquid especially in confined or enclosed spaces (such as sewers).

Helium can enter the environment through industrial discharges, unchecked venting to air, or through spills of the liquid. Since liquids will most likely vaporize rapidly, water and soil contamination are possible but improbable.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to helium.

Insufficient data are available on the short-term effects of helium on aquatic life, plants, birds, or land animals. However, as a relatively non-toxic, simple asphyxiant, it might be assumed that any acute ecological toxicity will be relatively low.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of helium to aquatic life, plants, birds, or land animals. However, as a relatively non-toxic, simple asphyxiant, it might be assumed that any chronic ecological toxicity will be relatively low.

◆ *Water Solubility*

Helium is only slightly soluble in water. Concentrations of 1 milligram or less may mix with a liter of water. It is normally a gas at room temperature and pressure and solubility may not be a concern.

Persistence in the Environment

Helium is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually all of helium will eventually end up in the air.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Helium is not expected to accumulate in the edible tissues of fish.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of helium should be segregated from other gases to prevent cross-contamination or contact. Buildings designated for storage should be equipped with monitors that provide ample warning (audible and visual) of oxygen deficient atmospheres.

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures. If applicable, contaminated soils should be removed for incineration and replaced with clean soil. When spills or leaks occur, it may be necessary to contact the local and/or state emergency response authorities. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of helium. If helium is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.

- If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- Keep helium out of a confined space, such as a sewer, because of the possibility of creating an inert atmosphere.
- It may be necessary to dispose of helium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving helium can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 293°F (145°C) | Specific Gravity (H ₂ O = 1) 1.66 |
| Vapor Pressure (mm Hg) 0.0003 (approx.) at 77°F (25°C) | Molecular Weight (atomic weight) 373.4 |
| Vapor Density (Air = 1) 13.0 | Freezing Point 203°F (95°C) |

Solubility

Insoluble in water (0.0006%). Soluble in hexane, petroleum distillates, xylene, alcohols, organic solvents.

Appearance and Odor

Pure heptachlor is a white, sand-like material with a camphor-like odor. Technical heptachlor is a white to light-tan crystalline, waxy, solid with a camphor-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Combustible Solid | Autoignition Temperature Not Determined |

Extinguishing Media

Use extinguishing media suitable to surrounding fire.

Special Fire Fighting Procedures

Heptachlor is a non-combustible solid, but it is often dissolved in a flammable or combustible liquid. Wear full protective clothing and SCBA. Remain clear of smoke, water fallout and water runoff. Move containers from fire area if it can be done without risk. Cool exposed containers. Toxic hydrogen chloride and carbon monoxide are formed in fire.

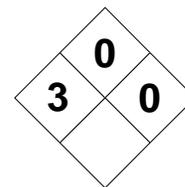

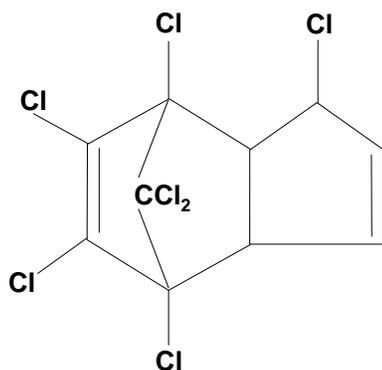

Unusual Fire and Explosion Hazards

Containers may explode in fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|---|------------------------------------|---|
| Stability | | Conditions to Avoid Heptachlor is normally stable in closed containers under routine conditions of storage and handling. Avoid contact with incompatible materials and do not store near heat or heat source. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with alkali metals. Corrosive to most metals. It can react with iron and its oxide to form hydrogen chloride gas. It is oxidized by chromic trioxide in acetic acid to produce heptachlor epoxide. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of heptachlor is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products At high temperatures, heptachlor decomposes and may produce poisonous gases, including toxic hydrogen chloride, carbonyl chloride, and carbon monoxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: Breathing vapors can cause convulsions, unconsciousness, and death. Can irritate the nose, eyes, mouth, and throat. Long-term exposure can damage the liver. ABSORPTION: Will pass through unbroken skin and enter the bloodstream. Contact may severely irritate the skin and eyes. INGESTION: Poisonous to humans by ingestion. Systemic effects due to central nervous system action include tremors, convulsion, excitement, ataxia, and gastritis. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | No | Group 3 | 29 CFR 1910.1000 Table Z-1 | Central nervous system; liver. |
| Medical Conditions Generally Aggravated by Exposure Kidney, liver, and lung diseases, and convulsive disorders may be aggravated by exposure to heptachlor. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes; seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of water, then triple-wash with soap and water. Inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: If victim is conscious, do NOT induce vomiting (CNS depression may induce seizures). Seek medical attention immediately. Never give anything by mouth to an unconscious or convulsing person. DOCTOR: Suggest gastric lavage and use of activated charcoal and sodium sulfate. Do not give epinephrine since it may induce ventricular fibrillation. Enforce complete rest. Monitor CBC, liver, and kidney function (urinalysis). | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all sources of heat. Ventilate area of spill. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. Collect powder materials using HEPA vacuum. Do NOT dry sweep. Absorb any liquid solution spills in vermiculite and place in sealed drum for disposal. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, dry, dark, well-ventilated area away from heat. | | | | |
| Other Precautions and Warnings Avoid generating dusty conditions in storage areas. Protect containers from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above 0.5 mg/m³, use a NIOSH-approved supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | Rubber | Eye Protection | Chemical Goggles or Face Mask | Other Protective Clothing |
| | | | | Protective Apron, Boots (avoid skin contact) |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HEPTACHLORC₁₀H₅Cl₇

CAS: 76-44-8

**IDENTIFICATION AND TYPICAL USES**

Pure heptachlor is a white, sand-like material with a camphor-like odor. Technical heptachlor is a white to light-tan crystalline, waxy, solid with a camphor-like odor. It was used for many years as an insecticide for seed treatment and in the control of certain insects that attack corn and other field-type crops. Since 1983, the only permitted use has been for the control of termites in subsurface soil treatments and for dipping non-food plants.

RISK ASSESSMENT: HEALTH**General Assessment**

Heptachlor is highly toxic to humans by *ingestion*. It is moderately toxic by *inhalation* and skin *absorption*. It is a suspected human carcinogen with experimental carcinogenic data reported. Human mutation data have been reported. There is some evidence in the references that indicates heptachlor is a suspected human carcinogen with long-term effects primarily in the liver.

Heptachlor is a central nervous system stimulant. Symptoms of exposure by all routes include nausea, vomiting, abdominal pain, irritation, confusion, apprehension, excitability, paresthesia, dizziness, headache, disorientation, tremor, ataxia (loss of muscle coordination), stupor, coma, convulsions, respiratory collapse, and possibly death.

Skin contact will result in moderate to severe irritation with rash or burning sensation. Eye contact may also result in irritation. Caution is warranted when both inhalation and skin contact exposures are possible. Even though air levels may be within limits, personnel may be overexposed if heptachlor should

contact the skin. The dangerous chronic dose in humans is unknown. May cause liver damage (fatty degeneration), characteristic of chronic alcoholism.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to heptachlor:

Skin: Liquid can pass through unbroken skin. Contact may cause irritation and rash. Symptoms of exposure include headache, nausea, abdominal pain, and vomiting.

Eye: Severe irritation and possible damage on contact.

Lung: Irritation of the nose and throat. Breathing vapors can cause cough, convulsions, unconsciousness, and death.

CNS: A central nervous system stimulant. Symptoms include ataxia, excitement, tremors, convulsions, confusion, delirium, and irritability.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to heptachlor and can last for months or even years:

Cancer Hazards: Heptachlor may be a carcinogen in humans since it has been shown to cause liver cancer in animals. There is no evidence in the references to confirm the human carcinogenicity of heptachlor.

Reproductive Hazard: There is no evidence that exposure to heptachlor can cause damage to the developing fetus in test animals. More research is required.

Other Chronic Effects: Long-term exposure to heptachlor may damage the liver and kidneys.

U **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with heptachlor. If a less toxic material or compound cannot be substituted for heptachlor, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of heptachlor dust release. This may be practical in manufacturing operations, but is not feasible in application since it is used outdoors. While not always operationally possible, isolating operations involving heptachlor manufacturing can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around heptachlor. At exposures above the PEL of 5 mg/m³ (TWA), use an MSHA/NIOSH-approved supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode for the greatest possible respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with heptachlor.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where heptachlor is used or stored.

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release.

If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to heptachlor and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of heptachlor should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to heptachlor, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by heptachlor should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to heptachlor.
- Where possible, automatically pump liquid heptachlor from drums or other storage containers to process containers.
- Specific engineering controls are recommended by NIOSH. Refer to NIOSH Criteria Document: Occupational Exposure During the Manufacture and Formulation of Pesticides (Publication Number 78-174).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Because of its use as an insecticide, heptachlor may be present in the environment at any given time and at a variety of levels. The environment is also at risk of exposure during transportation, storage, disposal, or destruction of heptachlor. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where heptachlor contacts incompatible commodities can result in violent and even explosive reactions (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Heptachlor is considered a non-combustible solid. It may also be present (dissolved) in some other flammable liquids such as benzene. Also, because it is incompatible with many common alkali metals, such as iron and its oxide, extreme caution is required in handling, storage, transportation, and disposal of heptachlor. These characteristics also require special consideration during any emergency situation involving a leak or spill of heptachlor powder or dust.

Heptachlor is an insecticide and, because of its once widespread, general usage in the past in areas where termites are treated, heptachlor enters the environment in agricultural and residential runoff.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to heptachlor.

Heptachlor has high acute toxicity to aquatic life. Heptachlor has caused injuries to agricultural crops and ornamental tree shrub species. Insufficient data are available to evaluate or predict on the short-term effects of heptachlor to birds and land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Heptachlor has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of heptachlor to plants, birds, or land animals.

💧 *Water Solubility*

Heptachlor is very slightly soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Heptachlor is highly persistent in the water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 44.5% of heptachlor will eventually end up in terrestrial soil; approximately 41.5% will end up in aquatic sediments; the remainder will end up in water.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of heptachlor found in fish tissues is expected to be considerably higher than the average concentration of heptachlor in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of heptachlor into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of heptachlor should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Buildings or storage areas should be equipped with appropriate fire protection systems (alarms, sprinklers). Proper ventilation and protective equipment should be used while handling the powders or while preparing aqueous solutions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If heptachlor should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is only slightly soluble in water and partial or total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of heptachlor. If heptachlor is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.

- ☑ Collect powdered materials using HEPA vacuum. Do NOT dry sweep. Absorb solution spills in vermiculite or other material and place in sealed drum for disposal or reclamation.
- ☑ It may be necessary to dispose of heptachlor as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving heptachlor can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime terms “cancer” or “carcinogen” are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered whenever developing or implementing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. Keep victim warm and at rest. If swallowed: Seek medical attention immediately. Warning! Aspiration hazard, do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled For small spills, absorb in vermiculite and allow to evaporate in a safe place (fume hood). Absorb large spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition and use only non-sparking tools during cleanup. Notify proper authorities. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Use only non-sparking tools to open and close containers. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where heptane is used, handled, or stored. Heat may cause containers to build up pressure and explode. Containers must be grounded and bonded during transfer. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) For high exposures (above the PEL), use a MSHA/NIOSH-approved organic vapor respirator. Best protection is obtained using a supplied-air respirator with full facepiece in continuous flow mode, or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Neoprene or Rubber | | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Rubber Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HEPTANE

CAS: 142-82-5

**IDENTIFICATION AND TYPICAL USES**

Heptane is a colorless liquid with a gasoline-like odor. It is used as a standard for octane rating determinations (pure, normal heptane has zero octane number). Also used as an anesthetic, a solvent, in organic synthesis, and in the preparation of laboratory reagents.

RISK ASSESSMENT: HEALTH**General Assessment**

Heptane is an acute irritant of low-order toxicity by *inhalation* and *ingestion*. Skin contact can also produce some adverse topical effects and *absorption* is likely to occur. There is no evidence in the references that exposure to heptane will lead to carcinogenic, mutagenic, or teratogenic effects.

Significant inhalation may cause irritation of the respiratory tract and depress the central nervous system. Symptoms include nausea, dizziness, vomiting, lightheadedness, giddiness, stupor, vertigo, loss of coordination, loss of appetite, depression, hallucinations, and possibly chemical pneumonia (if the swallowed liquid is aspirated into the lungs). At high concentrations, it is a narcotic and can lead to loss of consciousness, coma, and death due to respiratory failure. It is of low chronic toxicity due to its efficient metabolism and excretion.

Skin and eye contact may produce mild to moderate irritation on contact. Prolonged or repeated contact with the skin can cause dryness, cracking, and dermatitis. Ingestion may cause gastrointestinal irritation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to heptane:

Skin: Mild to moderate irritation and absorption.

Eye: Mild to moderate irritation.

Lung: Direct irritation of the respiratory tract and associated mucosa. May cause dizziness, vomiting, and nausea. Primary result of inhalation of heptane is its action on the CNS.

CNS: A CNS depressant: headache, dizziness, depression, hallucinations, changes in mood, loss of consciousness, coma, and death (respiratory failure).

☼ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to heptane and can last for months or even years:

Cancer Hazards: According to information presented in the references, heptane has not been adequately tested for its ability to cause cancer in animals.

Reproductive Hazard: According to information presented in the references, heptane has not been tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged skin contact may cause drying, cracking, and chapping of the affected area that may lead to dermatitis. Repeated or long-term exposures to heptane may affect the liver and kidneys.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with heptane. Even though the toxicity of this chemical is considered to be of relatively low order, it can still cause significant health effects if improperly used or if over-exposures occur. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose opera-

tions and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around heptane. For exposures above the PEL (400 ppm), an organic vapor respirator should be used (per OSHA 29 CFR 1910.134). Better protection is provided by a supplied-air respirator with full facepiece operated in continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious neoprene or rubber gloves should be used. Glove manufacturers should be contacted and permeation studies obtained before final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with heptane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where heptane is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney and liver function tests.
- ☑ Evaluation of nervous system function.
- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy and/or dermatitis).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and per-

sonnel are trained on its use, care, and maintenance.

- ☑ Wash thoroughly immediately after exposure to heptane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of heptane should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to heptane, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of heptane.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of heptane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Heptane is considered a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point make this chemical a serious fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with common peroxides and other oxidizers and contact can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of heptane. Should heptane ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is possible.

Heptane may enter the environment through industrial discharges or spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to heptane.

This chemical has high acute toxicity to aquatic life. It causes membrane damage in ornamental crop species. Insufficient data are available on the short-term effects of heptane exposure to birds or terrestrial animals.

☛ **Chronic Ecological Effects**

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Heptane has moderate chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of heptane to plants, birds, or land animals.

💧 **Water Solubility**

Heptane is nearly insoluble in water. Concentrations of less than 10 milligrams may mix with a liter of water, depending on water pH and chemical concentration of heptane.

⌚ **Persistence in the Environment**

Heptane is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of heptane will eventually end up in air.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of heptane found in fish tissue is expected to be somewhat higher than the average concentration of heptane in the water from which the fish was taken.

🛡️ **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react

properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of heptane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). All transfers of heptane from storage containers to process containers should be done automatically whenever possible. All containers and equipment must be grounded and bonded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If heptane should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of heptane. If heptane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb small spills (laboratory spills) in vermiculite and allow evaporation in a safe place (a fume hood or open air). Dispose of residue in sealed drums. For larger spills, absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect materials using non-sparking tools.
- ☑ It may be necessary to dispose of heptane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving heptane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from

Risk Management for Hazardous Chemicals

personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, 1-heptene can emit highly toxic/poisonous gases, including oxides of carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: An asphyxiant gas. Initial symptoms are those of oxygen starvation. Feeling of "air hunger," diminished mental alertness, headache, dullness, shortness of breath, and an impairment in muscle coordination. Continued exposures lead to faulty judgment, depression of senses, rapid fatigue, unconsciousness, convulsions, coma, and death. SKIN & EYES: Minimum hazard. On prolonged contact may cause smarting and reddening of the skin. INGESTION: Possibly mildly toxic. Unspecified gastrointestinal effects. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Respiratory system, CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. Keep victim warm and at rest. If swallowed: Seek medical attention immediately. Contact poison control center for assistance. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled For small spills, absorb in vermiculite and allow to evaporate in a safe place (fume hood). Absorb large spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition and use only non-sparking tools during cleanup. Notify proper authorities. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Use only non-sparking tools to open and close containers. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where 1-heptene is used, handled, or stored. Heat may cause containers to build up pressure and explode. Containers must be grounded and bonded during transfer. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) No exposure levels established and 1-heptene is an asphyxiant. Best protection is obtained using a supplied-air respirator with full facepiece in continuous flow mode, or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Clothing |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

1-HEPTENE

CAS: 592-76-7

**IDENTIFICATION AND TYPICAL USES**

1-Heptene is a colorless liquid used primarily in organic synthesis.

RISK ASSESSMENT: HEALTH***General Assessment***

1-Heptene is a simple asphyxiant gas. As such, its primary route of entry into the body is through *inhalation*. While it does not pose a significant physiological effect (i.e., no systemic poisoning or toxicity), it can displace oxygen levels to below that which is necessary to sustain life. Skin contact with the liquid can cause mild irritation on prolonged contact, but absorption is not a likely exposure route. Ingestion of the liquid may also occur, but little data are available on the resulting effects. There are no data in the references on the carcinogenic, mutagenic, or teratogenic properties of 1-heptene in humans or animals.

Inhalation of 1-heptene vapors can cause mild irritation with headache, dullness, shortness of breath, and the symptoms of asphyxiation. These include rapid respiration and a feeling of “air hunger” or air starvation followed by a decrease in mental alertness, and impaired muscular coordination. If exposure continues, there can be nausea, vomiting, prostration, unconsciousness, coma, and death.

Skin or eye contact with the vapor poses no serious threat. The vapors have not been shown to cause any physiological response and the liquid has only been shown to cause mild to moderate irritation on prolonged contact. Soaked clothing should be removed immediately to avoid a reaction.

☠ *Acute Health Effects*

The following acute health effects may occur immediately or shortly after exposure to 1-heptene:

Skin: Possible mild irritation.

Eye: Mild to moderate irritation.

Lung: Vapor is only slightly irritating and therefore poses little threat of damage to the lungs. However, in high concentrations, 1-heptene can lead to symptoms of asphyxiation and oxygen deprivation up to and including death.

CNS: Effects of asphyxiation cause adverse nervous system reactions.

☞ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to 1-heptene and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to 1-heptene does not lead to carcinogenic effects (it is a simple asphyxiant).

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: None reported.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with 1-heptene. Even though the toxicity of this chemical is considered to be of relatively low order, it can still cause significant health effects if improperly used or if over-exposures occur. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. However, because the vapors of 1-heptene can deplete oxygen levels in confined spaces, caution is warranted if enclosed operations is a chosen method of exposure control. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less

effective than the controls mentioned above, but is still advisable whenever working with or around 1-heptene. Air-purifying respirators (e.g., the cartridge-type or gas masks) cannot be used with 1-heptene. These types of respirators only purify the air and can do nothing to protect in oxygen deficient atmospheres. A powered air-supplied respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures with the liquid, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 1-heptene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 1-heptene is used or stored.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Because exposure to 1-heptene can cause asphyxiation, the use of local exhaust ventilation is vital. If local exhaust ventilation or enclosure is not possible or feasible, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and personnel are trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to 1-heptene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 1-heptene should be communicated to all exposed and potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 1-heptene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of 1-heptene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 1-heptene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

1-Heptene is considered a Class 1C flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point make this chemical a serious fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with common peroxides and other oxidizers and contact can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of 1-heptene. Should 1-heptene come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is possible. 1-Heptene may enter the environment through industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 1-heptene.

This chemical has high acute toxicity to aquatic life. It may cause membrane damage in ornamental crop species. Insufficient data are available on the short-term effects of 1-heptene exposure to birds or terrestrial animals.

☪ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

1-Heptene has moderate chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of 1-heptene to plants, birds, or land animals.

◆ *Water Solubility*

1-Heptene is insoluble in water. Concentrations of less than 1 milligram will not mix with a liter of water.

⌚ *Persistence in the Environment*

1-Heptene is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. There are no data on its soil sorption capabilities. It is assumed that virtually 100% of 1-heptene will eventually end up in air.

🐡 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

There are no data available on the bioaccumulation of 1-heptene in aquatic organisms.

🔧 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 1-heptene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). All transfers of 1-heptene from storage containers to process containers should be done automatically whenever possible. All containers and equipment must be grounded and bonded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If 1-heptene should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 1-heptene. If 1-heptene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb small spills (laboratory spills) in vermiculite and allow evaporation in a safe place (a fume hood or open air). Dispose of residue in sealed drums. For larger spills, absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect materials using non-sparking tools.
- ☑ It may be necessary to dispose of 1-heptene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 1-heptene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔧 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Steps to be Taken in Case Material is Released or Spilled For small spills, absorb in vermiculite and allow to evaporate in a safe place (fume hood). Absorb large spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition and use only non-sparking tools during cleanup. Notify proper authorities. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Use only non-sparking tools to open and close containers. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where 2-heptene is used, handled, or stored. Heat may cause containers to build up pressure and explode. Containers must be grounded and bonded during transfer. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) No exposure levels established and 2-heptene is an asphyxiant. Best protection is obtained using a supplied-air respirator with full facepiece in continuous flow mode, or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Clothing | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

2-HEPTENE

CAS: 592-77-8

**IDENTIFICATION AND TYPICAL USES**

2-Heptene is a colorless liquid. Its suggested use is as a plant growth retardant.

RISK ASSESSMENT: HEALTH**General Assessment**

2-Heptene is a simple asphyxiant gas. As such, its primary route of entry into the body is through *inhalation*. While it does not pose a significant physiological effect (i.e., no systemic poisoning or toxicity), it can displace oxygen levels to below that which is necessary to sustain life. Skin contact with the liquid can cause mild irritation on prolonged contact, but absorption is not a likely exposure route. Ingestion of the liquid may also occur, but little data are available on the resulting effects. There are no data in the references on the carcinogenic, mutagenic, or teratogenic properties of 2-heptene in humans or animals.

Inhalation of 2-heptene vapors can cause mild irritation with headache, dullness, shortness of breath, and the symptoms of asphyxiation. These include rapid respiration and a feeling of “air hunger” or air starvation followed by a decrease in mental alertness, and impaired muscular coordination. If exposure continues, there can be nausea, vomiting, prostration, unconsciousness, coma, and death.

Skin or eye contact with the vapor poses no serious threat. The vapors have not been shown to cause any physiological response and the liquid has only been shown to cause mild to moderate irritation on prolonged contact. Soaked clothing should be removed immediately to avoid a reaction.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chemicals such as 2-heptene:

Skin: Possible mild irritation.

Eye: Mild to moderate irritation.

Lung: Vapor is only slightly irritating and therefore poses little threat of damage to the lungs. However, in high concentrations, 2-heptene can lead to symptoms of asphyxiation and oxygen deprivation up to and including death.

CNS: Effects of asphyxiation cause adverse nervous system reactions.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to 2-heptene and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to 2-heptene does not lead to carcinogenic effects (it is a simple asphyxiant).

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: None reported.

☞ Recommended Risk-Reduction Measures

Personnel should avoid direct contact with 2-heptene. Even though the toxicity of this chemical is considered to be of relatively low order, it can still cause significant health effects if improperly used or if over-exposures occur. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. However, because the vapors of 2-heptene can deplete oxygen levels in confined spaces, caution is warranted if enclosed operations is a chosen method of exposure control. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less

effective than the controls mentioned above, but is still advisable whenever working with or around 2-heptene. Air-purifying respirators (e.g., the cartridge-type or gas masks) cannot be used with 2-heptene. These types of respirators only purify the air and can do nothing to protect in oxygen deficient atmospheres. A powered air-supplied respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures with the liquid, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 2-heptene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 2-heptene is used or stored.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Because exposure to 2-heptene can cause asphyxiation, the use of local exhaust ventilation is vital. If local exhaust ventilation or enclosure is not possible or feasible, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and personnel are trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to 2-heptene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 2-heptene should be communicated to all exposed and potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 2-heptene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of 2-heptene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 2-heptene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

2-Heptene is considered a Class 1C flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point make this chemical a serious fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with a common peroxides and other oxidizers and contact can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of 2-heptene. Should 2-heptene come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is possible. 2-heptene may enter the environment through industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 2-heptene.

This chemical has high acute toxicity to aquatic life. It may cause membrane damage in ornamental crop species. Insufficient data are available on the short-term effects of 2-heptene exposure to birds or terrestrial animals.

☪ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

2-Heptene has moderate chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of 2-heptene to plants, birds, or land animals.

◆ *Water Solubility*

2-Heptene is insoluble in water. Concentrations of less than 1 milligram will not mix with a liter of water.

⌚ *Persistence in the Environment*

2-Heptene is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. There are no data on its soil sorption capabilities. It is assumed that virtually 100% of 2-heptene will eventually end up in air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

There are no data available on the bioaccumulation of 2-heptene in aquatic organisms.

🔧 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 2-heptene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). All transfers of 2-heptene from storage containers to process containers should be done automatically whenever possible. All containers and equipment must be grounded and bonded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If 2-heptene should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 2-heptene. If 2-heptene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb small spills (laboratory spills) in vermiculite and allow evaporation in a safe place (a fume hood or open air). Dispose of residue in sealed drums. For larger spills, absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect materials using non-sparking tools.
- ☑ It may be necessary to dispose of 2-heptene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 2-heptene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔧 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

3-HEPTENE (mixed isomers)C₃H₇CH:CHC₂H₅

CAS: 25339-56-4

**IDENTIFICATION AND TYPICAL USES**

3-Heptene is a colorless liquid of mixed heptene monomers. Its suggested use is as a plant growth retardant.

RISK ASSESSMENT: HEALTH**General Assessment**

3-Heptene is a simple asphyxiant gas. As such, its primary route of entry into the body is through *inhalation*. While it does not pose a significant physiological effect (i.e., no systemic poisoning or toxicity), it can displace oxygen levels to below that which is necessary to sustain life. Skin contact with the liquid can cause mild irritation on prolonged contact, but absorption is not a likely exposure route. Ingestion of the liquid may also occur, but little data are available on the resulting effects. There are no data in the references on the carcinogenic, mutagenic, or teratogenic properties of 3-heptene in humans or animals.

Inhalation of 3-heptene vapors is probably narcotic in high concentrations. It can cause mild irritation with headache, dullness, shortness of breath, and the symptoms of asphyxiation. These include rapid respiration and a feeling of "air hunger" or air starvation followed by a decrease in mental alertness, impaired muscular coordination with progression to nausea, vomiting, prostration, unconsciousness, coma, and death.

Skin or eye contact with the vapor poses no serious threat. The vapors have not been shown to cause any physiological response and the liquid has only been shown to cause mild to moderate irritation on prolonged contact. Soaked clothing should be removed immediately to avoid a reaction.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chemicals such as 3-heptene:

Skin: Possible mild irritation.

Eye: Mild to moderate irritation.

Lung: Vapor is only slightly irritating and therefore poses little threat of damage to the lungs. However, in high concentrations, 3-heptene can lead to symptoms of asphyxiation and oxygen deprivation up to and including death.

CNS: Effects of asphyxiation cause adverse nervous system reactions. Possible narcotic effects in high concentrations.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to 3-heptene and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to 3-heptene does not lead to carcinogenic effects (it is a simple asphyxiant).

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: None reported.

🔧 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with 3-heptene. Even though the toxicity of this chemical is considered to be of relatively low order, it can still cause significant health effects if improperly used or if over-exposures occur. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. However, because the vapors of 3-heptene can deplete oxygen levels in confined

spaces, caution is warranted if enclosed operations is a chosen method of exposure control. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 3-heptene. Air-purifying respirators (e.g., the cartridge-type or gas masks) cannot be used with 3-heptene. These types of respirators only purify the air and can do nothing to protect in oxygen deficient atmospheres. A powered air-supplied respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures with the liquid, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 3-heptene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 3-heptene is used or stored.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Because exposure to 3-heptene can cause asphyxiation, the use of local exhaust ventilation is vital. If local exhaust ventilation or enclosure is not possible or feasible, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and personnel are trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to 3-heptene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of 3-heptene should be communicated to all exposed and potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to 3-heptene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of 3-heptene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 3-heptene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

3-Heptene is considered a Class 1C flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point make this chemical a serious fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with a common peroxides and other oxidizers and contact can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of 3-heptene. Should 3-heptene come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is possible.

3-Heptene may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 3-heptene.

This chemical has high acute toxicity to aquatic life. It may cause membrane damage in ornamental crop species. Insufficient data are available on the

short-term effects of 3-heptene exposure to birds or terrestrial animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

3-Heptene has moderate chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of 3-heptene to plants, birds, or land animals.

💧 *Water Solubility*

3-Heptene is insoluble in water. Concentrations of less than 1 milligram will not mix with a liter of water.

⌚ *Persistence in the Environment*

3-Heptene is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. There are no data on its soil sorption capabilities. It is assumed that virtually 100% of 3-heptene will eventually end up in air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

There are no data available on the bioaccumulation of 3-heptene in aquatic organisms.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 3-heptene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). All transfers of 3-

heptene from storage containers to process containers should be done automatically whenever possible. All containers and equipment must be grounded and bonded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If 3-heptene should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 3-heptene. If 3-heptene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb small spills (laboratory spills) in vermiculite and allow evaporation in a safe place (a fume hood or open air). Dispose of residue in sealed drums. For larger spills, absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect materials using non-sparking tools.
- ☑ It may be necessary to dispose of 3-heptene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 3-heptene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

● Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and respiratory tract. Possible damage to the liver, immune system, thyroid, kidneys, and the nervous system. Causes irritability, muscle weakness, tremors, pins and needles, and other nerve damage. ABSORPTION: Passes through intact skin to cause toxic systemic effects. A condition called porphiria cutaneatarda can also occur (rash, changes in pigment, skin thickening, red or dark urine, and other body changes). Hexachlorobenzene accumulates in the body. INGESTION: Toxic systemic effects (see inhalation). | | | | |
| Carcinogenicity Suspected Human Confirmed Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2B | OSHA Regulated? No | Target Organs? Respiratory system, eyes, skin, CNS, liver, kidney. |
| Medical Conditions Generally Aggravated by Exposure Exposure to sunlight shortly after exposure may increase the systemic effects of the chemical. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. <u>Seek medical assistance.</u> For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Gastric lavage followed by saline catharsis recommended. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquid solutions in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect solids using HEPA vacuum. Do NOT dry sweep. Damp-mop residues. Ventilate area of spill or leak. Remove all ignition sources. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method Dissolve in combustible solvent and burn in a chemical incinerator (with an afterburner and scrubber). | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from heat, sparks, or flames. Sources of ignition are prohibited where hexachlorobenzene is used, handled, or stored. | | | | |
| Other Precautions and Warnings At temperatures above 149°F (65°C), hexachlorobenzene reacts violently with dimethylformamide. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) The ACGIH TLV is low and difficult to monitor. For any exposure to a suspected carcinogen, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode or, use a self-contained breathing apparatus (SCBA) in continuous flow mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HEXACHLOROBENZENEC₆Cl₆

CAS: 118-74-1

**IDENTIFICATION AND TYPICAL USES**

Hexachlorobenzene appears as a white crystalline solid in the form of needles or prisms. It is often mixed in solution. It is used as a wood preservative, as a fungicide for treating seeds, and as an intermediate in organic synthesis.

RISK ASSESSMENT: HEALTH***General Assessment***

Hexachlorobenzene is an extremely toxic and poisonous substance. It can enter the body through *inhalation*, *absorption* (through intact skin), and by *ingestion*. It is a confirmed animal carcinogen and has caused teratogenic, reproductive, and mutagenic effects in animal experiments.

Inhalation of hexachlorobenzene vapors can cause irritation of the eyes, nose, throat, and mucosa of the respiratory tract. Exposure by all routes can lead to damage to the liver, immune system, thyroid, kidneys, and the central nervous system (CNS). There may be symptoms of irritability, muscle weakness, tremors, paresthesia (pins and needles), and other nerve damage. Skin contact causes irritation. Exposure by absorption and possibly by other routes may lead to a condition known as porphiria cutaneatarda with rash, changes in skin pigment, skin thickening, red and dark urine, and other body changes. Hexachlorobenzene accumulates in the body over time.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to hexachlorobenzene:

Skin: Possible irritation with rash. There may be changes in skin pigment, thickening of the skin, and other changes. Exposure to sunlight with or soon after exposure will increase these effects. After this reaction, blistering of the skin and red or dark urine may be noticed.

Eye: Moderate to severe irritation.

Lung: Irritation of the nose, throat, and lungs following exposure.

CNS: A CNS depressant causing systemic effects including drowsiness, ataxia, weakness, lethargy, malaise, fatigue, lightheadedness, and loss of consciousness.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to hexachlorobenzene and can last for months or even years:

Cancer Hazards: Hexachlorobenzene is a known animal carcinogen and has been shown to cause mutations in living cells. Its human carcinogenicity is considered highly suspect.

Reproductive Hazard: According to the data presented in the references, hexachlorobenzene has been shown to cause teratogenic and adverse reproductive effects in test animals.

Other Chronic Effects: Long-term exposure to hexachlorobenzene may cause damage to the liver, immune system (increasing the risk of infection), thyroid, and kidneys. High or repeated exposure may damage the nervous system, and can cause irritability, difficulty with walking and coordination, muscle weakness, tremor, and/or a feeling of "pins and needles" (paresthesia) on the skin. Repeated skin exposures

can lead to permanent skin changes, such as changes in pigment, tight, thickened skin, easy wrinkling, skin scarring, fragile skin, and increased hair growth (on the face and forearms).

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hexachlorobenzene. It is a suspected human carcinogen and has been shown to cause mutagenic, teratogenic, and reproductive effects in animals. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hexachlorobenzene. The ACGIH TLV for this chemical is extremely low (0.025 mg/m³) and difficult to monitor reliably under most operating or emergency conditions. A supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated pressure demand or other positive pressure mode are the recommended respiratory protection methods of choice. In either case, if a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexachlorobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hexachlorobenzene is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- ☑ Liver function tests.

- ☑ Interview for nervous system effects, including recent irritability, weakness, loss of coordination, paresthesia, and other such symptoms.
- ☑ Consider cerebellar and autonomic and peripheral nervous system evaluation. Positive and borderline individuals should be referred for neuropsychological testing.

Also, iron used as a dietary supplement could increase liver damage caused by hexachlorobenzene. Personnel who have potential exposure to hexachlorobenzene should be reminded to consult with their personal physicians before taking iron supplements.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Hexachlorobenzene is often mixed in solution with a combustible solvent. Where possible, automatically transfer hexachlorobenzene from drums or other storage containers to process containers.
- ☑ Specific engineering controls are recommended by NIOSH in publication 78-174 (Occupational Exposure During the Manufacture and Formulation of Pesticides) and publication 76-147 (Working with Pesticides).
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to hexachlorobenzene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexachlorobenzene should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexachlorobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possi-

ble contamination of the surrounding environmental mediums (water, soil, and air).

Hexachlorobenzene is considered a non-combustible solid but it is often mixed in solution with combustible or possibly flammable commodities. It can also react explosively when heated or when in contact with dimethylformamide. These characteristics require special consideration during any emergency situation involving a leak or spill of hexachlorobenzene.

Hexachlorobenzene has been used for many years as a fungicide and wood preservative. It has been detected in samples taken around the world and is generally recognized as a global pollutant. It may enter the environment from agricultural runoff or atmospheric deposition.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexachlorobenzene.

Hexachlorobenzene has high acute toxicity to aquatic life and moderate acute toxicity to land animals. Insufficient data are available to evaluate the short-term effects of hexachlorobenzene exposure to plants or birds.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Hexachlorobenzene has high chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of hexachlorobenzene to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Hexachlorobenzene is only very slightly soluble in the aquatic environment. Concentrations of less than 1 milligram will mix with a liter of water.

🕒 *Persistence in the Environment*

Hexachlorobenzene is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Approximately 50% of hexachlorobenzene will eventually end up in terrestrial soils; about 46.75% will end up in aquatic sediments, about 3% will end up in air, and approximately 0.25% will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hexachlorobenzene found in fish tissues is expected to be considerably higher than the average concentration of hexachlorobenzene in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexachlorobenzene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings or facilities should be equipped with proper fire protection equipment (sprinklers/extinguishers, alarms).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hexachlorobenzene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is nearly insoluble in the aquatic environment and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexachlorobenzene. The proper disposal method for hexachlorobenzene is to mix it in a com-

bustible solvent and burn it in a chemical incinerator equipped with an afterburner and an air scrubber.

If hexachlorobenzene powders or liquid solutions are spilled or leaked, the following specific response steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ If liquid is spilled, absorb in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect using non-sparking tools. For solid (powdered) spills, collect using a vacuum equipped with a high-efficiency particulate air (HEPA) filter. Do NOT dry sweep (generates dusts). Damp mop residues and collect for disposal.
- ☑ It may be necessary to dispose of hexachlorobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexachlorobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered whenever developing or implementing any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to hazardous chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Cor-

porate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Vapor Density (Air = 1) 9.0 | Melting Point -6°F (-21°C) |

Solubility

Insoluble in water. Soluble in alcohol and ether, compatible (miscible) with many resins.

Appearance and Odor

Clear, colorless, heavy liquid with a mild turpentine-like odor. Odor Threshold ≈ 1 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Combustible Liquid | Autoignition Temperature 1130°F (610°C) |

Extinguishing Media

Carbon dioxide, water spray, foam, or dry chemical.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Approach fire from upwind position. Use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire. Hexachlorobutadiene is a suspected human carcinogen. Avoid smoke and runoff.

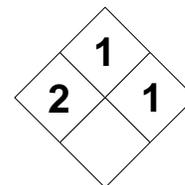

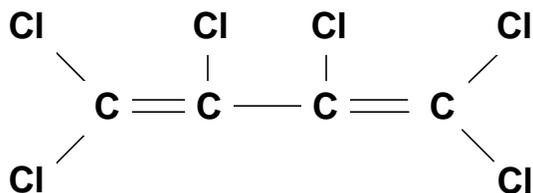

Unusual Fire and Explosion Hazards

Can become combustible when exposed to heat and flame. Move containers from fire if it can be done without risk. Containers may explode in fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|---|--------------------------------|--|
| Stability | | Conditions to Avoid Hexachlorobutadiene is normally stable in closed containers under routine conditions of handling and storage. Avoid contact with heat and incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reacts with bromine perchlorate to form an explosive product. Combustible when exposed to heat or flame. Can react vigorously with oxidizing materials. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of hexachlorobutadiene is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, hexachlorobutadiene can emit highly toxic/poisonous fumes including fumes of chloride and carbon dioxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and respiratory tract. Possible damage to the liver, kidneys, and the nervous system. Causes irritability, muscle weakness, tremors, pins and needles, and other nerve damage. ABSORPTION: Passes through intact skin to cause toxic systemic effects. Contact will also cause surface irritation to the skin and may damage the eyes if not removed immediately. INGESTION: Toxic systemic effects (see inhalation). | | | | |
| Carcinogenicity Suspected Human Confirmed Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? No | Target Organs? Respiratory system, eyes, skin, CNS, liver, kidney. |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For red or blistered skin, seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Contact poison control center. Unless advised otherwise, give 1 to 2 glasses of water and induce vomiting. Never make an unconscious or convulsing person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquid solutions in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Hexachlorobutadiene is a hazardous waste; handle accordingly. | | | | |
| Preferred Waste Disposal Method Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area away from heat, sparks, or flames. Sources of ignition are prohibited where hexachlorobutadiene is used, handled, or stored. | | | | |
| Other Precautions and Warnings A regulated, marked controlled area should be established where hexachlorobutadiene is handled, used, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) The PEL is low and difficult to monitor. For any exposure to a suspected carcinogen, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) in continuous flow mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron or Clothing |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HEXACHLOROBUTADIENECl₂C:CCICCl:CCl₂

CAS: 87-68-3

**IDENTIFICATION AND TYPICAL USES**

Hexachlorobutadiene appears as a clear, colorless, heavy liquid with a mild, turpentine-like odor. It is used as a solvent for elastomers, as a heat-transfer liquid, a transformer and hydraulic fluid, a wash liquor for removing C₄ and higher hydrocarbons.

RISK ASSESSMENT: HEALTH**General Assessment**

Hexachlorobutadiene is an extremely toxic and poisonous substance. It can enter the body through *inhalation*, *absorption* (through intact skin), and by *ingestion*. It is a confirmed animal carcinogen and has caused teratogenic, reproductive, and mutagenic effects in animal experiments.

Inhalation of hexachlorobutadiene vapors can cause irritation of the eyes, nose, throat, and mucosa of the respiratory tract. It may lead to chronic bronchitis and possibly hepatitis. Exposure by all routes can lead to damage to the liver, kidneys, and the central nervous system (CNS). There may be symptoms of hypotension, cardiac disease, nervous system functional disturbances such as irritability, muscle weakness, tremors, paresthesia (pins and needles), and other nerve damage. Skin contact causes localized irritation at site of contact. Simultaneous exposure by absorption and other routes can cause a compound effect on the body.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hexachlorobutadiene:

Skin: Possible irritation with rash.

Eye: Moderate to severe irritation.

Lung: Irritation of the nose, throat, and lungs following exposure.

CNS: A CNS depressant causing systemic effects including drowsiness, ataxia, weakness, lethargy, malaise, fatigue, lightheadedness, and loss of consciousness.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hexachlorobutadiene and can last for months or even years:

Cancer Hazards: Hexachlorobutadiene is a known animal carcinogen and has been shown to cause mutations in living cells. Its human carcinogenicity is considered highly suspect.

Reproductive Hazard: According to the data presented in the references, hexachlorobutadiene has been shown to cause teratogenic and adverse reproductive effects in test animals.

Other Chronic Effects: Long-term exposure to hexachlorobutadiene may cause damage to the liver and/or kidneys and may lead to cardiac disease and possibly hypotension.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with hexachlorobutadiene. It is a suspected human carcinogen and has been shown to cause mutagenic, teratogenic, and reproductive effects in animals. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the con-

trols mentioned above, but is still advisable whenever working with or around hexachlorobutadiene. The PEL for this chemical is extremely low (0.02 ppm) and difficult to monitor reliably under most operating or emergency conditions. A supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated pressure demand or other positive pressure mode are the recommended respiratory protection methods of choice. In either case, if a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexachlorobutadiene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hexachlorobutadiene is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- Liver function tests.
- Kidney function tests.
- Interview for nervous system effects, including recent irritability, weakness, loss of coordination, paresthesia, and other such symptoms.
- Consider cerebellar and autonomic and peripheral nervous system evaluation. Positive and borderline individuals should be referred for neuropsychological testing.

Also, because more than light or casual alcohol consumption can lead to liver damage, drinking alcohol may increase the potential liver damage caused by hexachlorobutadiene. Prudent risk management requires proper consideration of *all* possible exposure factors when evaluating workplace health hazard risk.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release.

If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Where possible, automatically transfer hexachlorobutadiene from drums or other storage containers to process containers.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to hexachlorobutadiene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexachlorobutadiene should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexachlorobutadiene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hexachlorobutadiene is considered a combustible liquid. It can react in contact with bromine perchlorate to form an explosive product. It can react vigorously with oxidizing agents. These characteristics require special consideration during any emergency situation involving a leak or spill of hexachlorobutadiene.

Hexachlorobutadiene may enter the environment primarily during the disposal of wastes from the chlorinated hydrocarbon industry.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexachlorobutadiene.

Hexachlorobutadiene has high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of hexachlorobutadiene exposure to plants, birds, or land animals.

☼ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Hexachlorobutadiene has high chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of hexachlorobutadiene to plants, birds, or terrestrial animals.

💧 *Water Solubility*

Hexachlorobutadiene is moderately soluble in the aquatic environment. Concentrations between 1 and 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Hexachlorobutadiene is non-persistent in the aquatic environment, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Approximately 98.6% of hexachlorobutadiene will eventually end up in air; about 0.4% will end up in water; and the remaining 1% will be divided about evenly between terrestrial soils and aquatic sediments.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hexachlorobutadiene found in fish tissues is expected to be much higher than the average concentration of hexachlorobutadiene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexachlorobutadiene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings or facilities should be equipped with proper

fire protection equipment (sprinklers/extinguishers, alarms).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hexachlorobutadiene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in the aquatic environment and, therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexachlorobutadiene. The proper disposal method for hexachlorobutadiene is to burn it in a chemical incinerator equipped with an afterburner and an air scrubber.

If hexachlorobutadiene is spilled or leaked, the following specific response steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- If liquid is spilled, absorb in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- It may be necessary to dispose of hexachlorobutadiene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexachlorobutadiene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of cur-

rent as well as future business. Always remember that anytime the terms “cancer,” “carcinogen,” or “reproductive hazard” are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered whenever developing or implementing any public relations policies.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to hazardous chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Identification Number UN 2646 | Chemical Formula C₅Cl₆ | |

Synonyms
HCCPD; hexachloro-1,3-cyclopentadiene; 1,2,3,4,5,5-hexachloro-1,3-cyclopentadiene; Graphlox; perchlorocyclopentadiene;

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|--|
| Hexachlorocyclopentadiene (derivation: By chlorinating cyclopentadiene, followed by catalytic chlorination over phosphorus pentachloride or arsenic oxide and thermally dechlorinating the product). 1 ppm = 11.34 mg/m³ | PEL: 0.01 ppm 0.1 mg/m³ STEL: Not Established | REL: 0.01 ppm 0.1 mg/m³ STEL: Not Established | Not Determined | TLV: 0.01 ppm 0.11 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 462°F (239°C) | Specific Gravity (H ₂ O = 1) 1.71 |
| Vapor Pressure (gas) 0.08 at 77°F (25°C) | Molecular Weight 272.8 |
| Vapor Density (Air = 1) 9.42 | Melting Point 16°F (-9°C) |

Solubility
Practically insoluble in water (0.0002% at 77°F). Soluble in acetone, carbon tetrachloride, hexane, and methanol.

Appearance and Odor
Pale-yellow to amber-colored dense, oily liquid with a pungent, unpleasant odor (a solid below 16°F). Odor Threshold = 0.03 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) None Reported (opened cup) | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Combustible Liquid | Autoignition Temperature Not Determined |

Extinguishing Media
Use dry chemical, foam, carbon dioxide. Do NOT use water spray unless no other means are available.

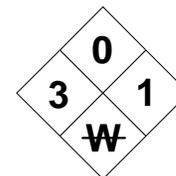

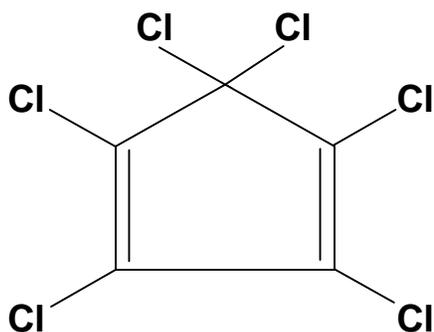

Special Fire Fighting Procedures
Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Do not allow water or water spray to enter drums or storage containers.

Unusual Fire and Explosion Hazards
Will react with water to form explosive hydrogen gas. Container may explode violently in heat.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|--|--|
| Stability | | Conditions to Avoid Stable in dry, closed containers. Keep away from heat or flame and incompatible materials. Reacts in the presence of water or moisture. Forms explosive hydrogen gas on reaction with water. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) May explode on contact with sodium. Forms hydrochloric acid in contact with water or moisture and can corrode iron and other metals. Also forms hydrogen gas, which is an explosion hazard. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of hexachlorocyclopentadiene is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Hexachlorocyclopentadiene decomposes at high temperatures to produce toxic and acrid smoke and fumes, including hydrogen chloride, chloride, phosgene, and carbon monoxide fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Very irritating to the eyes, nose, throat, and lungs. At low levels, there will be sneezing, lachrymation (tearing), headaches, and burning of the eyes and throat. Higher levels can lead to pulmonary edema (fluid in the lungs), which can be fatal. ABSORPTION: Severe irritation and possible burns to the eyes and skin. Passes through intact skin to cause toxic systemic effects including dyspnea, salivation, nausea, vomiting. INGESTION: Causes nausea, vomiting, diarrhea, depression, and gastrointestinal disturbances. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1-A | Target Organs? Respiratory system, eyes, skin, liver, kidneys. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance, if necessary. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. Observe for 48 hours for lung effect (pulmonary edema). If swallowed: Never give an unconscious or convulsing person anything by mouth. Seek medical attention immediately. Give 1 to 2 glasses of water, then induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Use water spray to knock down vapors, but do not direct water on liquid spills. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, dry, well-ventilated area away from heat and flame. Suggest using an inert gas (nitrogen) blanket inside storage containers to prevent moisture condensation. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where hexachlorocyclopentadiene is used, handled, or stored. Heat may cause containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposures (to PEL), use an organic vapor respirator. For higher exposures, use a supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HEXACHLOROCYCLOPENTADIENEC₅Cl₆

CAS: 77-47-4

**IDENTIFICATION AND TYPICAL USES**

Hexachlorocyclopentadiene is a pale-yellow to amber-colored liquid with a pungent, unpleasant odor. It may appear as a solid below 16°F (-9°C). It is used as an intermediate in the synthesis of dyes, cyclodiene pesticides, (aldrin, dieldrin, endosulfan), fungicides, pharmaceuticals, and in the manufacture of chlorendic anhydride and chlorendic acid.

RISK ASSESSMENT: HEALTH**General Assessment**

Hexachlorocyclopentadiene is considered a deadly poison by *inhalation* and is moderately toxic by *ingestion* and skin contact (*absorption*). There are no data in the references on its carcinogenic or mutagenic properties. However, there is some evidence that exposure causes teratogenic effects in test animals.

Inhalation of hexachlorocyclopentadiene vapors can be extremely irritating to the eyes, nose, throat, and lungs. Because of its distinguishable odor and irritating, intolerable properties, overexposure is not likely since personnel will normally remove themselves from exposure. However, such exposures are still possible, especially in emergency situations. Symptoms include dyspnea, cough, sneezing, chest pains and tightness, headache, bronchitis and bronchiolitis, and possible pulmonary edema (fluid in the lungs), which is a medical emergency and can be fatal. Development of pulmonary edema may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk. There may also be transient nervous system effects such as loss of memory and confusion. A condition known as proteinuria (excess protein in urine) may develop which could indicate latent kidney effects. Liver, nervous

system, and heart damage are also suspect possibilities.

Skin contact will cause immediate irritation with possible burns and blistering. Absorption will occur and result in the toxic systemic effects noted for inhalation. Eye contact with the vapor or liquid will cause conjunctivitis, inflammation, and other possible damage to the surrounding tissues (depending upon length of contact). Ingestion will cause nausea, vomiting, diarrhea, and other unspecified gastrointestinal effects.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hexachlorocyclopentadiene:

Skin: Severe irritation and possible burns.

Eye: Moderate to severe irritation and possible burns. Conjunctivitis, inflammation, and possible tissue damage.

Lung: Irritation of the entire respiratory tract with a potential for the development of bronchitis (inflammation of the bronchial tubes), bronchiolitis (inflammation of the bronchioles), and pulmonary edema (fluid in the lungs).

Other: May cause kidney effects (proteinuria) and possible kidney and liver damage.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hexachlorocyclopentadiene and can last for months or even years:

Cancer Hazards: According to information presented in the references, hexachlorocyclopentadiene has not

been adequately tested for its ability to cause cancer in animals.

Reproductive Hazard: According to information presented in the references, hexachlorocyclopentadiene may cause teratogenic effects in test animals.

Other Chronic Effects: Repeated or long-term exposures to hexachlorocyclopentadiene may affect or damage the liver, kidneys, heart, and nervous system. Chronic effects may also include the development of chloro-acne.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hexachlorocyclopentadiene. The long-term (chronic) toxicity of this chemical is not completely understood. Prudent risk management requires caution and a conservative approach when assessing the hazard of such chemicals.

If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hexachlorocyclopentadiene. The PEL is extremely low and difficult to monitor (0.01 ppm). For exposures above the PEL, a full face-piece respirator equipped with an organic vapor cartridge should be used. For high or prolonged exposures, or when exposure levels are unknown (as in an emergency), a supplied-air respirator with full face-piece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full face-piece and pressure demand are the recommended respiratory protection methods of choice. If a full face-piece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around chemicals such as hexachlorocyclopentadiene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hexachlorocyclopentadiene is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- ☑ Kidney and liver function tests.
- ☑ Lung function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney and liver function tests.
- ☑ Lung function tests (including Forced Vital Capacity, or “FVC”).
- ☑ Examination of the nervous system.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, emphysema, and other lung diseases, smokers may experience exposure symptoms more quickly than non-smokers under the same conditions of exposure. Risk managers must consider *all* possible exposure factors when evaluating workplace hazards.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, liquids should be transferred automatically from storage containers to process containers.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to hexachlorocyclopentadiene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexachloro-

cyclopentadiene should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hexachlorocyclopentadiene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of hexachlorocyclopentadiene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexachlorocyclopentadiene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hexachlorocyclopentadiene is considered a non-combustible liquid. But it can react in the presence of moisture or water to liberate corrosive hydrochloric acid and explosive hydrogen gas. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is a dangerous explosion hazard when exposed to heat and flame. Therefore, special consideration is required during any emergency situation involving a leak or spill of hexachlorocyclopentadiene.

Hexachlorocyclopentadiene may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chemicals such as hexachlorocyclopentadiene.

Hexachlorocyclopentadiene has high acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the acute effects of hexachlorocyclopentadiene exposure to plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Hexachlorocyclopentadiene has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of hexachlorocyclopentadiene to plants, birds, or land animals.

💧 *Water Solubility*

Hexachlorocyclopentadiene is nearly insoluble in water. Concentrations of less than 100 milligrams may mix with a liter of water.

⌚ *Persistence in the Environment*

Hexachlorocyclopentadiene is virtually non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 97.6% of this chemical will eventually end up in the air; about 0.4% will end up in water; and about 2% will be divided almost equally between terrestrial soil and aquatic sediments.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hexachlorocyclopentadiene found in fish tissue is expected to be much higher than the average concentration of hexachlorocyclopentadiene in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexachlorocyclopentadiene should be segregated from incompatible materials (such as water) to minimize the risk of cross-contamination or contact. Buildings designated for storage should be

equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hexachlorocyclopentadiene should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexachlorocyclopentadiene. If hexachlorocyclopentadiene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of hexachlorocyclopentadiene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexachlorocyclopentadiene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "reproductive hazard" is used, public emotion, hysteria, and ignorance can run equally high. This must be properly considered when developing public relation policies and procedures.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

HEXACHLOROETHANE

CAS: 67-72-1

**IDENTIFICATION AND TYPICAL USES**

Hexachloroethane is a colorless to white crystalline (sand-like) solid or a dissolved liquid with a camphor-like odor. Used as a solvent, in the manufacture of fireworks and smoke devices, in explosives, in celluloid, as an insecticide, and as a rubber vulcanizing accelerator. It had once been used as an anthelmintic for livestock.

RISK ASSESSMENT: HEALTH**General Assessment**

Hexachloroethane is toxic by *ingestion* and *absorption* through intact skin. It is also toxic through *inhalation*, but its specific toxicity is expected to be relatively low due to hexachloroethane's low vapor pressure. It is suspected to cause cancer in test animals and has been shown to adversely affect reproduction in laboratory tests.

Inhalation causes irritation of the eyes, nose, throat, and respiratory system. Exposure to high concentrations may cause narcosis with central nervous system (CNS) depression with symptoms of weakness, dizziness, lightheadedness, staggering gait, and twitching muscles. Loss of consciousness may also occur. Eye irritation from exposure to the vapors may lead to conjunctivitis, lachrymation, redness, and inflammation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hexachloroethane:

Skin: Irritation with possible rash and burning feeling. Absorption is likely to occur.

Eye: Severe irritation, conjunctivitis, burning feeling, pain. Corneal damage is not likely to occur.

Lung: Nose, throat, and respiratory tract irritation.

CNS: Headaches, lightheadedness, dizziness, confusion, excitement, drowsiness, intoxication, anesthesia, amnesia, analgesia, respiratory depression.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hexachloroethane and can last for months or even years:

Cancer Hazards: Hexachloroethane has been shown to cause liver cancer in test animals and it may have this effect in humans as well.

Reproductive Hazard: According to information presented in the references, hexachloroethane has been shown to cause adverse reproductive and teratogenic effects in laboratory test animals. It is not known if human exposure will have this effect.

Other Chronic Effects: Long-term exposure may lead to liver and kidney damage. This chemical has not been adequately tested to determine whether brain or other nerve damage could occur with repeated exposure. However, many solvents and other petroleum-based chemicals have been shown to cause such damage. Effects may include reduced memory and concentration, personality changes (withdrawal, irritability), fatigue, sleep disturbances, reduced coordination, possible effects on the nerves supplying internal organs (autonomic nerves), or the nerves to the arms and legs (weakness, "pins and needles").

🕒 **Recommended Risk-Reduction Measures**

Exposure to hexachloroethane presents a serious and even life-threatening risk to human health. Personnel should therefore avoid direct contact with hexachloroethane. Occupational poisoning occurs most commonly by inhalation and skin absorption. If a less toxic material or compound cannot be substituted for hexachloroethane, then *engineering controls* are the most effective method of reducing exposures. The best protection for workers is to ensure controlled use of hexachloroethane and, wherever possible, enclose operations or provide adequate local exhaust ventilation at the site of hexachloroethane release. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hexachloroethane. Caution should be exercised when selecting respiratory protection since it is not known if exposure to hexachloroethane will cause cancer in humans. The PEL is extremely low and difficult to accurately monitor (1 ppm). For exposures to any level, use a supplied-air respirator with full facepiece and mask operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexachloroethane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hexachloroethane is used or stored.

For those personnel with frequent or potentially high exposures (half the PEL or greater), the following are recommended before beginning employment and at regular intervals thereafter (e.g., annually):

- Liver function tests.

If symptoms develop or overexposure is suspected, the following recommended medical tests should be considered:

- Liver and kidney function tests.
- Interview for brain effects, including recent changes in memory, mood (irritability, withdrawal), and concentration. Look for headaches, malaise, and altered sleeping patterns. Cerebellar, autonomic, and peripheral nervous system evaluation should be considered. Positive or borderline cases should be referred for further neuropsychological testing.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because more than light or casual alcohol consumption can lead to liver damage, drinking alcohol may increase the potential liver damage caused by hexachloroethane. Prudent risk management requires proper consideration of *all* possible exposure factors when evaluating workplace health hazard risk.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its proper use and care.
- Wash thoroughly immediately after exposure to hexachloroethane and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexachloroethane should be communicated to all exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hexachloroethane, emergency shower facilities should also be provided in the immediate area.
- Workers whose clothing has been contaminated by hexachloroethane should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to hexachloroethane.

- ☑ Where possible, automatically transfer liquids containing hexachloroethane from drums or other containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexachloroethane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Hexachloroethane is a non-combustible solid. However, if it is involved in fire, hexachloroethane can emit highly toxic oxides of carbon, hydrogen chloride gas, and phosgene. It is incompatible with most oxidizers, alkalis, and many metals (such as zinc, cadmium, aluminum, hot iron, and mercury). Caution is always required in handling, storage, transportation, and disposal of hexachloroethane. Emergency responders should be made aware of the presence of hexachloroethane at any emergency response situation.

Hexachloroethane can enter the environment from chlorination of water at municipal treatment plants, industrial discharges, municipal waste treatment discharges, or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexachloroethane.

Hexachloroethane has high acute toxicity to aquatic life. Insufficient data are available on the short-term effects of hexachloroethane to plants, birds, or land animals.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Hexachloroethane has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of hexachloroethane to plants, birds, or terrestrial animals.

💧 Water Solubility

Hexachloroethane is nearly insoluble in water. Concentrations between 1 and 100 milligrams may mix with a liter of water.

🕒 Persistence in the Environment

Hexachloroethane is moderately persistent in water, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually all (99.98%) of hexachloroethane will eventually end up in air.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hexachloroethane found in fish tissues is expected to be somewhat higher than the average concentration of hexachloroethane in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of hexachloroethane into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexachloroethane should be segregated from other chemicals and materials (especially oxidizers, alkalis, and metals) to minimize the risk of cross-contamination. Careful consideration is required when selecting containers for storage or use.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hexachloroethane should contact the water table, aquifer, or navigable waterway, time is of the essence. It is practically insoluble and total remediation may be possible. The local and/or state emergency response authorities must

be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexachloroethane. For disposal, hexachloroethane may be mixed with a combustible solvent and burned in a chemical incinerator equipped with an afterburner and scrubber to remove the haloacids.

If hexachloroethane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect solids using HEPA vacuum. Do NOT dry sweep (generates airborne dusts). Damp mop residue and collect for disposal. Absorb liquids in vermiculite, sand, earth, or similar material and deposit in sealed drum.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of hexachloroethane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexachloroethane can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, ignorance, and hysteria can run equally high. This must be carefully considered during the development of any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-

designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: A severe irritant causing nausea, jaundice, indigestion, drowsiness, which can progress to central nervous system depression with confusion, fatigue, fever, and coma. A serious hepatotoxic chemical. Severe liver damage and tissue necrosis can occur. ABSORPTION: Severe eye and skin irritant. May cause chloro-acne (an acne-form dermatitis). Symptoms include dry skin with intense itching, blackheads, and cysts. Hepatitis can also occur. INGESTION: Nausea, jaundice, liver effects and damage, coma, and possibly death. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Liver, skin, and CNS. |
| Medical Conditions Generally Aggravated by Exposure Existing skin diseases or conditions (eczema, psoriasis) and liver dysfunction may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of warm water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Give conscious and alert person 2-3 glasses of water and induce vomiting with 40 to 45 mg (adult dose) of syrup of Ipecac. Never give an unconscious or convulsing person anything by mouth. Post-vomiting, give 1-2 mg/kg charcoal slurry. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Restrict those not wearing proper protective equipment and who are not involved in cleanup from entering area. Collect solids with HEPA vacuum and damp mop residues. Do NOT dry sweep. Place in sealed container for disposal. Flush trace residues with copious amounts of water and collect for disposal. | | | | |
| Preferred Waste Disposal Method Mix with a combustible solid and burn in chemical incinerator equipped with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, dark, well-ventilated location. Protect containers from physical damage. Keep away from oxidizing materials and heat. | | | | |
| Other Precautions and Warnings Ensure adequate ventilation in storage areas. Avoid vapor/dust inhalation and use appropriate personal protective equipment if necessary. Do not store in direct sunlight. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposures, use an air purifying respirator with a HEPA filter. Otherwise, use a supplied-air respirator or a self-contained breathing apparatus with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Apron if Splash is Likely |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HEXACHLORONAPHTHALENE

CAS: 1335-87-1

**IDENTIFICATION AND TYPICAL USES**

Hexachloronaphthalene is a white to light-yellow wax-like solid with a mild, aromatic, pleasant odor. It is used to insulate electrical equipment and wires, in flame proofing and water proofing, in paper coatings, in batteries, and as a lubricant additive.

RISK ASSESSMENT: HEALTH**General Assessment**

Hexachloronaphthalene is toxic to humans by *ingestion*, *inhalation*, and *absorption* through intact skin. It is a severe irritant and a strong liver toxin (hepatotoxin). There is no information in the references on its carcinogenic, teratogenic, or mutagenic capabilities.

Inhalation causes irritation of the eyes, nose, throat, and respiratory system. It can cause nausea, jaundice (yellowing of the skin and sclera), dark urine, indigestion, and drowsiness. There may be progression to central nervous system (CNS) depression with confusion, fever, and even coma. Possible liver damage, necrosis (tissue destruction), and/or atrophy (tissue death) may also occur.

Skin contact results in the absorption of the chemical into the body causing many of the same toxic systemic effects of inhalation, especially those resulting in liver and CNS damage. Skin contact can also cause a serious acne-like dermatitis known as chlor-acne. This condition is characterized by dry skin with intense itching and the appearance of blackheads and cysts containing keratin and sebaceous matter about the face, ears, neck, shoulders, arms, and stomach. Hepatitis is also a frequent result of skin contact. Ingestion will likely cause similar toxic systemic effects

as inhalation and absorption with nausea and stomach pain as well.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hexachloronaphthalene:

- Skin:** Irritation with possible rash, intense itching, and acne-like rash with blackheads and cysts on the face, neck, ears, shoulders, and stomach.
- Eye:** Mild to moderate irritation (depending upon length of time contact occurs).
- Lung:** Nose, throat, and respiratory tract irritation.
- CNS:** Headaches, lightheadedness, dizziness, confusion, excitement, drowsiness, fever, coma, and possibly death.
- Other:** Exposure results in serious and possibly life-threatening effects to the liver. There can be jaundice, hepatitis, necrosis, and atrophy of the organ. Death can also occur, but is not likely on acute exposure (unless exposure levels are extremely high).

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hexachloronaphthalene and can last for months or even years:

Cancer Hazards: According to information presented in the references, hexachloronaphthalene has not been adequately tested for its ability to cause cancer in laboratory animals.

Reproductive Hazard: According to information presented in the references, hexachloronaphthalene has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Long-term exposure may lead to fatal damage to the central nervous system and/or the liver. Prolonged contact may cause chronic skin irritation and acne-like rash. The skin may become extremely sensitive to sunlight and any exposure may cause a persistent flare-up of acne symptoms.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hexachloronaphthalene. Occupational poisoning occurs most commonly by inhalation and skin absorption. If a less toxic material or compound cannot be substituted for hexachloronaphthalene, then *engineering controls* are the most effective method of reducing exposures. The best protection for workers is to ensure controlled use of hexachloronaphthalene and, wherever possible, enclose operations or provide adequate local exhaust ventilation at the site of hexachloronaphthalene release. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hexachloronaphthalene. The PEL is extremely low and difficult to accurately monitor (0.2 mg/m^3). For exposures to low levels or infrequent exposures, use an air purifying respirator equipped with a dust/mist pre-filter or high-efficiency particulate air (HEPA) filter. For higher exposures, or when the level is unknown (as in an emergency), use a supplied-air respirator with full facepiece and mask operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexachloronaphthalene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where hexachloronaphthalene is used or stored.

For those personnel with frequent or potentially high exposures (half the PEL or greater), the following are recommended before beginning employment and at regular intervals thereafter (e.g., annually):

- ☑ Liver function tests.
- ☑ Evaluation of the skin by a dermatologist for indications or symptoms of chlor-acne.

If symptoms develop or overexposure is suspected, the following recommended medical tests should be considered:

- ☑ Liver and kidney function tests.
- ☑ Interview for nervous system effects and any changes in personality (irritability, moodiness) or normal function (weakness, fever, drowsiness).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because more than light or casual alcohol consumption can lead to liver damage, drinking alcohol may increase the potential liver damage caused by hexachloronaphthalene. Prudent risk management requires proper consideration of *all* possible exposure factors when evaluating workplace health hazard risk.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its proper use and care.
- ☑ Wash thoroughly immediately after exposure to hexachloronaphthalene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexachloronaphthalene should be communicated to all exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hexachloronaphthalene, emergency shower facilities should also be provided in the immediate area.

- ☑ Workers whose clothing has been contaminated by hexachloronaphthalene should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to hexachloronaphthalene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexachloronaphthalene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Hexachloronaphthalene is a non-combustible solid. However, if it is involved in fire, hexachloronaphthalene can emit highly toxic oxides of carbon and toxic fumes of chloride. It is incompatible with most oxidizers and must be kept away from permanganates, nitrates, peroxides, chlorates, and perchlorates. Caution is always required in handling, storage, transportation, and disposal of hexachloronaphthalene. Emergency responders should be made aware of the presence of hexachloronaphthalene at any emergency response situation.

Hexachloronaphthalene can enter the environment through industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexachloronaphthalene.

Hexachloronaphthalene has high acute toxicity to aquatic life. Insufficient data are available on the short-term effects of hexachloronaphthalene to plants, birds, or land animals.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Hexachloronaphthalene has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of hexachloronaphthalene to plants, birds, or terrestrial animals.

chloronaphthalene to plants, birds, or terrestrial animals.

💧 Water Solubility

Hexachloronaphthalene is nearly insoluble in water. Concentrations of 1 milligram will mix with a liter of water.

🕒 Persistence in the Environment

Hexachloronaphthalene is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 52% of hexachloronaphthalene will eventually end up in terrestrial soil; the remainder will end up in aquatic sediments.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hexachloronaphthalene found in fish tissues is expected to be considerably higher than the average concentration of hexachloronaphthalene in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of hexachloronaphthalene into the environment. Labels on all containers, trucks, and rail cars should accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexachloronaphthalene should be segregated from other chemicals and materials (especially oxidizers) to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hexachloronaphthalene should contact the water table, aquifer, or navigable

Risk Management for Hazardous Chemicals

waterway, time is of the essence. It is practically insoluble and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexachloronaphthalene. For disposal, hexachloronaphthalene may be dissolved in a combustible solvent and burned in a chemical incinerator equipped with an afterburner and scrubber to remove the haloacids.

If hexachloronaphthalene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect solids using HEPA vacuum. Do NOT dry sweep (generates airborne dusts). Damp mop residue and collect for disposal. Absorb liquid solutions in vermiculite, sand, earth, or similar material and deposit in sealed drum.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of hexachloronaphthalene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexachloronaphthalene can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and

policies should be developed, approved, and implemented long before any need for such arises.

| Vapor Pressure (atmospheres) 5.8 at 69°F (20°C) | Molecular Weight (atomic weight) 166.0 |
| Vapor Density (Air = 1) Not Found | Freezing Point -188°F (-122°C) |

Solubility

Reacts violently in water and many other substances, releasing large amounts of heat in the process.

Appearance and Odor

Colorless gas with a musty odor, normally shipped as a liquefied compressed gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Flammable Gas | Autoignition Temperature Not Determined |

Extinguishing Media

Use extinguishing media suitable to surrounding fires. Do NOT use water. Hexafluoroacetone does not burn but it is highly reactive with water and many other substances and will release heat on reaction.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear self-contained breathing apparatus (SCBA) and full protective gear. Move containers from fire if it can be done without risk. Cool sides of closed, fire-exposed containers with water. Monitor smoke directions and stay clear. Be aware of runoff from fire control measure. Do NOT release runoff to sewers or waterways. Dike for collection and disposal.

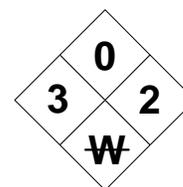

Unusual Fire and Explosion Hazards

Reactive gas can produce extreme heat in contact with incompatible commodities, including water.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|--|------------------------------------|---|
| Stability | | Conditions to Avoid Hexafluoroacetone is normally stable in closed containers, under routine conditions of storage and handling. Avoid contact with heat and exposure to incompatible materials. A very reactive gas. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Hexafluoroacetone is incompatible with water and acids. Reaction will be exothermic (produces extreme heat). It is also hygroscopic (absorbs moisture from air) and will react to form highly acidic sesquihydrate. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of hexafluoroacetone cannot occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Poisonous gases and acrid fumes are produced in fire, including extremely toxic fumes and gases, including carbon monoxide and oxides of fluorine. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? |
| Health Hazards INHALATION: Severe irritation of the eyes, nose, throat, and respiratory system. May react with the moisture-content on the nose, throat, and lungs to cause burns and destruction of tissue. It can also lead to a life-threatening buildup of fluid in the lungs (pulmonary edema). ABSORPTION: Severe eye and skin irritant. Irritation to the mucous membranes. Passes through intact skin. Liquid will cause frostbite burns and tissue destruction. INGESTION: Not likely since hexafluoroacetone is normally a gas at room temperature and pressure. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Eyes, skin, resp. sys., kidney, reproductive system. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with tepid water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of warm water. Do NOT rub affected areas or use forced air heat. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If swallowed: Not likely to occur. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Stop flow of gas, if possible. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Move leaking cylinders to a safe location (outdoors) and allow to vent until empty. Keep water away. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed, air-tight, moisture-proof cylinders in a cool, dry, well-ventilated location away from water. Protect containers from physical damage. | | | | |
| Other Precautions and Warnings Ensure adequate ventilation in storage areas. Avoid gas inhalation and use appropriate personal protective equipment if necessary. Always ensure stored cylinders are properly secured at all times. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low-level exposures, use a gas mask equipped for hexafluoroacetone. Otherwise, use a supplied-air respirator or a self-contained breathing apparatus with full facepiece in a positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Thermal Gloves | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HEXAFLUOROACETONE $(CF_3)_2CO$

CAS: 684-16-2

**IDENTIFICATION AND TYPICAL USES**

Hexafluoroacetone is a colorless gas with a slight musty odor. It is normally shipped as a liquefied compressed gas. It is used almost exclusively as an intermediate in organic synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

Hexafluoroacetone is normally a gas and is therefore toxic primarily by *inhalation*. However, it can also pass through intact skin (*absorption*) and, because of the super-cold temperature of the liquid, it presents a skin contact hazard as well. Ingestion is not a likely exposure route since hexafluoroacetone normally exists as a gas at room temperature and pressure. The compressed liquid can be expected to vaporize rather quickly when released to air. There are no reports of any carcinogenic effects resulting from exposure to this chemical. Animal studies have shown teratogenic effects in laboratory experiments.

Inhalation of the gas causes immediate and severe irritation to the moisture-rich mucosa of the eyes, nose, throat, and respiratory tract. This is due to reactive properties of hexafluoroacetone on contact with water. Because the reaction is exothermic (produces heat), there may also be burns and tissue destruction. The irritation may be severe enough to cause a dangerous (life-threatening) buildup of fluid in the lungs, a condition known as pulmonary edema. Symptoms of cough, tightness in chest, congestion, and dyspnea may be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk.

Skin or eye contact with the gas results in severe irritation. The liquid will cause burns due to frostbite. Tissue destruction, especially around the eyes, can be quite severe.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hexafluoroacetone:

Skin: Irritation, burn (frostbite), tissue destruction. Absorption is likely to occur.

Eye: Severe irritation and burn with possible temporary or permanent damage to eye tissues.

Lung: Nose, throat, and respiratory tract irritation and burns. May cause pulmonary edema.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hexafluoroacetone and can last for months or even years:

Cancer Hazards: According to information in the references, hexafluoroacetone has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, hexafluoroacetone has shown to cause teratogenic effects in test animals, including testicular atrophy. It is not known if exposure to hexafluoroacetone will have this effect on humans.

Other Chronic Effects: Repeated exposure has caused changes in the spleen, thymus, lymph nodes, and bone marrow of test animals. It is not known if human exposure will have this same effect.

🛡 Recommended Risk-Reduction Measures

Exposure to hexafluoroacetone presents a serious and even life-threatening risk to human health. Personnel should therefore avoid direct contact with hexafluoroacetone. Occupational poisoning occurs most commonly by inhalation and skin absorption. If a less toxic material or compound cannot be substituted for

hexafluoroacetone, then *engineering controls* are the most effective method of reducing exposures. The best protection for workers is to ensure controlled use of hexafluoroacetone and, wherever possible, enclose operations or provide adequate local exhaust ventilation at the site of hexafluoroacetone release. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hexafluoroacetone. The PEL is extremely low and difficult to accurately monitor (0.1 ppm). For exposures to low levels, use a gas mask. Otherwise, use a supplied-air respirator with full facepiece and mask operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures impervious, thermal protective gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexafluoroacetone.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hexafluoroacetone is used or stored.

For those personnel with frequent or potentially high exposures (half the PEL or greater), the following are recommended before beginning employment and at regular intervals thereafter (e.g., annually):

- Lung function tests (establish baselines).

If symptoms develop or overexposure is suspected, the following recommended medical tests should be considered:

- Lung function tests.
- Consider chest X-ray after acute overexposure (may be negative if taken immediately following exposure due to delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because

smoking can cause heart disease, emphysema, and other lung diseases, smokers exposed to hexafluoroacetone may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* possible exposure factors when evaluating workplace health hazard risk.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its proper use and care.
- Wash thoroughly immediately after exposure to hexafluoroacetone and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexafluoroacetone should be communicated to all exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hexafluoroacetone, emergency shower facilities should also be provided in the immediate area.
- Workers whose clothing has been contaminated by hexafluoroacetone should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to hexafluoroacetone.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexafluoroacetone. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (primarily the air).

Hexafluoroacetone is a non-combustible gas. However, it is very reactive with water and many other materials and will produce excessive heat on

contact. Also, if it is involved in fire, hexafluoroacetone can emit highly toxic carbon monoxide and oxides of fluoride. It is incompatible with many common acids, such as nitric and sulfuric, and contact can liberate heat and acid fumes. It is hygroscopic (absorbs moisture from air) and will form a highly acidic sesquihydrate. Caution is always required in handling, storage, transportation, and disposal of hexafluoroacetone. Emergency responders should be made aware of the presence of hexafluoroacetone at any emergency response situation.

Hexafluoroacetone can enter the environment from accidental discharges, leaking cylinders, and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexafluoroacetone.

Insufficient data are available on the short-term effects of hexafluoroacetone to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of hexafluoroacetone to aquatic life, plants, birds, or terrestrial animals.

💧 *Water Solubility*

Hexafluoroacetone is highly reactive in water. It will liberate excessive heat and form highly corrosive compounds.

🕒 *Persistence in the Environment*

Hexafluoroacetone is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat con-

taminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Hexafluoroacetone is not expected to accumulate in the edible tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of hexafluoroacetone into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexafluoroacetone should be segregated from other chemicals and materials (especially water and acids) to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hexafluoroacetone should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexafluoroacetone.

If hexafluoroacetone is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Stop leak of gas, if possible. Remove damage or leaking cylinders to open areas and allow to vent. Do NOT use water to knock down vapors and keep all water sources clear of the area.
- Ventilate area of spill or leak.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexafluoroacetone can present a serious threat to business operations. The loss or damage of equipment or facilities can signifi-

cantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "reproductive hazard" is used, public emotion, ignorance, and hysteria can run equally high. This must be carefully considered during the development of any public relations policies.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Poisonous gases and acrid fumes are produced in fire, including toxic, corrosive, and dangerous materials such as fluorine, hydrogen fluoride, and carbonyl fluoride. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? |
| Health Hazards INHALATION: An asphyxiant gas. Initial symptoms are those of oxygen starvation. Feeling of "air hunger," diminished mental alertness, headache, dullness, shortness of breath, and an impairment in muscle coordination. Continued exposures lead to faulty judgment, depression of senses, rapid fatigue, unconsciousness, convulsions, coma, and death. SKIN & EYES: Contact with the compressed gas or refrigerated liquid can cause frostbite and burns. INGESTION: Not likely since hexafluoroethane is a gas at normal working (room) temperatures. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Skin, eyes (frostbite). |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact (liquid): Immediately flush large amounts of tepid water for 15 minutes (minimum), occasionally lifting eyelids; seek medical attention. Skin contact (liquid): Remove all contaminated clothing. Immediately flush area with large amounts of tepid water. Do NOT rub! Seek medical assistance. For inhalation: Remove the person from exposure. Emergency responders must be protected from inert atmospheres. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Treat frozen tissues and protect the airway. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. Ensure response personnel are properly protected with self-contained breathing apparatus (SCBA). | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed steel pressurized containers in cool, dark, dry, well-ventilated location. Protect containers from physical damage. Exercise caution when working with asphyxiating gases. | | | | |
| Other Precautions and Warnings Ensure adequate ventilation in storage areas. Avoid vapor inhalation and use appropriate personnel protective equipment if necessary. Hexafluoroethane is a high-density gas (nearly five times that of air) and can present an asphyxiation hazard, especially in confined areas. Keep out of direct sunlight. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At any detectable level, use a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Thermal Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron if Splash is Likely | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HEXAFLUOROETHANE

CAS: 76-16-4

**IDENTIFICATION AND TYPICAL USES**

Hexafluoroethane is a gas at room temperature and pressure with a slight ethereal odor. It is used as a dielectric and as a coolant. It is also used as an aerosol propellant, and as a refrigerant.

RISK ASSESSMENT: HEALTH***General Assessment***

Hexafluoroethane is an asphyxiating gas. As such, its primary route of entry into the body is through *inhalation*. While it does not pose a significant physiological effect (i.e., no systemic poisoning or toxicity), it can displace oxygen levels to below that which is necessary to sustain life. Skin contact with the liquid can be destructive to tissues due to the extremely cold temperatures but absorption is not a likely exposure route. Since hexafluoroethane usually exists as a gas at room temperature, ingestion is not likely to occur either.

Inhalation of hexafluoroethane gas can cause headache, dullness, shortness of breath, and the symptoms of asphyxiation. These include rapid respiration and a feeling of "air hunger" or air starvation followed by a decrease in mental alertness and impaired muscular coordination. If exposure continues, there can be nausea, vomiting, prostration, unconsciousness, coma, and death.

Skin or eye contact with the vapor poses no serious threat. The vapors have not been shown to cause any physiological response. However, if the liquid should contact either the skin or the eyes, there can be serious irritation, burns, tissue damage, and frostbite.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to chemicals such as hexafluoroethane:

Skin: Liquid threat only. Redness, pain, swelling, blisters, and severe frostbite.

Eye: Liquid threat only. Causes frostbite, redness, irritation, severe pain, and blurred vision.

Lung: Vapor is non-irritating and therefore poses no threat of damage to the lungs. However, in high concentrations, hexafluoroethane can lead to symptoms of asphyxiation and oxygen deprivation up to and including death.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to hexafluoroethane and can last for months or even years:

Cancer Hazards: According to information presented in the references, hexafluoroethane has not been adequately tested for its ability to cause cancer in test animals. However, its primary effect appears to be asphyxiation and other such gases have not been shown to cause a cancer threat in humans or test animals.

Reproductive Hazard: According to information presented in the references, hexafluoroethane has not been adequately tested for its ability to cause adverse reproductive effects in humans. However, its primary effect appears to be asphyxiation and other such gases have not been shown to adversely affect reproduction in humans or test animals.

Other Chronic Effects: None reported.

🚫 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with hexafluoroethane. If another gas cannot be substituted for a hexafluoroethane, then *engineering controls* are the most effective method of reducing exposures. The best protection is to separate operations and provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with hexafluoroethane. Air-purifying respirators (e.g., the cartridge-type or gas masks) *cannot* be used with hexafluoroethane. These types of respirators only purify the air and can do nothing to protect in oxygen deficient atmospheres. A powered air-supplied respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber or leather apron should be worn. To prevent hand and skin exposures with the liquid, thermal insulated gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexafluoroethane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hexafluoroethane is used or stored.

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, consider installing automatic sensors that warn personnel of dropping oxygen levels and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are adequately trained on its proper use, care, and maintenance.

- ☑ Safety shower and eyewash stations should be readily available in work areas where hexafluoroethane is used or stored.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexafluoroethane should be communicated to all exposed or potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexafluoroethane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Hexafluoroethane is non-combustible gas. However, if it is involved in fire, hexafluoroethane can emit highly toxic, corrosive, and dangerous materials such as fluorine, hydrogen fluoride, and carbonyl fluorides. It is incompatible with alkali and alkali earth metals such as sodium and potassium, and finely-ground or powdered magnesium or aluminum. Caution is always required in handling, storage, transportation, and disposal of hexafluoroethane. Emergency responders should be made aware of the presence of hexafluoroethane at any emergency response situation.

Hexafluoroethane can enter the environment through industrial discharges, unchecked venting to air, or through spills of the liquid. Since liquids will most likely vaporize rapidly, water and soil contamination are possible but improbable.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexafluoroethane.

Insufficient data are available on the short-term effects of hexafluoroethane on aquatic life, plants, birds, or land animals. However, as a relatively non-toxic, asphyxiant gas, it might be assumed that any acute ecological toxicity will be relatively low.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of hexafluoroethane to aquatic life, plants, birds, or land animals. However, as a relatively non-toxic, asphyxiant gas, it might be assumed that any chronic ecological toxicity will be relatively low.

💧 *Water Solubility*

Hexafluoroethane is only slightly soluble in water. Concentrations of 1 milligram or less may mix with a liter of water. It is normally a gas at room temperature and pressure and solubility may not be a concern.

🕒 *Persistence in the Environment*

Hexafluoroethane is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually all of hexafluoroethane will eventually end up in the air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Hexafluoroethane is not expected to accumulate in the edible tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexafluoroethane should be segregated from other gases to prevent cross-contamination or contact. Buildings designated for storage should be equipped with monitors that provide ample warning (audible and visual) of oxygen deficient atmospheres.

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by

those trained in proper containment procedures. If applicable contaminated soils should be removed for incineration and replaced with clean soil. When spills or leaks occur, it may be necessary to contact the local and/or state emergency response authorities.

A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexafluoroethane. If hexafluoroethane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ If applicable, stop flow of leaking liquid or gas. If the leak cannot be stopped in place, remove leaking container to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep hexafluoroethane out of a confined space, such as a sewer, because of the possibility of creating an inert atmosphere.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexafluoroethane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Identification Number UN 2280 UN 1783 | Chemical Formula H₂N(CH₂)₆NH₂ | |

Synonyms

1,6-Diaminohexane; 1,6-hexanediamine; 1,6-diamino-*n*-hexane; 1,6-hexamethylenediamine; HMDA.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Hexamethylenediamine (derivation: Reaction of adipic acid and ammonia (catalytic vapor-phase) to yield adiponitrile, followed by liquid-phase catalytic hydrogenation; chlorination of butadiene followed by reaction with sodium cyanide (cuprous chloride catalyst) to 1,4-dicyanobutylene and hydrogenation). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 401°F (205°C) | Specific Gravity (H ₂ O = 1) 0.799 (solid) 0.933 (liquid) |
| Vapor Pressure (mm Hg) Not Found | Molecular Weight 116.20 |
| Vapor Density (Air = 1) 4.0 | Melting Point 108°F (42°C) |

Solubility

Very soluble in water, slightly soluble in alcohol and benzene. Absorbs water and carbon dioxide from the air.

Appearance and Odor

Colorless, leaflet-shaped solid with a piperidine odor (weak, fishy odor). Also appears in solution form.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) 160°F (71°C) opened cup | Explosive Limits in Air % by Volume LEL: 0.7% UEL: 6.3% |
| NFPA Classification Combustible Solid | Autoignition Temperature Not Determined |

Extinguishing Media

Use dry chemical, carbon dioxide, foam, or water.

Special Fire Fighting Procedures

Poisonous gases are produced in fire; wear full protective clothing and self-contained breathing apparatus (SCBA). Contact with hexamethylenediamine causes burns. Stay upwind and clear of smoke and runoff. Move containers from fire area if it can be done safely. Cool exposed container with water.

Unusual Fire and Explosion Hazards

Hexamethylenediamine is combustible when exposed to heat or flame and will react with oxidizing materials. Its low melting causes it to become liquid or molten in a fire. Exercise extreme caution when attempting to move or relocate containers that may have been exposed to high heat.

SECTION V - REACTIVITY DATA

| | | |
|---------------------------------|----------------------------|---|
| Stability | | Conditions to Avoid Hexamethylenediamine is normally stable under routine conditions of handling and storage. Avoid contact with incompatible materials. Keep away from heat and flame. |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Oxidizing agents (such as chlorine, bromine, and oxygen) and other oxidizable materials. |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of hexamethylenediamine is not expected to occur. |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating oxides of nitrogen are produced when hexamethylenediamine is heated to decomposition or involved in a fire. |

SECTION VI - HEALTH HAZARD DATA

| | | | |
|-----------------------------------|-------------------------|--------------------------------|------------------------|
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X |
|-----------------------------------|-------------------------|--------------------------------|------------------------|

Health Hazards

INHALATION: Irritation of the nose, throat, and lungs. Will cause coughing, nausea, headache, and may cause vomiting and fainting.

SKIN & EYES: A corrosive. Eye contact will cause irritation and inflammation. Skin contact causes severe irritation and possible dermatitis. First and second degree burns possible.

INGESTION: Poison by ingestion. Gastrointestinal irritation and irritation of the mouth and stomach.

| | | | | |
|---|-------------|---------------------------|-----------------|---|
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Eyes, skin, respiratory system mucosa. |

Medical Conditions Generally Aggravated by Exposure

Chronic respiratory diseases and skin disorders may be aggravated by exposure.

Emergency and First-aid Procedures

Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. **Skin contact:** Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For **inhalation:** Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If **swallowed:** Call the poison control center and seek medical attention immediately. Never attempt to give an unconscious or convulsing person anything by mouth. Have conscious person drink 1-2 glasses of water and induce vomiting.

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled

Absorb solutions in vermiculite or other absorbent and deposit in DOT-approved drum. Dry spills should be collected in safest manner possible and deposited in sealed drums. Use HEPA vacuum, do NOT dry sweep. Ventilate area. Restrict those not involved in cleanup from entering area.

Preferred Waste Disposal Method

No citation.

Precautions to be Taken in Handling and Storage

Do not store hexamethylenediamine in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Protect containers from physical damage. Electrically ground and bond all storage containers and equipment.

Other Precautions and Warnings

A corrosive material.

SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT

Respiratory Protection (*specify type*)

No exposure levels have been established. This does not mean exposures are without risk to health. For low or infrequent exposures, use an organic vapor respirator with dust/mist pre-filter. Greater protection is provided with an MSHA/NIOSH-approved supplied-air respirator with full facepiece operated in continuous flow or other positive pressure mode (pressure demand), or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode.

Ventilation

Local exhaust or general mechanical systems recommended.

|---|---|--|

Work/Hygiene Practices

Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals.

HEXAMETHYLENEDIAMINE

CAS: 124-09-4

**IDENTIFICATION AND TYPICAL USES**

Hexamethylenediamine appears as colorless leaflets with an odor of piperidine (weak, fish-like). It may also appear mixed in liquid solution. It absorbs water and carbon dioxide from the air. It is used as a chemical intermediate for nylon-type polyamide resins and for the formation of high polymers such as nylon 66.

RISK ASSESSMENT: HEALTH***General Assessment***

Hexamethylenediamine is a human poison and is toxic by *ingestion* and *inhalation*. It is also moderately toxic by skin contact (corrosive). It will irritate the nose and throat (mucous membranes) and is a severe eye and skin irritant. Experimental teratogenic data have also been reported.

Inhalation will cause irritation to the nose, throat, and the mucous membranes of the respiratory tract. It will cause cough, nausea, headache, and fainting. In addition to airway irritation, there is a possibility of abnormalities in white blood cells as well as liver and intestine irregularities.

Ingestion will result in digestive system irritation, and unspecified but adverse gastrointestinal effects with irritation of the mouth and stomach. There may be nausea, vomiting, cramps, and headache.

Skin contact results in severe irritation and may produce dermatitis with rash and itching. Eye contact can result in severe irritation, conjunctivitis, smarting pain, corneal edema, and burns. The severity of burns may range from first degree (brief exposures) and second degree (prolonged contact).

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur either immediately or shortly after (within hours or days) exposure to hexamethylenediamine:

Skin: Irritation, inflammation, redness, itching, and possible dermatitis. First or second degree burns are possible.

Eye: Severe irritation, inflammation, and possible damage to the cornea. Burns and conjunctivitis can also occur.

Lung: Irritation causing coughing and/or shortness of breath. There may be nausea, headache, fainting, and other adverse effects.

Other: In animal studies and limited human exposure data, there appears to be some propensity for liver and intestine irregularities and white blood cell abnormalities.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to hexamethylenediamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, hexamethylenediamine has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, hexamethylenediamine has been shown to cause teratogenic effects in test animals. It is not known if it will have this effect on humans.

Other Chronic Effects: Low, chronic exposures to skin may cause allergy or dermatitis. Once an allergy develops, even small future exposures will cause a recurrence of symptoms.

🛡 *Recommended Risk-Reduction Measures*

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide

local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hexamethylenediamine. No exposure levels have been established for this chemical. This does not mean, however, that human exposures present no health risks. For relatively low, infrequent, or transient exposures, an organic vapor respirator with a dust/mist pre-filter may suffice. For higher or prolonged exposure, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or a supplied-air respirator with full facepiece in continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists or an airborne dust condition is likely, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexamethylenediamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hexamethylenediamine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- ☑ Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests.
- ☑ Consider chest X-ray after acute overexposure.
- ☑ Evaluation by a qualified allergist with careful evaluation of exposure history and administration of special tests (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphy-

sema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to hexamethylenediamine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexamethylenediamine should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of hexamethylenediamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hexamethylenediamine is considered a combustible solid. It can react with many common oxidizing materials to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of hexamethylenediamine. Should hexamethylenediamine ever come into contact with incompatible substances

either during use, transportation, or storage, violent reactions can occur.

Hexamethylenediamine can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexamethylenediamine.

Insufficient data are available to evaluate or predict the short-term effects of hexamethylenediamine to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of hexamethylenediamine to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Hexamethylenediamine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Hexamethylenediamine is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hexamethylenediamine found in fish tissues is expected to be somewhat higher than the average concentration of hexamethylenediamine in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexamethylenediamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. This chemical will remain in soil for extended periods and may leach to underground aquifers. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If hexamethylenediamine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexamethylenediamine. If hexamethylenediamine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove all ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal. Collect solids using a shovel or scoop. Do NOT dry sweep (creates airborne dusts). Recommend using a vacuum equipped with a high-efficiency particulate air (HEPA) filter.
- ☑ It may be necessary to dispose of hexamethylenediamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexamethylenediamine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "reproductive hazard" is used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered whenever developing public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|------------------------------------|
| Characterization Isocyanate, Organic | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name Hexamethylenediisocyanate | Chemical Abstract Service (CAS) Number 822-06-0 | |
| DOT Hazard Class and Label Requirements Poison B | DOT Emergency Guide Code 55 | |
| DOT Identification Number UN 2281 | Chemical Formula OCN(CH₂)₆NCO | |

Synonyms

1,6-Diisocyanatohexane; HDI; hexamethylene-1,6-dissocyanate; 1-6-hexamethylene diisocyanate; HMDI.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|--|
| Hexamethylene diisocyanate 1 ppm = 6.99 mg/m³ | PEL: Not Established STEL: Not Established | REL: 0.005 ppm 0.034 mg/m³ CEILING: (10 minute) 0.020 ppm 0.14 mg/m³ | Not Determined | TLV: 0.005 ppm 0.034 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 491°F (225°C) | Specific Gravity (H ₂ O = 1) 1.04 |
| Vapor Pressure (mm Hg) 0.5 at 77°F (25°C) | Molecular Weight 168.2 |
| Saturated Vapor Density (Air = 1.2 kg/m ³) 1.2002 kg/m³ | Melting Point -105°F (-67°C) |

Solubility

Decomposes in water; soluble in most organic solvents.

Appearance and Odor

Clear, colorless, to slightly yellow liquid with a sharp, pungent odor. Odor Threshold = 0.02 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 284°F (140°C) closed cup | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Class IIIB Combustible Liquid | Autoignition Temperature Not Determined |

Extinguishing Media

Dry chemical, water spray, regular foam, or fog.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Approach fire from upwind position. Remove containers from fire if it can be done without risk. Use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire. Avoid smoke and runoff.

Unusual Fire and Explosion Hazards

Combustible when exposed to heat and flame. Containers may explode in fire. Stay clear of ends of tanks. Fight fire from maximum distance, if possible.

| SECTION V - REACTIVITY DATA | | | | |
|--|--------------------------|--|---|--|
| Stability | | Conditions to Avoid Hexamethylene diisocyanate is normally stable at room temperature and pressure. However, exposure to excessive heat will cause polymerization. Avoid contact with heat and incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reacts with water (forms carbon dioxide), alcohols, strong bases, amines, carboxylic acids, metal compounds, and organotin catalysts. | | |
| Hazardous Polymerization | | Conditions to Avoid Hexamethylene diisocyanate will polymerize at temperatures above 392°F (200°C). It has an average shelf-life of twelve months. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products When heated to decomposition, hexamethylene diisocyanate can emit highly toxic/poisonous fumes including fumes of chloride and carbon dioxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X (skin contact) | Ingestion? X |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and respiratory tract. Causes increased secretions, cough, painful respiration, pulmonary edema (fluid in the lungs), and possible death. A cholinesterase inhibitor that may lead to respiratory disease. SKIN & EYES: Skin contact may cause redness, swelling, and painful blistering. Eye contact can lead to the development of conjunctivitis and inflammation of the eyelids. INGESTION: Unspecified gastrointestinal effects. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure Respiratory system problems or diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For red or blistered skin, seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If <u>swallowed:</u> Contact poison control center. Unless advised otherwise, give conscious person 1 to 2 glasses of water to dilute. Do NOT induce vomiting (chemical is a severe irritant). | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquid solutions in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Remove all ignition sources. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method Mix in combustible solvent, burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, dry, well-ventilated area away from heat, sparks, or flames. Sources of ignition are prohibited where hexamethylene diisocyanate is used, handled, or stored. | | | | |
| Other Precautions and Warnings Keep away from water or moisture. Do NOT reseal a container if contamination is suspected. Package for disposal or reclamation. Protect containers from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) The PEL is low and difficult to monitor. For any exposure level, use a MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode or, use a self-contained breathing apparatus (SCBA) in continuous flow mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron or Clothing |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

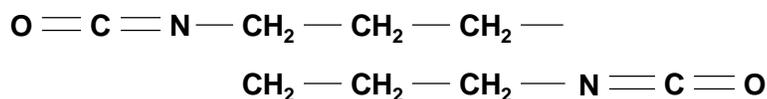

HEXAMETHYLENE DIISOCYANATE

CAS: 822-06-0

1

2

1

**IDENTIFICATION AND TYPICAL USES**

Hexamethylene diisocyanate appears as a clear, colorless liquid with a sharp, pungent odor. It is used primarily as a chemical intermediate and as a cross-linking agent in the production of polyurethane foam, dental materials, contact lenses, medical absorbents, and extremely high quality coatings.

RISK ASSESSMENT: HEALTH**General Assessment**

Hexamethylene diisocyanate is an extremely toxic and poisonous substance. It can enter the body through *inhalation* and by *ingestion*. It will also cause adverse health effects on contact with the skin, although absorption has not been reported. There is no information on its carcinogenic, teratogenic, or mutagenic capabilities in humans or animals.

Inhalation of hexamethylene diisocyanate vapors can be highly irritating to the eyes, nose, throat, and mucosa of the respiratory tract. Symptoms of exposure include wheezing, cough, increased secretions, dyspnea, sweating, difficulty in breathing, insomnia, painful respiration, and possible life-threatening pulmonary edema (fluid in the lungs). Development of pulmonary edema may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk. In severe cases, there may be some restriction of air movement and eventual respiratory failure (due to edema). Prolonged contact can lead to chronic bronchitis, asthma-like symptoms, and allergic pulmonary sensitization. Hexamethylene diisocyanate is a cholinesterase inhibitor.

Skin contact causes irritation and painful burning with skin blisters on prolonged contact. If the liquid should contact the eye directly, there may be irritation, inflammation of the eyelids and surrounding tissues, conjunctivitis, and possible damage to the cornea. Ingestion causes unspecified gastrointestinal effects.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hexamethylene diisocyanate:

Skin: Possible irritation with painful burning and blistering.

Eye: Moderate to severe irritation. There can be inflammation, irritation of the eyelids, and conjunctivitis.

Lung: Irritation of the nose, throat, and lungs following exposure. There can be a delayed but dangerous buildup of fluid in the lungs (pulmonary edema), which is a medical emergency.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hexamethylene diisocyanate and can last for months or even years:

Cancer Hazards: There is insufficient information in the references on the carcinogenic or mutagenic properties of hexamethylene diisocyanate.

Reproductive Hazard: According to the data presented in the references, hexamethylene diisocyanate has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Long-term exposure to hexamethylene diisocyanate may lead to allergic sensitization of the respiratory system with initial symptoms of night coughs and difficulty breathing and possible progression to asthmatic bronchitis.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with hexamethylene diisocyanate. If a less toxic chemical cannot be substituted for a hazardous substance, then *en-*

engineering controls are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hexamethylene diisocyanate. The ACGIH TLV for this chemical is extremely low (0.005 ppm) and difficult to monitor reliably under most operating or emergency conditions. A supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode are the recommended respiratory protection methods of choice. In either case, if a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexamethylene diisocyanate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hexamethylene diisocyanate is used or stored. If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- Lung function tests.
- Consider chest X-ray following acute over exposure (may be negative if taken immediately after exposure due to delayed development of pulmonary edema).

Also, since smoking can cause heart disease, emphysema, and other lung diseases, smokers exposed to hexamethylene diisocyanate may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* possible exposure factors when evaluating workplace health hazard risk. Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Where possible, automatically transfer hexamethylene diisocyanate from drums or other storage containers to process containers.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
- Wash thoroughly immediately after exposure to hexamethylene diisocyanate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexamethylene diisocyanate should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexamethylene diisocyanate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hexamethylene diisocyanate is considered a Class IIIB combustible liquid (per OSHA 29 CFR 1910.106). It can react vigorously with oxidizing agents, water, alcohols, strong bases, amines, carboxylic acids, and organotin catalysts. In addition, pressure may build in closed containers. These characteristics require special consideration during any emergency situation involving a leak or spill of hexamethylene diisocyanate.

Hexamethylene diisocyanate may enter the environment primarily during the disposal of wastes from the chlorinated hydrocarbon industry.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexamethylene diisocyanate.

Insufficient data are available to evaluate or predict the short-term effects of hexamethylene diisocyanate exposure to aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of hexamethylene diisocyanate to aquatic life, plants, birds, or terrestrial animals.

💧 *Water Solubility*

Hexamethylene diisocyanate reacts in water to form carbon dioxide. It is, therefore, only slightly soluble in the aquatic environment. Concentrations of less than 1 milligram will mix with a liter of water.

⌚ *Persistence in the Environment*

Hexamethylene diisocyanate is non-persistent in the aquatic environment, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hexamethylene diisocyanate found in fish tissues is expected to be much lower than the average concentration of hexamethylene diisocyanate in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexamethylene diisocyanate should be segregated from incompatible chemicals to minimize

the risk of cross-contamination or contact. Storage buildings or facilities should be equipped with proper fire protection equipment (sprinklers/extinguishers, alarms).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hexamethylene diisocyanate should contact the water table, aquifer, or navigable waterway, time is of the essence. Even though it is only slightly soluble in the aquatic environment, it will slowly react in water and, therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexamethylene diisocyanate. The proper disposal method for hexamethylene diisocyanate is to burn it in a chemical incinerator equipped with an afterburner and an air scrubber.

If hexamethylene diisocyanate is spilled or leaked, the following specific response steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- If liquid is spilled, absorb in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Use non-sparking tools.
- It may be necessary to dispose of hexamethylene diisocyanate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexamethylene diisocyanate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Law-

suits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to hazardous chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Non-specific symptoms of exposure. May cause nausea, abdominal pain, irritation and possible damage to the eyes, nose, throat, and lungs causing nasal discharges and lung changes. High exposures may lead to kidney damage. A possible carcinogen. ABSORPTION: Irritation of the skin and eyes. Absorbs through the skin (see effects of inhalation). INGESTION: Can cause similar systemic effects as noted for inhalation. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | 5th Annual Report | Group 2B | No | Eyes, skin, respiratory system, CNS, GI tract. |
| Medical Conditions Generally Aggravated by Exposure None identified. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Have conscious person drink 1 - 2 glasses of water and induce vomiting. Never make an unconscious of convulsing person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Ventilate area of spill. Wear SCBA respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Absorb liquids in vermiculite and deposit in sealed drums. Use non-sparking tools. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated location away from heat (including direct sunlight). Protect containers from physical damage. Avoid skin contact and inhalation. | | | | |
| Other Precautions and Warnings Sources of ignition (open flame or smoking), are prohibited where hexamethylphosphoramide is used or stored. Work and storage areas should be labeled as containing a suspected carcinogen. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels established and material is a suspected human carcinogen. For any exposure level, use a powered air purifying respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure or other continuous flow mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Clothing (prevent skin contact) | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HEXAMETHYLPHOSPHORAMIDE

CAS: 680-31-9

**IDENTIFICATION AND TYPICAL USES**

Hexamethylphosphoramide (HEMPA) is a colorless, clear, water-white liquid with an aromatic, spicy, amine-like odor. It can appear as a solid at temperatures below 43°F (6°C).

RISK ASSESSMENT: HEALTH**General Assessment**

HEMPA is a human poison by *inhalation* and *absorption* through intact skin. *Ingestion* is also a possible route of entry into the body. It is a known animal carcinogen and has also caused adverse reproductive effects in test animals. Human mutation data have also been reported for HEMPA.

Inhalation causes irritation of the eyes, nose, throat, and respiratory tract. There may be symptoms of dyspnea, cough, wheeze, abdominal pain, and possible damage to the eyes, nose, throat, and lungs causing nasal discharges and lung changes. Prolonged contact may lead to severe kidney damage.

Skin contact causes immediate irritation and possible burns with blisters. HEMPA passes through intact skin and will cause toxic systemic effects involving the central nervous system and possibly the kidneys. Eye contact will cause burning and intense pain. Damage to vision may occur if not removed immediately.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to HEMPA:

Skin: Irritation with rash and localized inflammation. Absorption through intact skin is extremely likely on short exposures.

Eye: Severe irritation; pain and inflammation. Damage to vision is possible.

Lung: Nose, throat, and respiratory tract irritation causing coughing, sneezing, and likely absorption through the respiration process to cause toxic systemic effects.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to HEMPA and can last for months or even years:

Cancer Hazards: According to the information presented in the references, there is limited evidence that exposure to HEMPA may cause cancer of the nose in test animals. The lungs may also be at risk. Human mutation data have also been reported. The specific human carcinogenicity of HEMPA is not clearly understood in the references.

Reproductive Hazard: According to information presented in the references, HEMPA has been shown to adversely affect reproduction in test animals causing developmental abnormalities. Its human teratogenicity is unknown and requires additional study.

Other Chronic Effects: Long-term exposure to HEMPA may lead to kidney damage.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with HEMPA. Occupational poisoning occurs most commonly by inhalation and skin absorption. If a less toxic material or compound cannot be substituted for HEMPA, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of HEMPA release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective.

tive than the controls mentioned above, but is still advisable whenever working with or around HEMPA. No exposure limits have been established for HEMPA. This does not mean that exposure is without risk. Its specific carcinogenic properties are not clearly understood. Therefore, an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or a supplied-air respirator in continuous flow mode are appropriate levels of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contracted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with HEMPA.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where HEMPA is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered:

- Examination of the nasal cavity.
- Lung function tests.
- Kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, emphysema, and other respiratory disorders, smokers exposed to HEMPA may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposure symptoms in the workplace.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to HEMPA and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of HEMPA should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to HEMPA, emergency shower facilities should be provided.
- Workers whose clothing has been contaminated by HEMPA should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to HEMPA.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of HEMPA. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

HEMPA is a Class IIIB combustible solid per OSHA 29 CFR 1910.106. It is incompatible with many commonly encountered strong oxidizing materials, strong acids, chemically-active metals (such as potassium, sodium, magnesium, and zinc) and contact can result in violent and explosive reactions. Caution is always required in handling, storage, transportation, and disposal of HEMPA. Emergency responders should be made aware of the presence of HEMPA at any emergency response situation.

HEMPA can enter the environment from industrial effluents and from spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to HEMPA. HEMPA has

slight acute toxicity to aquatic life. It has also been shown to have high acute toxicity to redwing blackbirds and moderate-to-slight acute toxicity to coturnix quail. Insufficient data are available to evaluate the short-term effects of HEMPA on plants or terrestrial animals.

☼ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. HEMPA has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of HEMPA to plants, birds, or terrestrial animals.

💧 *Water Solubility*

HEMPA is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

HEMPA is slightly persistent in water, with a half-life between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.8% of HEMPA will eventually end up in water; the rest will end up in the air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of HEMPA found in fish tissues is expected to be about the same as the average concentration of HEMPA in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of HEMPA into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to en-

able emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of HEMPA should be segregated from other chemicals and materials to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If HEMPA should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and total containment and remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of HEMPA.

If HEMPA is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Absorb liquids in vermiculite, dry earth, or other similar material, collect using non-sparking tools, and deposit in sealed drums for disposal.
- ☑ Ventilate area of spill or leak and remove all ignition sources and sources of heat.
- ☑ It may be necessary to dispose of HEMPA as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving HEMPA can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness (leukemia), injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of

current as well as future business. Always remember that anytime the terms “cancer,” “carcinogen,” or “reproductive hazard” are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered whenever developing or implementing public relations policies.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HEXANE

CAS: 110-54-3

**IDENTIFICATION AND TYPICAL USES**

Hexane is a colorless liquid with a gasoline-like odor. It is a chief constituent of petroleum ether, gasoline, and rubber solvent. It is used as a solvent for adhesives, in low temperature thermometers, in calibration procedures, as a paint diluent, in vegetable oils, and in organic analysis, and for denaturing alcohol.

RISK ASSESSMENT: HEALTH**General Assessment**

Hexane is a severe irritant by *inhalation* and *ingestion*. Skin contact can also produce some adverse topical effects and *absorption* is likely to occur. There is no clear evidence in the references to indicate that exposure to hexane will lead to carcinogenic, mutagenic, or teratogenic effects. However, there does appear to be an increased risk of contracting Leukemia associated with exposure to a number of chemical substances in the rubber industry, including hexane.

Significant inhalation may cause irritation of the respiratory tract and depress the central nervous system. Symptoms include nausea, dizziness, vomiting, lightheadedness, giddiness, stupor, vertigo, loss of coordination, loss of appetite, depression, hallucinations, and possibly chemical pneumonia (if the swallowed liquid is aspirated into the lungs). At high concentrations, it is a narcotic and can lead to muscle weakness, cold feeling in extremities, blurred vision, anorexia, headaches, polyneuropathy, loss of consciousness, coma, and death due to respiratory failure. Studies have shown that hexane will accumulate in fatty tissues as is evidenced by its affinity for the blood, liver, and brain where lipids are prevalent.

Skin and eye contact may produce immediate irritation with redness, painful burning, and possible blistering on contact. It is absorbed through the skin in both liquid and vapor form. Prolonged or repeated

contact with the skin can cause dryness, cracking, and dermatitis. Ingestion will cause immediate gastrointestinal irritation and presents a serious aspiration hazard. If the liquid is aspirated into the lungs, oxygen can be displaced and the resultant asphyxiation can lead to brain damage or even cardiac arrest.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hexane:

Skin: Severe and painful irritation with possible burns and blistering. Absorption through intact skin is likely to occur on exposure to the liquid or the vapor.

Eye: Severe irritation and burning on contact.

Lung: Direct irritation of the respiratory tract and associated mucosa. May cause dizziness, vomiting, nausea, and can lead to chemical pneumonia. Primary result of inhalation of hexane is its action on the CNS.

CNS: A CNS depressant: headache, dizziness, depression, hallucinations, changes in mood, loss of consciousness, coma, and death (respiratory failure).

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hexane and can last for months or even years:

Cancer Hazards: According to the references, hexane has not been adequately tested for its ability to cause cancer in animals. However, there is some evidence to indicate that exposure to hexane may be associated with an increased risk of contracting Leukemia.

Reproductive Hazard: According to information presented in the references, hexane has not been tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged exposure may lead to polyneuropathy with symptoms of muscle weakness, loss of motor functions, numbness and pain in the extremities. There may also be paresthesia, foot drop, decreased muscle tone and strength, visual disturbances including changes in color perception, retinal pigmentation, and blurred vision.

🔗 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hexane since it is known to cause significant adverse health effects, especially if improperly used or if overexposures occur. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hexane. For exposures above the PEL (500 ppm), an organic vapor respirator should be used (per OSHA 29 CFR 1910.134). Better protection is provided by a supplied-air respirator with full facepiece operated in continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Nitrile, Viton, PVC, or chlorinated polyethylene gloves are recommended. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hexane is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Lung function tests.
- ☑ Evaluation of nervous system function.
- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy and/or dermatitis).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and personnel are trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to hexane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexane should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hexane, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of hexane.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hexane is considered a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point make this chemical a serious fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with common peroxides and other oxidizers and contact can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of hexane. Should hexane ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is possible.

Hexane may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexane.

This chemical has high acute toxicity to aquatic life. It causes membrane damage in ornamental crop species. Insufficient data are available on the short-term effects of hexane exposure to birds or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Hexane has moderate chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of hexane to plants, birds, or land animals.

💧 *Water Solubility*

Hexane is nearly insoluble in water. Concentrations of less than 10 milligrams may mix with a liter of water, depending on water pH and chemical concentration of hexane.

🕒 *Persistence in the Environment*

Hexane is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of hexane will eventually end up in air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hexane found in fish tissue is expected to be about the same as the average concentration of hexane in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). All transfers of hexane from storage containers to process containers should be done automatically whenever possible. All containers and equipment must be grounded and bonded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If hexane should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexane.

To dispose of hexane properly, it should be burned in a chemical incinerator equipped with an afterburner and scrubber to ensure appropriate emission control.

If hexane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.

- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect materials using non-sparking tools.
- ☑ It may be necessary to dispose of hexane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

HEXANE ISOMERS (excluding *n*-hexane)C₆H₁₄

CAS: 107-83-5

**IDENTIFICATION AND TYPICAL USES**

Hexane isomers appear as colorless liquids with a gasoline-like odor. They are used as commercial solvents for vegetable oils, glues, coatings, and paints. They are also found in gasoline and as intermediates for chemicals. Also constituents of rubber solvent and petroleum ether.

RISK ASSESSMENT: HEALTH**General Assessment**

Hexane isomers are severe irritants by *inhalation* and *ingestion*. Skin contact can also produce some adverse topical effects and *absorption* is likely to occur. There is no clear evidence in the references to indicate that exposure to hexane isomers will lead to carcinogenic, mutagenic, or teratogenic effects.

Significant inhalation may cause irritation of the respiratory tract and depress the central nervous system. Symptoms include nausea, dizziness, vomiting, lightheadedness, giddiness, stupor, vertigo, loss of coordination, loss of appetite, depression, hallucinations, and possibly chemical pneumonia (if the swallowed liquid is aspirated into the lungs). At high concentrations, it is a narcotic and can lead to muscle weakness, cold feeling in extremities, blurred vision, anorexia, headaches, polyneuropathy, loss of consciousness, coma, and death due to respiratory failure. Studies have shown that hexane isomers will accumulate in fatty tissues as is evidenced by its affinity for the blood, liver, and brain where lipids are prevalent.

Skin and eye contact may produce immediate irritation with redness, painful burning, and possible blistering on contact. It is absorbed through the skin in both liquid and vapor form. Prolonged or repeated contact with the skin can cause dryness, cracking, and dermatitis. Ingestion will cause immediate gastroin-

testinal irritation and presents a serious aspiration hazard. If the liquid is aspirated into the lungs, oxygen can be displaced and the resultant asphyxiation can lead to brain damage or even cardiac arrest.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hexane isomers:

Skin: Severe and painful irritation with possible burns and blistering. Absorption through intact skin is likely to occur on exposure to the liquid or the vapor.

Eye: Severe irritation and burning on contact.

Lung: Direct irritation of the respiratory tract and associated mucosa. May cause dizziness, vomiting, nausea, and can lead to chemical pneumonia. Primary result of inhalation of hexane isomers is its action on the CNS.

CNS: A CNS depressant: headache, dizziness, depression, hallucinations, changes in mood, loss of consciousness, coma, and death (respiratory failure).

●* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hexane isomers and can last for months or even years:

Cancer Hazards: According to information presented in the references, the hexane isomers have not been adequately tested for their ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, the hexane isomers have not been tested for their ability to affect reproduction.

Other Chronic Effects: Prolonged exposure may lead to polyneuropathy with symptoms of muscle weakness, loss of motor functions, numbness and pain in the extremities. There may also be contact dermatitis with de-fattening of the skin's protective oily surface layer and subsequent drying, cracking, chapping, and possible secondary infection.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hexane isomers since they are known to cause significant adverse health effects, especially if improperly used or if overexposures occur. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hexane isomers. For exposures above the PEL (500 ppm), an organic vapor respirator should be used (per OSHA 29 CFR 1910.134). Better protection is provided by a supplied-air respirator with full facepiece operated in continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Nitrile, Viton, PVC, or chlorinated polyethylene gloves are recommended. Glove manufacturers should be contacted and permeation studies obtained before final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexane isomers.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hexane isomers are used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Lung function tests.
- ☑ Evaluation of nervous system function.

- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy and/or dermatitis).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and personnel are trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to hexane isomers and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexane isomers should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hexane isomers, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of hexane isomers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexane isomers. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hexane isomers are considered Class 1B flammable liquids (per OSHA 29 CFR 1910.106). Their extremely low flash point range and relatively low boiling point range make these chemicals a serious fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. Hexane isomers are incompatible with common peroxides and other oxidizers and contact can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of hexane isomers. Should hexane isomers ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is possible.

Hexane isomers may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexane isomers.

These chemicals have high acute toxicity to aquatic life. Insufficient data are available on the short-term effects of hexane isomers exposure to plants, birds, or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of hexane isomers to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Hexane isomers are nearly insoluble in water. Concentrations of less than 1 milligram may mix with a liter of water, depending on water pH and chemical concentration of hexane isomers.

🕒 *Persistence in the Environment*

Hexane isomers are non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of hexane isomers will eventually end up in air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hexane isomers found in fish tissue is expected to be about the same as the average concentration of hexane isomers in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexane isomers should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). All transfers of hexane isomers from storage containers to process containers should be done automatically whenever possible. All containers and equipment must be grounded and bonded.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If hexane isomers should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexane isomers.

To dispose of hexane isomers properly, they should be burned in a chemical incinerator equipped with an afterburner and scrubber to ensure appropriate emission control.

If hexane isomers are spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Collect materials using non-sparking tools.
- ☑ It may be necessary to dispose of hexane isomers as hazardous wastes. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexane isomers can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: There may be slight irritation of the eyes, nose, and mucosa of the respiratory tract. Exposure can also cause CNS depressions with stupor, fatigue, sleepiness, nausea, vomiting, diarrhea, and hypotension. Pulmonary edema may also occur. SKIN & EYES: As a solvent, causes dry skin, cracking, and possible dermatitis. Eye contact can result in burning, stinging, tearing, corneal injury, and hyperemia of the conjunctiva. INGESTION: Nausea, vomiting, diarrhea, and gastrointestinal hemorrhage. Also causes headache, dizziness, giddiness, loss of muscular coordination, delirium, sedation, respiratory depression, and coma. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Skin, eyes, mucosa, CNS, respiratory system. |
| Medical Conditions Generally Aggravated by Exposure Skin and respiratory diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If <u>swallowed:</u> Seek medical attention. Unless advised otherwise, induce vomiting using Syrup of Ipecac. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have extinguishing agent available in case of fire. Store materials in DOT-approved containers. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire, and flame away. Outside building or underground storage is recommended. | | | | |
| Other Precautions and Warnings Ground and bond all metal containers. Ensure Class 1, Group D electrical installations. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels have been established. An organic vapor air-purifying respirator may suffice, but greater protection is obtained using a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Impermeable Apron or Protective Suit |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HEXANOLC₆H₁₃OH

CAS: 111-27-3

**IDENTIFICATION AND TYPICAL USES**

Hexanol is a colorless liquid with a faint, fatty, fruity odor and aromatic flavor. It is used as a synthetic flavoring agent, a solvent, a plasticizer, an intermediate for textile and leather finishing, and as a chemical intermediate for hypnotic and antiseptic preparations.

RISK ASSESSMENT: HEALTH**General Assessment**

Hexanol is primarily toxic to humans by *ingestion*, *inhalation*, and *skin absorption*. There are no reports of carcinogenic, teratogenic, or mutagenic effects following exposure to hexanol in animals or humans.

Inhalation can cause irritation of the eyes, nose, throat, upper respiratory tract, and associated mucosa. There may be adverse effects on the central nervous system (CNS) with symptoms of headache, nervousness, tremors, dizziness, tearing, hypotension, fatigue, loss of muscle coordination, somnolence, delirium, sedation, giddiness, and narcosis with stupor and loss of consciousness. Other symptoms of exposure can include respiratory depression, nausea, vomiting, and diarrhea. Lung tissue irritation may lead to a dangerous buildup of fluids in the lungs, a condition known as pulmonary edema. This is a medical emergency and can be fatal. Symptoms of cough, congestion, difficulty breathing, and tightness in chest may be delayed up to 48 hours after exposure thereby creating a false sense of security with regard to health exposure risk.

Liquid contact with the eyes causes immediate burning and stinging with lachrymation and reflex closure of the lids. There may be injury to the corneal epithelium and possible hyperemia (excessive blood) of the conjunctiva. Skin contact results in drying and cracking which can lead to secondary infections and dermatitis. Absorption may be quick and systemic

effects target the CNS in the same way as inhalation or ingestion. If skin absorption occurs in conjunction with another exposure route, such as inhalation of hexanol vapors, then the resulting effects can be present a serious threat to health.

Ingestion of hexanol causes nausea, vomiting, diarrhea, and gastrointestinal hemorrhage. In addition, the ingested chemical can lead to CNS effects similar to that of inhalation. If the liquid is aspirated into the lungs (as is possible during vomiting episodes), hemorrhagic pneumonitis can occur.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hexanol:

- Skin:** Causes dryness and cracking leading to dermatitis and possible secondary infection.
- Eye:** Severe irritation with burning and stinging with possible damage to the cornea and conjunctiva.
- Lung:** Irritation of the eyes, nose, throat, and respiratory tract. Delayed pulmonary edema is possible which can be fatal.
- CNS:** High concentrations can cause depression of the CNS with symptoms of sleepiness and lack of concentration, giddiness, somnolence, loss of muscle coordination, delirium, depression, respiratory depression, and coma.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hexanol and can last for months or even years:

Cancer Hazards: According to information presented in the references, hexanol is not known to cause cancer in laboratory test animals.

Reproduction: According to the references, hexanol has not been adequately tested for its ability to cause cancer in test animals. Additional research is required in this area of study.

Other Chronic Effects: Very high or prolonged exposure may result in mucous membrane irritation, headache, and depression of the CNS with symptoms of somnolence and lack of concentration. Prolonged skin contact can cause dermatitis. In animal studies, hexanol is known to cause liver damage.

🔊 **Recommended Risk-Reduction Measures**

The best risk reduction measure is to use a less toxic chemical as a substitute for a hexanol. However, depending upon industrial applications and use requirements, substitution may not always be a practical alternative. Therefore, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations and restricting personnel access can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hexanol. Even though no exposure levels have been established for this chemical, it does not mean that exposure to hexanol is without health risks. For low or infrequent exposures, an air-purifying respirator with an organic vapor cartridge may suffice. However, the best protection is obtained using a supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexanol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where hexanol is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- ☑ Liver function tests.
- ☑ Lung function tests.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately following exposure due to delayed development of pulmonary edema).
- ☑ Skin testing with dilute hexanol to help diagnose allergy (performed by a qualified allergist).

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause lung cancer, heart disease, emphysema, and other respiratory disorders, smokers exposed to hexanol may experience symptoms of respiratory distress more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible factors which may be causing the appearance of exposure symptoms.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel have been trained on its use and care.
- ☑ Wash thoroughly immediately after exposure to hexanol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexanol should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexanol. In almost every scenario, the threat of environmental

exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hexanol is considered a Class IIIA combustible liquid (according to OSHA 29 CFR 1910.106). Its moderate flash point and boiling point present a fire and explosion hazard concern. Also, because it is incompatible with a number of common materials, especially strong oxidizers, contact can result in violent and explosive reactions. It can also form explosive mixtures in air and can ignite on contact with heat, fire, or sparks. Its vapors are heavier than air and can travel for some distance to an ignition source to flashback and cause fire or explosion. A boiling liquid expanding vapor explosion (BLEVE) is possible when hexanol is exposed to heat or fire in closed containers. Fire fighters should be notified of the presence of hexanol. These characteristics require special consideration during any emergency situation involving a leak or spill of hexanol.

Hexanol can enter the environment through unchecked industrial discharges into effluents and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexanol.

This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of hexanol to plants, birds, or terrestrial animals.

☞ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Hexanol has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of hexanol to plants, birds, or land animals.

💧 *Water Solubility*

Hexanol is slightly soluble in water. Concentrations of 1 to 100 milligrams can be effectively mixed with a liter of water.

⌚ *Persistence in the Environment*

Hexanol is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hexanol found in fish tissues is expected to be about the same as the average concentration of hexanol in water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexanol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Equipment should be designed to meet explosion-proof standards.

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If hexanol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexanol. If hexanol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools.
- ☑ It may be necessary to dispose of hexanol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS General Assessment

Accidents or mishaps involving hexanol can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| 2 Hexanone (derivation: By reaction of acetyl chloride with butyl magnesium chloride or by catalyzed reaction of acetic acid and ethylene under pressure, followed by distillation.) 1 ppm = 4.17 mg/m³ | PEL (8 hour): 100 ppm 410 mg/m³ STEL: Not Established | REL (10 hour): 1 ppm 4 mg/m³ (skin) STEL: Not Established | 1600 ppm | TLV: 5 ppm 20 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 262°F (128°C) | Specific Gravity (H ₂ O = 1) 0.81 |
| Vapor Pressure (mm Hg) 11 at 77°F (25°C) | Molecular Weight 100.2 |
| Vapor Density (Air = 1) 3.45 | Freezing Point -71°F (-57°C) |

Solubility

Slightly soluble (1.4%) in water. Soluble in alcohol, acetone, and ether.

Appearance and Odor

Clear, colorless liquid with an acetone-like odor. Odor Threshold = 0.076 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 77°F (25°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.22% UEL: 8% |
| NFPA Classification Class IC Flammable Liquid | Autoignition Temperature 795°F (423°C) |

Extinguishing Media

Carbon dioxide, dry chemical, alcohol-resistant foam, or fog. Water spray may be ineffective on fire.

Special Fire Fighting Procedures

Wear full protective clothing and SCBA. Fight fire from a distance. Keep containers cool with water spray. A solid stream of water may spread fire. If possible, move fire-exposed containers from fire area.

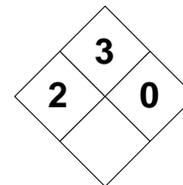

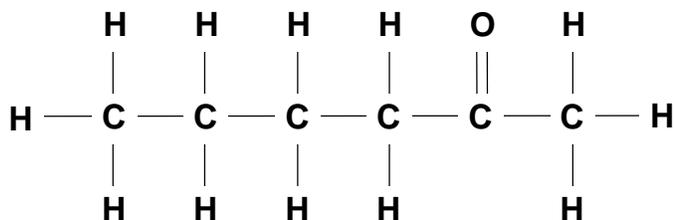

Unusual Fire and Explosion Hazards

Containers may explode in fire. BLEVE (boiling liquid expanding vapor explosion) is possible. Immediately evacuate if rising sound is heard from venting device or a discoloration is observed on the sides of the tank or storage vessel.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|--|---------------------------------------|--|
| Stability | | Conditions to Avoid Normally stable. Do not allow 2-hexanone to come into contact with incompatible materials. Avoid contact with fire or high heat sources. Do not use in confined spaces. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with strong oxidizers (bromine, chlorine, fluorine). Also note that ketones + nitric acid and hydrogen peroxide form highly explosive solids or oils. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of 2-hexanone is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, 2-hexanone emits acrid, irritating smoke and fumes, including oxides of carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Irritation of the conjunctiva of the eyes and mucosa of the nose and throat. Symptoms of CNS depression include dizziness, headache, and unconsciousness. Neurotoxic effects to the peripheral nervous system may also occur. ABSORPTION: Mild irritation on contact with the skin and eyes. Easily absorbed through intact skin. INGESTION: Symptoms of gastrointestinal irritation with nausea and vomiting and CNS depression. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Respiratory system; skin; eyes; CNS, PNS. |
| Medical Conditions Generally Aggravated by Exposure Skin conditions (dermatitis) or any nervous system disorders may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Seek medical attention immediately. Give victim several glasses of water. Do NOT induce vomiting (possibility of liquid aspiration to lungs). Never try to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Restrict persons not wearing protective equipment from entering area of spill or leak until cleanup is complete. Ventilate area. Absorb liquid in dry sand or other material and deposit in sealed containers. Use water spray to knock-down vapors. | | | | |
| Preferred Waste Disposal Method Burn in chemical incinerator equipped with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from fire, sparks, and flame. Use non-sparking tools on containers. Ground and bond metal containers during transfer operations. | | | | |
| Other Precautions and Warnings Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). Protect containers from physical damage. Dike around outside storage areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposures above 100 ppm: MSHA/NIOSH-approved full-facepiece respirator with organic vapor cartridge. Greater protection is obtained from a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves | Eye Protection Chemical Goggles and/or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

2-HEXANONE

CAS: 591-78-6

**IDENTIFICATION AND TYPICAL USES**

2-Hexanone is a colorless liquid with an acetone-like odor. It was formerly used as a solvent for nitrocellulose, resins, lacquers, oils, fats, and waxes. It is not currently produced in the United States. However, it may exist as a by-product in wood pulping, coal gasification, and oil shale processing and, therefore, exposure is still possible.

RISK ASSESSMENT: HEALTH**General Assessment**

2-Hexanone is mildly toxic to humans by *inhalation*, skin contact (*absorption*), and *ingestion*. There are no reports in the references of carcinogenic or mutagenic effects. However, experimental teratogenic and reproductive effects have been reported.

Inhalation of 2-hexanone vapors causes mild to moderate irritation to the skin, eyes, and mucous membranes of the respiratory tract. Exposures to extremely high levels of vapor concentration can cause depression of the central nervous system (CNS) leading to symptoms of narcosis with headache, dizziness, nausea, loss of consciousness, and possible coma. Neurotoxic effects also appear to focus on the actions of the peripheral nervous system due to the metabolites of 2-hexanone.

Skin contact will result in mild irritation. Prolonged exposures can lead to dryness, cracking, contact dermatitis, and a possibility for secondary infection at the point of contact. 2-Hexanone is easily absorbed through intact skin. Eye contact causes irritation, even at concentrations as low as 1000 ppm for as little as fifteen minutes.

Ingestion can produce gastrointestinal irritation, nausea, and vomiting. It will also lead to central nerv-

ous system depression with symptoms similar to that of inhalation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to 2-hexanone:

Skin: Mild to moderate irritation and possible dermatitis. Absorption is likely.

Eye: Mild to moderate irritation.

Lung: Irritation of the mucous membranes of the respiratory tract.

CNS: A mild narcotic compound. Inhalation of high concentrations of the vapor may cause dizziness, lightheadedness, and possible loss of consciousness. Also appears to effect the peripheral nervous system (PNS) with symptoms of numbness and paresthesia in the extremities.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to 2-hexanone and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to 2-hexanone has not been shown to cause carcinogenic effects.

Reproduction: There is limited evidence that exposure to 2-hexanone causes teratogenic and adverse reproductive effects in test animals. It is not known if human exposure will have this effect.

Sensitivity: Repeated exposure to the skin may result in dermatitis. Repeated or prolonged exposures through inhalation or skin absorption may lead to damage to the peripheral nervous system.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with 2-hexanone. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with 2-hexanone. For exposures to the PEL (100 ppm), use a NIOSH-approved, full facepiece organic vapor respirator. For higher or prolonged exposures, a supplied-air respirator with full facepiece operated in a positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. Natural rubber and polyvinylchloride (PVC) gloves will NOT protect against ketones. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with 2-hexanone.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 2-hexanone is used or stored.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to 2-hexanone and at the end of the work shift or before eating, drinking, or smoking.

- ☑ Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of 2-hexanone should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of 2-hexanone. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

2-Hexanone is considered a Class IC flammable liquid (per OSHA 29 CFR 1910.106). It can react with strong oxidizers to cause a serious fire and explosion hazard. When mixed with nitric acid and hydrogen peroxide, it will form solids or oils that are highly explosive. When involved in a fire, it can release acrid and irritating oxides of carbon. A boiling liquid expanding vapor explosion (BLEVE) is also a possibility. These characteristics require special consideration during any emergency involving a leak or spill of 2-hexanone.

The proper disposal/destruction method for 2-hexanone is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

2-Hexanone can enter the environment through manufacturing, unchecked discharge into effluents from industrial or municipal waste treatment plants, and through spills.

☠ **Acute Ecological Effects**

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 2-hexanone. Insufficient data are available to evaluate or predict the short-term effects of 2-hexanone on aquatic life, plants, birds, or land animals.

🌱 **Chronic Ecological Effects**

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first ex-

posure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of 2-hexanone on aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

2-Hexanone is slightly soluble in water. Concentrations of less than 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

2-Hexanone is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. There is no information in the references on the specific persistence percentages for this chemical in the various environmental mediums (air, soil, water).

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 2-hexanone found in fish tissues is expected to be about the same as the average concentration of 2-hexanone in water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 2-hexanone should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be re-

moved for incineration and replaced with clean soil. If 2-hexanone should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in water and, therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 2-hexanone.

If 2-hexanone is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers for disposal.
- ☑ For large spills, dike area far ahead of spill to ensure total containment. Do not allow spilled materials or runoff to reach waterways.
- ☑ It may be necessary to dispose of 2-hexanone as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 2-hexanone can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term “reproductive hazard” is used, public emotion, ignorance, and hysteria can run equally high. This must be properly considered whenever developing or implementing public relations policies.

🚫 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in

Risk Management for Hazardous Chemicals

the development of any procedures dealing with safety, health, or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| sec-Hexyl Acetate (derivation: By catalytic reaction of 4-methyl-2-pentanol and acetic acid. Occurs naturally in apples and in their leaves). 1 ppm = 5.99 mg/m³ | PEL: 50 ppm 300 mg/m³ STEL: Not Established | REL: 50 ppm 300 mg/m³ STEL: Not Established | 500 ppm | TLV: 50 ppm 295 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 297°F (146°C) | Specific Gravity (H ₂ O = 1) 0.86 |
| Vapor Pressure (mm Hg) 3 at 68°F (20°C) | Molecular Weight 144.2 |
| Vapor Density (Air = 1) 4.97 | Melting Point -83°F (-64°C) |

Solubility

Slightly soluble in water (0.08%). Soluble in alcohol and acetone (miscible).

Appearance and Odor

Clear, colorless liquid with a mild, pleasant, fruity, banana-like odor. Odor Threshold = 0.39 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) 113°F (45°C) closed cup | Explosive Limits in Air % by Volume LEL: 0.9% UEL: 5.83% |
| NFPA Classification Class II Combustible Liquid | Autoignition Temperature 510°F (265°C) |

Extinguishing Media

Dry chemical, alcohol foam, carbon dioxide, water fog. Use water to keep fire-exposed containers cool.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Use blanketing effect with foam to smother large fires. Continue to cool containers with water after fire is extinguished. Water on fire itself may be ineffective and actually spread fire further.

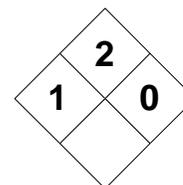

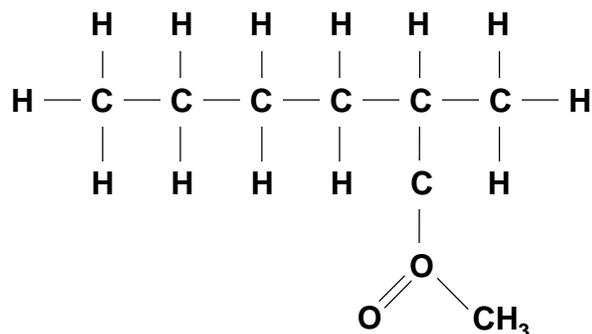

Unusual Fire and Explosion Hazards

Immediately withdraw if rising sound from venting device is heard or if fire is causing discoloration to the tank. Evacuate 1500 feet radius if fire becomes uncontrollable or container is exposed to direct flame. Vapors are heavier than air and may travel a distance to ignition source to flashback.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|--|--|---|
| Stability | | Conditions to Avoid sec-Hexyl acetate is stable under normal conditions of storage and operation. Avoid contact with incompatible materials. Keep away from heat, flame, and other sources of ignition. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reacts violently in contact with nitrates, strong oxidizers, alkalis, and acids. Particularly reactive with chlorosulfonic acid, lithium aluminum hydride and 2-chloromethyl furan, oleum, and potassium t-butoxide. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of sec-hexyl acetate is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, sec-hexyl acetate emits acrid and irritating fumes and oxides of carbon. | | |

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and respiratory tract. Exposures above 100 ppm may cause narcosis and headache. Systemic effects include olfactory changes, conjunctiva irritation, and pulmonary changes. It is irritating to the mucosa, particularly the eyes, gums, and respiratory passages. Can also cause corneal clouding. SKIN & EYES: Will irritate the skin. May cause contact dermatitis. Eye contact may cause corneal damage with cloudy swelling, and fatty degeneration of the viscera. INGESTION: May cause headache, drowsiness, and unconsciousness. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system; skin; eyes, CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Call poison control center for advice. Give 1-2 glasses of milk or water and induce vomiting unless advised otherwise. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire, and flame away. If possible, automatically transfer liquids between containers. | | | | |
| Other Precautions and Warnings Bulk storage of sec-hexyl acetate is not recommended. Ground and bond all metal containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Where potential exists for exposure over 50 ppm, use an MSHA/NIOSH-approved full facepiece respirator with an organic vapor cartridge. For high exposures, use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Impermeable Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

sec-HEXYL ACETATE

CAS: 108-84-9

**IDENTIFICATION AND TYPICAL USES**

sec-Hexyl acetate is a clear, colorless liquid with a characteristic sweet, mild, pleasant, fruity, banana-like odor. It is used as a solvent for nitrocellulose and lacquers, as a fragrance in perfumes and cosmetics, as a component in insecticide formulations (particularly housefly insecticides), and as a component in attractants for the large spruce bark beetle.

RISK ASSESSMENT: HEALTH**General Assessment**

sec-Hexyl acetate is mildly toxic by *inhalation* and *ingestion*. Skin contact can produce localized effects but absorption has not been reported. No specific carcinogenic, mutagenic, or teratogenic effects have been reported.

Inhalation of *sec*-hexyl acetate vapors will cause irritation of the eyes, nose, throat, and upper respiratory tract, including the mucosa (particularly the eyes, gums, and respiratory passages). Inhalation can cause changes in the sense of smell (olfactory changes), conjunctiva irritation, and pulmonary changes. In high concentrations, there can be depression of the central nervous system with mild narcotic effects with headache, dizziness, and nausea.

Skin contact results in the removal of the skin's natural protective oily layer on its surface with subsequent drying, cracking, and possible secondary infections and dermatitis. Eye contact can cause serious damage to the cornea with a possibility for permanent effects to vision.

Ingestion of *sec*-hexyl acetate may cause headache, drowsiness, unconsciousness, and unspecified gastrointestinal effects.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to *sec*-hexyl acetate:

Skin: Mild to moderate irritation. Will remove the skin's protective oily layer to cause drying, cracking, and possible secondary infection.

Eye: Severe irritation which can lead to injury and permanent damage if allowed to remain in contact with the eyes.

Lung: Irritation of the eyes, nose, throat and lungs (especially the mucus membranes). May cause changes in the sense of smell and in pulmonary function.

CNS: High concentrations can depress the central nervous system leading to narcoses and possible loss of consciousness.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to *sec*-hexyl acetate and can last for months or even years:

Cancer Hazards: According to the references, *sec*-hexyl acetate has not been adequately tested for its ability to cause cancer in test animals. Further research is required and caution is warranted in use, handling, and storage.

Reproduction: According to the references, *sec*-hexyl acetate has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: There are reports that prolonged exposure in animal studies led to permanent damage to the CNS. It is not known if long-term human exposure will have this effect.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with *sec*-hexyl acetate. The best risk reduction measure is to use a less toxic chemical as a substitute for *sec*-hexyl acetate. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around *sec*-hexyl acetate. For exposures over 50 ppm (PEL for 8 hours), an MSHA/NIOSH-approved chemical respirator with an organic vapor cartridge should be used. For higher exposures, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode or a supplied-air respirator with full facepiece operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Caution is warranted in glove selection for *sec*-hexyl acetate. Glove manufacturers should be contacted to obtain permeation studies *before* gloves are selected.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with *sec*-hexyl acetate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *sec*-hexyl acetate is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- Liver and kidney function tests.
- Evaluation of nervous system functions.
- Skin testing with dilute *sec*-hexyl acetate to help diagnose allergy (performed by a qualified allergist).

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to *sec*-hexyl acetate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of *sec*-hexyl acetate should be communicated to all potentially exposed workers.
- Never eat, drink, or smoke in areas where *sec*-hexyl acetate is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT *General Assessment*

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *sec*-hexyl acetate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). *sec*-Hexyl acetate is considered a Class II combustible liquid (according to OSHA 29 CFR 1910.106). Its moderate flash point and boiling point present a fire and explosion hazard concern. Also, because it is incompatible with a number of common materials, especially strong oxidizers and acids, contact can result in violent and explosive reactions. It can also form explosive mixtures in air and can ignite on contact with heat, fire, or sparks. These characteristics require special consid-

eration during any emergency situation involving a leak or spill of *sec*-hexyl acetate.

The proper disposal/destruction method for *sec*-hexyl acetate is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. *sec*-Hexyl acetate can enter the environment through unchecked industrial discharges into effluents and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *sec*-hexyl acetate. Insufficient data are available to evaluate or predict the short-term effects of *sec*-hexyl acetate to aquatic life, plants, birds, or terrestrial animals.

🌱 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of *sec*-hexyl acetate to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

sec-Hexyl acetate is only slightly soluble in water. Concentrations of 1 to 10 milligrams may mix with a liter of water.

🕒 *Persistence in the Environment*

sec-Hexyl acetate is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of *sec*-hexyl acetate found in fish tissues is expected to be somewhat higher than the

average concentration of *sec*-hexyl acetate in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *sec*-hexyl acetate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil.

If *sec*-hexyl acetate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is nearly insoluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *sec*-hexyl acetate. If *sec*-hexyl acetate is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.
- Remove all ignition sources from area.
- Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools.
- It may be necessary to dispose of *sec*-hexyl acetate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving *sec*-hexyl acetate can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

HEXYLENE GLYCOL

CAS: 107-41-5

**IDENTIFICATION AND TYPICAL USES**

Hexylene glycol is a clear, colorless, hygroscopic, liquid with a sweet odor. It is used as a chemical intermediate, a selective solvent in petroleum refining, in hydraulic brake fluids, in printing inks, as a coupling agent and penetrant for textiles, a fuel and lubricant additive, and emulsifying agent, an inhibitor of ice formation in carburetors, and as a component in some cosmetics and pharmaceuticals.

RISK ASSESSMENT: HEALTH**General Assessment**

Hexylene glycol is a dangerous human poison by *ingestion* and is moderately toxic by *inhalation*. It will also cause skin irritation and may easily pass through broken skin (*absorption*); however reports of toxic systemic effects by this route of exposure are lacking in the references. There are no reports in the references to indicate that exposure causes cancer in humans or animals. However, mutation data (genetic changes) have been reported and many scientists believe that such chemicals may pose a carcinogenic threat in the long-term. Data are conflicting and inconsistent in this regard.

Inhalation is rare because of this chemical's low vapor pressure. However, when it is heated or misted, it presents a significant health hazard risk. There will be some initial irritation of the eyes, nose, and throat followed by lachrymation, feeling of intoxication or "drunkenness" (inebriation), burning cough, headache, nystagmus (rapid eye movements), and coma. Other symptoms include urine abnormalities, delayed onset of respiratory deterioration with pulmonary edema (fluid buildup in the lungs), heart enlargement, with onset of kidney failure. Symptoms of pulmonary edema may be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk.

Skin and eye contact may produce mild to moderate irritation on contact and may cause an allergic reaction and rash. It will pass through broken skin, but its ability to produce toxic systemic effects by this route has not been confirmed.

On ingestion, hexylene glycol poses a serious poison threat. Initial symptoms are stimulation or excitement, followed by depression of the central nervous system (CNS). Symptoms can progress to include cardiovascular and pulmonary system affects, mild hypertension, tachycardia (rapid heartbeat), tachypnea (rapid respiration), and systemic capillary damage. Finally, death may occur due to kidney complications leading to necrosis and renal failure (24-72 hours post-ingestion).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hexylene glycol:

Skin: Some irritation at site of contact. Allergic rash may develop. Absorption is possible when there is broken skin.

Eye: Mild to moderate irritation (liquid only).

Lung: Nose and throat irritation. Produces intoxicating effects and may cause lung effects, including pulmonary edema.

CNS: Stimulation and depression with symptoms of dizziness, headache, lightheadedness, nausea, vomiting, and coma.

⚠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hexylene glycol and can last for months or even years:

Cancer Hazards: According to information presented in the references, hexylene glycol has not been ade-

quately tested for its ability to cause cancer in animals. Some studies indicate that it causes mutations in humans, while others are inconclusive in this regard.

Reproductive Hazard: According to information presented in the references, hexylene glycol has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated or high exposures may cause kidney damage. Skin allergy can develop in the long-term. If this happens, even small future exposures can cause recurrence of symptoms (rash and itching). Cardiovascular effects include heart enlargement.

🔒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hexylene glycol. This chemical is a dangerous human poison by two exposure routes (inhalation and ingestion). If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hexylene glycol. Chemical cartridge respirators may provide adequate protection up to the PEL. However, the best protection is provided by a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hexylene glycol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where hexylene glycol is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney function tests.
- ☑ Urine oxalate level. Urinalysis may show low specific gravity, proteinuria, pyuria, cylinduria, hematuria, calcium oxide, and hippuric crystals.
- ☑ Lung function tests.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Medical management of acute exposures may include determination of anion gap and monitoring of heart rhythm, respiratory status, arterial blood gases, and both acute and delayed hepatic and renal function status.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Where possible, automatically pump liquid hexylene glycol from drums to process containers.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to hexylene glycol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hexylene glycol should be communicated to all exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hexylene glycol, emergency shower facilities should also be provided in the immediate work area.

- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered only by personnel who have been properly trained on the hazards of exposure to hexylene glycol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hexylene glycol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hexylene glycol is considered a Class IIIB combustible liquid (per OSHA 29 CFR 1910.106). Under normal operating conditions, it presents a mild fire hazard. However, when heated or misted, it becomes a serious fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with many common peroxides, other oxidizers, and strong acids and contact can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of hexylene glycol. Should hexylene glycol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal method for hexylene glycol is to burning it in a chemical incinerator equipped with an afterburner and scrubber.

Hexylene glycol may enter the environment through industrial discharges, municipal waste treatment plant discharges, agricultural runoff or disposal, or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hexylene glycol.

Hexylene glycol has moderate acute toxicity to aquatic life. Insufficient data are available on the short-term effects of hexylene glycol exposure to plants, birds or land animals.

☘ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Hexylene glycol has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of hexylene glycol exposure on birds, plants, or land animals.

💧 Water Solubility

Hexylene glycol is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ Persistence in the Environment

Hexylene glycol is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of hexylene glycol will eventually end up in water.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hexylene glycol found in fish tissue is expected to be about the same as the average concentration of hexylene glycol in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hexylene glycol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire

protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If hexylene glycol should contact the water table, aquifer, or navigable waterway, cleanup should be started immediately. It is highly soluble in water and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hexylene glycol.

If hexylene glycol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers using non-sparking tools.
- ☑ It may be necessary to dispose of hexylene glycol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hexylene glycol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Synonyms Diamine; hydrazine, anhydrous; hydrazine base; diamide. | | |

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|---|---|---|
| Hydrazine (derivation: Reaction of sodium hypochlorite and ammonia yielding chloramine and sodium hydroxide; reaction of chloramine, ammonia, and sodium hydroxide to yield hydrazine, sodium chloride, and water in the presence of colloidal materials (glue, starch) to prevent side reactions). 1 ppm = 1.33 mg/m³ | PEL (skin): 1 ppm 1.3 mg/m³ STEL: Not Applicable | REL (ceiling): 0.06 ppm 0.04 mg/m³ (2-hr ceiling) Possible Cancer Agent | 50 ppm | TLV (skin): 0.1 ppm 0.13 mg/m³ Suspected Human Carcinogen |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 236°F (113°C) | Specific Gravity (H ₂ O = 1) 1.01 |
| Vapor Pressure (mm Hg) 10 mm at 69°F (20°C) | Molecular Weight 32.1 |
| Vapor Density (Air = 1) 1.1 | Melting Point 36°F (2°C) |

Solubility

Miscible in water and alcohol. Insoluble in chloroform and ether.

Appearance and Odor

Colorless, fuming, oily liquid with an ammonia or fish-like odor. A solid below 36°F (2°C).

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 100°F (38°C) opened cup | Explosive Limits in Air % by Volume LEL: 2.9% UEL: 98% |
| NFPA Classification Class IC Flammable Liquid | Autoignition Temperature Varies with contact surfaces |

Extinguishing Media

Use water spray in flooding amounts as fog, or use alcohol foam, carbon dioxide, or dry chemical.

Special Fire Fighting Procedures

Structural protective clothing is permeable. Remain clear of smoke, water fallout, and water runoff. Poisonous gases are produced in fire. Move containers if it can be done without risk. Cool fire-exposed containers with water spray and use water spray to disperse vapors. Evacuate non-essential personnel 2500 feet from the fire area (consider wind conditions).

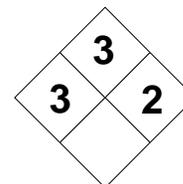

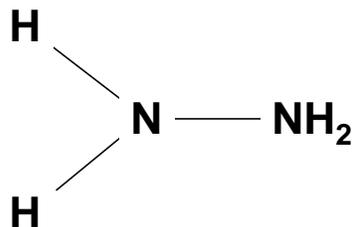

Unusual Fire and Explosion Hazards

Contact with oxidizing agents can cause violent and explosive ignition. A volatile liquid that is flammable over a wide vapor-to-air range. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flashback to cause fire or explosion. Burns with clear flame.

| SECTION V - REACTIVITY DATA | | | | |
|---|-------------------------------------|---|-----------------------------------|---|
| Stability | | Conditions to Avoid Hydrazine is stable at room temperature in closed containers under normal conditions of storage and handling. Avoid contact with incompatible chemicals and materials and heat. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Highly reactive with oxidizers (chlorine, bromine, nitrogen dioxide), halogens, ferric oxide (iron rust), metallic mercury, fuming nitric acid, hydrogen peroxide (ignites spontaneously with oxidizers). | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of hydrazine is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, hydrazine will produce toxic and irritating gases, including ammonia and oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Highly corrosive to the skin, eyes, and mucosa. Causes choking, chest pain, dyspnea, lethargy, nausea, convulsions, tremors, pulmonary edema, liver injury, and hypoxia. | | | | |
| ABSORPTION: Will pass through unbroken skin to cause toxic systemic effects as noted above. Extremely corrosive to skin tissue causing chemical burns (2nd and 3rd degree) on short contact. Very injurious to the eyes, causing corneal damage and permanent blindness. | | | | |
| INGESTION: A poison by ingestion. Delayed gastrointestinal irritation. Systemic effects can occur. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | 5th Annual Report | Group 2B | 29 CFR 1910.1000 Table Z-1 | CNS, skin, liver, eyes, GI tract, blood, resp. system. |
| Medical Conditions Generally Aggravated by Exposure Existing deficiencies in CNS function, liver, kidneys, and the circulatory system may be aggravated. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum) while holding upper and lower eyelids open. Seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of water (15 minutes minimum). For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects (pulmonary edema). If swallowed: Call the poison control center. Give 1-2 glasses of water or milk to a conscious and alert person and induce vomiting. Seek medical attention immediately. Never attempt to give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Evacuate area and deny entry to those not involved in cleanup activities. Protective clothing is mandatory. Remove all sources of ignition. Ventilate area of spill. Dilute with water to less than 40% hydrazine solution. Absorb liquids with toweling, vermiculite, or sand. Deposit in sealed drum for disposal. | | | | |
| Preferred Waste Disposal Method | | | | |
| Incineration in a chemical incinerator equipped with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store in tightly closed containers in a cool, dark, dry, well-ventilated area. Personnel should be trained on the hazardous properties of hydrazine prior to working with the material. | | | | |
| Other Precautions and Warnings | | | | |
| Containers should be protected from physical damage. Use extreme caution when handling this compound. Use explosion-proof electrical equipment in areas where this chemical is used or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| A carcinogenic agent. Exposure level is extremely low and difficult to monitor. For any exposures, use a supplied-air respirator set in positive pressure or continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Impervious Gloves | | Chemical Goggles or Face Mask | | Full Protective Clothing or Suit |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HYDRAZINE

CAS: 302-01-2

**IDENTIFICATION AND TYPICAL USES**

Hydrazine is a colorless, fuming, oily liquid with an ammonia or fish-like odor. It is used as a reducing agent for many transition metals and some nonmetals (arsenic, selenium, tellurium), as well as uranium and plutonium. It is a corrosion inhibitor in boiler feed water and reactor cooling water. It is used in wastewater treatment, in electroplating of metals on glass and plastics, in nuclear fuel processing, in redox reactions, as a polymerization catalyst, in fuel cells, as a blowing agent, a scavenger for gases, in the manufacture of certain drugs and agricultural chemicals (maleic hydrazide); as a photographic developer, as a component in high energy fuel cells, in dyes, in explosives, in the metallurgy industry, in spandex fibers, in diving equipment, in pesticides, in solder fluxes, and as a hypergolic rocket propellant.

RISK ASSESSMENT: HEALTH**General Assessment**

Hydrazine is a suspected human and animal carcinogen. It is an experimental teratogen and human mutation data have also been reported. It is primarily toxic by *inhalation* and skin contact (*absorption*). It can also cause toxic and damaging effects by *ingestion*.

Inhalation will cause pulmonary irritation up to and including pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can lead to death. Symptoms may be delayed up to 48 hours creating a false sense of security with regard to health exposure risk. Symptoms include choking, extreme chest pain, dyspnea (difficulty in breathing), lethargy, nausea, convulsions, tremors, liver injury, and hypoxia (reduced oxygen levels in the blood) leading to hemolytic anemia. Systemic intoxication, depression of the central nervous system (CNS), and delayed gastrointestinal irritation may also occur. Hydrazine may cause damage to the liver and destruction of red blood cells.

Aside from its ability to pass through intact skin (absorption), hydrazine is also extremely corrosive to skin tissue and can cause 2nd and 3rd degree burns on contact. Damage to the eyes and cornea can be severe causing partial or complete loss of vision. It is a powerful reducing agent which is corrosive to the eyes, skin, and mucous membranes. May also cause skin sensitization as well as systemic poisoning.

Ingestion is very unusual since the vapors of this chemical are so irritating, personnel are not likely to get close enough to ingest it. However, should it be swallowed, there can be burning of the mouth, throat, and esophagus, followed by gastrointestinal irritation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydrazine:

- Skin:** Severe irritation and burning. Extremely corrosive to tissues. Skin absorption will occur causing toxic systemic effects.
- Eye:** Severe irritation and tissue damage up to and including loss of vision.
- Lung:** Irritation of the upper respiratory tract causing choking, coughing, dyspnea, and pulmonary irritation leading to pulmonary edema (fluid in the lungs), which can be fatal.
- CNS:** Dizziness, convulsions, tremors, nausea, headaches, possible injury to the nervous system.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hydrazine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, hydrazine has been shown to cause cancer in test animals. Its carcinogenicity in

humans is expected to be at least equal to that of animals. Human mutation data have been reported for this compound.

Reproductive Hazard: According to the information presented in the references, this chemical has been shown to cause teratogenic effects as well as adversely affect reproduction in test animals.

Other Chronic Effects: Repeated exposures can lead to hemolytic anemia and convulsions. Chronic exposures may lead to cancer. There can also be chronic inflammation of the nasal, tracheal, and bronchial tissue resulting in chronic bronchitis. Repeated skin exposure can cause dermatitis with a characteristic rash.

🔹 **Recommended Risk-Reduction Measures**

Hydrazine is listed by the IARC as a confirmed animal carcinogen and the ACGIH and NTP as a suspected human carcinogen. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hydrazine. The exposure level is extremely low (1 ppm) and difficult to detect and monitor. For any detectable exposures to a suspected carcinogenic agent, use a supplied-air respirator set in positive pressure or continuous flow mode, or use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever an eye or face contact hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selection has been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques as well as the exposure control measures that will be practiced whenever personnel are to work with or around hydrazine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where hydrazine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- ☑ Lung function tests (establish a baseline).
- ☑ Complete blood count (CBC).
- ☑ Examination of the nervous system.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests.
- ☑ Liver and kidney function tests.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special tests (may help diagnose allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers under the same exposure conditions. Also, because alcohol consumption can cause liver damage, drinking alcohol can increase the potential for liver damage caused by exposure to hydrazine. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to hydrazine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information must be posted in the work area. It is recommended that a regulated, controlled work area should be established

wherever this chemical is used, handled, or stored. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydrazine should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided in the immediate area.
- ☑ Specific engineering controls are recommended for this chemical by NIOSH in Publication Number 78-172 (*Occupational Exposure to Hydrazine*).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of hydrazine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hydrazine should always be handled with extreme caution. It is a Class 1C flammable liquid. Its relatively low flash point and moderate boiling point make this chemical a fire and explosion hazard. Its vapors form explosive mixtures in air over a wide range of concentrations. It forms shock-sensitive explosive products when combined with metal perchlorates, alkali metals, or their dichromates. It is highly reactive with a number of substances, especially oxidizers and oxidizing agents. These characteristics require special consideration during any emergency situation involving a leak or spill of hydrazine.

Hydrazine can enter the environment through industrial discharges or through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydrazine.

This chemical has high acute toxicity to aquatic life. Insufficient data are available to evaluate or pre-

dict the short-term effects of hydrazine to plant, birds, or land animals.

☠ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Hydrazine has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of hydrazine to plants, birds, or land animals.

💧 *Water Solubility*

Hydrazine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Hydrazine is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It is expected to absorb to sediment.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Hydrazine is not expected to accumulate in the edible tissues of aquatic species consumed by humans.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydrazine should be segregated from other chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with proper fire protection and prevention equipment and explosion-proof electrical components and equipment. Bulk storage of hydrazine is not rec-

ommended. Hydrazine is hypergolic (ignites explosively) with incompatible materials such as oxidizers.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures and the health hazards associated with carcinogenic materials. Contaminated soils should be removed for incineration and replaced with clean soil.

If hydrazine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. It is highly soluble in water and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydrazine. Burning hydrazine in a chemical incinerator equipped with an afterburner and an air scrubber is an acceptable disposal method.

If hydrazine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove all ignition sources.
- ☑ Absorb liquids in vermiculite or sand and place in a sealed drums for disposal.
- ☑ It may be necessary to dispose of hydrazine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hydrazine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the

term “carcinogen,” “cancer,” or “reproductive hazard” are used, public emotion, hysteria, and ignorance can run equally high. This should be considered during the development of any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| | | Not Found | |

Extinguishing Media

Use high expansion foam, low expansion foam, dry chemical, carbon dioxide, water, water fog, or water spray.

Special Fire Fighting Procedures

Structural protective clothing is permeable. Remain clear of smoke, water fallout, and water runoff. Poisonous gases are produced in fire. Move containers if it can be done without risk. Cool fire-exposed containers with water spray. Evacuate non-essential personnel 2500 feet from the fire area (consider wind conditions).

Unusual Fire and Explosion Hazards

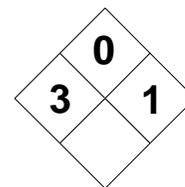

Contact with oxidizing agents can cause violent and explosive ignition.

SECTION V - REACTIVITY DATA

| | | | | |
|---|---|---|------------------------------|---|
| Stability | | Conditions to Avoid Hydrazine sulfate is stable at room temperature in closed containers under normal conditions of storage and handling. Avoid contact with incompatible chemicals and materials and heat. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Highly reactive with oxidizers (chlorine, bromine, nitrogen dioxide, peroxides, permanganates, chlorates, and nitrates), and bases. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of hydrazine sulfate is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, hydrazine sulfate will produce toxic and irritating gases, including oxides of nitrogen and sulfur. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X | |
| Health Hazards INHALATION: Highly irritating to the skin, eyes, and mucosa. Causes choking, chest pain, dyspnea, nausea, convulsions, tremors, blood cell injury, and possible methemoglobinemia. May affect the brain and the function of the central nervous system. ABSORPTION: Will pass through unbroken skin to cause toxic systemic effects as noted above. Eye contact causes severe pain and possible damage to vision. INGESTION: A poison by ingestion causing paresthesia, somnolence, nausea, and vomiting. | | | | |
| Carcinogenicity | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Animal Evidence | OSHA Regulated? No | Target Organs? CNS, skin, liver, eyes, GI tract, blood, resp. system. |
| Medical Conditions Generally Aggravated by Exposure Existing deficiencies in CNS function, liver, kidneys, and the circulatory system may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum) while holding upper and lower eyelids open. Seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of water (15 minutes minimum). For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Call the poison control center. Give 1-2 glasses of water or milk to a conscious and alert person to dilute. Do NOT induce vomiting. Seek medical attention immediately. Never attempt to give anything by mouth to an unconscious or convulsing person. Never make an unconscious or convulsing person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Evacuate area and deny entry to those not involved in cleanup activities. Protective clothing is mandatory. Remove all sources of ignition. Ventilate area of spill. Collect powdered materials in safest manner possible. Do NOT dry sweep. Use HEPA vacuum instead. Deposit in sealed drum for disposal. | | | | |
| Preferred Waste Disposal Method Incineration in a chemical incinerator equipped with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, dry, well-ventilated area. Personnel should be trained on the hazardous properties of hydrazine sulfate <i>prior</i> to working with the material. | | | | |
| Other Precautions and Warnings Containers should be protected from physical damage. Use extreme caution when handling this compound. Protect containers from physical damage and keep away from incompatible materials. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) A carcinogenic agent. No exposure levels have been established. For any exposures, use a supplied-air respirator set in positive pressure or continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Full Protective Clothing or Suit | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HYDRAZINE SULFATE

CAS: 10034-93-2

**IDENTIFICATION AND TYPICAL USES**

Hydrazine sulfate is a colorless or white crystalline, sand-like solid material. It is used in the manufacture of chemicals, in condensation reactions, as a catalyst in making acetate fibers, in refining rare metals, as an antioxidant in soldering flux for light metals, in the determination of arsenic content in metals, for separating polonium from tellurium, as a reducing agent in the analysis of minerals and slags, in tests for blood, and as a fungicide and germicide.

RISK ASSESSMENT: HEALTH***General Assessment***

Hydrazine sulfate is a suspected human and confirmed animal carcinogen. It is an experimental teratogen and human mutation data have also been reported. It is primarily toxic by *inhalation* of its airborne dusts and powders, by skin contact (*absorption*), and by direct *ingestion*.

Inhalation will cause irritation of the nose, throat, and upper respiratory tract. Symptoms include choking, extreme chest pain, dyspnea (difficulty in breathing), lethargy, nausea, and possible liver and kidney injury. It can also affect brain and nervous system function with symptoms of lightheadedness, dizziness, trembling, excitement, and even convulsions. Systemic intoxication, depression of the central nervous system (CNS), and delayed gastrointestinal irritation may also occur. Hydrazine sulfate may cause damage to the red blood cells and may result in a low blood count (anemia). It can also interfere with the ability of the blood to carry or transport oxygen throughout the body, a condition known as methemoglobinemia, causing weakness and shortness of breath.

Skin contact results in irritation and possible burns. Damage to the eyes and cornea can be severe causing partial or complete loss of vision. It is a powerful reducing agent which is corrosive to the eyes, skin, and mucous membranes. May also cause skin

sensitization as well as systemic poisoning. Once absorbed through the skin, toxic systemic effects similar to that of inhalation can occur. If absorption occurs simultaneously with inhalation or ingestion, the resulting effects can be fatal.

Ingestion of hydrazine sulfate powders will cause paresthesia (pins and needles), somnolence, nausea, and vomiting.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydrazine sulfate:

- Skin: Severe irritation and burning. Skin absorption will occur causing toxic systemic effects.
- Eye: Severe irritation and tissue damage up to and including loss of vision.
- Lung: Irritation of the upper respiratory tract causing choking, coughing, dyspnea, and pulmonary irritation.
- CNS: Dizziness, convulsions, tremors, nausea, headaches, possible injury to the brain and nervous system.

⚠ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to hydrazine sulfate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, hydrazine sulfate has been shown to cause cancer in test animals. Its carcinogenicity in humans is expected to be at least equal to that of animals. Human mutation data have been reported for this compound.

Reproductive Hazard: According to the information presented in the references, this chemical has been

shown to cause teratogenic effects as well as adversely affect reproduction in test animals.

Other Chronic Effects: Repeated exposures can lead to hemolytic anemia and convulsions. Chronic exposures may lead to cancer, liver or kidney damage, and methemoglobinemia. The latter can cause chronic fatigue, shortness of breath, bluish color in the face, lips, nose, finger tips, and toes (cyanosis) due to a lack of oxygen in the blood. Repeated skin exposure can cause dermatitis or skin allergy. Once an allergy develops, even the slightest future exposures can cause itching and rash.

🔹 **Recommended Risk-Reduction Measures**

Hydrazine sulfate is listed by the IARC as a confirmed animal carcinogen and the NTP as a suspected human carcinogen. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is always required whenever working with or around hydrazine sulfate. No exposure levels have been established for hydrazine sulfate, although NIOSH has set a maximum ceiling (2-hours) for hydrazine at 0.04 mg/m³ which may be used as a reference. For any possible or potential exposures to a suspected carcinogenic agent, use a supplied-air respirator set in positive pressure or continuous flow mode, or use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever an eye or face contact hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selection has been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques as well as the exposure control measures that will be practiced whenever personnel are to work with or around hydrazine sulfate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hydrazine sulfate is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Liver and kidney function tests.
- Complete blood count (CBC).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Examination of nervous system function.
- Liver and kidney function tests.
- Blood methemoglobin level.
- Evaluation by a qualified allergist with careful consideration of exposure history and special tests (may help diagnose allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, because more than light alcohol consumption can cause liver damage, drinking alcohol can increase the potential for liver damage caused by exposure to hydrazine sulfate. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to hydrazine sulfate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information must be posted in the work area. It is recommended that a regulated, controlled work area should be established wherever this chemical is used, handled, or stored. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydrazine sulfate

should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided in the immediate area.
- ☑ Specific engineering controls are recommended for this chemical by NIOSH in Publication Number 78-172 (*Occupational Exposure to Hydrazine*).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of hydrazine sulfate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hydrazine sulfate should always be handled with extreme caution. It is highly reactive with a number of substances, especially oxidizers and oxidizing agents such as perchlorates, permanganates, chlorates, and nitrates. These characteristics require special consideration during any emergency situation involving a leak or spill of hydrazine sulfate.

Hydrazine sulfate can enter the environment through industrial and municipal discharges, spills, and through non-point sources due to its use as a fungicide.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydrazine sulfate.

This chemical has slight acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of hydrazine sulfate to plant, birds, or land animals.

☠* Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These

effects can be seen long after first exposure(s) to toxic chemicals. Hydrazine sulfate has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of hydrazine sulfate to plants, birds, or land animals.

💧 Water Solubility

Hydrazine sulfate is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ Persistence in the Environment

Hydrazine is slightly persistent in water, with a half-life of between 2 to 20 days. Sulfate is highly persistent in water with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Neither hydrazine nor the sulfate are expected to accumulate in the edible tissues of aquatic species consumed by humans.

🛡️ Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydrazine sulfate should be segregated from other chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with proper fire protection and prevention equipment and explosion-proof electrical components and equipment. Bulk storage of hydrazine sulfate is not recommended.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures and the

health hazards associated with carcinogenic materials. Contaminated soils should be removed for incineration and replaced with clean soil.

If hydrazine sulfate should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. It is highly soluble in water and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydrazine sulfate. Burning hydrazine sulfate in a chemical incinerator equipped with an afterburner and an air scrubber is an acceptable disposal method.

If hydrazine sulfate is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area and remove all ignition sources.
- Collect powders in safest manner possible. Do NOT dry sweep (generates air borne dusts). Use a vacuum equipped with a high-efficiency particulate air filter (HEPA) instead. Deposit in sealed drums for disposal.
- It may be necessary to dispose of hydrazine sulfate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 4-dimethylaminoazobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "carcinogen," "cancer," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high.

This should be considered during the development of any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

HYDRIODIC ACID

HI

CAS: 10034-85-2

**IDENTIFICATION AND TYPICAL USES**

Hydriodic acid is a colorless liquid when freshly made but will rapidly turn to yellow-brown in the presence of light or air. It is used in the preparation of iodine salts, in organic preparations, as an analytical reagent, as a disinfectant, and in pharmaceuticals.

RISK ASSESSMENT: HEALTH***General Assessment***

Exposure to hydriodic acid is possible through *inhalation* of its vapors and by skin contact (although absorption through intact skin has not been reported). It can also enter the body through *ingestion*. Although it is considered to be of moderate to severe toxicity, it is a highly caustic and, therefore, corrosive compound. There are no reports on its carcinogenic, mutagenic, or teratogenic properties.

Inhalation produces severe irritation of the eyes, nose, and mucosa of the respiratory tract with coughing, dyspnea (labored breathing), sneezing, lachrymation, nasal discharge, bronchitis, headache, cyanosis (bluish face and lips), salivation, giddiness, nausea, nasal membrane ulceration, muscle weakness and/or total body weakness. There can be progression to secondary chemical pneumonia which can lead to death. There may also be a life-threatening buildup of fluid in the lungs (pulmonary edema) which may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk.

Skin contact causes severe burning with possible vesiculation. Its extremely corrosive properties cause immediate stinging, burning, redness, swelling, membrane ulceration, painful skin blistering, and local necrosis (tissue destruction) upon contact. Shock may occur as a result of the intense pain. Eye contact causes immediate stinging and watering with tissue damage and the possibility of corneal ulceration. There will be redness and swelling of the lids, intense pain, and tissue destruction. There may be blurred

vision resulting from corneal opaqueness, and there is a possibility of lost sight.

Ingestion is extremely dangerous, even life-threatening. It causes severe poisoning, burning of the lips, mouth, and throat. Other symptoms include painful swallowing, excessive salivation and drooling, nausea, ulceration of the mouth mucosa, intense thirst, painful stomach cramps, bloody vomiting (due to digestive hemorrhage), acute tissue damage, diarrhea with pain, shock, breathing difficulties, convulsions, coma, circulatory collapse, and death.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydriodic acid:

Skin: Irritation/rash or burning feeling on contact with redness, blistering and vesiculation, and localized tissue destruction.

Eye: Severe irritation; may cause burns and damage with permanent loss of vision.

Lung: Severe irritation of the mucous membranes in the nose, throat, and lungs following exposure. May cause pulmonary edema and secondary chemical pneumonia.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to hydriodic acid and can last for months or even years:

Cancer Hazards: According to information presented in the references, hydriodic acid has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, hydriodic acid has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Skin contact causes irritation and burns. There may be some lasting effects of chronic exposures such as sensitization. Once an individual becomes “sensitized,” even the slightest future exposures can cause an allergic reaction.

☉ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hydriodic acid. It is extremely corrosive and moderately toxic to humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hydriodic acid. No exposure levels have been established for this chemical. This does not mean that exposure to hydriodic acid is without risk. For best protection, a self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a synthetic rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be used. Hydriodic acid will attack and corrode natural rubber and natural rubber products (such as gloves). Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hydriodic acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hydriodic acid is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

- Lung function tests (look for chronic respiratory diseases).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

- Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).
- Lung function tests.
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to hydriodic acid and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydriodic acid should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hydriodic acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, air).

Hydriodic acid is considered a non-combustible liquid. However, it is extremely corrosive to many materials. It is incompatible with oxidizing agents and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of hydriodic acid. Should hydriodic acid ever come into contact with incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Hydriodic acid can enter the environment mainly through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydriodic acid.

Insufficient data are available to evaluate or predict the short-term effects of hydriodic acid exposure to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of hydriodic acid to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Hydriodic acid is highly soluble in water. Concentrations of over 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Hydriodic acid is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hydriodic acid found in fish tissues is expected to be about the same as the average concentration of hydriodic acid in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydriodic acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hydriodic acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly miscible in water and, therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydriodic acid. If hydriodic acid is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all sources of heat.
- Ventilate area or spill or leak.
- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Neutralize remaining residue with soda ash or sodium bicarbonate. Do not flush to drains, sewers, or waterways.
- It may be necessary to dispose of hydriodic acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS
General Assessment

Accidents or mishaps involving hydriodic acid can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Hazard Class and Label Requirements Non-Flammable Gas or Corrosive Liquid; Poison Gas. | DOT Emergency Guide Code 15 (anhydrous) 60 (solution) | |
| DOT Identification Number UN 1048 (anhydrous) UN 1788 (solution) | Chemical Formula BrH | |

Synonyms

Anhydrous hydrogen bromide; hydrobromic acid; anhydrous hydrobromic acid.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|--|---|--|
| Hydrogen bromide (derivation: By passing hydrogen with bromine vapor over warm platinum sponge which acts as catalyst; as a by-product in the bromination of organic compounds). 1 ppm = 3.36 mg/m³ | PEL (ceiling): 3 ppm 10 mg/m³ STEL: Not Applicable | PEL (ceiling): 3 ppm 10 mg/m³ STEL: Not Applicable | 30 ppm | TLV (ceiling): 3 ppm 10 mg/m³ STEL: Not Applicable |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point -87°F (-66°C) | Specific Gravity (H ₂ O = 1) 2.81 |
| Vapor Pressure (atmospheres) 20 | Molecular Weight 127.91 |
| Vapor Density (Air = 1) 2.71 | Melting Point -124°F (-86°C) |

Solubility

Dissolves in water to form hydrobromic acid. Soluble in alcohol.

Appearance and Odor

Colorless gas with a sharp, irritating odor. Normally shipped as a liquefied compressed gas. Often used in aqueous solution. In solution, appears as a clear or slightly yellow fuming liquid.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Flammable Gas | Autoignition Temperature Not Determined |

Extinguishing Media

Carbon dioxide, dry chemical, fog, or regular foam. Reacts with water or steam to form toxic and corrosive fumes. Use water only as a last resort and take precautions to avoid inhalation or contact.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Also, use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire.

Unusual Fire and Explosion Hazards

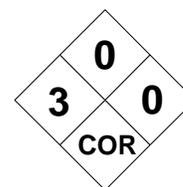

Potentially explosive reaction with strong oxidizers, strong caustics, and moisture. Containers may explode in fire. Firefighters should avoid contact with vapors produced during fire. Hydrogen bromide will react with metals and moisture to produce hydrogen.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|--|--|---|
| Stability | | Conditions to Avoid Hydrogen bromide is normally stable in closed, pressurized containers under routine conditions of handling and storage. Keep away from metals and other incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with strong oxidizers, strong caustics, moisture, and most metals (especially copper, brass, and zinc). It will corrode most metals and form explosive hydrogen gas in the process. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of hydrogen bromide is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, hydrogen bromide can emit highly toxic/poisonous gases. The emission of explosive hydrogen gas during a fire creates a dangerous hazard to personnel and property. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Vapors cause irritation to the upper respiratory tract with coughing, dyspnea, headache, congestion, and possible burns to the nasal airway with a brownish discoloration of the affected tissues, including the mucous membranes of the upper respiratory. SKIN & EYES: Skin contact causes smarting, tingling, redness, burning, swelling, blistering, necrosis, and shock. Eye contact causes burning, watering, redness, corneal ulceration, blurred vision, and possible blindness. The liquefied gas causes frostbite burns to tissues. INGESTION: Not likely (hydrogen bromide is a gas at room temperature). | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Upper respiratory tract, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Not likely. If accidental ingestion of solutions occurs, seek medical attention or contact poison control center. Do NOT induce vomiting. Give conscious person 1-2 glasses of water or milk to drink to dilute. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area (avoid vapors). Shut off flow of gas if possible. Solution spills should be neutralized with sodium bicarbonate, soda ash, or slacked lime and deposited in sealed containers. Ventilate area of spill. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Hydrogen bromide is a non-flammable gas. Avoid contact with strong oxidizers such as chlorine since violent reactions occur. Store in tightly closed containers in cool, well-ventilated area away from heat. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where hydrogen bromide is used, handled, or stored. Detached facility storage is preferred. Prevent damage to containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure levels are low. Recommend using a supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Acid Resistant Rubber | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HYDROGEN BROMIDE

BrH

CAS: 10035-10-6

**IDENTIFICATION AND TYPICAL USES**

Hydrogen bromide is a colorless gas with a sharp, irritating odor. It is normally shipped as a liquefied compressed gas and is often used in aqueous solution. The solution (hydrobromic acid) is a clear or slightly yellow fuming liquid that will darken slowly on exposure to air or light. The fume from reaction with moist air has a sour taste. It is used in organic synthesis, to make bromides by direct reaction with alcohols, as a pharmaceutical intermediate, an alkylation and oxidation catalyst, and as a powerful reducing agent.

RISK ASSESSMENT: HEALTH***General Assessment***

Exposure to hydrogen bromide is possible through *inhalation* of its vapors and by skin contact (although absorption through intact skin has not been reported). It can also enter the body through *ingestion*, but this exposure route is extremely unlikely since the chemical exists as a gas at room temperature and pressure. Although it is considered to be of moderate to severe toxicity, it is a highly caustic and, therefore, corrosive compound. There are no reports on its carcinogenic, mutagenic, or teratogenic properties.

Inhalation produces severe irritation of the eyes, nose, and mucosa of the upper respiratory tract with coughing, dyspnea (labored breathing), sneezing, lachrymation, and nausea. There may be a brownish discoloration of the affected tissues, including the mucous membranes that line the upper respiratory tract.

Skin contact with the vapor or the liquid solution causes severe burning due to hydrogen bromide's intense corrosive action on human tissue. The liquid may cause frostbite burns that will compound the corrosive effects. These extremely corrosive properties cause immediate stinging, burning, redness, swelling, membrane ulceration, painful skin blistering, and local necrosis (tissue destruction) upon contact. Shock may occur as a result of the intense pain. Eye contact

causes immediate stinging and watering with tissue damage and the possibility of corneal ulceration. There will be redness and swelling of the lids, intense pain, and tissue destruction. Loss of vision is possible.

Ingestion is extremely unlikely under normal operating conditions. However, if liquid solutions are accidentally swallowed, there can be severe burns to the lips, mouth, throat, and stomach. If vomiting occurs and the liquid is aspirated into the lungs, the corrosive action on the lung tissues can be fatal.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydrogen bromide:

Skin: Irritation/rash or burning feeling on contact with redness, blistering, and localized tissue destruction. The liquefied compressed gas can cause frostbite.

Eye: Severe irritation; may cause burns and damage with permanent loss of vision. Frostbite can also occur on contact with the compressed gas.

Lung: Severe irritation of the mucous membranes in the nose, throat, and lungs following exposure.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to hydrogen bromide and can last for months or even years:

Cancer Hazards: According to information presented in the references, hydrogen bromide has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the references, hydrogen bromide has not been adequately tested for

its ability to adversely affect reproduction in test animals.

Other Chronic Effects: None reported.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hydrogen bromide. It is extremely corrosive and moderately toxic to humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hydrogen bromide. The exposure level is extremely low (3 ppm) and difficult to accurately monitor. For low or infrequent exposures, an acid vapor respirator or gas mask may suffice. However, better protection is obtained using a self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hydrogen bromide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hydrogen bromide is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

- Lung function tests (establish baseline).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

- Lung function tests (compare to baseline).

- Examination of the nasal airway for discoloration.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to hydrogen bromide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydrogen bromide should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hydrogen bromide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and especially air).

Hydrogen bromide is considered a non-flammable gas. However, it is extremely corrosive to many materials. It is incompatible with oxidizing agents and contact can cause fire or explosion. In contact with many common metals (copper, brass, zinc) and moisture, it can liberate extremely explosive hydrogen gas. These characteristics require special consideration during any emergency situation involving a leak or spill of hydrogen bromide. Should hydrogen bromide ever come into contact with any incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Hydrogen bromide can enter the environment mainly industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydrogen bromide.

Insufficient data are available to evaluate or predict the short-term effects of hydrogen bromide exposure to aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of hydrogen bromide to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Hydrogen bromide is highly soluble in water. Concentrations of over 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Hydrogen bromide is practically non-persistent in the aquatic environment, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of hydrogen bromide will eventually end up in the air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hydrogen bromide found in fish tissues is expected to be much lower than the average concentration of hydrogen bromide in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydrogen bromide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils (solution spills) should be removed for incineration and replaced with clean soil. If hydrogen bromide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and is extremely volatile. Therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydrogen bromide. If hydrogen bromide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all sources of heat and ignition.
- ☑ Ventilate area or spill or leak.
- ☑ Shut off gas leak, if possible. If leak is from a cylinder and it cannot be turned off, remove cylinder to safe area (outdoors) and allow to vent. Take care to avoid contact with the vapors or any escaping compressed liquids. Use water spray to protect personnel attempting to stop leak. Be aware of the possibility that hydrogen gas may be in the area (explosion hazard).
- ☑ Absorb solution spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. *Carefully* neutralize remaining residue with soda ash, slacked lime, or sodium bicarbonate. Do not flush to drains, sewers, or waterways.
- ☑ It may be necessary to dispose of hydrogen bromide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving hydrogen bromide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Vapors cause irritation to the upper respiratory tract with coughing, dyspnea, headache, congestion, ulcers in the nose, throat, and larynx, tissue dehydration, larynx spasm, and/or pulmonary edema. Chronic exposures may cause teeth erosion. SKIN & EYES: Skin contact causes smarting, tingling, redness, burning, swelling, blistering, necrosis, and shock. Eye contact causes burning, watering, redness, corneal ulceration, blurred vision, and possible blindness. The liquefied gas causes frostbite burns to tissues. INGESTION: Not likely (hydrogen chloride is a gas at room temperature). | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Upper respiratory tract, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 48 hours for lung effects. If swallowed: Not likely. If accidental ingestion of solutions occurs, seek medical attention or contact poison control center. Do NOT induce vomiting. Give conscious person 1-2 glasses of water or milk to drink to dilute. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area (avoid vapors). Shut off flow of gas if possible. Solution spills should be neutralized with sodium bicarbonate, soda ash, or slacked lime and deposited in sealed containers. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Hydrogen chloride is a non-flammable gas. Avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where hydrogen chloride is used, handled, or stored. Detached facility storage is preferred. Prevent damage to containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure levels are relatively low. Recommend using a supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Acid Resistant Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HYDROGEN CHLORIDE

HCl

CAS: 7647-01-0

**IDENTIFICATION AND TYPICAL USES**

Hydrogen chloride is a colorless gas with a sharp, characteristic, suffocating, pungent, and irritating odor. It is normally shipped as a liquefied compressed gas and is often used in aqueous solution. The solution (hydrochloric acid) is a clear or slightly yellow fuming liquid that will darken slowly on exposure to air or light. The fumes from reaction with moist air has a sour taste. It is used in the production of vinyl chlorides from acetylene and alkyl chlorides from olefins. It is also used in the hydrochlorination of certain rubber products, in polymerization, isomerization, alkylation, and nitration reactions. It is used in the manufacture of pharmaceutical hydrochlorides, and as a gaseous flux for babbiting operations.

RISK ASSESSMENT: HEALTH***General Assessment***

Exposure to hydrogen chloride is possible through *inhalation* of its vapors and by skin contact (although absorption through intact skin has not been reported). It can also enter the body through *ingestion*, but this exposure route is extremely unlikely since the chemical exists as a gas at room temperature and pressure. Although it is considered to be of moderate to severe toxicity, it is a highly caustic and, therefore, corrosive compound. There are no reports on its carcinogenic, mutagenic, or teratogenic properties.

Inhalation severely dehydrates tissues and causes destructive corrosive damage to the nose, throat, and mucosa of the upper respiratory tract with ulceration of the nose, throat, and larynx. There can be coughing, dyspnea (labored breathing), lachrymation, and nausea. Severe exposures may cause spasm of the larynx and/or pulmonary edema (fluid in the lungs). The development of pulmonary edema can be delayed up to 48 hours after exposure, thereby creating a false sense of security with regard to health exposure risk.

Skin contact with the vapor or the liquid solution causes severe burning due to hydrogen chloride's intense corrosive action on human tissue. The liquid may cause frostbite burns that will compound the corrosive effects. These extremely corrosive properties cause immediate stinging, burning, redness, swelling, membrane ulceration, painful skin blistering, and local necrosis (tissue destruction) upon contact. Eye contact causes immediate stinging and watering with tissue damage and the possibility of corneal damage. There will be redness and swelling of the lids, intense pain, and tissue destruction. Loss of vision may occur.

Ingestion is extremely unlikely under normal operating conditions. However, if liquid solutions are accidentally swallowed, there can be severe burns to the lips, mouth, throat, and stomach. If vomiting occurs and the liquid is aspirated into the lungs, the corrosive action on the lung tissues can be fatal.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydrogen chloride:

- Skin:** Irritation/rash or burning feeling on contact with redness, blistering, and localized tissue destruction. The liquefied compressed gas can cause frostbite.
- Eye:** Severe irritation; may cause burns and damage with permanent loss of vision. Frostbite burns can occur on contact with the compressed gas.
- Lung:** Severe irritation of the mucous membranes in the nose, throat, and lungs following exposure.

☠ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to hydrogen chloride and can last for months or even years:

Cancer Hazards: According to information presented in the references, hydrogen chloride has not been adequately tested for its ability to cause cancer in laboratory test animals.

Reproductive Hazard: According to information presented in the references, hydrogen chloride has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated or prolonged exposure may cause erosion of the teeth.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hydrogen chloride. It is extremely corrosive and moderately toxic to humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hydrogen chloride. The exposure level is extremely low (5 ppm) and difficult to accurately monitor. For low or infrequent exposures, an acid vapor respirator or gas mask may suffice. However, better protection is obtained using a self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hydrogen chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where hydrogen chloride is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

Lung function tests (establish baseline).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

Lung function tests (compare to baseline).

Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to hydrogen chloride and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydrogen chloride should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hydrogen chloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and especially air).

Hydrogen chloride is considered a non-flammable gas. However, it is extremely corrosive to many materials. It is incompatible with hydroxides, amines, and alkalis and contact can cause fire or explosion. In contact with many common metals (copper, brass, zinc) and moisture, it can liberate extremely explosive hydrogen gas. These characteristics require special consideration during any emergency situation involv-

ing a leak or spill of hydrogen chloride. Should hydrogen chloride ever come into contact with any incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Hydrogen chloride can enter the environment mainly through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydrogen chloride.

Hydrogen chloride has slight acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of hydrogen chloride exposure to plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Hydrogen chloride has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of hydrogen chloride to plants, birds, or land animals.

💧 *Water Solubility*

Hydrogen chloride is highly soluble in water. Concentrations of over 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Hydrogen chloride is slightly persistent in the aquatic environment, with a half-life of less than 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of hydrogen chloride will eventually end up in the air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Small quantities of acids will be neutralized by the alkalinity in aquatic systems, but larger quantities can lower the pH for extended periods of time. Hydrogen chloride contains chloride whose concentrations in edible tissues of most aquatic species that are consumed by humans is expected to be about the same as the average concentration of hydrogen chloride in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydrogen chloride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Containers should be protected against physical damage and stored away from direct sunlight or other heat sources.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils (solution spills) should be removed for incineration and replaced with clean soil. If hydrogen chloride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and is extremely volatile. Therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydrogen chloride. If hydrogen chloride is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all sources of heat and ignition.
- Ventilate area or spill or leak.
- Shut off gas leak, if possible. If leak is from a cylinder and it cannot be turned off, remove cyl-

inder to safe area (outdoors) and allow to vent. Take care to avoid contact with the vapors or any escaping compressed liquids. Use water spray to protect personnel attempting to stop leak. Be aware of the possibility that hydrogen gas may be in the area (explosion hazard).

- ☑ Absorb solution spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. *Carefully* neutralize remaining residue with soda ash, slacked lime, or sodium bicarbonate. Do not flush to drains, sewers, or waterways.
- ☑ It may be necessary to dispose of hydrogen chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hydrogen chloride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, hydrogen cyanide releases toxic fumes of cyanide and nitric oxide. On contact with water or steam, toxic hydrogen cyanide will be released. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: High concentrations will cause tachypnea (rapid breathing) which will further increase the amount of cyanide inhaled. This leads to dyspnea, paralysis, convulsions, and respiratory arrest with death occurring in minutes. Low concentrations may cause headache, vertigo, nausea, and vomiting. There could be asphyxiation, weakness, confusion, and gasping. ABSORPTION: Will pass through unbroken skin and enter the bloodstream. Large exposures can be fatal. INGESTION: A poison by ingestion. May cause toxic systemic effects and death. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1 | CNS, CVS, thyroid, blood, all body cells. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. Do not allow water to enter nose or mouth. For inhalation: Remove the person from exposure. Break amyl nitrate pearl in cloth and hold lightly under nose for 15 seconds; repeat 5 times at 15 second intervals. Give 100% oxygen. Do NOT administer CPR (caregiver can be poisoned). Transfer to medical facility. If swallowed: Break amyl nitrate pearl in cloth and hold lightly under nose for 15 seconds. Do NOT induce vomiting. Repeat inhalation of amyl nitrate 5 times at 15 second intervals. Seek medical attention immediately. Call poison control center for advice. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Full protective clothing is required. Stop flow of gas. Evacuate area. Use water spray to knock down vapors. Restrict those not involved in cleanup from entering area. Notify emergency response personnel. | | | | |
| Preferred Waste Disposal Method Destroy by burning in a combustion chamber with a fuel-air mix. | | | | |
| Precautions to be Taken in Handling and Storage Store in air-tight, moisture-proof containers in cool, dry, well-ventilated area. Prevent physical damage. | | | | |
| Other Precautions and Warnings Shield containers from exposure to heat, including direct sunlight. Limit access to storage areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For any exposure level use an NIOSH/MSHA-approved self-contained breathing apparatus with full face-piece operated in positive pressure mode. Inhalation of dusts must be avoided. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit, Boots (avoid skin contact) | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HYDROGEN CYANIDE

HCN

CAS: 74-90-8

**IDENTIFICATION AND TYPICAL USES**

Hydrogen cyanide is a colorless gas or a pale-blue liquid (above 78°F) with a bitter, almond-like odor. It is used in the manufacture of acrylonitrile, acrylates, adiponitrile, cyanide salts, dyes, chelates, rodenticides, and pesticides. Used in the fumigation of ships, railroad cars, orchards, buildings, tobacco, and various food stocks. Can also be produced during petroleum refining, electroplating, metallurgy, and in photographic development.

RISK ASSESSMENT: HEALTH**General Assessment**

Hydrogen cyanide is a highly poisonous compound. The toxic routes of entry are *inhalation*, *ingestion* and skin contact (*absorption*). Exposure by either route can lead to death in large enough doses. There are no reports of carcinogenic, mutagenic, or teratogenic effects resulting from exposure to hydrogen cyanide. It is a true "protoplasmic poison" which means it will combine in the tissues with the enzymes associated with cellular oxidation. This makes oxygen unavailable to the tissues and causes death through asphyxia. The effect on tissue oxidation lasts only as long as exposure occurs. If the person is removed from exposure before death has occurred, normal cellular oxidation will be restored.

Inhalation causes a burning sensation in the mouth and throat. Initial systemic response is rapid breathing which further increases the cyanide intake. Symptoms progress first to rapid pulse and high blood pressure followed by decreased pulse and lower blood pressure. There will be dyspnea, paralysis, convulsions, and respiratory arrest. Death can occur in minutes if the person is not removed from exposure. Lesser concentrations cause headache, vertigo, confusion, shock, convulsions, coma, nausea, vomiting, and gasping for breath. There may be thyroid and blood changes.

Poisonous reactions on exposure may cause cherry-red mucous membranes and blood due to the inability of the blood to remove its oxygen to the cells. High concentrations can be rapidly fatal.

Skin contact will cause burns and redness. Absorption occurs quickly causing toxic systemic effects similar to that of inhalation. It is also extremely toxic via ingestion.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydrogen cyanide:

Skin: Severe irritation may occur. Absorption is rapid and the effects can be fatal.

Eye: Irritation and possible damage on contact.

Lung: High exposures can cause rapid and severe lung damage, with shortness of breath, chest pain, cough, loss of consciousness, and death.

Other: High exposure to hydrogen cyanide may be rapidly fatal. It appears to injure the central nervous system, liver, and kidneys as well as affect the blood and every cell in the body.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hydrogen cyanide and can last for months or even years:

Cancer Hazards: According to the information in the references, the data on the cancer-causing properties of hydrogen cyanide are inconclusive. However, this is probably due to the fact that it is highly poisonous and long-term exposures seldom occur (death is more likely).

Reproductive Hazard: It is not known if exposure to hydrogen cyanide will adversely affect the reproductive system of males or females.

Other Chronic Effects: Repeated exposures to low concentrations may result in enlargement of the thyroid gland, chronic fatigue, weakness, headache, changes in taste and smell, irritation of the throat, chronic dyspnea, nervous instability, abdominal colic, and other systemic chronic effects.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hydrogen cyanide. If a less toxic material or compound cannot be substituted for hydrogen cyanide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of hydrogen cyanide dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with or around hydrogen cyanide. Although an air-purifying respirator may suffice for low concentrations, better protection is provided using a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode or a supplied-air respirator operated in continuous flow or other positive pressure mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and protective suit should also be used (skin contact must be prevented). To prevent hand and skin exposures, gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hydrogen cyanide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hydrogen cyanide is used or stored.

If exposure occurs, break an amyl nitrate pearl into a cloth and hold it lightly under the victim's nose for 15 seconds. This should be repeated five times, at 15 second intervals.

For those with frequent or potentially high exposure (half the PEL or greater), or significant skin contact, the following medical tests are recommended before initial assignment and regularly thereafter:

- ☑ Urine thiocyanate test (most accurate if performed right after exposure).
- ☑ Lung function test and chest X-ray (for baseline).

If symptoms develop or overexposure is suspected, the following should also be considered:

- ☑ Blood cyanide level. (Note: Since cigarettes contain some cyanide, smokers may show an increase in cyanide level on testing).
- ☑ Evaluation of thyroid function.
- ☑ Lung function test and chest X-ray (compare to baseline).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, personnel who smoke should avoid any unprotected contact with hydrogen cyanide powders.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and personnel must be trained on its correct use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to hydrogen cyanide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydrogen cyanide should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hydrogen cyanide, emergency shower facilities should also be provided in the immediate work area.
- ☑ Workers whose clothing has been contaminated by hydrogen cyanide should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to hydrogen cyanide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Industrial uses of hydrogen cyanide place the environment at risk of exposure during its transportation, storage, disposal, or destruction. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where hydrogen cyanide contacts incompatible commodities can result in the release of hazardous fumes and gases (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hydrogen cyanide is considered a Class IA flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and low boiling point make hydrogen cyanide a dangerous fire and explosion hazard. Because it is incompatible with many commodities, including water, steam, acids, oxidizers, amines, sodium hydroxides, calcium hydroxide, and most caustics, extreme caution is required in handling, storage, transportation, and disposal of hydrogen cyanide. These characteristics also require special consideration during any emergency situation involving a leak or spill of hydrogen cyanide.

Should hydrogen cyanide ever come into contact with any incompatible substances either during use, transportation, storage, or disposal, release of poisonous fumes and possible violent reactions are possible.

Hydrogen cyanide can enter the environment from industrial and municipal waste treatment plant discharges and from spills. Also, as a fumigant and insecticide, it will also enter the environment as a result of its intended use.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydrogen cyanide. Hydrogen cyanide has high acute toxicity to aquatic life and terrestrial animals. Insufficient data are available to evaluate the short-term effects of hydrogen cyanide to plants and birds.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Hydrogen cyanide has high chronic toxicity to aquatic life and terrestrial animals. Insufficient data are available to evaluate or predict the long-term effects of hydrogen cyanide to plants and birds.

💧 Water Solubility

Hydrogen cyanide is highly soluble in water. Concentrations of 1000 milligrams will mix with a liter of water.

🕒 Persistence in the Environment

Hydrogen cyanide is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the estimated percentages of hydrogen cyanide persistence in the aquatic or terrestrial environments.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hydrogen cyanide found in fish tissues is expected to be much higher than the average concentration of hydrogen cyanide in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of hydrogen cyanide dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydrogen cyanide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. It should be kept dry and in air-tight, moisture-proof containers. Physical damage to containers must be prevented. Proper ventilation and protective equipment should be used while handling the solid or while preparing aqueous solutions.

Hydrogen cyanide is destroyed by burning in a chemical incinerator equipped with an afterburner and scrubber.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. A hydrogen cyanide spill control and countermeasure plan should be developed and practiced before the need for such arises. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. If hydrogen cyanide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydrogen cyanide. If hydrogen cyanide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Gas leaks must be stopped. If this is not possible, the container should be removed to a safe area (outdoors) and allow to vent. Water spray should be used to knock down vapors and protect response personnel trying to stop leak.
- ☑ It may be necessary to dispose of hydrogen cyanide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hydrogen cyanide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Any incident involving a chemical containing the word "cyanide" in its description can evoke an emotional reaction from the public, even when no exposures have occurred. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or envi-

ronmental damage can also result in a loss of profits and loss of current as well as future business.

🔊 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Vapors cause irritation to the upper respiratory tract with coughing, dyspnea, headache, congestion, ulcers in the nose and throat, tissue dehydration, rhinitis, bronchitis, bone changes, congestion, fluorosis, and/or pulmonary edema. ABSORPTION: Skin contact causes immediate swelling, blistering, necrosis, and burning that becomes more intense with prolonged contact. Burns can be bone-deep. Eye contact causes burning, watering, redness, corneal ulceration, blurred vision, and possible blindness. INGESTION: Not likely (hydrogen fluoride is a gas at room temperature). | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin; bone. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of water for 2 to 4 hours or soak in iced Zephiran (0.13%), Epsom salts or a 70% denatured ethyl alcohol solution for 1 to 4 hours. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Not likely. If accidental ingestion of solutions occurs, seek medical attention or contact poison control center. Do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area (avoid vapors). Shut off flow of gas if possible. Solution spills should be covered with lime to form a slurry and deposited in sealed containers. Ventilate area of spill and remove all ignition sources (hydrogen gas may be present). Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, dry, well-ventilated area away from heat and moisture. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where hydrogen fluoride is used, handled, or stored. Detached facility storage is preferred. Prevent damage to containers. Use non-sparking tools around containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure levels are relatively low. Recommend using a supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Acid Resistant Neoprene or PVC | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HYDROGEN FLUORIDE

HF

CAS: 7664-39-3

**IDENTIFICATION AND TYPICAL USES**

Hydrogen fluoride is a colorless gas or a fuming liquid (below 67°F) with a strong, irritating, pungent odor. It is used as a catalyst in alkylation, isomerization, condensation, dehydration, and polymerization reactions. It is also used as a fluorinating agent in organic and inorganic reactions, in the production of fluorine and aluminum fluoride, as an additive in liquid rocket propellants, and in the refining of uranium.

RISK ASSESSMENT: HEALTH**General Assessment**

Hydrogen fluoride is a deadly human poison by *inhalation* and by skin contact (*absorption*). It can also enter the body through *ingestion*, but this exposure route is extremely unlikely since the chemical exists as a gas at room temperature and pressure. It is highly caustic and, therefore, an extremely corrosive and destructive compound. While there are no reports of any carcinogenic effects resulting from exposure to hydrogen fluoride, experimental teratogenic, reproductive, and mutagenic effects have been documented.

Inhalation severely dehydrates tissues and causes destructive corrosive damage to the nose, throat, and mucosa of the upper respiratory tract with possible ulceration of the nose and throat. There can be coughing, dyspnea (labored breathing), lachrymation, and nausea. Severe exposures may cause fluorosis and/or pulmonary edema (fluid in the lungs). The development of pulmonary edema can be delayed up to 48 hours after exposure, thereby creating a false sense of security with regard to health exposure risk.

Skin contact with the vapor or the liquid solution causes severe burning due to hydrogen fluoride's intense corrosive action on human tissue. The liquid may continue to burn and destroy skin tissues long after the exposure if it is not properly removed. Because of the fluoride ion's affinity for calcium, burns

may be bone-deep in some instances. Extensive hydrogen fluoride burns can cause a calcium imbalance which can lead to cardiac irregularities. The extremely corrosive properties of hydrogen fluoride can cause immediate stinging, burning, redness, swelling, membrane ulceration, painful skin blistering, and local necrosis (tissue destruction) upon contact. Eye contact causes immediate stinging and watering with tissue damage and the possibility of corneal damage. There will be redness and swelling of the lids, intense pain, and tissue destruction. Loss of vision is likely.

Ingestion is extremely rare under normal operating conditions. However, if liquid solutions are accidentally swallowed, there can be severe burns to the lips, mouth, throat, and stomach. If vomiting occurs and the liquid is aspirated into the lungs, the corrosive action on the lung tissues can be fatal.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydrogen fluoride:

- Skin:** Irritation/rash or burning feeling on contact with redness, blistering, localized tissue destruction, and deep-seated burns.
- Eye:** Severe irritation; may cause burns and damage with permanent loss of vision.
- Lung:** Severe irritation of the mucous membranes in the nose, throat, and lungs following exposure. Pulmonary edema is likely to occur within 48 hours of exposure.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hydrogen fluoride and can last for months or even years:

Cancer Hazards: According to information presented in the references, hydrogen fluoride has not been ade-

quately tested for its ability to cause cancer in laboratory test animals. However, mutation data have been reported and many scientists believe that such chemicals may pose a cancer risk in the long-term. Additional research is required in this regard.

Reproductive Hazard: According to information presented in the references, hydrogen fluoride has been shown to cause teratogenic and other adverse reproductive effects in test animals.

Other Chronic Effects: Repeated or prolonged exposure may cause fluorosis with possible erosion of teeth enamel. Long-term exposure may damage the kidneys and liver.

🔧 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hydrogen fluoride. It is extremely corrosive and highly toxic to humans. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hydrogen fluoride. The exposure level is extremely low (3 ppm) and difficult to accurately monitor. It is not detectable by odor below this PEL and, therefore, by the time its presence is noticed by smell, an overexposure may have already occurred. While an acid vapor respirator or gas mask may suffice for low or infrequent exposures, the best protection is obtained using a self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, acid resistant neoprene or polyvinyl chloride gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hydrogen fluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hydrogen fluoride is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following tests are recommended:

Lung function tests (establish baseline).

If symptoms occur or overexposure is suspected, the following additional tests are suggested:

Lung function tests (compare to baseline).

Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Liver and kidney function tests.

If skin exposure has occurred, affected area should be washed with flooding amounts of water for 2 to 4 hours. If possible, soak in iced Zephiran (0.13%), Epsom salts, or 70% denatured ethyl alcohol for 1 to 4 hours.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, because smoking can cause heart disease, emphysema, and other respiratory disorders, smokers exposed to hydrogen fluoride may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* possible exposure factors.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to hydrogen fluoride and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydrogen fluoride should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hydrogen fluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and especially air).

Hydrogen fluoride is considered a non-flammable gas. However, it is extremely corrosive to many materials. It is incompatible with water or steam and will liberate explosive hydrogen gas and heat on contact. It is corrosive to most metals, glass, and reacts with calcium silicate to form silicon tetrafluoride. Reaction with alkali metals can be explosive and violent. If it contacts porous materials such as wood or cement, the resultant continuation can remain indefinitely. These characteristics require special consideration during any emergency situation involving a leak or spill of hydrogen fluoride. Should hydrogen fluoride ever come into contact with any incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Hydrogen fluoride can enter the environment mainly industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydrogen fluoride.

Insufficient data are available to evaluate or predict the short-term effects of hydrogen fluoride exposure to aquatic life, plants, birds, or land animals.

🌱 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of hydrogen fluoride to aquatic life, plants, birds, or land animals.

💧 Water Solubility

Hydrogen fluoride is highly soluble in water. Concentrations of over 1000 milligrams will mix with a liter of water.

⌚ Persistence in the Environment

Hydrogen fluoride is slightly persistent in the aquatic environment, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Small quantities of such acids as hydrogen fluoride will be neutralized by the alkalinity in aquatic systems, but larger quantities can lower the pH for extended periods of time. The concentration of fluoride found in the edible tissues of most aquatic species that are consumed by humans is expected to be about the same as the average concentration of hydrogen fluoride in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydrogen fluoride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Containers should be protected against physical damage and stored away from direct sunlight or other heat sources. Because it will corrode and/or react with many materials, selection of storage containers requires proper consideration. Hydrogen fluoride will corrode glass and react with most metals. Among the substances it does not corrode

are lead, platinum, wax, and polyethylene. It should therefore be stored in lead carboys or in waxed or polyethylene bottles.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils (solution spills) should be removed for incineration and replaced with clean soil. If hydrogen fluoride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and, therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydrogen fluoride. If hydrogen fluoride is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove ignition sources and ventilate area.
- Shut off gas leak, if possible. If leak is from a cylinder and it cannot be turned off, remove cylinder to safe area (outdoors) and allow to vent. Take care to avoid contact with the vapors or any escaping compressed liquids. Be aware of the possibility that hydrogen gas may be in the area (explosion hazard).
- Carefully neutralize liquid spills with lime to form a slurry and collect for disposal. Do not flush to drains, sewers, or waterways.
- It may be necessary to dispose of hydrogen fluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hydrogen fluoride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may

result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Irritation of the nose, mouth, and lungs. At low concentrations (3%), relatively non-toxic. Between 8-20%, very corrosive. The vapors can cause lachrymation, sneezing, headache, dyspnea, cyanosis, salivation, nausea and vomiting, giddiness, insomnia, tremors, coma, bleaching of hair, and pulmonary edema. SKIN & EYES: A severe (caustic) skin irritant that can cause whitening of the surface, redness, blisters, and vesiculation. Eye contact can cause corneal ulceration and loss of sight. INGESTION: Irritation and burning of the lips, mouth, and throat, painful swallowing, salivation, throat swelling, intense thirst, nausea and bloody vomiting, stomach distention and perforation, convulsions, coma, possible cerebral edema, and death. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, CNS. |
| Medical Conditions Generally Aggravated by Exposure Chronic respiratory diseases or skin diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), lifting and holding eyelids open. Seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water for 15 minutes (minimum). Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If swallowed: Seek medical attention immediately. Give large amounts of water and induce vomiting (unless advised otherwise). | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials. Store in tightly closed containers in cool, dry, well-ventilated area away from heat and flame. Prevent contamination to avoid violent decomposition. | | | | |
| Other Precautions and Warnings Do NOT use near organic materials. Heat may cause containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure level is low and difficult to monitor. Recommend use of a supplied-air respirator with full face-piece, in continuous flow mode, or a SCBA operated in pressure demand or positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl, Nitrile, Natural Rubber, Viton | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HYDROGEN PEROXIDE (3-52%)

CAS: 7722-84-1

**IDENTIFICATION AND TYPICAL USES**

Hydrogen peroxide is a colorless liquid with a slight, sharp odor. It is often used in aqueous solutions of varying concentrations. It is used in bleaching and deodorizing of textiles, wood, pulp, hair, and fur. It is also a source of organic and inorganic peroxides. It is used extensively in the pulp and paper industries, as a plasticizer, in waste treatment, in the manufacture of foam rubber, in making glycerol, in dyeing, in electroplating, as an antiseptic (dilute solutions), as a laboratory reagent, in epoxidation, in hydroxylation, in oxidation, and reduction. It is used as a viscosity control for starch and cellulose derivatives, in refining and cleaning metals, as a bleaching and oxidizing agent in foods, as a neutralizing agent in wine distillation, as a seed disinfectant, and as a substitute for chlorine in water and sewage treatment.

RISK ASSESSMENT: HEALTH***General Assessment***

Hydrogen peroxide at concentrations of 3% is relatively non-toxic. Concentrations over 8% is considered a severe irritant causing caustic destruction to tissues. Exposure can be by *inhalation* of its vapors, direct *ingestion* of the liquid, or by skin contact (although absorption through the skin has not been reported). At concentrations above 50% it has caused questionable carcinogenic effects in test animals but the extent of its human cancer-causing properties is unknown. Human mutation data have been reported.

Inhalation of concentrations above 8% causes mild to severe irritation and burns to the eyes, nose, and throat. There will be tearing (lachrymation), sneezing, cough with phlegm, headache, dyspnea, cyanosis, salivation, giddiness, nausea, vomiting, muscle weakness, ulceration of the nasal mucosa, insomnia, tremors, parasthesia, secondary chemical

pneumonia, and pulmonary edema (fluid in the lungs). Symptoms of pulmonary edema may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk. Serious cases end in shock, convulsions, and death. The vapors may also bleach the hair white.

On skin contact, hydrogen peroxide will cause irritation and immediate erythema (redness). If allowed to remain in contact, there will be painful blisters, swelling, vesiculation, and corrosive tissue damage. Eye contact will also be irritating and painful and may cause corneal ulceration and possible damage to vision.

Ingestion of concentrations between 8 and 50% causes irritation and burning to the lips, mouth, throat, and gastrointestinal tract with painful swallowing, excessive salivation, thirst, throat swelling, nausea and bloody vomiting due to digestive hemorrhage, stomach distention and perforation, convulsions, possible cerebral edema (fluid on the brain), and death.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydrogen peroxide:

- Skin:** Immediate irritation, rash, and burning feeling on contact. Corrosive destruction possible.
- Eye:** Irritation and possible damage if allowed to remain in contact. May cause burns.
- Lung:** Irritation of the respiratory tract, including the nose and mouth. There may be cough with phlegm, salivation, and shortness of breath. Pulmonary edema is possible at higher levels, which can be fatal.
- CNS:** Causes giddiness, parasthesia, muscle weakness, convulsions, cyanosis, tremors, coma, and death.

Other: Exposure to the vapors may bleach the hair and skin white.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to hydrogen peroxide and can last for months or even years:

Cancer Hazards: According to information presented in the references, hydrogen peroxide concentrations greater than 8% may cause mutations (genetic changes) in living cells. Its carcinogenic properties are questioned in animals and unknown in humans.

Reproductive Hazard: According to information presented in the references, hydrogen peroxide has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: None reported.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hydrogen peroxide. The exact nature of its carcinogenic properties is unknown in humans. Solutions greater than 8% hydrogen peroxide are severely corrosive and destructive to human tissues. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hydrogen peroxide, especially at concentrations above 8%. The exposure limit for hydrogen peroxide is relatively low (1 ppm) and difficult to accurately monitor. For any concentration, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or a supplied-air respirator in continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, nitrile, Viton, butyl, or natural rubber gloves should be used. Glove manufacturers should be compensated and permeation studies obtained *before* glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which

specify the methods and techniques that will be practiced whenever personnel are to work with or around hydrogen peroxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hydrogen peroxide is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), or for those having frequent or potentially high exposures, the following medical tests are recommended:

Lung function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

Lung function tests.

Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Gastric lavage may be recommended if swallowed.

Analysis of body fluids (gastric aspirates) using titanium chloride reaction will reveal peroxides if performed immediately.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause lung cancers, emphysema, heart disease, and a number of other respiratory problems, the effects of exposure to hydrogen peroxide in smokers may appear to be significantly higher than that which is seen in non-smokers. This must be taken into consideration for proper risk assessment and management.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to hydrogen peroxide and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information

on the health and safety hazards of hydrogen peroxide should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hydrogen peroxide, emergency shower facilities should also be provided in the immediate area.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of hydrogen peroxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hydrogen peroxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hydrogen peroxide is considered a non-combustible liquid but an extremely powerful oxidizer. Concentrated solutions can decompose violently if trace impurities are present. Contact with oxidizable materials may cause spontaneous combustion. Violent explosions may occur in contact with many common metals. These characteristics require extreme caution in handling, storage, transportation, and disposal. Also, contact with incompatible materials can cause violent fire or explosion and special consideration is required during any emergency situation involving a leak or spill of hydrogen peroxide. Should hydrogen peroxide ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is also extremely possible.

Hydrogen peroxide may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydrogen peroxide.

Insufficient data are available on the short-term effects of hydrogen peroxide exposure to aquatic life, plants, birds, or land animals.

☼ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of hydrogen peroxide to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Hydrogen peroxide is highly soluble in water. Concentrations of 1000 milligrams or more will mix with a liter of water.

🕒 *Persistence in the Environment*

Insufficient data are available on the properties of hydrogen peroxide to estimate or predict its distribution in the environment. Limited data suggest that hydrogen peroxide will be moderately persistent in water, with a half-life of between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Hydrogen peroxide is not expected to accumulate in the edible tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydrogen peroxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appro-

Risk Management for Hazardous Chemicals

priate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hydrogen peroxide should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydrogen peroxide. If hydrogen peroxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of hydrogen peroxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hydrogen peroxide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate

plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|--|---|--|
| Hydrogen peroxide (derivation: By autoxidation of an alkyl anthrahydroquinone in which the quinone formed in the oxidation step is reduced to the starting material by hydrogen in the presence of a supported palladium catalyst; by an electrolytic process). 1 ppm = 1.41 mg/m³ | PEL: 1 ppm 1.4 mg/m³ STEL: Not Established | REL: 1 ppm 1.4 mg/m³ STEL: Not Established | 75 ppm | TLV: 1 ppm 1.4 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 306°F (152°C) pure H₂O₂ | Specific Gravity (H ₂ O = 1) 1.29 |
| Vapor Pressure (gas) 5 at 86°F (30°C) | Molecular Weight 34.0 |
| Vapor Density (Air = 1) 1.2 | Melting Point 31°F (-0.4°C) pure H₂O₂ |

Solubility

Soluble in water, alcohol, and ether. Insoluble in petroleum ether. Decomposes in most solvents.

Appearance and Odor

Colorless liquid with a slight, sharp odor. The pure compound is a crystalline solid below 31°F (-0.4°C).

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: Not Applicable UEL: Not Applicable |
| NFPA Classification Non-Combustible Liquid | Autoignition Temperature Not Applicable |

Extinguishing Media

Use flooding amounts of water on surrounding fire. Do NOT use dry chemical.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Move containers from fire if it can be done without risk. Remain clear of smoke. Fight fires from a distance or protected location, if possible. Use water to keep combustible materials wet.

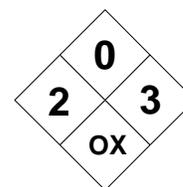

Unusual Fire and Explosion Hazards

A non-combustible liquid but a powerful oxidizer. Dangerous fire and explosion hazard when exposed to heat or flame. Containers may explode in fire. Flammable hydrogen gas may be formed in fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|---|--|---|
| Stability | | Conditions to Avoid Hydrogen peroxide solution free of contaminants is normally stable but will still decompose to release oxygen when inhibited with acetanilide or sodium stannate. It must be stored in vented containers. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Oxidizable materials, ordinary organic materials (paper, wood), most metals (such as iron, copper, brass, bronze, chromium, zinc, lead, silver, manganese). Will ignite spontaneously in contact with organics. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of hydrogen peroxide is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, explosion is possible due to the release of hydrogen gas. In fire, hydrogen peroxide produces water and ½ oxygen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: Irritation of the nose, mouth, and lungs. Symptoms include nosebleeds, sore throat, hoarseness, cough with phlegm, increased saliva, and shortness of breath. The vapors may also cause lachrymation, sneezing, headache, dyspnea, cyanosis, salivation, nausea and vomiting, giddiness, insomnia, tremors, bleaching of hair, and pulmonary edema. SKIN & EYES: A severe (caustic) skin irritant that can cause whitening of the surface, redness, blisters, and vesiculation. Eye contact can cause corneal ulceration and loss of sight. INGESTION: Irritation and burning of the lips, mouth, and throat, painful swallowing, salivation, throat swelling, intense thirst, nausea and bloody vomiting, stomach distention and perforation, convulsions, coma, possible cerebral edema, and death. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, CNS. |
| Medical Conditions Generally Aggravated by Exposure Chronic respiratory diseases or skin diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), lifting and holding eyelids open. Seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water for 15 minutes (minimum). Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If swallowed: Seek medical attention immediately. Give large amounts of water and induce vomiting (unless advised otherwise). | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials. Store in tightly closed containers in cool, dry, well-ventilated area away from heat and flame. Prevent contamination to avoid violent decomposition. | | | | |
| Other Precautions and Warnings Do NOT use near organic materials. Heat may cause containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure level is low and difficult to monitor. Recommend use of a supplied-air respirator with full face-piece, in continuous flow mode, or a SCBA operated in pressure demand or positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl, Nitrile, Natural Rubber, Viton | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HYDROGEN PEROXIDE (52-100%)

CAS: 7722-84-1

**IDENTIFICATION AND TYPICAL USES**

Hydrogen peroxide is a colorless liquid with a slight, sharp odor. The pure compound appears as a crystalline solid at temperatures below 31°F (-0.4°C). It is often used in aqueous solutions of varying concentrations. It is used in bleaching and deodorizing of textiles, wood, pulp, hair, and fur. It is also a source of organic and inorganic peroxides. It is used extensively in the pulp and paper industries, as a plasticizer, in rocket fuels (90% solution), in the manufacture of foam rubber, in making glycerol, in dyeing, in electroplating, as an antiseptic (dilute solutions), as a laboratory reagent, in epoxidation, in hydroxylation, in oxidation, and reduction. It is used as a viscosity control for starch and cellulose derivatives, in refining and cleaning metals, as a bleaching and oxidizing agent in foods, as a neutralizing agent in wine distillation, as a seed disinfectant, and as a substitute for chlorine in water and sewage treatment.

RISK ASSESSMENT: HEALTH***General Assessment***

Hydrogen peroxide is a severe irritant causing caustic destruction to tissues. Exposure can be by *inhalation* of its vapors, direct *ingestion* of the liquid, or by skin contact (although absorption through the skin has not been reported). It has caused questionable carcinogenic effects in test animals but the extent of its human cancer-causing properties is unknown. Human mutation data have been reported.

Inhalation causes severe irritation and even burns to the eyes, nose, and throat. There will be tearing (lachrymation), sneezing, cough with phlegm, headache, dyspnea, cyanosis, salivation, giddiness, nausea, vomiting, muscle weakness, ulceration of the nasal mucosa, insomnia, tremors, parasthesia, secondary chemical pneumonia, and possible pulmonary edema

(fluid in the lungs). Symptoms of pulmonary edema may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk. Serious cases end in shock, convulsions, and death. The vapors may also bleach the hair white.

On skin contact, hydrogen peroxide will cause irritation and immediate erythema (redness). If allowed to remain in contact, there will be painful blisters, swelling, vesiculation, and corrosive tissue damage. Eye contact will also be irritating and painful. Contact may also cause corneal ulceration and permanent damage to vision.

Ingestion causes immediate irritation and burning to the lips, mouth, throat, and gastrointestinal tract with painful swallowing, excessive salivation, thirst, throat swelling, nausea and bloody vomiting due to digestive hemorrhage, stomach distention and perforation, convulsions, possible cerebral edema (fluid on the brain), and death.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydrogen peroxide:

- Skin:** Immediate irritation, rash, and burning feeling on contact. Corrosive destruction possible.
- Eye:** Irritation and possible damage if allowed to remain in contact. May cause burns.
- Lung:** Irritation of the respiratory tract, including the nose and mouth. There may be cough with phlegm, salivation, and shortness of breath. Pulmonary edema possible at higher levels, which can be fatal.
- CNS:** Causes giddiness, parasthesia, muscle weakness, convulsions, and coma.
- Other:** Exposure to the vapors may bleach the hair and skin white.

☼ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to hydrogen peroxide and can last for months or even years:

Cancer Hazards: According to information presented in the references, hydrogen peroxide may cause mutations (genetic changes) in living cells. Its carcinogenic properties are questioned in animals and unknown in humans and requires more testing.

Reproductive Hazard: According to information presented in the references, hydrogen peroxide has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: None reported.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hydrogen peroxide. The exact nature of its carcinogenic properties is unknown in humans. Solution greater than 52% hydrogen peroxide are severely corrosive and destructive to human tissues. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hydrogen peroxide. The exposure limit for hydrogen peroxide is relatively low (1 ppm) and difficult to accurately monitor. For any concentration, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or a supplied-air respirator in continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, nitrile, Viton, butyl, or natural rubber gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be prac-

ticed whenever personnel are to work with hydrogen peroxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hydrogen peroxide is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), or for those having frequent or potentially high exposures, the following medical tests are recommended:

Lung function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

Lung function tests.

Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Gastric lavage may be recommended if swallowed.

Analysis of body fluids (gastric aspirates) using titanium chloride reaction will reveal peroxides if performed immediately.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause lung cancers, emphysema, heart disease, and a number of other respiratory problems, the effects of exposure to hydrogen peroxide in smokers may appear to be significantly higher than that which is seen in non-smokers. This must be taken into consideration for proper risk assessment and management.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to hydrogen peroxide and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydrogen per-

oxide should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hydrogen peroxide, emergency shower facilities should also be provided in the immediate area.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of hydrogen peroxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hydrogen peroxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hydrogen peroxide is considered a non-combustible liquid but an extremely powerful oxidizer. Concentrated solutions can decompose violently if trace impurities are present. Contact with oxidizable materials may cause spontaneous combustion. Violent explosions may occur in contact with many common metals. These characteristics require extreme caution in handling, storage, transportation, and disposal. Also, contact with incompatible materials can cause violent fire or explosion and special consideration is required during any emergency situation involving a leak or spill of hydrogen peroxide. Should hydrogen peroxide ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is also extremely possible.

Hydrogen peroxide may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydrogen peroxide.

Insufficient data are available on the short-term effects of hydrogen peroxide exposure to aquatic life, plants, birds, or land animals.

☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of hydrogen peroxide to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Hydrogen peroxide is highly soluble in water. Concentrations of 1000 milligrams or more will mix with a liter of water.

⌚ *Persistence in the Environment*

Insufficient data are available on the properties of hydrogen peroxide to estimate or predict its distribution in the environment. Limited data suggest that hydrogen peroxide will be moderately persistent in water, with a half-life of between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Hydrogen peroxide is not expected to accumulate in the edible tissues of fish.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydrogen peroxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings

designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hydrogen peroxide should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydrogen peroxide. If hydrogen peroxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of hydrogen peroxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hydrogen peroxide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be

pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

HYDROGEN SELENIDEH₂Se

CAS: 7783-07-5

**IDENTIFICATION AND TYPICAL USES**

Hydrogen selenide is a colorless gas with an extremely irritating odor resembling that of decaying horseradish. It is normally shipped as a liquefied compressed gas. It is used in the preparation of metallic selenides and organoselenium compounds. It is also used in doping as a mix for preparation of semiconductor materials containing controlled amounts of significant impurities.

RISK ASSESSMENT: HEALTH***General Assessment***

Hydrogen selenide is a gas at room temperature and pressure and, therefore, presents a serious (life-threatening) hazard to human health through *inhalation*. The liquefied compressed gas can also cause serious health hazard concerns if it should contact the skin or eyes. Ingestion is not considered a probable route of entry. There are no reports in the references regarding the carcinogenic, mutagenic, or teratogenic effects of hydrogen selenide on humans or animals.

Inhalation of hydrogen selenide vapors causes irritation of the eyes, nose, throat, and mucous membranes of the respiratory tract. Other symptoms include a metallic taste in the mouth and garlic odor on breath, nausea, vomiting, diarrhea, olfactory fatigue, and other indications of central nervous system effects. These include dizziness, lassitude, headache, and fatigue. It is an allergen and may cause conjunctivitis. Higher exposures can lead to a dangerous buildup of fluid in the lungs in a condition known as pulmonary edema. This is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk.

Skin and eye contact with the compressed liquefied gas can result in serious tissue destruction and burns from frostbite. There may be surface redness

(erythema), blistering, and painful swelling. There may also be permanent damage or loss to vision.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydrogen selenide:

Skin: The liquid causes painful frostbite and deep burns with tissue destruction.

Eye: The vapor can be extremely irritating and the liquid may cause tissue destruction as a result of frostbite burns. Loss of vision is possible.

Lung: Severe irritation of the nose and throat. May cause delayed pulmonary edema.

CNS: Dizziness, headaches, nausea, vomiting, fatigue, lassitude, and other related nervous system effects.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to hydrogen selenide and can last for months or even years:

Cancer Hazards: According to the information presented in the references, hydrogen selenide has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, hydrogen selenide has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged exposures may damage the liver and/or the lungs.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with hydrogen selenide. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Care should be taken when isolating jobs to ensure an asphyxiation condition is not created.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hydrogen selenide. This chemical has an extremely low and difficult to monitor permissible exposure limit (0.05 ppm). Therefore, prudent risk management requires a conservative approach to personal protection. A self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or a supplied-air respirator in continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever compressed liquefied hydrogen selenide gas is being used, a chemical splash hazard exists and a face shield and protective apron should be worn. To prevent hand and skin exposures, impervious, thermal protective gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hydrogen selenide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hydrogen selenide is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests
- Liver function tests.
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory disorders,

smokers may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible factors which might be causing the appearance of exposure symptoms in the workplace.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to hydrogen selenide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydrogen selenide should be communicated to all exposed or potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hydrogen selenide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills of the liquefied compressed gas or releases of the hydrogen selenide gas, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hydrogen selenide is considered a highly flammable and extremely reactive gas. It presents a serious fire and explosion hazard under normal conditions of temperature and pressure. As a gas, it can quickly and easily form explosive mixtures in air. In reaction to incompatible materials such as halogenated hydrocarbons, strong oxidizers, acids, and even water, it may ignite or explode. These characteristics require special consideration during any emergency situation involving a leak or spill of hydrogen selenide or hydrogen selenide mixtures. Should hydrogen selenide ever

come into contact with any of these incompatible substances either during use, transportation, or storage, violent reactions can occur.

Hydrogen selenide can enter the environment through industrial discharges or releases, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydrogen selenide.

Insufficient data are available to evaluate or predict the short-term effects of hydrogen selenide to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of hydrogen selenide to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Hydrogen selenide is very slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

🕒 *Persistence in the Environment*

Hydrogen selenide is non-persistent in water, with a half-life less than 2 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Virtually 100% of hydrogen is expected to end up in the air. Selenium is moderately persistent in the environment with a half-life between 20 and 200 days. Selenium is expected to end up in aquatic sediments and terrestrial soils.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of the selenide found in fish tissues is expected to be much higher than the average

concentration of hydrogen selenide in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydrogen selenide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil using non-sparking tools. If hydrogen selenide should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydrogen selenide. If hydrogen selenide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Stop the flow of gas before attempting cleanup procedures. If leak is from a cylinder and it cannot be stopped, remove cylinder to safe location (outdoors) and allow to vent until empty. Use water spray to knock down unignited vapors and to protect response personnel.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hydrogen selenide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require

a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|--|---------------------------------|
| Characterization Gas, Toxic and Flammable | RCRA Number U135 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Hydrogen Sulfide | Chemical Abstract Service (CAS) Number 7783-06-4 | |
| DOT Hazard Class and Label Requirements Flammable Gas; Poison Gas | DOT Emergency Guide Code 13 | |
| DOT Identification Number UN 1053 | Chemical Formula H₂S | |

Synonyms

Sulfuretted hydrogen; sulfur hydride; hydrogen sulfuric acid; stink damp.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Hydrogen sulfide (derivation: By action of dilute sulfuric acid on a sulfide, usually iron sulfide; by direct union of hydrogen and sulfur vapor at a definite temperature and pressure; as a byproduct of petroleum refining). 1 ppm = 1.42 mg/m³ | PEL (ceiling): 20 ppm 28 mg/m³ PEAK: 50 ppm (10-minute) | REL (ceiling): 10 ppm 15 mg/m³ (10-minute) STEL: Not Applicable | 100 ppm | TLV: 10 ppm 15 mg/m³ STEL: 15 ppm 21 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point -76°F (-60°C) | Specific Gravity (H ₂ O = 1) 1.19 |
| Vapor Pressure (atmospheres) 18.5 at 68°F (20°C) | Molecular Weight 34.1 |
| Vapor Density (Air = 1) 1.175 | Melting Point -122°F (-86°C) |

Solubility

Slightly soluble water (0.4%). Soluble in ethyl alcohol, gasoline, kerosene, crude oil, ethylene glycol.

Appearance and Odor

Colorless gas with a characteristic odor similar to that of rotten eggs. Normally shipped as a liquefied compressed gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: 4.0% UEL: 44.0% |
| NFPA Classification Flammable Gas | Autoignition Temperature 500°F (260°C) |

Extinguishing Media

Stop flow of gas before attempting to extinguish fire! Use water spray to knock down vapors.

Special Fire Fighting Procedures

Extremely flammable gas. Burns with a blue flame and gives off sulfur dioxide and other poisonous gases. Wear full protective clothing and self-contained breathing apparatus (SCBA). Move containers from fire area if it can be done without risk. Use unmanned device if possible.

Unusual Fire and Explosion Hazards

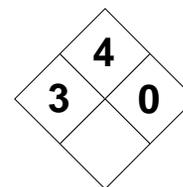

Hydrogen sulfide is denser than air and can travel low to the ground and collect in low-lying areas to present a serious explosion hazard. It can also travel to an ignition source and flashback to cause fire or explosion. Cool containers with water spray long after fire is out. Contain runoff.

SECTION V - REACTIVITY DATA

| | | | | |
|--|----------------------------|---|--|---|
| Stability | | Conditions to Avoid Hydrogen sulfide is normally stable under routine conditions of handling and storage. Avoid contact with heat and incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reacts in contact with strong oxidizers, such as chlorine, fluorine, and bromine, strong nitric acid, and will attack most metals (forms sulfides). | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of hydrogen sulfide is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, hydrogen sulfide emits toxic fumes and gases, including highly toxic sulfur dioxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and respiratory system. May cause nausea, vomiting, cramps, dizziness, headache, diarrhea, sneezing, staggering, excitability, dry cough, pale complexion, muscular weakness, drowsiness, rhinitis, bronchitis, pharyngitis, and other lung effects such as pneumonia and pulmonary edema. Other effects include asphyxia, tremors, fatigue, weakness and numbing in the extremities, convulsions, coma, death. SKIN & EYES: The liquefied compressed gas can cause painful frostbite, burning, and blistering to the eyes and skin. Absorption of the vapor is not likely to occur. INGESTION: Not likely (hydrogen sulfide is a gas at room temperature and pressure) | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, skin, eyes, CNS. |
| Medical Conditions Generally Aggravated by Exposure Eye and nervous system disorders may be aggravated by exposure to hydrogen sulfide. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with warm water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Wash area with large amounts of warm (tepid) water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 48 hours for lung effects. If swallowed: Not a likely exposure route. DOCTOR: Administration of 100% oxygen and hyperbaric oxygen if possible. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Stop flow of gas. Use water spray to knock down vapors and protect personnel. If leak is a cylinder and it cannot be stopped, remove it to a safe location (outdoors) and allow to vent until empty. Ventilate area and remove ignition sources. Neutralize runoff with crushed limestone or slacked lime. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store hydrogen sulfide in the presence of incompatible chemicals or materials. Store in tightly closed steel cylinders in a cool, dark, well-ventilated area. Personnel working with hydrogen sulfide should be trained on its proper handling and storage <i>prior</i> to being assigned to such responsibilities. | | | | |
| Other Precautions and Warnings Prevent physical damage to containers. Use non-sparking tools, especially when opening and closing cylinders. Use class 1, group C electrical equipment in storage and use areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Recommend using a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode, or use a supplied-air respirator operated in continuous flow mode. Air purifying respirators do NOT provide protection in oxygen deficient atmospheres. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious, Thermal Protective | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron (avoid skin contact) |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HYDROGEN SULFIDEH₂S

CAS: 7783-06-4

**IDENTIFICATION AND TYPICAL USES**

Hydrogen sulfide is a colorless gas with an extremely irritating, characteristic odor resembling that of rotten eggs. It is normally shipped as a liquefied compressed gas. It is used in the purification of hydrochloric acid and sulfuric acid, in precipitating sulfides of metals, as an analytical reagent, in the manufacture of heavy water, and as a source of sulfur and hydrogen. It occurs in natural gas and in sewer gas. It is formed by the reaction of a metal sulfide with dilute mineral acid and in petroleum refining.

RISK ASSESSMENT: HEALTH***General Assessment***

Hydrogen sulfide is a gas at room temperature and pressure and, therefore, presents a serious (life-threatening) hazard to human health through *inhalation*. The liquefied compressed gas can also cause serious health hazard risks if it should contact the skin or eyes. Ingestion is not considered a probable route of entry. There are no reports in the references regarding the carcinogenic, mutagenic, or teratogenic effects of hydrogen sulfide on humans or animals.

Inhalation of hydrogen sulfide vapors causes irritation of the eyes, nose, throat, and mucous membranes of the respiratory tract. Other symptoms include nausea, vomiting, diarrhea, olfactory fatigue, and other indications of central nervous system effects. These include dizziness, convulsions, staggering gait, excitability, pale complexion, muscular weakness, numbing in the extremities, headache, and fatigue. These effects can progress to unconsciousness and death due to respiratory paralysis. It is also an allergen and an asphyxiant. Higher exposures can lead to a dangerous buildup of fluid in the lungs in a condition known as pulmonary edema. This is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk.

Other respiratory system effects include asphyxia, rhinitis, bronchitis, pharyngitis, and pneumonia.

Skin and eye contact with the compressed liquefied gas can result in serious tissue destruction and burns from frostbite. There may be surface redness (erythema), blistering, vesiculation, and painful swelling. There may also be permanent damage or loss to vision. The eyes are susceptible to a condition known as gas eye (keratoconjunctivitis) with palpebral edema, bulbar conjunctivitis, and mucous-puss secretions.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydrogen sulfide:

- Skin:** The liquid causes painful frostbite and deep burns with tissue destruction.
- Eye:** The vapor can be extremely irritating and the liquid may cause tissue destruction as a result of frostbite burns. Loss of vision is possible.
- Lung:** Severe irritation of the nose and throat. May cause delayed pulmonary edema, which can be fatal. Olfactory fatigue is also common.
- CNS:** Dizziness, headaches, nausea, vomiting, fatigue, and other related nervous system effects.

☹ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to hydrogen sulfide and can last for months or even years:

Cancer Hazards: According to the information presented in the references, hydrogen sulfide has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, hydrogen sulfide has not

been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged exposures may lead to chronic headaches, fatigue, conjunctivitis, digestive disturbances, weight loss, dizziness, a grayish-green line on the gums of the mouth, and irritability.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hydrogen sulfide. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Care should be taken when isolating jobs to ensure an asphyxiation condition is not created.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hydrogen sulfide. This chemical has a relatively low permissible exposure limit ceiling (20 ppm) and, because hydrogen sulfide will cause rapid olfactory fatigue, the sense of smell should NOT be relied upon to warn of the continuous presence of hydrogen sulfide gas. Therefore, prudent risk management requires a conservative approach to personal protection. A self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or a supplied-air respirator in continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever compressed liquefied hydrogen sulfide gas is being used, a chemical splash hazard exists and a face shield and protective apron should be worn. To prevent hand and skin exposures, impervious, thermal protective gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hydrogen sulfide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hydrogen sulfide is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory disorders, smokers may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* possible factors which might be causing the appearance of exposure symptoms in the workplace.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to hydrogen sulfide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydrogen sulfide should be communicated to all exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hydrogen sulfide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills of the liquefied compressed gas or releases of the hydrogen sulfide gas, large or small, can result in fire,

explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hydrogen sulfide is considered a highly flammable gas. It presents a serious fire and explosion hazard under normal conditions of temperature and pressure. As a gas, it can quickly and easily form explosive mixtures in air. In reaction to incompatible materials such as strong oxidizers, acids, and many metals, it may ignite or explode. These characteristics require special consideration during any emergency situation involving a leak or spill of hydrogen sulfide or hydrogen sulfide mixtures. Should hydrogen sulfide ever come into contact with any of these incompatible substances either during use, transportation, or storage, violent reactions can occur.

Hydrogen sulfide occurs naturally and can also enter the environment through industrial discharges or releases, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydrogen sulfide.

Insufficient data are available to evaluate or predict the short-term effects of hydrogen sulfide to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of hydrogen sulfide to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Hydrogen sulfide is very slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

🕒 *Persistence in the Environment*

Hydrogen sulfide is non-persistent in water, with a half-life less than 2 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Virtually 100% of hydrogen is expected to end up in the air. The sulfide is moder-

ately persistent in the environment with a half-life between 20 and 200 days.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of the sulfide found in fish tissues is expected to be much higher than the average concentration of hydrogen sulfide in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydrogen sulfide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Class 1, group C electrical equipment should be installed in storage areas.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hydrogen sulfide should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydrogen sulfide.

If hydrogen sulfide is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all sources of ignition.

- ☑ Stop the flow of gas before attempting cleanup procedures. If leak is from a cylinder and it cannot be stopped, remove cylinder to safe location (outdoors) and allow to vent until empty. Use water spray to knock down unignited vapors and to protect response personnel.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hydrogen sulfide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Medical Conditions Generally Aggravated by Exposure Skin diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. Keep victim warm and at rest. If <u>swallowed:</u> Seek medical attention immediately. Give conscious person 1 to 2 glasses of water to dilute. Do NOT induce vomiting. <u>DOCTOR:</u> Consider gastric lavage and a urine screen test. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powders using HEPA vacuum. Do NOT dry sweep. Absorb solution spills in vermiculite and place in sealed drum. Ventilate area of spill or leak. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, dry, well-ventilated area away from heat, flame, and direct sunlight. Use only non-sparking tools. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where hydroquinone is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above the PEL, use a MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves PVC, Chlorinated Polyethylene | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HYDROQUINONE

CAS: 123-31-9

**IDENTIFICATION AND TYPICAL USES**

Hydroquinone is a colorless, light-tan, or light-gray, crystalline (hexagonal) solid in the shape of prisms. The degree of color change is dependent upon the level of oxidation. It is used as a reducing agent, in black and white photography development, as a dye intermediate, as an inhibitor, as a stabilizer in paints and varnishes, in motor fuels and oils, as an antioxidant for fats and oils, as an inhibitor of polymerization, and in skin hyper-pigmentation.

RISK ASSESSMENT: HEALTH**General Assessment**

Hydroquinone is moderately toxic by *ingestion* and *inhalation*. It will cause moderate health hazard risk on skin or eye contact, but absorption through intact skin has not been reported. Its carcinogenicity in humans is not known but is questioned in some animal studies. It has been shown to cause mutations (genetic changes) in human cells. Experimental reproductive data have also been reported in animal tests. Hydroquinone is metabolized in the body to more toxic quinone which is responsible for the compound's systemic toxicity.

Inhalation of the dusts causes irritation of the nose, throat, and mucous membranes of the respiratory tract. It may also cause central nervous system disturbances similar to those caused by ingestion.

Skin and eye contact may produce mild to moderate irritation on contact. It can cause sensitization and eczematous dermatitis. Direct eye contact with hydroquinone particles causes immediate irritation and possible corneal ulceration.

Ingestion of hydroquinone causes serious toxic systemic effects. It is readily absorbed through the digestive process. There will be initial gastrointestinal

irritation followed by central nervous system effects including blurred speech, ringing in the ears, tremors, a feeling of suffocation, headache, muscular twitching, vomiting, nausea, convulsions, dyspnea, cyanosis and methemoglobinemia, coma and unconsciousness, collapse, and possibly death due to respiratory failure. There may be changes in the color of the urine to green or brownish-green.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydroquinone:

- Skin:** Will defat the skin and cause irritation and dermatitis (eczematous) and sensitization.
- Eye:** Severe irritation with a potential for corneal injury or damage.
- Lung:** Nose and throat irritation. Produces central nervous system effects and may cause lung effects as well.
- CNS:** Numerous effects by ingestion and inhalation. There may be headaches, muscle twitching, convulsions, dyspnea, blurred speech, ringing in the ears, tremors, coma, collapse, and death.

☪ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hydroquinone and can last for months or even years:

Cancer Hazards: According to information presented in the references, hydroquinone has been shown to cause cancer in some test animals. However, the data are conflicting and inconclusive in this regard. Some studies indicate that it causes mutations in humans.

Some studies have listed its cancer causing properties as questioned animal studies.

Reproductive Hazard: According to information presented in the references, hydroquinone may have the ability to adversely affect reproduction in animals. The teratogenicity of hydroquinone in humans has not been adequately studied.

Other Chronic Effects: Prolonged contact may cause brownish staining of the conjunctiva followed by corneal changes and possible loss of visual acuity. Repeated skin contact can lead to chronic dermatitis and may cause de-pigmentation (in darker-skinned people) and hyper-pigmentation (in fair-skinned persons).

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with hydroquinone. The exact nature of the toxicity of this chemical is not entirely understood in the references. Therefore, prudent risk management requires it be treated as though it posed a significant health risk in the event of overexposure. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hydroquinone. The exposure ceiling is relatively low (2 mg/m^3) and difficult to accurately monitor. For all exposures, a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious polyvinyl chloride or polyethylene gloves should be used. Glove manufacturers should be contacted to obtain permeation studies *before* glove selection has been made for hydroquinone.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hydroquinone.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hydroquinone is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney function tests and urinalysis (check for color changes).
- ☑ Evaluation by a qualified allergist, with careful consideration of exposure history and special skin tests (may help diagnose allergy).
- ☑ Evaluation for nervous system disorders.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatic transfer of hydroquinone from storage containers to process or work containers is recommended.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its proper use and care.
- ☑ Wash thoroughly immediately after exposure to hydroquinone and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydroquinone should be communicated to all exposed and potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hydroquinone, emergency shower facilities should also be provided in the immediate work area.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of hydroquinone.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hydroquinone. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Hydroquinone is considered a combustible solid. A cloud of hydroquinone dusts may explode if ignited in an enclosed area. It also presents a moderate fire and explosion hazard risk, especially in contact with incompatible materials. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers and alkalis and contact can cause fire or explosion. It reacts violently with sodium hydroxide and forms *p*-benzoquinone with chlorine. Therefore, special consideration is required during any emergency situation involving a leak or spill of hydroquinone. Should hydroquinone ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Hydroquinone may enter the environment through industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydroquinone.

Hydroquinone has high acute toxicity to aquatic life and has caused germination decrease in agricultural crops. Insufficient data are available on the short-term effects of hydroquinone exposure to birds or terrestrial animals.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Hydroquinone has high chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of hydroquinone exposure to birds, plants, or terrestrial animals.

💧 Water Solubility

Hydroquinone is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 Persistence in the Environment

Hydroquinone is slightly persistent in water, with a half-life between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99% of hydroquinone will eventually end up in water; the rest will end up in air.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of hydroquinone found in fish tissue is expected to be about the same as the average concentration of hydroquinone in the water from which the fish was taken.

🛑 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydroquinone should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and

Risk Management for Hazardous Chemicals

replaced with clean soil. If hydroquinone should contact the water table, aquifer, or navigable waterway, cleanup should be started immediately. It is highly soluble in water and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydroquinone. If hydroquinone is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of leak.
- ☑ Collect powdered materials using a high-efficiency particulate air (HEPA) filter. Do NOT dry sweep (generates airborne dusts). Place in proper container for disposal. Absorb liquids containing hydroquinone in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of hydroquinone as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hydroquinone can present a significant threat to business operations. The mismanagement of chemical commodities can cause personnel injuries and/or property damage/loss. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business prospects.

Always remember that anytime the terms “cancer,” “carcinogen,” or “reproductive hazard” are used, public emotion, hysteria, and ignorance can run equally high. This must be carefully considered whenever developing or implementing public relations policies.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| NFPA Classification | Autoignition Temperature |
| Combustible Solid | Not Determined |

Extinguishing Media

Use dry chemical or alcohol foam. Water may cause frothing. Carbon dioxide initiates decomposition.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Structural fire-fighting clothing is permeable and may not provide adequate protection. Wear self-contained breathing apparatus (SCBA) operated in positive pressure mode. Move fire-exposed containers from fire if it can be done without risk. Cool with water spray.

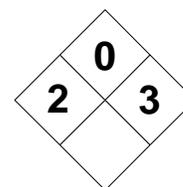

Unusual Fire and Explosion Hazards

Highly explosive when heated. Containers may explode in fire. Fight fire from distance, if possible, using unmanned equipment. Do not direct a solid stream of water at bulk quantities of hydroxylamine.

| SECTION V - REACTIVITY DATA | | | | |
|--|---|--|------------------------------|--|
| Stability | | Conditions to Avoid Hydroxylamine is highly unstable and will rapidly decompose on exposure to air at room temperature. This is especially true in the presence of moisture or carbon dioxide. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Barium oxides, chlorine, copper (II) sulfate, lead dioxide, potassium dichromate, potassium permanganate, sodium, zinc, calcium, chlorates, bromates, and perchlorates in the presence of sulfuric acid. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of hydroxylamine is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Poisonous gases, including oxides of nitrogen are produced when hydroxylamine is involved in a fire. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the nose, throat, and respiratory tract. Symptoms include cough, sneezing, tachycardia, hypertension, cyanosis, headache, fatigue, anorexia, vomiting, emaciation, and bladder problems causing hematuria (blood in urine), proteinuria (excessive proteins in urine), and bladder injury. Can cause vertigo, tinnitus (ringing in the ears), and cyanosis due to methemoglobinemia (decreased oxygen-carrying capabilities of the blood). SKIN & EYES: Irritation of the skin and eyes. A strong sensitizer causing eczema in some individuals. INGESTION: Can cause similar systemic effects as noted for inhalation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Resp. sys. CNS, eyes, skin, blood, kidneys. |
| Medical Conditions Generally Aggravated by Exposure Existing skin diseases may be aggravated by exposure to hydroxylamine. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Unless advised otherwise, give a conscious person 1 to 2 glasses of water to drink and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Wear SCBA respiratory protection. Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Avoid skin contact. Do not create dust cloud. Ventilate area of spill. Do NOT dry sweep. Use HEPA vacuum and deposit in sealed drums. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated location away from heat (including direct sunlight). Protect containers from physical damage. Prevent dust buildup in storage and use areas. | | | | |
| Other Precautions and Warnings Sources of ignition (open flame or smoking) are prohibited where hydroxylamine is used or stored. Metal containers should be used. Do NOT generate dust clouds or dusty conditions when working. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Use a NIOSH-approved respirator equipped with HEPA filter, or a powered air purifying respirator, or use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Clothing (prevent skin contact) | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

HYDROXYLAMINEH₃NO

CAS: 7803-49-8

**IDENTIFICATION AND TYPICAL USES**

Hydroxylamine can appear as large, hygroscopic (absorbs moisture from the air), white flakes or crystals, or as a colorless liquid solution. It is used as a reducing agent, an analytical reagent, as a hair remover, and as an antioxidant for fatty acids and soaps. It is also used in the manufacture of synthetic rubber, in photographic developing solutions, in the preparation of paints and varnishes, in rust proofing, and in dilute solutions for the treatment of skin diseases.

RISK ASSESSMENT: HEALTH**General Assessment**

Hydroxylamine is a human poison by *inhalation* and *ingestion*. It is a corrosive irritant to the eyes, skin, and mucosa. Its human carcinogenicity, mutagenicity, and teratogenicity are unknown.

Inhalation or ingestion of hydroxylamine dusts can cause toxic systemic effects with localized irritation of the skin, eyes, nose, throat, and the mucous membranes lining the respiratory tract. There can be eczema, tachycardia (rapid heartbeat) hypertension (increased blood pressure) coughing, sneezing, headache, fatigue, anorexia, diarrhea, loss of appetite with subsequent weight loss, low body temperature, cyanosis due to methemoglobinemia, jaundice, nausea and vomiting, emaciation, and death due to respiratory paralysis. There can also be serious bladder disorders, including hematuria (blood in urine) and proteinuria (excessive proteins in urine), as well as bladder damage. Central nervous system effects typically include vertigo, headache, tinnitus (ringing in the ears), and general fatigue.

Prolonged exposures can lead to contact dermatitis with erythema and squamous-type eczema. The trunk, forearms, and the back of the hands are usually the areas most affected by the dermatitis. Hydroxylamine is highly corrosive to the eye and surrounding tissues.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to hydroxylamine:

Skin: Irritation with rash and localized inflammation. An allergen that may cause dermatitis in some individuals.

Eye: Severe irritation; pain and inflammation.

Lung: Nose, throat, and respiratory tract irritation causing coughing, sneezing, and likely absorption through the respiration process to cause toxic systemic effects.

CNS: Causes vertigo, tinnitus, headaches, fatigue, and other depression effects up to and including death from respiratory paralysis.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to hydroxylamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, hydroxylamine has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, hydroxylamine has not been adequately tested for its ability to cause adverse reproductive effects in test animals.

Other Chronic Effects: Chronic exposure to skin can cause eczema.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with hydroxylamine. Occupational poisoning occurs most commonly by inhalation and ingestion. If a less toxic material or compound cannot be substituted for hy-

droxylamine, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of hydroxylamine release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around hydroxylamine. No exposure levels have been established for this compound. This does not mean that exposure is without risk. As a minimum, personnel should wear an MSHA/NIOSH-approved respirator equipped with a high efficiency particulate air (HEPA) filter for low or infrequent exposures. An MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand is a more appropriate level of respiratory protection when high exposures to hydroxylamine are anticipated. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, polyvinyl alcohol gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with hydroxylamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where hydroxylamine is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered:

- Complete blood count (CBC).
- Urinalysis to test for blood and protein levels in urine (establish baseline).

If symptoms should develop or overexposure is suspected, the following additional tests may be helpful:

- Complete blood count.
- Urinalysis (compare to baseline).
- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to hydroxylamine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of hydroxylamine should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to hydroxylamine, emergency shower facilities should be provided.
- Workers whose clothing has been contaminated by hydroxylamine should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to hydroxylamine.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of hydroxylamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Hydroxylamine is a combustible solid. It can present a dangerous explosion hazard if its dusts form a cloud and come into contact with an ignition source. It is also incompatible with oxidizing materials and contact can result in violent and explosive reactions. Caution is always required in handling, storage, transportation, and disposal of hydroxylamine. Emergency responders should be made aware of the presence of hydroxylamine at any emergency response situation.

Hydroxylamine can enter the environment from industrial effluents and from spills.

☠ **Acute Ecological Effects**

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to hydroxylamine. Hydroxylamine has high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of hydroxylamine on plants, birds, or terrestrial animals.

🌱 **Chronic Ecological Effects**

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Hydroxylamine has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of hydroxylamine to plants, birds, or terrestrial animals.

💧 **Water Solubility**

Hydroxylamine is highly soluble in water, especially cold water. Concentrations of 1000 milligrams and more will mix with a liter of water. It decomposes in water to form ammonium hydroxide, nitrous oxide, and nitrogen oxide.

⌚ **Persistence in the Environment**

Hydroxylamine is slightly persistent in water, with a half-life of between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It is expected to decompose to form other compounds relatively quickly in the aquatic environment.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Hydroxylamine is not expected to accumulate in the edible tissues of fish.

🛡️ **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of hydroxylamine into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of hydroxylamine should be segregated from other chemicals and materials to minimize the risk of cross-contamination. It should be stored to avoid contact with heat or ignition sources, including direct sunlight.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If hydroxylamine should contact the water table, aquifer, or navigable waterway, time is of the essence. It decomposes in water and total containment and remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of hydroxylamine.

If hydroxylamine is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Do NOT generate dusts. Dust clouds of the right proportions in air present a dangerous explosion hazard. Use a scoop or a vacuum equipped with a high efficiency particulate air filter (HEPA) to collect spills. Place materials in drum for recovery or disposal, as required. Absorb solution spills in vermiculite and place in a sealed container for disposal.
- Ventilate area of spill or leak.
- Remove all ignition sources and sources of heat from the hazard area.
- Containers should be removed to safer area if it can be done without increasing the risk.
- It may be necessary to dispose of hydroxylamine as a hazardous waste. The responsible state agency or the regional office of the federal Envi-

ronmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving hydroxylamine can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

INDENEC₉H₈

CAS: 95-13-6

**IDENTIFICATION AND TYPICAL USES**

Indene is a colorless liquid with a pungent odor. It can also exist as a solid at temperatures below 29°F (-2°C). It is used primarily in the preparation of coumarone-indene resins and as a chemical intermediate. It has also been used as an insecticide.

RISK ASSESSMENT: HEALTH**General Assessment**

Indene is moderately toxic to humans by *ingestion*, and *inhalation*. Skin contact causes irritation but dermal absorption has not been reported as a route of entry. It is a severe irritant and may cause liver, kidney, or spleen damage. There is no information in the references on its carcinogenic, teratogenic, or mutagenic capabilities.

Inhalation causes irritation of the eyes, nose, throat, and respiratory system. Its severe irritating properties can lead to chemical pneumonitis, especially if the liquid is somehow aspirated into the lungs (as is possible when vomiting). Pulmonary edema with symptoms of coughing, wheezing, congestion, dyspnea, and tightness or pain in the chest, may develop and can be fatal. These symptoms may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk.

Skin contact results in surface irritation and may cause redness (erythema) and possible blistering. Eye contact may cause moderate to severe irritation. Ingestion of large amounts of indene will likely cause toxic systemic effects with nausea and stomach pain.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to indene:

Skin: Irritation with possible redness and blistering.

Eye: Mild to moderate irritation (depending upon length of time contact occurs).

Lung: Nose, throat, and respiratory tract irritation. May cause chemical pneumonitis and even delayed pulmonary edema, which can be fatal.

Other: Acute exposures to high concentrations may lead to liver, kidney, or spleen injury.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to indene and can last for months or even years:

Cancer Hazards: According to information presented in the references, indene has not been adequately tested for its ability to cause cancer in laboratory animals.

Reproductive Hazard: According to information presented in the references, indene has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Long-term exposure may lead to permanent liver, kidney, or spleen dysfunction. Indene can also cause dermatitis in some individuals.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with indene. Occupational poisoning occurs most commonly by inhalation and ingestion. If a less toxic material or compound cannot be substituted for indene, then *engineering controls* are the most effective method of reducing exposures. The best protection for workers is to ensure controlled use of indene and, wherever possible, enclose operations or provide adequate local exhaust ventilation at the site of indene release. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around indene. For exposures to low

levels or infrequent exposures, use an air-purifying respirator equipped with an organic vapor cartridge. For higher exposures, or when the level is unknown (as in an emergency), use a supplied-air respirator with full facepiece and mask operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with indene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where indene is used or stored.

For those personnel with frequent or potentially high exposures (half the PEL or greater), the following are recommended before beginning employment and at regular intervals thereafter (e.g., annually):

- ☑ Liver and kidney function tests.
- ☑ Lung function tests.
- ☑ Evaluation of the skin by a dermatologist for indications or symptoms of chlor-acne.

If symptoms develop or overexposure is suspected, the following recommended medical tests should be considered:

- ☑ Liver and kidney function tests.
- ☑ Lung function tests.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Because more than light or casual alcohol consumption can lead to liver damage, drinking alcohol may increase the potential liver damage caused by indene. Also, since smoking can cause heart disease, emphysema, and

other respiratory disorders, smokers exposed to indene may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* possible exposure factors when evaluating workplace health hazard risk.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its proper use and care.
- ☑ Wash thoroughly immediately after exposure to indene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of indene should be communicated to all exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to indene, emergency shower facilities should also be provided in the immediate area.
- ☑ Workers whose clothing has been contaminated by indene should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to indene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of indene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Indene is a Class IIIA combustible liquid (as per OSHA 29 CFR 1910.106). It can react in contact with heat, sunlight, and acids. It will explode in contact with sulfuric + nitric acid. If it is involved in fire, indene can emit highly toxic oxides of carbon. Because

it is also incompatible with most oxidizers, it must be kept away from permanganates, nitrates, peroxides, chlorates, and perchlorates. Caution is always required in handling, storage, transportation, and disposal of indene. Emergency responders should be made aware of the presence of indene at any emergency response situation.

Indene can enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to indene.

Insufficient data are available on the short-term effects of indene to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of indene to aquatic life, plants, birds, or terrestrial animals.

💧 *Water Solubility*

Indene is insoluble in water. Concentrations of 1 milligram or less may not mix with a liter of water.

🕒 *Persistence in the Environment*

Indene is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of indene found in fish tissues is expected to be considerably higher than the average

concentration of indene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of indene into the environment. Labels on all containers, trucks, and rail cars should accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of indene should be segregated from other chemicals and materials (especially oxidizers) to minimize the risk of cross-contamination. Caution must be taken to ensure indene is not stored in direct sunlight or near any source of heat or ignition.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If indene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is insoluble in water and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of indene.

If indene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Absorb liquid solutions in vermiculite, sand, earth, or similar material and deposit in sealed drum. Flush residue with large amounts of water and collect for disposal. Do not release residue to waterways or sewers.
- ☑ Ventilate area of spill or leak and remove all sources of ignition.
- ☑ It may be necessary to dispose of indene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving indene can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. If rash develops, seek medical attention. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If <u>swallowed:</u> Provide breathing assistance if necessary. Never attempt to give a convulsing or unconscious person anything by mouth. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts and friction). Carefully use a vacuum equipped with a high efficiency particulate air (HEPA) filter. Exercise extreme caution, indium dust clouds can ignite or explode in air or if heated. Use non-sparking tools. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area and protect from physical damage. Sources of heat or ignition are prohibited where indium is used, handled, or stored. | | | | |
| Other Precautions and Warnings Avoid contact with incompatible materials. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposure to low levels, use a full facepiece respirator with a high efficiency particulate air (HEPA) filter. For higher or prolonged exposures, use a full facepiece supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Suit or Clothing |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

INDIUM

In

CAS: 7440-74-6

**IDENTIFICATION AND TYPICAL USES**

Indium is a silver-white, shining, lustrous, ductile, metallic solid that can also appear in the form of powder or dusts. It is softer than lead. It is metallic element of atomic number 49, group IIIA of the periodic table, atomic weight 114.82, valences 1, 3, with 2 stable isotopes. Used in automobile bearings, radiation detectors, electronic and semiconductor devices, low-melting brazing and soldering alloys, and in reactor control rods. Also used in electroplated coatings on silver-plated steel aircraft bearings which are tarnish-resistant.

RISK ASSESSMENT: HEALTH***General Assessment***

Indium is a moderately toxic metal by *inhalation* and mildly toxic by *ingestion*. Since it is not significantly soluble in water, it is not absorbed efficiently by ingestion. Terratogenic effects have been reported but there are no data on its carcinogenicity or mutagenicity.

Inhalation of indium dusts and powders will cause irritation of the nose, throat, respiratory tract, and associated mucous membranes. It has been known to cause liver, kidney, heart, and blood effects in test animals. Lung effects can include the development of pulmonary edema (fluid in the lungs). Symptoms of cough, sneezing, congestion, difficulty in breathing, and tightness in the chest may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk.

Skin contact results in surface irritation and may lead to dermatitis. The powders can irritate the eyes and may cause redness and inflammation depending upon the duration of exposure. Ingestion causes unspecified gastrointestinal effects. There may be vomiting and stomach pain. Toxic systemic effects re-

sulting from ingestion are possible but not likely to occur.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to indium:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Indium particles can irritate the eyes and may cause redness if not quickly removed.

Lung: Irritation of the dusts and fumes can irritate the nose, mouth, throat, lungs, and mucosa of the respiratory tract. Delayed pulmonary edema can occur which is a medical emergency and can be fatal.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to indium and can last for months or even years:

Cancer Hazards: According to information presented in the references, indium has not been shown to cause cancer in test animals. Liver damage has occurred in test animals but no correlation to human exposure has been documented.

Reproductive Hazard: According to information available in the references, indium has been shown to cause teratogenic effects in test animals.

Other Chronic Effects: Possible liver, kidney, heart, and blood effects.

🚫 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with indium. The exact nature of its human toxicity is not clearly understood in the references. If the specific indium compound in question is unknown, adequate risk management dictates that it be handled and treated as

though it posed a serious risk to human health. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around indium. For exposure to indium at low or transient levels, an MSHA/NIOSH-approved respirator with a high efficiency particulate air (HEPA) filter is recommended. For higher exposures, or exposures to unknown levels (as in an emergency), use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with indium.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where indium is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures, the following medical tests are recommended:

- Lung function tests.
- Chest X-ray.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Liver, kidney, and lung function tests.
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

- Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to indium may be more pronounced in smokers than in non-smokers. Prudent risk management requires proper consideration of *all* possible factors that may be causing exposure symptoms in the workplace.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are adequately trained on the use, care, and maintenance of their personnel protective equipment.
- Wash thoroughly immediately after exposure to indium and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of indium should be communicated to all potentially exposed workers.
- Where possible, automatically transfer indium from drums or other storage containers to process containers. Avoid contact with air and do not generate airborne dusts.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of indium. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Indium powder will explode in air when heated. It will also react explosively in the presence of dinitrogen tetraoxide + acetonitrile. It will react violently with mercury (II) bromide at high temperatures. Mixtures with sulfur ignite when heated. It oxidizes readily at high temperatures. These characteristics require special consideration during any emergency situation involving a leak or spill of indium.

Indium can occur in the environment as a natural element in certain ores in the earth's crust. Indium-bearing ores occur in western United States, Canada, Peru, Japan, Europe, and the former Soviet Union. It can also enter the environment through industrial and municipal discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to indium.

Insufficient data are available to evaluate the short-term effects of indium exposure to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of indium exposure to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Elemental indium and most of its compounds are insoluble in water. Concentrations of less than 1 milligram will not mix with water.

🕒 *Persistence in the Environment*

Indium and its compounds are highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat con-

taminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of indium found in fish is expected to be somewhat higher than the average concentration of indium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of indium should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage of indium should be avoided. Conditions which can generate dusty conditions must be avoided. Storage facilities should be designed with proper fire suppression and protection equipment. Containers must be protected from exposure to heat and from physical damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum method to reduce dust during cleanup. Do not dry sweep (generates airborne dusts and friction). *Carefully* and *slowly* use a vacuum equipped with a high efficiency particulate air (HEPA) filter, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed and replaced with clean soil. If indium should contact the water table, aquifer, or navigable waterway, time is of the essence. Indium is not soluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of indium.

If indium is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.

- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- ☑ It may be necessary to dispose of indium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving indium can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If <u>swallowed:</u> Seek medical attention immediately. Give conscious person milk to drink. Keep victim warm and at rest. Contact poison control center. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials using HEPA vacuum (do NOT dry sweep) and place in sealed containers. Damp mop residues. Avoid vapors. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method No Citation | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals. Store in tightly closed containers in a cool, dark, well-ventilated area. Keep fire and flame away. Keep separate from organic, combustible, and readily oxidizable substances. Keep out of direct sunlight. | | | | |
| Other Precautions and Warnings Bulk storage of iodine is not recommended. Protect containers from physical damage. Avoid breathing vapors or dusts. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Extremely corrosive and damaging to lung tissue. For any exposure, use a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Impermeable Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

IODINEI₂

CAS: 7553-56-2

**IDENTIFICATION AND TYPICAL USES**

Iodine is a violet-colored solid with a sharp, characteristic odor. It volatilizes at room temperature to a violet gas. It is a nonmetallic halogen element of atomic number 53, group VIIA of the periodic table, atomic number 126.904, valences of 1,3,5,7, and no stable isotopes but many artificial isotopes. It is the least reactive of the halogens. It is used in dyes, as an alkylation and condensation catalyst, in iodides, iodates, antiseptics, and germicides. Also used as an X-ray contrast media, as a food and feed additive, in stabilizers, in photographic film, in water treatment, in pharmaceuticals, and in medicinal soaps.

RISK ASSESSMENT: HEALTH**General Assessment**

Iodine is a human poison by *ingestion* and possibly by other routes of exposure. It is moderately toxic by *inhalation*. Skin contact causes serious effects because of the corrosive properties of iodine and dermal *absorption* may occur on prolonged contact. Human mutation data have been reported but there are no data on the carcinogenic or teratogenic capabilities of iodine.

Inhalation of iodine vapors will cause severe irritation of the eye, nose, throat, and mucosa of the respiratory tract with lachrymation (tearing), nasal secretion, tightness in the chest, sore throat, and headache. High concentrations can lead to a dangerous buildup of fluid in the lungs (pulmonary edema) which can be fatal. Symptoms can be delayed up to 48 hours thereby creating a false sense of security with regard to health hazard risk.

Skin contact causes serious corrosive destruction to tissues. There may be rash, burns, and skin sensitization. Absorption through intact skin has been reported leading to toxic systemic effects similar to those of inhalation and ingestion.

Ingestion causes diarrhea, abdominal pains, nausea, vomiting, purging, excessive thirst, circulatory failure, and possible hypersensitivity of the thyroid.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to iodine:

Skin: Irritation, burns, possible ulcer-like wounds.

Eye: Irritation which can lead to permanent damage if allowed to remain in contact with the eyes.

Lung: Severe irritation of respiratory passages and lung tissue with coughing, nausea, and possible pulmonary edema (fluid in the lungs), which is a medical emergency and can be fatal.

Other: A human poison by ingestion causing diarrhea, stomach pain, nausea, vomiting, thirst, and a possibility of circulatory failure and death.

☼ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to iodine and can last for months or even years:

Cancer Hazards: According to the references, iodine is not known to cause cancer in humans or test animals. Human mutation data have been reported and many scientists believe that such chemicals may pose a cancer risk in the long-term.

Reproduction: According to the references, iodine has not been shown to cause teratogenic and experimental reproductive effects in test animals.

Other Chronic Effects: It has been reported that long-term exposure to iodine may cause allergic sensitization in some individuals. Once sensitization has oc-

curred, even the slightest exposures in the future can cause the reappearance of exposure symptoms.

☉ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with iodine under any circumstances. A less toxic chemical should be substituted for a hazardous substance. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around iodine. At virtually any exposure level, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, protective gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with iodine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where iodine is used or stored. If overexposure is suspected, the following is recommended:

- ☑ Lung function test.
- ☑ Complete examination of nervous system function.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- ☑ Evaluation by a qualified allergist with special testing and careful consideration of exposure history (may help diagnose skin allergy).

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release.

If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to iodine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of iodine should be communicated to all potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where iodine is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of iodine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Iodine is considered a non-combustible solid. However, as a powerful oxidizing agent, iodine will accelerate the burning of combustibles. These characteristics require special consideration during any emergency situation involving a leak or spill of iodine.

Should iodine ever come into contact with incompatible substances such as ammonia, acetylene, phosphorus, potassium, sodium, acetaldehyde, acrolein, acrylonitrile, or powdered aluminum either during use, transportation, or storage, violent and explosive reactions are extremely possible. Ammonium hydroxide will react with iodine to form shock-sensitive iodides that are explosive when dry.

Iodine can occur in the environment naturally as well as through manufacturing, unchecked discharge into effluents, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to iodine.

There is insufficient information available to evaluate or predict the short-term effects of iodine on aquatic life, birds, plants or terrestrial animals.

☉ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

There is insufficient information available to evaluate the long-term effects of iodine on aquatic life, birds, plants or terrestrial animals.

💧 *Water Solubility*

Iodine is very slightly soluble in water. Concentrations of 1 to 100 milligrams may mix with a liter of water.

🕒 *Persistence in the Environment*

Iodine is highly persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. No data are available on the percentages of iodine that will eventually end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of iodine found in fish tissues is expected to be much higher than the average concentration of iodine in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of iodine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire pro-

tection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If iodine should contact the water table, aquifer, or navigable waterway, time is of the essence. It is nearly insoluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of iodine. If iodine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Collect powdered materials in safest manner possible and place in sealed containers for reclamation or disposal. Do NOT dry sweep (generates airborne dusts). Use vacuum equipped with a high-efficiency particulate air (HEPA) filter instead.
- ☑ It may be necessary to dispose of iodine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving iodine can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term “reproductive hazard” is used, public emotion,

hysteria, and ignorance can run equally high. This must be carefully considered when developing or implementing public relations policies.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

IODINE MONOCHLORIDE

ICI

CAS: 7790-99-0

**IDENTIFICATION AND TYPICAL USES**

Iodine monochloride can appear as a reddish-brown oily liquid or as black crystals (the α form) or black needles (the β form). It is used in analytical chemistry and organic synthesis. Iodine monochloride is also used to estimate the iodine values of fats and oils and is a topical anti-infection agent.

RISK ASSESSMENT: HEALTH**General Assessment**

Iodine monochloride is a human poison by *ingestion* and possibly by other routes of exposure. It is moderately toxic by *inhalation*. Skin contact causes serious effects because of the corrosive properties of iodine monochloride and dermal *absorption* may even be possible on prolonged contact (data inconclusive). There are no data on the carcinogenic, mutagenic, or teratogenic capabilities of iodine monochloride.

Inhalation of iodine monochloride vapors will cause severe irritation of the eye, nose, throat, and mucosa of the respiratory tract with lachrymation (tearing), nasal secretion, tightness in the chest, sore throat, and headache. High concentrations may cause significant damage to the mucous membranes and may lead to a dangerous buildup of fluid in the lungs (pulmonary edema) which can be fatal. Symptoms can be delayed up to 48 hours thereby creating a false sense of security with regard to health hazard risk.

Skin contact causes serious corrosive destruction to tissues. There may be rash, burns, the appearance of dark patches, and skin sensitization. Absorption of the liquid through intact skin may be a possible route of exposure. Eye contact may cause immediate pain with redness, swelling, and possible damage to vision.

Ingestion of the liquid or crystalline solid may cause diarrhea, abdominal pains, nausea, vomiting, and other unspecified gastrointestinal effects.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to iodine monochloride:

Skin: Irritation, burns, dark patches on the surface of the skin.

Eye: Irritation which can lead to permanent damage if allowed to remain in contact with the eyes.

Lung: Severe irritation of respiratory passages and lung tissue with coughing, nausea, and possible pulmonary edema (fluid on the lungs), which is a medical emergency and can be fatal.

Other: A human poison by ingestion causing diarrhea, stomach pain, nausea, and vomiting.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to iodine monochloride and can last for months or even years:

Cancer Hazards: According to the references, iodine monochloride has not been adequately tested for its ability to cause cancer in test animals.

Reproduction: According to the references, iodine monochloride has not been shown to cause teratogenic and experimental reproductive effects in test animals.

Other Chronic Effects: None reported.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with iodine monochloride under any circumstances. A less toxic chemical should be substituted for a hazardous substance. If this is not possible or feasible, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose

operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around iodine monochloride. No exposure levels have been established for this compound. However, this does not mean that exposure is without health risk. At virtually any exposure level, a powered supplied-air respirator in continuous flow mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash or airborne dust hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, protective gloves should be used. Iodine monochloride will react violently in contact with rubber and other organic materials. Glove manufacturers should therefore be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with iodine monochloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where iodine monochloride is used or stored. If an overexposure is suspected, the following is recommended:

- ☑ Lung function test.
- ☑ Complete examination of nervous system function.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- ☑ Evaluation by a qualified allergist with special testing and careful consideration of exposure history (may help diagnose skin allergy).

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release.

If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in the use, care, and maintenance of this equipment.
- ☑ Wash thoroughly immediately after exposure to iodine monochloride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of iodine monochloride should be communicated to all exposed and potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where iodine monochloride is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of iodine monochloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Iodine monochloride is considered a non-combustible solid. However, as an oxidizing agent, iodine monochloride will accelerate the burning of combustibles. It will even react with water or steam to produce highly toxic and corrosive fumes. These characteristics require special consideration during any emergency situation involving a leak or spill of iodine monochloride. It will react violently with aluminum foil and organic matter such as rubber or cork. Should iodine monochloride ever come into contact with these or other incompatible substances such as metals like potassium (explodes on contact), sodium (mixture explodes on impact), or aluminum (ignition after a delay period), either during use, transportation, or storage, violent and explosive reactions are extremely possible.

Iodine monochloride can enter the environment through manufacturing, unchecked discharge into effluents, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to iodine monochloride.

There is insufficient information available to evaluate or predict the short-term effects of iodine monochloride on aquatic life, birds, plants or terrestrial animals.

☛ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

There is insufficient information available to evaluate the long-term effects of iodine monochloride on aquatic life, birds, plants or terrestrial animals.

💧 *Water Solubility*

Iodine monochloride is moderately soluble in water (decomposes). Concentrations of 1 to 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Iodine monochloride is highly persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. No data are available on the percentages of iodine monochloride that will eventually end up in water or air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of iodine found in fish tissues is expected to be much higher than the average concentration of iodine in water from which the fish was taken. There is no information on the bioaccumulation of the monochloride in the edible tissues of fish.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and

rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of iodine monochloride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If iodine monochloride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and will decompose. Therefore, total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of iodine monochloride. If iodine monochloride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ Collect powdered materials in safest manner possible and place in sealed containers for reclamation or disposal. Do NOT dry sweep (generates airborne dusts). Use vacuum equipped with a high-efficiency particulate air (HEPA) filter instead. Damp mop residue and collect for disposal, Do NOT allow runoff from cleanup methods to enter sewers or waterways.
- ☑ Absorb liquid spills with vermiculite, dry earth, sand, or other material and place in sealed drums for disposal.
- ☑ It may be necessary to dispose of iodine monochloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving iodine monochloride can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Give conscious person 1-2 glasses of water and induce vomiting. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Restrict those not wearing protective equipment and who are not involved in cleanup from entering area. Collect solids with HEPA vacuum and damp mop residues. Do NOT dry sweep. Place in sealed container for disposal. Flush trace residues with copious amounts of water and collect for disposal. | | | | |
| Preferred Waste Disposal Method Mix with a combustible solid and burn in chemical incinerator equipped with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, dark, well-ventilated location. Protect containers from physical damage. Keep away from oxidizing materials and heat. | | | | |
| Other Precautions and Warnings Ensure adequate ventilation in storage areas. Avoid vapor/dust inhalation and use appropriate personnel protective equipment if necessary. Do not store in direct sunlight. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposures, use an air-purifying respirator with a HEPA filter. Otherwise, use a supplied-air respirator or a self-contained breathing apparatus with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Apron if Splash is Likely | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

IODIFORMCHI₃

CAS: 75-47-8

**IDENTIFICATION AND TYPICAL USES**

Iodoform is a yellow to greenish-yellow powder or crystalline solid with a pungent, disagreeable odor. It is used as a chemical intermediate, as a germicide and antiseptic for external use (in veterinary medicine), as a component in adhesives, and as a polymerization control agent.

RISK ASSESSMENT: HEALTH**General Assessment**

Iodoform is toxic to humans by *ingestion*, *inhalation*, and *absorption* through intact skin. It is a severe irritant and a strong liver toxin (hepatotoxin). There is no information in the references on its carcinogenic, teratogenic, or mutagenic capabilities. The data on human exposures are somewhat limited, especially with regard to inhalation exposures.

Inhalation causes irritation of the eyes, nose, throat, and respiratory system. It may cause dyspnea. There is also the possibility that inhalation will lead to central nervous system depression with lightheadedness, dizziness, nausea, incoordination, and other effects similar to that of ingestion.

Skin contact results in the absorption of the chemical into the body causing many of the same toxic systemic effects of inhalation and ingestion, especially those resulting in liver injury and CNS damage. Eye contact with iodoform may lead to visual impairment and possible transitory blindness. The optic nerve and retina may be affected.

Ingestion will likely cause similar toxic systemic effects as inhalation and absorption with nausea, vomiting, delirium, hallucinations, rapid heart rate, fever, coma, and death. High concentration absorbed

through the skin can lead to injury of the liver, heart, and kidneys.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to iodoform:

Skin: Irritation with possible rash and redness. Absorption leading to toxic systemic effects is likely to occur, especially on prolonged contact.

Eye: Mild to moderate irritation (depending upon length of time contact occurs). Visual impairment and even transient blindness are possible (effects seem to be temporary).

Lung: Nose, throat, and respiratory tract irritation. Absorption through the respiratory process may cause toxic systemic effects.

CNS: Headaches, lightheadedness, dizziness, confusion, excitement, drowsiness, fever, coma, and possibly death.

Other: Exposure to high concentrations may cause serious and possibly life-threatening effects to the liver, kidney, and heart.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to iodoform and can last for months or even years:

Cancer Hazards: According to information presented in the references, iodoform has not been adequately tested for its ability to cause cancer in laboratory animals.

Reproductive Hazard: According to information presented in the references, iodoform has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Repeated skin contact may cause dermatitis. Iodoform converts to carbon monoxide in the body. High exposures could lead to the production of carboxyhemoglobin at levels which may impair cardiovascular function.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with iodoform. Occupational poisoning occurs most commonly by inhalation and skin absorption. If a less toxic material or compound cannot be substituted for iodoform, then *engineering controls* are the most effective method of reducing exposures. The best protection for workers is to ensure controlled use of iodoform and, wherever possible, enclose operations or provide adequate local exhaust ventilation at the site of iodoform release. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around iodoform. The PEL is extremely low and difficult to accurately monitor (0.6 ppm). For exposures to low levels or infrequent exposures, use an air-purifying respirator equipped with a dust/mist pre-filter of high-efficiency particulate air (HEPA) filter. For higher exposures, or when the level is unknown (as in an emergency), use a supplied-air respirator with full facepiece and mask operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield should also be considered. To prevent hand and skin exposures impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with iodoform.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where iodoform is used or stored.

For those personnel with frequent or potentially high exposures (half the PEL or greater), the following

are recommended before beginning employment and at regular intervals thereafter (e.g., annually):

- ☑ Liver function tests.
- ☑ Evaluation of the skin by a dermatologist for indications or symptoms of chlor-acne.

If symptoms develop or overexposure is suspected, the following recommended medical tests should be considered:

- ☑ Liver and kidney function tests.
- ☑ Interview for nervous system effects and any changes in personality (irritability, moodiness) or normal function (weakness, fever, drowsiness).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because more than light or casual alcohol consumption can lead to liver damage, drinking alcohol may increase the potential liver damage caused by iodoform. Prudent risk management requires proper consideration of *all* possible exposure factors when evaluating workplace health hazard risks.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its proper use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to iodoform and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of iodoform should be communicated to all exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to iodoform, emergency shower facilities should also be provided in the immediate area.
- ☑ Workers whose clothing has been contaminated by iodoform should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who

have been informed of the hazards of exposure to iodoform.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of iodoform. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Iodoform is a non-combustible solid. However, if it is involved in fire, iodoform can emit highly toxic oxides of carbon and toxic fumes of chloride. It is incompatible with most oxidizers and must be kept away from permanganates, nitrates, peroxides, chlorates, and perchlorates. Caution is always required in handling, storage, transportation, and disposal of iodoform. Emergency responders should be made aware of the presence of iodoform at any emergency response situation.

Iodoform can enter the environment through industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to iodoform. Insufficient data are available on the short-term effects of iodoform to aquatic life, plants, birds, or land animals.

☹ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of iodoform to aquatic life, plants, birds, or terrestrial animals.

💧 Water Solubility

Iodoform is nearly insoluble in water. Concentrations of 1 milligram will mix with a liter of water.

🕒 Persistence in the Environment

Iodoform is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Iodoform is expected to be mobile in terrestrial soils.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of iodoform found in fish tissues is expected to be about the same as the average concentration of iodoform in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of iodoform into the environment. Labels on all containers, trucks, and rail cars should accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of iodoform should be segregated from other chemicals and materials (especially oxidizers) to minimize the risk of cross-contamination.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If iodoform should contact the water table, aquifer, or navigable waterway, time is of the essence. It is practically insoluble and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of iodoform. For disposal, iodoform may be dissolved in a combustible solvent and burned in an incinerator equipped with an afterburner and scrubber.

If iodoform is spilled or leaked, the following specific steps are recommended:

Risk Management for Hazardous Chemicals

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect solids using HEPA vacuum. Do NOT dry sweep (generates airborne dusts). Damp mop residue and collect for disposal. Absorb liquid solutions in vermiculite, sand, earth, or similar material and deposit in sealed drum.
- ☑ Ventilate area of spill or leak.
- ☑ It may be necessary to dispose of iodoform as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS***General Assessment***

Accidents or mishaps involving iodoform can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Irritation of the respiratory system and mucous membranes. Exposures to iron dusts can lead to iron pneumoconiosis and possible siderosis (mottling or spotting of the lungs). SKIN & EYES: An irritant to the eyes causing conjunctivitis with deposition of iron particles leaving a rust ring or brownish stain on the cornea. Skin contact can cause rash. INGESTION: Bloody vomiting (hematemesis), lethargy, shock, acidosis, cyanosis, and fever. There can also be liver damage, gastrointestinal fibrosis, pancreatic fibrosis, obstruction of the respiratory tract, diabetes mellitus, liver cirrhosis, and possible cardiac toxicity. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, skin, eyes, liver, pancreas. |
| Medical Conditions Generally Aggravated by Exposure Existing chronic respiratory diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. If rash develops, seek medical attention. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Provide breathing assistance if necessary. Give conscious person 1 to 2 glasses of water and induce vomiting. Never give a convulsing or unconscious person anything by mouth. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a HEPA vacuum. Iron dust clouds can ignite or explode in air or if heated. Use non-sparking tools. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, dry, well-ventilated area and protect from physical damage. Sources of heat or ignition are prohibited where iron is used, handled, or stored. | | | | |
| Other Precautions and Warnings Avoid contact with incompatible materials. Avoid breathing iron dusts or powders. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposure to low levels, use a full facepiece respirator with a high efficiency particulate air (HEPA) filter. For higher or prolonged exposures, use a full facepiece supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

IRON

Fe

CAS: 7439-89-6

**IDENTIFICATION AND TYPICAL USES**

Iron is a silver-white or gray, shining, ductile, malleable metallic solid that can also appear in the form of a black-gray powder or dusts. It is the only metal that can be tempered. It is a metallic element of atomic number 26, group VIII of the periodic table, atomic weight 55.847, valences 2, 3, with 4 stable isotopes and 4 radioactive isotopes. The solid form is used to alloy with carbon, manganese, chromium, nickel, and other elements to form steel. Powdered iron is used in metallurgy products, in magnets, in high-frequency cores, in certain automobile parts, and as a catalyst in ammonia synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

Iron is a mildly toxic metal by *inhalation* and moderately toxic by *ingestion*. It can also cause adverse health effects in contact with the eyes. It is potentially toxic by all routes of exposure in all forms (solid, powder/dust). The data on its specific carcinogenic properties are conflicting and inconclusive in the references.

Inhalation of iron dusts and powders will cause irritation of the nose, throat, respiratory tract, and associated mucous membranes. Inhalation of large amounts of iron dusts can cause iron pneumoconiosis and siderosis (mottling and spotting of the lungs).

Skin contact results in surface irritation and may lead to irritating rash. The powders can irritate the eyes and may cause redness and inflammation depending upon the duration of exposure. Eye contact may also cause conjunctivitis and the deposition of iron particles can leave a rust ring or brownish stain on the cornea.

Ingestion causes bloody vomiting (hematemesis), lethargy, shock, abdominal pain, bloody diarrhea, acidosis, cyanosis, fever, liver injury (possible cirrhosis),

gastrointestinal fibrosis, pancreatic fibrosis, diabetes mellitus, and possible cardiac effects. There can also be obstruction of the digestive tract and large doses can be fatal.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to iron:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Iron particles can irritate the eyes and may cause redness, conjunctivitis, and brown-staining of the cornea (rust rings).

Lung: Inhalation of the dusts and fumes can irritate the nose, mouth, throat, lungs, and mucosa of the respiratory tract. Iron pneumoconiosis (arc welder's lung) is possible.

Other: Ingestion can result in the systemic distribution of iron deposits throughout the body leading to conditions such as pancreatic scarring, diabetes mellitus, and cirrhosis of the liver.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to iron and can last for months or even years:

Cancer Hazards: According to information presented in the references, iron's ability to cause cancer has not been clearly established. Liver damage has occurred in test animals as well as occupational exposures, but no correlation to cancer has been determined.

Reproductive Hazard: According to information available in the references, iron has been shown to cause teratogenic effects in test animals.

Other Chronic Effects: Possible liver, pancreas, lung, and digestive tract effects may occur in the long-term.

☉ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with iron, especially its dusts and powders. The exact nature of its human toxicity is not clearly understood in the references. If the specific iron compound in question is unknown, adequate risk management dictates that it be handled and treated as though it posed a serious risk to human health. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around iron compounds. For exposure to iron at low or transient levels, an MSHA/NIOSH-approved respirator with a high efficiency particulate air (HEPA) filter is recommended. For higher exposures, or exposures to unknown levels (as in an emergency), use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with iron.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where iron is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures, the following medical tests are recommended:

- ☑ Lung function tests.
- ☑ Chest X-ray.

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Liver, kidney, and lung function tests.
- ☑ Consider chest X-ray after acute overexposure.
- ☑ Complete blood count (CBC) and blood gases.
- ☑ Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to iron may be more pronounced in smokers than in non-smokers. Prudent risk management requires proper consideration of *all* possible factors that may be causing exposure symptoms in the workplace.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are adequately trained on the use, care, and maintenance of their personnel protective equipment.
- ☑ Wash thoroughly immediately after exposure to iron and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of iron should be communicated to all potentially exposed workers.
- ☑ Where possible, automatically transfer iron from drums or other storage containers to process containers. Avoid contact with air and do not generate airborne dusts.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

While iron obviously occurs naturally in the environment, the environment is at risk of exposure during transportation, storage, disposal, or destruction of

iron. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Iron powder will explode in air (pyrophoric). It will also react explosively in the presence of a number of compounds and materials, including ammonium nitrate + heat, chlorine, dinitrogen tetroxide, liquid fluorine, hydrogen peroxide, and many other common compounds. Mixtures of iron dust with air and water may ignite on drying. It is a powerful reducing agent that oxidizes readily in moist air and reacts with steam to yield hydrogen and iron oxides. These characteristics require special consideration during any emergency situation involving a leak or spill of iron.

Iron can occur in the environment as a natural element. Iron occurs in Minnesota, Alabama, Labrador, Yukon, Europe, and South America. It can also enter the environment through industrial and municipal discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to iron.

Insufficient data are available to evaluate the short-term effects of iron exposure to aquatic life, plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of iron exposure to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Elemental iron and most of its compounds are insoluble in water. Concentrations of less than 1 milligram will not mix with water.

🕒 *Persistence in the Environment*

Iron and its compounds are highly persistent in the aquatic environment, with a half-life of greater than

200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of iron is expected to accumulate in either terrestrial soils or aquatic sediments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of iron found in fish is expected to be somewhat higher than the average concentration of iron in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of iron should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage of iron powders should be avoided. Conditions which can generate airborne dusts must also be avoided. Storage facilities should be designed with proper fire suppression and protection equipment. Containers must be protected from exposure to heat and from physical damage or abuse.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum method to reduce dust during cleanup. Do not dry sweep (generates airborne dusts and friction). *Carefully* and *slowly* use a vacuum equipped with a high efficiency particulate air (HEPA) filter, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed and replaced with clean soil. If iron should contact the water table, aquifer, or navigable waterway, time is of the essence. Iron is not soluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified.

A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of iron.

If iron is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in safest manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead. Damp mop residue and collect for disposal.
- ☑ It may be necessary to dispose of iron as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving iron can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Irritation of the respiratory system and mucous membranes. Exposures may lead to the development of benign pneumoconiosis with X-ray shadows that are indistinguishable from fibrotic pneumoconiosis (siderosis). A nuisance dust at low exposures. SKIN & EYES: An irritant to the eyes and skin that may cause redness and inflammation. INGESTION: Not a probable exposure route. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system |
| Medical Conditions Generally Aggravated by Exposure Existing chronic respiratory diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. If rash develops, seek medical attention. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Not likely. Seek medical attention immediately. Unless advised otherwise, give large amounts of water and induce vomiting using an emetic. Never give a convulsing or unconscious person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high-efficiency particulate air (HEPA) filter. Damp mop residues and collect for disposal. Do NOT release to sewers or waterways. Notify appropriate authorities, if required. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, dry, well-ventilated area and protect from physical damage. Sources of heat or ignition are prohibited where iron (III) oxide is used, handled, or stored. | | | | |
| Other Precautions and Warnings Avoid contact with incompatible materials. Do NOT create dusty conditions. Always use in areas with adequate ventilation. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposure to low levels, use a full facepiece respirator with a high efficiency particulate air (HEPA) filter. For higher or prolonged exposures, use a full facepiece supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

IRON (III) OXIDEFe₂O₃

CAS: 1309-37-1

**IDENTIFICATION AND TYPICAL USES**

Iron (III) oxide is a reddish-brown solid, dust, or fume. It is used as a pigment, a polishing compound, in metallurgy, in magnetic inks, in ferrites for the electronic industry, in coatings for magnetic tape, and as a catalyst.

RISK ASSESSMENT: HEALTH**General Assessment**

Iron (III) oxide is a mildly toxic compound by *inhalation*. Skin contact produced no serious health effects and ingestion is not considered a likely route of exposure. It is a questionable carcinogen with experimental tumorigenic data reported. It is considered a nuisance dust on low-level exposures. Higher concentrations may lead to pulmonary changes.

Inhalation of large quantities of iron (III) oxide dusts and powders over a prolonged period may cause the development a benign pneumoconiosis with X-ray shadows that may be indistinguishable from fibrotic pneumoconiosis (siderosis). There can be irritation of the eyes, nose, throat, and respiratory tract.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to iron (III) oxide:

- Skin:** No serious effects reported. May cause irritation and rash in some individuals.
- Eye:** No serious effects reported. May cause irritation and redness in some individuals, depending upon the duration of exposure.
- Lung:** Inhalation of the dusts and fumes can irritate the nose, mouth, throat, lungs, and mucosa of the respiratory tract.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to iron (III) oxide and can last for months or even years:

Cancer Hazards: According to information presented in the references, iron (III) oxide has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information available in the references, iron (III) oxide has been shown to cause teratogenic effects in test animals.

Other Chronic Effects: Prolonged exposure may cause the development of a benign pneumoconiosis that does not appear to be associated with pulmonary fibrosis or disability. It may cause the appearance of siderosis-type shadows on chest X-rays.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with iron (III) oxide, especially its dusts and powders. The exact nature of its human toxicity is not clearly understood in the references. Prudent risk management dictates that it be handled and treated as though it posed a serious risk to human health. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around iron (III) oxide compounds. For exposure to iron (III) oxide at low or transient levels, an MSHA/NIOSH-approved respirator with a high efficiency particulate air (HEPA) filter is recommended. For higher exposures, or exposures to un-

known levels (as in an emergency), use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever an airborne chemical dust hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with iron (III) oxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where iron (III) oxide is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures, the following medical tests are recommended:

- Lung function tests.
- Chest X-ray.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Lung function tests.
- Consider chest X-ray after acute overexposure.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to iron (III) oxide may be more pronounced in smokers than in non-smokers. Prudent risk management requires proper consideration of *all* possible factors that may be causing exposure symptoms in the workplace.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
- Wash thoroughly immediately after exposure to iron (III) oxide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of iron (III) oxide should be communicated to all exposed workers.
- Where possible, automatically transfer iron (III) oxide from drums or other storage containers to process containers. Avoid contact with air and do not generate airborne dusts.

RISK ASSESSMENT: ENVIRON (III) OXIDEMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of iron (III) oxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Iron (III) oxide powder will explode in contact with many compounds and when heated. It will also react and possibly ignite in the presence of a number of compounds and materials, including guanidinium perchlorate. Reaction with carbon monoxide may form an explosive product. The wet oxide reacts explosively with molten aluminum-magnesium alloys. It reacts violently when heated with powdered aluminum, calcium disilicide, magnesium, metal acetylides, hydrazine, calcium hypochlorite, performic acid, and bromine pentafluoride. These characteristics require special consideration during any emergency situation involving a leak or spill of iron (III) oxide.

Iron can occur in the environment as a natural element. Iron (III) oxide can also enter the environment through industrial discharges, or from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to iron (III) oxide.

Insufficient data are available to evaluate the short-term effects of iron (III) oxide exposure to aquatic life, plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of iron (III) oxide exposure to aquatic life, plants, birds, or land animals.

◆ *Water Solubility*

Elemental iron and most of its compounds are insoluble in water. Concentrations of less than 1 milligram will not mix with water.

⌚ *Persistence in the Environment*

Iron and its compounds are highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of iron found in fish is expected to be somewhat higher than the average concentration of iron in the water from which the fish was taken.

🕒 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of iron (III) oxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage of iron (III) oxide powders should be avoided. Storage facilities should be designed with proper fire suppression and protection equipment. Containers must be protected from exposure to heat and physical damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum method to reduce dust during cleanup. Do not dry sweep (generates airborne dusts and friction). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed and replaced with clean soil. If iron (III) oxide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is not soluble in water and total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of iron (III) oxide.

If iron (III) oxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in and safest manner possible and place in sealed drums for disposal. Do not dry sweep; use HEPA vacuum instead. Damp mop residue and collect for disposal.
- ☑ It may be necessary to dispose of iron (III) oxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving iron (III) oxide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may

result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Extinguishing Media

Use water, foam, dry chemical, or carbon dioxide.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep containers cool. Fight fire from distance, if possible.

Unusual Fire and Explosion Hazards

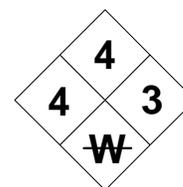

Iron pentacarbonyl is pyrophoric in air. It will ignite and burn vigorously without any contact with an ignition source. It presents a serious fire and explosion hazard.

SECTION V - REACTIVITY DATA

| | | | | |
|--|--|--|--------------------------------|--|
| Stability | | Conditions to Avoid Iron pentacarbonyl will spontaneously ignite in air. It decomposes on exposure to sunlight or air, releasing carbon monoxide in the process. It is stable only in tightly closed, air-tight, moisture-proof containers. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Iron pentacarbonyl is incompatible with oxidizers, nitrogen oxide, zinc + metal halides (cobalt, rhodium, ruthenium) mixtures with acetic acid + water produce a pyrophoric powder, heat, and light. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of iron pentacarbonyl is improbable (both the liquid and the vapor are highly reactive). | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, iron pentacarbonyl can produce high levels of toxic carbon monoxide gas. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Symptoms of dizziness, headache, fever, cyanosis, nausea, vomiting, coughing, shortness of breath, difficulty breathing, degenerative changes in the central nervous system, unconsciousness, delayed chest pains, pneumonitis, circulatory collapse, and death with injury to the kidneys, liver, and brain. | | | | |
| ABSORPTION: An irritant to the eyes and skin. Absorption through intact skin causes toxic systemic effects similar to that of inhalation. | | | | |
| INGESTION: Toxic systemic effects that are similar to that of inhalation. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, skin, eyes, liver, kidneys, CNS |
| Medical Conditions Generally Aggravated by Exposure Liver diseases and nervous system disorders may be affected by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. If rash develops, seek medical attention. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Never give a convulsing or unconscious person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Iron pentacarbonyl is pyrophoric and will ignite on exposure to air or light. Spill situations can present a serious danger to personnel and property. Evacuate area and keep those not involved in cleanup from entering area. Remove all ignition sources. Provide explosion-proof ventilation. Stop leak of iron pentacarbonyl at its source, if possible. Use non-sparking tools to collect the material. | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in air-tight, moisture-proof containers in cool, well-ventilated area. Protect from physical damage. Sources of heat or ignition are prohibited where iron pentacarbonyl is used, handled, or stored. | | | | |
| Other Precautions and Warnings Avoid contact with incompatible materials. Do not store in direct sunlight. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure level is low and difficult to monitor. For any potential exposures recommend using a full face-piece supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in positive pressure or continuous flow mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |

IRON PENTACARBONYLFe(CO)₅

CAS: 13463-40-6

**IDENTIFICATION AND TYPICAL USES**

Iron pentacarbonyl is a colorless to yellow to dark-red, oily, mobile liquid with no detectable odor. It is used as a catalyst and a reagent in organic chemistry, as an anti-knock agent in motor fuels, and to produce finely divided iron (carbonyl iron) which, in turn, is used in the production of powdered iron cores for high-frequency coils in radios and televisions. It is also used as an ignitor for underground combustion petroleum recovery.

RISK ASSESSMENT: HEALTH***General Assessment***

Iron pentacarbonyl is highly toxic by *inhalation* and skin *absorption*. It can also enter the body and cause adverse health effects through *ingestion*. There are no data on its carcinogenic, mutagenic, or teratogenic properties in the references.

Inhalation and dermal absorption of iron pentacarbonyl can cause immediate headache, dizziness, fever, cyanosis, coughing, shortness of breath, labored breathing, nausea, vomiting, delayed chest pains, degenerative changes in the central nervous system, pneumonitis, circulatory collapse, liver, kidney, and brain effects, and death.

Ingestion of this compound may cause similar toxic effects, although there are limited data available in the references on the specific health risks posed by this exposure route.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to iron pentacarbonyl:

Skin: Irritation with a possibility of rash and other surface effects. Absorption through intact

skin can occur quickly, causing serious (life-threatening) systemic effects.

Eye: No documented effects. May cause irritation, especially on prolonged contact.

Lung: Irritation to the nose, throat, and respiratory tract. Coughing, dyspnea, chest pain, and other lung-related conditions are possible.

Other: Systemic effects appear to target the central nervous system, the liver, the kidneys, and (possibly) the brain. Immediate headaches and dizziness, followed by fever, cyanosis, nausea, and vomiting. Death may occur due to circulatory system collapse.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to iron pentacarbonyl and can last for months or even years:

Cancer Hazards: According to information presented in the references, the ability of iron pentacarbonyl to cause cancer has not been clearly established. Liver, kidney, and even brain injury has occurred in test animals, but no correlation to cancer has been determined.

Reproductive Hazard: According to information available in the references, iron pentacarbonyl has been shown to cause teratogenic effects in test animals.

Other Chronic Effects: There appears to be a possibility of cumulative effects in the central nervous system and the liver. Additional research is required.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with iron pentacarbonyl. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering*

controls are the most effective method of reducing exposures in the workplace.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around iron pentacarbonyl compounds. The exposure level for this compound is extremely low (0.1 ppm) and difficult to accurately monitor. For any exposure level, a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever an airborne chemical hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selection have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with iron pentacarbonyl.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where iron pentacarbonyl is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures, the following medical tests are recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Liver, kidney, and lung function tests.
- Consider chest X-ray after acute overexposure.
- Nervous system evaluation with careful consideration of exposure history and special testing of nervous system function by a qualified neurologist.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Because more than light alcohol consumption can affect the function of the liver and lead to liver injury and/or disease, those persons who use alcohol regularly may experience symptoms more quickly than non-drinkers under the same conditions of exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to iron pentacarbonyl may be more pronounced in smokers than in non-smokers. Prudent risk management requires proper consideration of *all* possible factors that may be causing exposure symptoms in the workplace.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are adequately trained on the use, care, and maintenance of their personnel protective equipment.
- Wash thoroughly immediately after exposure to iron pentacarbonyl and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of iron pentacarbonyl should be communicated to all workers.
- Iron pentacarbonyl is pyrophoric. Avoid contact with air. Where possible, automatically transfer iron pentacarbonyl from drums or other storage containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

While iron pentacarbonyl obviously occurs naturally in the environment, the environment is at risk of exposure during transportation, storage, disposal, or destruction of iron pentacarbonyl. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in

fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Iron pentacarbonyl will ignite and possibly explode on exposure to air or sunlight (pyrophoric). It will also react vigorously in the presence of a number of compounds and materials, including most oxidizable materials, nitrogen oxide, and zinc + metallic halides (such as calcium halides). Mixtures of iron pentacarbonyl with acetic acid + water produce a pyrophoric powder. It is also a powerful reducing agent. These characteristics require special consideration during any emergency situation involving a leak or spill of iron pentacarbonyl.

Iron pentacarbonyl can enter in the environment through industrial and municipal discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to iron pentacarbonyl.

Insufficient data are available to evaluate the short-term effects of iron pentacarbonyl exposure to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of iron pentacarbonyl exposure to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Iron pentacarbonyl is insoluble in water. Concentrations of less than 1 milligram will not mix with water.

🕒 *Persistence in the Environment*

Iron pentacarbonyl is slightly persistent in the aquatic environment, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of iron pentacarbonyl found in fish is expected to be somewhat higher than the average concentration of iron pentacarbonyl in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of iron pentacarbonyl should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage of iron pentacarbonyl powders should be avoided. Storage facilities should be designed with proper fire suppression and protection equipment. Containers must be protected from exposure to heat, air, and light, as well as physical damage or abuse.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed and replaced with clean soil. If iron pentacarbonyl should contact the water table, aquifer, or navigable waterway, time is of the essence. Iron pentacarbonyl is not soluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of iron pentacarbonyl.

If iron pentacarbonyl is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ The source of any leak should be located and stopped. Personnel must be aware of the pyro-

phoric action of iron pentacarbonyl and respond accordingly. A source of water should be available in case of fire. Personnel involved in cleanup activities should use non-sparking tools and collect the spilled materials in safest manner possible.

- ☑ It may be necessary to dispose of iron pentacarbonyl as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving iron pentacarbonyl can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|--|--|
| Characterization Aliphatic Ester | RCRA Number D001 | EPA Class Characteristic (I) Waste |
| DOT Proper Shipping Name Amyl Acetates | Chemical Abstract Service (CAS) Number 123-92-2 | |
| DOT Hazard Class and Label Requirements Flammable Liquid | DOT Emergency Guide Code 26 | |
| DOT Identification Number UN 1104 | Chemical Formula CH₃COOCH₂CH₂CH(CH₃)₂ | |

Synonyms

Banana oil; isopentyl acetate; 3-methyl-1-butanol acetate; 3-methylbutyl ester of acetic acid; 3-methylbutyl ethanoate; acetic acid, isoamyl ester; acetic acid, isopentyl ester.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|--|---|--|
| Isoamyl acetate (derivation: By rectification of commercial amyl acetate). 1 ppm = 5.41 mg/m³ | PEL: 100 ppm 525 mg/m³ STEL: Not Established | REL: 100 ppm 525 mg/m³ STEL: Not Established | 1000 ppm | TLV: 100 ppm 525 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 288°F (142°C) | Specific Gravity (H ₂ O = 1) 0.87 |
| Vapor Pressure (mm Hg) 4 at 68°F (20°C) | Molecular Weight 130.2 |
| Vapor Density (Air = 1) 4.49 | Melting Point -109°F (-78°C) |

Solubility

Very slightly soluble in water. Soluble in ethyl acetate, amyl alcohol, acetone, ethanol, ether, fixed oils.

Appearance and Odor

Clear colorless liquid with a pear or banana-like odor and taste. Odor Threshold = <1 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) 77°F (25°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.0% at 212°F (100°C) UEL: 7.5% |
| NFPA Classification Class IC Flammable Liquid | Autoignition Temperature 680°F (360°C) |

Extinguishing Media

Dry chemical, alcohol foam, carbon dioxide, water spray. Use water spray to cool exposed containers.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing with SCBA. Use blanketing effect with foam to smother large fires. Continue to cool containers with water after fire is extinguished.

Unusual Fire and Explosion Hazards

Immediately withdraw if rising sound from venting device is heard or if fire is causing discoloration to the tank. Evacuate 1500 feet radius if fire becomes uncontrollable or container is exposed to direct flame. Vapors are heavier than air and may travel a distances to ignition source to flashback.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|---|--|---|
| Stability | | Conditions to Avoid Isoamyl acetate is stable under normal conditions of storage and operation. Avoid contact with incompatible materials. Keep away from heat, flame, and other sources of ignition. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) Reacts violently in contact with nitrates, strong oxidizers, alkalis, and acids. Particularly reactive with chlorosulfonic acid and strong reducing agents. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of isoamyl acetate is not expected to occur. It will attack or break down many natural and artificial rubber products and coatings. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, isoamyl acetate emits acrid and irritating fumes, including toxic oxides of carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and respiratory tract. Causes central nervous system depression with headache, weakness, dizziness, and loss of consciousness. It can also cause edema of the glottis, difficulty breathing, rapid pulse rate, and fatigue. SKIN & EYES: Will irritate the skin. May cause contact dermatitis. Eye contact may cause irritation and possible visual disturbances that do not appear to be permanent. INGESTION: Irritation of the mouth, esophagus, stomach, and digestive tract, nausea, and vomiting. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system; skin; eyes, CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Call poison control center for advice. Give 1-2 glasses of milk or water. Do NOT induce vomiting unless advised otherwise. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite or other). Ventilate area of spill, remove ignition sources. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire, and flame away. If possible, automatically transfer liquids between containers. | | | | |
| Other Precautions and Warnings Bulk storage of isoamyl acetate is not recommended. Ground and bond all metal containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) Where potential exists for exposure over 100 ppm, use an MSHA/NIOSH-approved full facepiece respirator with an organic vapor cartridge. For higher exposures, use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves (avoid rubber) | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Impermeable Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

Personnel should avoid direct contact with isoamyl acetate. The best risk reduction measure is to use a less toxic chemical as a substitute for isoamyl acetate. If this is not possible or practical, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risks to other personnel.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around isoamyl acetate. For exposures over 100 ppm (8 hours), an MSHA/NIOSH-approved chemical respirator with an organic vapor cartridge should be used. For higher exposures, a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode or a supplied-air respirator with full facepiece operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Caution is warranted in glove selection since isoamyl acetate will attack many rubber products. Butyl rubber appears to provide some protection for limited periods of time. Natural rubber, neoprene, nitrile, polyethylene, polyvinyl chloride, and Viton are NOT recommended. Glove manufacturers should be contacted to obtain permeation studies before gloves are selected.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with isoamyl acetate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where isoamyl acetate is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- Lung function tests.
- Skin testing with dilute isoamyl acetate to help diagnose allergy (performed by a qualified allergist).

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to isoamyl acetate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of isoamyl acetate should be communicated to all exposed and potentially exposed workers.
- Never eat, drink, or smoke in areas where isoamyl acetate is used, handled, or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of isoamyl acetate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Isoamyl acetate is considered a Class IC flammable liquid (according to OSHA 29 CFR 1910.106). Its moderately low flash point presents a serious fire and explosion hazard concern. Also, because it is incompatible with a number of common materials, especially strong oxidizers and acids, contact can result in violent and explosive reactions. It can also form explosive mixtures in air and can ignite on contact with heat, fire, or sparks. These characteristics require special consideration during any emergency situation involving a leak or spill of isoamyl acetate.

The proper disposal/destruction method for isoamyl acetate is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Isoamyl acetate can enter the environment through

unchecked industrial discharges into effluents and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to isoamyl acetate.

Insufficient data are available to evaluate or predict the short-term effects of isoamyl acetate to aquatic life, plants, birds, or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of isoamyl acetate to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Isoamyl acetate is only slightly soluble in water. Concentrations of 1 to 100 milligrams may mix with a liter of water.

🕒 *Persistence in the Environment*

Isoamyl acetate is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of isoamyl acetate found in fish tissues is expected to be somewhat higher than the average concentration of isoamyl acetate in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT la-

beling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of isoamyl acetate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If isoamyl acetate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of isoamyl acetate. If isoamyl acetate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove all ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools.
- ☑ It may be necessary to dispose of isoamyl acetate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving isoamyl acetate can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or

environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| NFPA Classification Class II Combustible Liquid | | | Autoignition Temperature 657°F (347°C) | | | |
| Extinguishing Media Dry chemical, carbon dioxide, or alcohol foam, or water spray. | | | | | | |
| Special Fire Fighting Procedures Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Continue to cool containers with water after fire is extinguished. Move containers from fire area if it can be done without risk. For large fires, use unmanned hose apparatus, if possible. Evacuate non-essential personnel 1500 feet radius if fire. Consider down-wind conditions. | | | | | | |
| Unusual Fire and Explosion Hazards Vapors are heavier than air and may travel a distances to ignition source to flashback. Vapors may explode if ignited in an enclosed area. | | | | | | |

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|--|--|--|
| Stability | | Conditions to Avoid Isoamyl alcohol is stable under normal conditions of storage and operation. Avoid contact with incompatible materials. Keep away from heat, flame, and other ignition sources. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) Reacts violently in contact with oxidizers and many reducing materials. It will react explosively in contact with hydrogen trisulfide. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, isoamyl alcohol is not expected to undergo hazardous polymerization. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, isoamyl alcohol emits acrid and irritating fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? | Ingestion? X | |
| Health Hazards INHALATION: There may be slight irritation of the eyes, nose, and mucosa of the respiratory tract. Exposure can also cause stupor, fatigue, and sleepiness. Other effects include nausea, vomiting, flushing of skin, headaches, double vision, vertigo, weakness, sleepiness, olfactory changes, and death. SKIN & EYES: As a solvent, causes dry skin, cracking, and possible dermatitis. Eye contact can result in burning, stinging, tearing, corneal injury, and hyperemia of the conjunctiva. INGESTION: Sleep disorders, hallucinations, distorted perceptions, convulsions, ataxia and motor activity changes, coma, headache, and death. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Skin, eyes, respiratory system, CNS. |
| Medical Conditions Generally Aggravated by Exposure Chronic liver disease. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Contact poison control center. Give 1-2 glasses of water and induce vomiting. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite or other). Ventilate area of spill. Have extinguishing agent available in case of fire. Store materials in DOT-approved containers. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire, and flame away. Outside building or underground storage is recommended. | | | | |
| Other Precautions and Warnings Ground and bond all metal containers. Avoid contact with skin and eyes. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) For vapor exposures, use an organic vapor air-purifying respirator. Greater protection is obtained using a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Impermeable Apron or Protective Suit |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

believe that such chemicals pose a cancer risk in the long-term.

Reproduction: According to the references, isoamyl alcohol has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Very high or prolonged exposure may result in mucous membrane irritation, headache, and depression of the CNS with symptoms of somnolence and lack of concentration. Prolonged skin contact can cause dermatitis.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with isoamyl alcohol. The exact nature of its toxicity is not clearly understood in the references and its carcinogenic ability is considered suspect. The best risk reduction measure is to use a less toxic chemical as a substitute for a isoamyl alcohol. However, if substitution is not possible or operationally feasible, then *engineering controls* are the most effective methods of reducing exposures. An alternative method of protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around isoamyl alcohol. For concentrations over the PEL (100 ppm), an air-purifying respirator with an organic vapor cartridge will suffice. For higher exposures, a supplied-air respirator with full facepiece operated in positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with isoamyl alcohol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where isoamyl alcohol is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- ☑ Evaluation of nervous system function with careful consideration of exposure history and special testing by a qualified neurologist.
- ☑ Skin testing with dilute isoamyl alcohol to help diagnose allergy (performed by a qualified allergist).

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to isoamyl alcohol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of isoamyl alcohol should be communicated to all exposed or potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of isoamyl alcohol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Isoamyl alcohol is considered a Class II combustible liquid (according to OSHA 29 CFR 1910.106). Its relatively low flash point presents a moderate fire and explosion hazard concern. Also, because it is incom-

patible with a number of common materials, especially strong oxidizers and many reducing materials, contact can result in violent and explosive reactions. It can also react explosively with hydrogen trisulfide and can ignite on contact with heat, fire, or sparks. These characteristics require special consideration during any emergency situation involving a leak or spill of isoamyl alcohol.

Isoamyl alcohol can enter the environment through unchecked industrial discharges into effluents and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to isoamyl alcohol.

Insufficient data are available to evaluate or predict the short-term effects of isoamyl alcohol to aquatic life, plants, birds, or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of isoamyl alcohol to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Isoamyl alcohol is slightly soluble in water. Concentrations of 1 to 100 milligrams can be expected to mix with a liter of water.

🕒 *Persistence in the Environment*

Isoamyl alcohol is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 90% of isoamyl alcohol will eventually end up in the air; the remainder will end up in water.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become con-

centrated in the tissues and internal organs of animals as well as humans.

The concentration of isoamyl alcohol found in fish tissues is expected to be about the same as the average concentration of isoamyl alcohol in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of isoamyl alcohol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If isoamyl alcohol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of isoamyl alcohol.

If isoamyl alcohol is spilled or leaked, the following specific steps are recommended to ensure the protection of personnel and the environment:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers for disposal. Use non-sparking tools.
- ☑ It may be necessary to dispose of isoamyl alcohol as a hazardous waste. The responsible state

agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving isoamyl alcohol can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," or "carcinogen" are used, public emotion, hysteria, and ignorance can run equally high. This must be properly considered during the development of any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| Isobutane (derivation: An important component of natural gasoline, refinery gases, wet natural gas, also obtained by isomerization of butane). 1 ppm = 2.42 mg/m³ | PEL: Not Established STEL: Not Established | REL: 800 ppm 1900 mg/m³ STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|------------------------------|---------------------------|---|------------------------|
| Boiling Point | 11°F (-12°C) | Specific Gravity (H ₂ O = 1) | 2.06 |
| Vapor Pressure (atmospheres) | 3.1 at 70°F (21°C) | Molecular Weight | 58.14 |
| Vapor Density (Air = 1) | 2.01 | Freezing Point | -255°F (-160°C) |

Solubility

Slightly soluble in water. Soluble in alcohol and ether, very soluble in organic solvents.

Appearance and Odor

Colorless gas with a gasoline-like or natural gas odor. Shipped as a liquefied compressed gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|-------------------------------------|
| Flash Point (method used) | Explosive Limits in Air % by Volume |
| -117°F (-83°C) closed cup | LEL: 1.6% UEL: 8.4% |
| NFPA Classification | Autoignition Temperature |
| Flammable Gas; Class IA Flammable Liquid | 860°F (460°C) |

Extinguishing Media

Stop flow of gas first (if possible). Use carbon dioxide, dry chemical, foam, or water spray on fire.

Special Fire Fighting Procedures

Isobutane is an extremely flammable, very dangerous fire and explosion hazard. Poisonous gases are evolved from fire. Wear a self-contained breathing apparatus (SCBA) with full facepiece. Ensure ALL sources of escaping gas are controlled. Monitor area long after fire is extinguished. Move containers from fire area if it can be done without risk. Use water spray to knock down vapors.

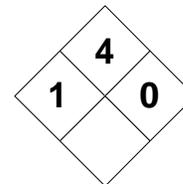

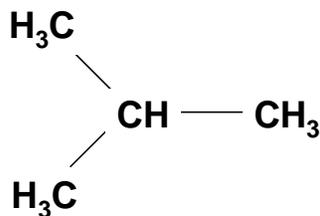

Unusual Fire and Explosion Hazards

Gas is explosive. Containers may explode in fire. Even if fire is extinguished, escaping gas can form explosive mixtures in air quickly and ignite without warning. Evacuate 2500 feet from fire area.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|--|--------------------|---|
| Stability | | Conditions to Avoid Isobutane is normally stable in its closed containers, during routine operations (those that do not expose it to ignition sources). Avoid contact with heat, sparks, flame, lighted tobacco products, and steam lines. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Isobutane is reactive in contact with strong oxidizers (nitrates and perchlorates), chlorine or chlorine dioxide, fluorine, other oxidizers, nickel carbonyl + oxygen, heat, sparks, and open flame. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of isobutane is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products If involved in fire, isobutane can produce acrid smoke and irritating fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: An asphyxiant gas. Initial symptoms are those of oxygen starvation. Feeling of "air hunger," diminished mental alertness, headache, dullness, shortness of breath, and an impairment in muscle coordination. Continued exposures lead to faulty judgment, depression of senses, rapid fatigue, unconsciousness, convulsions, coma, and death. SKIN & EYES: Contact with the compressed gas or refrigerated liquid can cause frostbite and burns. INGESTION: Not likely since isobutane is a gas at normal working (room) temperatures. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Insufficient data | No | No | No | Central nervous system |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Immediately flush with large amounts of warm (tepid) water for 15 minutes (minimum), occasionally lifting eyelids; seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of tepid water. If blisters occur, seek medical attention. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If <u>swallowed:</u> Not a likely exposure route. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. If gas has not yet ignited, use a water spray to knock down vapors and direct them from ignition source. | | | | |
| Preferred Waste Disposal Method None specified in the references (incineration of a gas may be the only alternative). | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible materials or in the presence of heat since violent reactions or explosions can occur. Store in tightly closed pressurized containers in a cool, dark, well-ventilated area away from sunlight. Keep away from ignition sources such as fire, sparks, and flame. | | | | |
| Other Precautions and Warnings Bulk storage of isobutane is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Isobutane is a simple asphyxiant. Do NOT use cartridge-type respirators (ineffective for this type of gas). Use a powered supplied-air respirator or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious, Thermal Protective | | Eye Protection Goggles and/or Face Mask | | Other Protective Clothing Leather Apron |

ISOBUTANE

CAS: 75-28-5

**IDENTIFICATION AND TYPICAL USES**

Isobutane is a colorless gas with a gasoline-like or natural gas odor. It is normally shipped as a liquefied compressed gas. It is a liquid below 11°F (-12°C). It is used in organic synthesis, as a refrigerant, in motor fuels, as a propellant for aerosols, in the manufacture of synthetic rubber, and as a calibration fluid.

RISK ASSESSMENT: HEALTH**General Assessment**

Isobutane is a simple asphyxiant gas. As such, its primary route of entry into the body is through *inhalation*. It can displace oxygen levels to below that which is necessary to sustain life. At high concentrations, it is a narcotic and can cause anesthesia and unconsciousness. Skin contact with the liquid can be destructive to tissues due to the extremely cold temperatures but absorption is not a likely exposure route. Since isobutane usually exists as a gas at room temperature, ingestion is not likely to occur either.

Inhalation of isobutane gas can cause headache, dullness, shortness of breath, and the symptoms of asphyxiation. These include rapid respiration and a feeling of "air hunger" or air starvation followed by a decrease in mental alertness, and impaired muscular coordination. If exposure continues, there can be narcosis, anesthesia, faulty judgment, depression of the senses, emotional instability, nausea, vomiting, prostration, unconsciousness, convulsions, coma, and death.

Skin or eye contact with the vapor poses no serious threat. The vapors have not been shown to cause any physiological response. On exposure to air, the liquid evaporates rapidly and may not have time to cause damage. However, if the liquid should contact

either the skin or the eyes, there can be serious irritation, burns, tissue damage, and frostbite.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to isobutane:

Skin: Liquid threat only. Redness, pain, swelling, blisters, and severe frostbite.

Eye: Liquid threat only. Causes frostbite, redness, irritation, severe pain, and blurred vision.

Lung: Vapor is non-irritating and therefore poses no threat of damage to the lungs. However, in high concentrations, isobutane can lead to symptoms of asphyxiation and oxygen deprivation up to and including irregular heartbeat, loss of consciousness, and death.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to isobutane and can last for months or even years:

Cancer Hazards: There is insufficient evidence in the references to evaluate isobutane for its ability to cause cancer in animals. It is a simple asphyxiant.

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: Isobutane may be a cardiac sensitizer. More research is required in this regard.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with isobutane. If another gas cannot be substituted for isobutane, then *engineering controls* are the most effective method of reducing exposures. The best protection is to separate

operations and provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using equipment with explosion-proof designs and ensuring all metal containers and tools are electrically grounded and bonded can further reduce the potential for injury or damage. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with isobutane. Air-purifying respirators (e.g., the cartridge-type or gas masks) cannot be used with isobutane. These types of respirators only purify the air and can do nothing to protect in oxygen deficient atmospheres. A powered air-supplied respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber or leather apron should be worn. To prevent hand and skin exposures with the liquid, thermal gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with isobutane. Administrative controls as well as engineering controls must consider the effects of working with isobutane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where isobutane is used or stored.

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, consider installing automatic sensors that warn personnel of dropping oxygen levels and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.

- ☑ Wash thoroughly immediately after exposure to isobutane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Safety shower and eyewash stations should be readily available in work areas where isobutane is used or stored.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of isobutane should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of isobutane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Isobutane is a highly flammable and explosive gas. Its extremely low flash point and boiling point present a serious fire hazard. It will float and boil on water to produce a flammable and visible vapor cloud. Also, since it can react violently in the presence of oxidizers, such as chlorine, isobutane requires special consideration during any emergency involving a leak or release of isobutane gas or liquid.

Isobutane can enter the environment through industrial discharges, unchecked venting to air, or through spills of the liquid. Since liquids will most likely vaporize rapidly, water and soil contamination are possible but improbable.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to isobutane.

Isobutane has slight acute toxicity to aquatic life. Insufficient data are available on the acute (short-term) effects of isobutane on plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of isobutane to aquatic life, plants, birds, or land animals.

◆ *Water Solubility*

Isobutane is only slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Isobutane is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.9% of isobutane will eventually end up in air; the rest will end up in the water.

🌀 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Isobutane is not expected to accumulate in the tissues of fish.

🕒 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of isobutane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures.

Contaminated soils should be removed for incineration and replaced with clean soil. When spills or leaks occur, it may be necessary to contact the local and/or state emergency response authorities. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of isobutane. If isobutane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep isobutane out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- ☑ It may be necessary to dispose of isobutane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving isobutane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with spe-

cific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| | | CH₃COOCH₂CH(CH₃)₂ | | | |

Synonyms

Isobutyl ester of acetic acid; 2-methylpropyl acetate; 2-methylpropyl ester of acetic acid; β-methylpropyl ethanoate; acetic acid isobutyl ester.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|--|---|--|
| Isobutyl acetate (derivation: By treating isobutanol with acetic acid in the presence of catalysts). 1 ppm = 4.83 mg/m³ | PEL: 150 ppm 700 mg/m³ STEL: Not Established | REL: 150 ppm 700 mg/m³ STEL: Not Established | 1300 ppm | TLV: 150 ppm 700 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|-------------------------|--------------------------|---|-----------------------|
| Boiling Point | 243°F (117°C) | Specific Gravity (H ₂ O = 1) | 0.87 |
| Vapor Pressure (mm Hg) | 13 at 68°F (20°C) | Molecular Weight | 116.2 |
| Vapor Density (Air = 1) | 4.00 | Melting Point | -145°F (-98°C) |

Solubility

Very slightly soluble in water (0.6%). Soluble in alcohol, ether, and hydrocarbons.

Appearance and Odor

Colorless, mobile liquid with a fruity, floral odor. Odor Threshold = 0.5 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|----------------------------------|-------------------------------------|-------------------|
| Flash Point (method used) | 64°F (18°C) closed cup | Explosive Limits in Air % by Volume | |
| | | LEL: 1.3% | UEL: 10.5% |
| NFPA Classification | Class IB Flammable Liquid | Autoignition Temperature | |
| | | 793°F (423°C) | |

Extinguishing Media

Dry chemical, alcohol foam, carbon dioxide, water spray. Use water spray to cool exposed containers.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing with SCBA. Use blanketing effect with foam to smother large fires. Continue to cool containers with water after fire is extinguished.

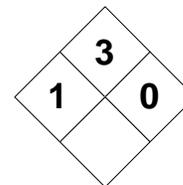

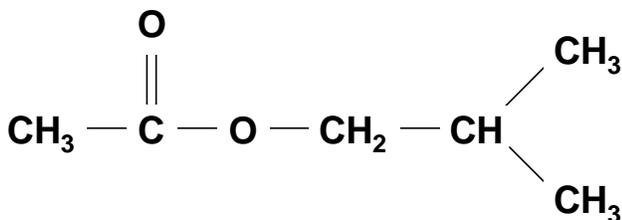

Unusual Fire and Explosion Hazards

Immediately withdraw if rising sound from venting device is heard or if fire is causing discoloration to the tank. Evacuate 1500 feet radius if fire becomes uncontrollable or container is exposed to direct flame. Vapors are heavier than air and may travel a distances to ignition source to flashback.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|--|--|---|
| Stability | | Conditions to Avoid Isobutyl acetate is stable under normal conditions of storage and operation. Avoid contact with incompatible materials. Keep away from heat, flame, and other sources of ignition. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) Reacts violently in contact with nitrates, strong oxidizers, alkalis, and acids. Particularly reactive with chlorosulfonic acid. It will dissolve many plastics. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of isobutyl acetate is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, isobutyl acetate emits acrid and irritating fumes, including toxic oxides of carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the eyes, nose, throat, and respiratory tract. Causes central nervous system depression with headache, weakness, dizziness, and loss of consciousness. It can also cause pulmonary edema, difficulty breathing, rapid pulse rate, and fatigue. There may also be liver damage, renal injury, and CNS effects (giddiness, confusion, delirium). SKIN & EYES: Will irritate the skin. May cause contact dermatitis. Eye contact may cause irritation and possible visual disturbances that do not appear to be permanent. INGESTION: Irritation of the mouth, esophagus, stomach, and digestive tract, nausea, and vomiting. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system; skin; eyes, CNS. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Call poison control center for advice. Give 1-2 glasses of water, induce vomiting and repeat until vomit is clear unless advised otherwise. Never give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill, remove ignition sources. Have water source available in case of fire. Store materials in DOT-approved containers. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire, and flame away. If possible, automatically transfer liquids between containers. | | | | |
| Other Precautions and Warnings Bulk storage of isobutyl acetate is not recommended. Ground and bond all metal containers. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) Where potential exists for exposure over 150 ppm (8 hours), use a MSHA/NIOSH-approved full facepiece respirator with an organic vapor cartridge. For higher exposures, use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Impermeable Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ISOBUTYL ACETATE

CAS: 110-19-0

**IDENTIFICATION AND TYPICAL USES**

Isobutyl acetate is a colorless liquid with a characteristic fruity or floral odor. It is used as a solvent for nitrocellulose, in the manufacture of thinners, sealants, and topcoat lacquers, in perfumery, and as a flavoring agent.

RISK ASSESSMENT: HEALTH**General Assessment**

Isobutyl acetate is mildly toxic by *inhalation* and *ingestion*. Skin contact can produce localized effects but absorption has not been reported. Upon absorption into the body (through respiration or digestion) it is hydrolyzed to acetic acid and isobutanol. There are no reports of any carcinogenic, teratogenic, or mutagenic effects in humans or animals following exposure to isobutyl acetate.

Inhalation of isobutyl acetate vapors can cause irritation to the eyes, nose, throat, and respiratory tract with nausea, vomiting, cough, shortness of breath, and unconsciousness. There may also be the development of pulmonary edema (fluid in the lungs) which can be fatal. Symptoms can be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk. Depending upon the concentration and duration of the exposure, there can also be varying degrees of central nervous system depression. Symptoms may include headaches, dizziness, general weakness and fatigue, loss of consciousness, difficulty in breathing, increased or rapid pulse rate, unconsciousness, and death.

Skin contact results in the removal of the skin's natural protective oily layer on its surface with subsequent drying, cracking, and possible secondary infections and dermatitis. Eye contact can cause irritation and the possibility for adverse effects to vision.

Ingestion of isobutyl acetate may cause irritation of the mouth, esophagus, stomach, and digestive tract with nausea and vomiting. There can also be gastrointestinal hemorrhage, liver damage, renal damage with glycosuria (excessive sugar in urine), and cardiac failure.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to isobutyl acetate:

Skin: Mild to moderate irritation. Will remove the skin's protective oily layer to cause drying, cracking, and possible secondary infection and dermatitis.

Eye: Irritation and possible inflammation.

Lung: Irritation of the eyes, nose, throat and lungs (especially the mucus membranes). May cause changes in the sense of smell and in pulmonary function. Delayed pulmonary edema is possible, which is a medical emergency.

CNS: High concentrations can depress the central nervous system leading to narcoses and possible loss of consciousness.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to isobutyl acetate and can last for months or even years:

Cancer Hazards: According to the references, isobutyl acetate has not been adequately tested for its ability to cause cancer in test animals.

Reproduction: According to the references, isobutyl acetate has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated or prolonged skin contact may cause the development of contact dermatitis with rash, itching, redness, and localized inflammation of the affected surface area.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with isobutyl acetate. The best risk reduction measure is to use a less toxic chemical as a substitute for isobutyl acetate. If this is not possible or practical, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risks to other personnel.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around isobutyl acetate. For exposures over 150 ppm (8-hours), an MSHA/NIOSH approved chemical respirator with an organic vapor cartridge should be used. For higher exposures, a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode or a supplied-air respirator with full facepiece operated in pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Caution is warranted in glove selection since isobutyl acetate will attack many plastic formulations. Glove manufacturers should be contacted to obtain permeation studies *before* gloves are selected.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with isobutyl acetate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where isobutyl acetate is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- ☑ Lung function tests.
- ☑ Liver and kidney function tests.
- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- ☑ Skin testing with dilute isobutyl acetate to help diagnose allergy (performed by a qualified allergist).

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, smokers exposed to isobutyl acetate may experience symptoms more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposure symptoms in the workplace.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to isobutyl acetate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of isobutyl acetate should be communicated to all exposed and potentially exposed workers.
- ☑ Never eat, drink, or smoke in areas where isobutyl acetate is used, handled, or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of isobutyl acetate. In almost every scenario, the threat of envi-

ronmental exposure is contingent upon the proper handling of the chemical substance.

Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Isobutyl acetate is considered a Class IB flammable liquid (according to OSHA 29 CFR 1910.106). Its moderately low flash point presents a serious fire and explosion hazard concern. Also, because it is incompatible with a number of common materials, especially strong oxidizers and acids, contact can result in violent and explosive reactions. It can also form explosive mixtures in air and can ignite on contact with heat, fire, or sparks. These characteristics require special consideration during any emergency situation involving a leak or spill of isobutyl acetate.

The proper disposal/destruction method for isobutyl acetate is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Isobutyl acetate can enter the environment through unchecked industrial discharges and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to isobutyl acetate.

Insufficient data are available to evaluate or predict the short-term effects of isobutyl acetate to aquatic life, plants, birds, or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of isobutyl acetate to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Isobutyl acetate is only slightly soluble in water. Concentrations of 1 to 100 milligrams may mix with a liter of water.

🕒 *Persistence in the Environment*

Isobutyl acetate is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of

the chemical to be degraded. There are insufficient data to evaluate or predict the percentages of isobutyl acetate that will eventually end up in the various environmental mediums (air, water, and soil).

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of isobutyl acetate found in fish tissues is expected to be somewhat higher than the average concentration of isobutyl acetate in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of isobutyl acetate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. If isobutyl acetate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of isobutyl acetate. If isobutyl acetate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove all ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools.
- ☑ It may be necessary to dispose of isobutyl acetate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving isobutyl acetate can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|---|---------------------------------|
| Characterization Alcohol | RCRA Number U140 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Isobutanol | Chemical Abstract Service (CAS) Number 78-83-1 | |
| DOT Hazard Class and Label Requirements Flammable or Combustible Liquid | DOT Emergency Guide Code 26 | |
| DOT Identification Number UN 1212 | Chemical Formula (CH₃)₂CHCH₂OH | |

Synonyms

IBA; isobutanol; isopropylcarbinol; 2-methyl-1-propanol; fermentation butyl alcohol.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|---|---|---|
| Isobutyl alcohol (derivation: By-product of synthetic methanol production, purified by rectification or by fermentation of carbohydrates). 1 ppm = 3.08 mg/m³ | PEL: 100 ppm 300 mg/m³ STEL: Not Established | REL: 50 ppm 150 mg/m³ STEL: Not Established | 1600 ppm | TLV: 50 ppm 152 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 270°F (132°C) | Specific Gravity (H ₂ O = 1) 0.81 |
| Vapor Pressure (mm Hg) 28 at 68°F (20°C) | Molecular Weight 88.2 |
| Vapor Density (Air = 1) 3.04 | Melting Point -179°F (-117°C) |

Solubility

Soluble in water. Miscible in alcohol and ether.

Appearance and Odor

Colorless, oily liquid with a sweet, musty odor. Odor Threshold = 40ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 82°F (28°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.7% at 123°F (51°C) UEL: 10.6% at 202°F (94°C) |
| NFPA Classification Class IC Flammable Liquid | Autoignition Temperature 780°F (415°C) |

Extinguishing Media

Dry chemical, carbon dioxide, alcohol-resistant foam, or water spray.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Continue to cool containers with water after fire is extinguished. Move containers from fire area if it can be done without risk. For large fires, use unmanned hose apparatus, if possible. Evacuate non-essential personnel one-half mile radius if fire. Consider down-wind conditions.

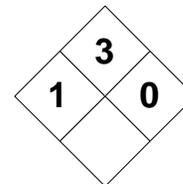

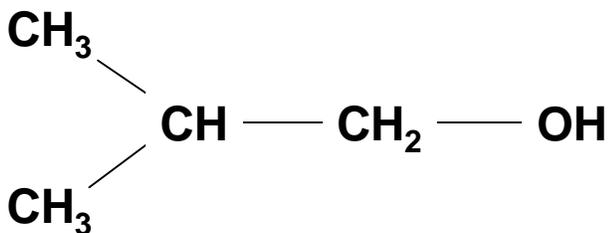

Unusual Fire and Explosion Hazards

Vapors are heavier than air and may travel a distances to ignition source to flashback. Vapors may explode if ignited in an enclosed area.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|---|--|--|
| Stability | | Conditions to Avoid Isobutyl alcohol is stable under normal conditions of storage and operation. Avoid contact with incompatible materials. Keep away from heat, flame, and other ignition sources. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) Reacts violently in contact with strong oxidizers, inorganic acids, aldehydes, and isocyanates. It ignites on contact with chromium trioxide and will form explosive hydrogen gas in contact with heated aluminum. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, isobutyl alcohol is not expected to undergo hazardous polymerization. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, isobutyl alcohol emits acrid and irritating fumes including carbon dioxide and isobutylene. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: There may be slight irritation of the eyes, nose, and mucosa of the respiratory tract. Exposure can also cause stupor, fatigue, and sleepiness. Other effects include nausea, vomiting, flushing of skin, headaches, double vision, vertigo, weakness, sleepiness, olfactory changes, pulmonary edema, and death. SKIN & EYES: As a solvent, causes skin dryness, cracking, and possible dermatitis. Eye contact can result in burning, stinging, tearing, corneal injury, and hyperemia of the conjunctiva. INGESTION: Sleep disorders, hallucinations, distorted perceptions, convulsions, ataxia and motor activity changes, renal and liver damage, cardiac failure, coma, headache, and death. | | | | |
| Carcinogenicity Unknown Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Skin, eyes, respiratory system, CNS. |
| Medical Conditions Generally Aggravated by Exposure Chronic liver, kidney, and chronic respiratory diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum); seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 48 hours for lung effects. If <u>swallowed:</u> Contact poison control center. Give 1-2 glasses of water or milk. Do NOT induce vomiting. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Contain spills using absorbent material (vermiculite, or other). Ventilate area of spill. Have extinguishing agent available in case of fire. Store materials in DOT-approved containers. | | | | |
| Preferred Waste Disposal Method Incineration in chemical incinerator equipped with scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in a cool, dark, well-ventilated area. Protect containers from physical damage. Keep heat, fire, and flame away. Outside building or underground storage is recommended. | | | | |
| Other Precautions and Warnings Ground and bond all metal containers. Avoid contact with skin and eyes. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) For vapor exposures, use an organic vapor air-purifying respirator. Greater protection is obtained using a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Impermeable Apron or Protective Suit |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ISOBUTYL ALCOHOL

CAS: 78-83-1

**IDENTIFICATION AND TYPICAL USES**

Isobutyl alcohol is a colorless or clear, oily liquid with a sweet, musty odor. It is used in organic synthesis, as a latent solvent in paints and lacquers, as an intermediate for amino coating resins, and as a substitute for n-butanol. It is also used in paint removers, fluorometric determination, in liquid chromatography, and in fruit flavor concentrates.

RISK ASSESSMENT: HEALTH***General Assessment***

Isobutyl alcohol is primarily toxic to humans by *inhalation* and *ingestion*. Skin contact can cause adverse surface effects but dermal absorption has not been reported. Isobutyl alcohol is not currently listed as a carcinogen by OSHA, the NTP, or the IARC. However, there are reports in the references that this compound is under review because of its ability to cause tumors in rats and that its listing as a carcinogenic is imminent. Mutation data have also been reported.

Inhalation can cause irritation of the eyes, nose, throat, upper respiratory tract, and associated mucosa. There may also be depression of the central nervous system (CNS) with narcosis and associated symptoms, including headache, nervousness, flushing of the skin, double vision, vertigo, tremors, dizziness, fatigue and general weakness, nausea, somnolence, pulmonary edema (fluid on the lungs), and narcosis with stupor, loss of consciousness, and death. The symptoms of pulmonary edema may be delayed up to 48 hours which can create a false sense of security with regard to health exposure risk.

Liquid contact with the eyes causes immediate burning and stinging with lachrymation and reflex closure of the lids. There may be severe, irreversible damage, injury to the corneal epithelium and possible

conjunctivitis, depending upon the duration of exposure and concentration strength. There may be a formation of vacuoles (small pockets of air or fluid) in cornea. Skin contact results in drying and cracking which can lead to secondary infections and dermatitis. There may be erythema (redness) and hypermia (and excessive blood in the skin).

Ingestion of isobutyl alcohol can lead to sleep disorders, hallucinations, ataxia, motor function changes, convulsions and tremors, coma, headaches, nausea or vomiting, loss of body temperature, renal and liver damage, gastrointestinal damage, cardiac failure, unconsciousness, and death.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to isobutyl alcohol:

- Skin:** Causes dryness and cracking leading to dermatitis and possible infection with erythema.
- Eye:** Severe irritation with burning and stinging with possible damage to the cornea and conjunctiva.
- Lung:** Irritation of the eyes, nose, throat, and respiratory tract. Delayed pulmonary edema is also a possible effect, which can be fatal.
- CNS:** High concentrations can cause depression of the CNS with symptoms of sleepiness, vertigo, loss of consciousness, and death.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to isobutyl alcohol and can last for months or even years:

Cancer Hazards: Isobutyl alcohol has been shown to cause cancer in experimental animals. It is not known

whether it will have this affect in humans but its carcinogenicity is considered questionable. Human mutation data have been reported. Many scientists believe that such chemicals pose a cancer risk in the long-term.

Reproduction: According to the references, isobutyl alcohol has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Very high or prolonged exposure may result in mucous membrane irritation, headache, and depression of the CNS with symptoms of somnolence and lack of concentration. Prolonged skin contact can cause dermatitis.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with isobutyl alcohol. The exact nature of its toxicity is not clearly understood in the references and its carcinogenic ability is considered suspect. The best risk reduction measure is to use a less toxic chemical as a substitute for isobutyl alcohol. However, if substitution is not possible or operationally feasible, then *engineering controls* are the most effective method of reducing exposures. An alternative method of protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around isobutyl alcohol. For concentrations over the PEL (100 ppm), an air-purifying respirator with an organic vapor cartridge will suffice. For higher exposures, a supplied-air respirator with full facepiece operated in positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a protective apron should be worn. To prevent hand and skin exposures, impervious gloves should be used.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with isobutyl alcohol. All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where isobutyl alcohol is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are recommended:

- ☑ Evaluation of nervous system function with careful consideration of exposure history and special testing by a qualified neurologist.
- ☑ Complete blood count (CBC) and determination of isobutyl alcohol levels (or its metabolites).
- ☑ Urinalysis to check for glycosuria (excessive sugar concentrations in urine).
- ☑ Electrocardiogram (EKG).
- ☑ Liver and lung function tests.
- ☑ Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- ☑ Skin testing with dilute isobutyl alcohol to help diagnose allergy (performed by a qualified allergist).

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, lung cancer, emphysema, and other respiratory diseases, smokers exposed to isobutyl alcohol may experience symptoms more rapidly than non-smokers under the same conditions of exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- ☑ Wash thoroughly immediately after exposure to isobutyl alcohol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of isobutyl alcohol should be communicated to all exposed or potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of isobutyl alcohol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Isobutyl alcohol is considered a Class IC flammable liquid (according to OSHA 29 CFR 1910.106). Its relatively low flash point presents a moderate fire and explosion hazard concern. Also, because it is incompatible with a number of common materials, especially strong oxidizers and many reducing materials, contact can result in violent and explosive reactions. It can also react explosively with hydrogen trisulfide and can ignite on contact with heat, fire, or sparks. These characteristics require special consideration during any emergency situation involving a leak or spill of isobutyl alcohol.

Isobutyl alcohol can enter the environment through unchecked industrial discharges into effluents and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to isobutyl alcohol.

Insufficient data are available to evaluate or predict the short-term effects of isobutyl alcohol to aquatic life, plants, birds, or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of isobutyl alcohol to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Isobutyl alcohol is slightly soluble in water. Concentrations of 1 to 100 milligrams can be expected to mix with a liter of water.

🕒 *Persistence in the Environment*

Isobutyl alcohol is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a

pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of isobutyl alcohol found in fish tissues is expected to be about the same as the average concentration of isobutyl alcohol in water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of isobutyl alcohol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil.

If isobutyl alcohol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of isobutyl alcohol.

If isobutyl alcohol is spilled or leaked, the following specific steps are recommended to ensure the protection of personnel and the environment:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers for disposal. Use non-sparking (e.g., brass, plastic) tools.
- ☑ It may be necessary to dispose of isobutyl alcohol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving isobutyl alcohol can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that any time the terms “cancer,” or “carcinogen” are used, public emotion, hysteria, and ignorance can run equally high. This must be properly considered during the development of any public relations policies.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures or policies intended to manage the use of chemicals in the workplace. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Identification Number UN 1214 | Chemical Formula (CH₃)₂CHCH₂NH₂ | |

Synonyms

1-Amino-2-methylpropane; monoisobutylamine; valamine; iso-butylamine; 2-methylpropylamine.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Isobutylamine (derivation: From isobutyl alcohol and ammonia. May also be isolated from fungi, and is a thermal decomposition product from valine and leucine). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 154°F (68°C) | Specific Gravity (H ₂ O = 1) 0.739 |
| Vapor Pressure (mm Hg) 100 at 66°F (19°C) | Molecular Weight 73.16 |
| Vapor Density (Air = 1) 2.5 | Melting Point -121°F (-85°C) |

Solubility

Completely soluble in water. Soluble in alcohol, ether, acetone, and benzene.

Appearance and Odor

Colorless or clear liquid with a strong, fish-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 15°F (-9°C) closed cup | Explosive Limits in Air % by Volume LEL: 3.4% UEL: 9% |
| NFPA Classification Class IB Flammable Liquid | Autoignition Temperature 712°F (378°C) |

Extinguishing Media

Use dry chemical, carbon dioxide, foam, or water (water may not be effective by itself).

Special Fire Fighting Procedures

Poisonous gases are produced in fire; wear full protective clothing and self-contained breathing apparatus (SCBA). Vapors are heavier than air and may travel for some distance to ignition source and flash-back. Move containers from fire area if it can be done safely. Cool exposed containers with water.

Unusual Fire and Explosion Hazards

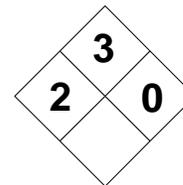

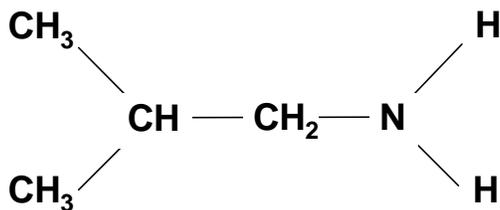

Containers may explode in fire due to buildup of excessive internal pressures. Exercise extreme caution when attempting to move or relocate containers that may have been exposed to high heat. A boiling liquid expanding vapor explosion (BLEVE) can occur when isobutylamine is involved in fire. Evacuate area if rising sound is heard coming from venting device or tanks are discoloring due to fire.

SECTION V - REACTIVITY DATA

| | | | | |
|--|----------------------------|---|------------------------------|---|
| Stability | | Conditions to Avoid Isobutylamine is normally stable under routine conditions of handling and storage. Avoid contact with incompatible materials. Keep away from heat and flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Oxidizing agents (such as chlorine, bromine, and oxygen) and other oxidizable materials. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of isobutylamine is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating oxides of nitrogen are produced when isobutylamine is heated to decomposition or involved in a fire. These include oxides of carbon and nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the nose, throat, and lungs. Will cause coughing, nausea, headache, and may cause vomiting. May cause fluid buildup in lungs (pulmonary edema) and death. SKIN & EYES: A severe irritant. Eye contact will cause irritation and inflammation. Skin contact causes irritation, inflammation, redness, blistering, and possible dermatitis. INGESTION: Poison by ingestion. Irritation of the mouth, throat, stomach, and digestive tract. Will also cause nausea and vomiting. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Eyes; skin; respiratory tract; mucous membranes. |
| Medical Conditions Generally Aggravated by Exposure Respiratory system disorders and any skin diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum); seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If <u>swallowed</u>: Call the poison control center; seek medical attention immediately. Give 1-2 glasses of water to dilute. Do NOT induce vomiting. Never attempt to give an unconscious person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Small spills may be absorbed in paper towels and evaporated in fume hood. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method Burn in a chemical incinerator equipped with a scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Do not store isobutylamine in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Personnel working with isobutylamine should be trained on its proper handling and storage <i>prior</i> to being assigned to such responsibilities. | | | | |
| Other Precautions and Warnings To prevent static sparks, electrically ground and bond all containers and equipment. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) No exposure levels have been established. This does not mean exposures are without risk to health. For low or infrequent exposures, use an organic vapor respirator. Greater protection at higher exposures is provided with an MSHA/NIOSH-approved supplied-air respirator with full facepiece operated in continuous flow or other positive pressure mode (pressure demand), or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ISOBUTYLAMINE

CAS: 78-81-9

**IDENTIFICATION AND TYPICAL USES**

Isobutylamine is a colorless or clear liquid with a fish-like odor. It is used in organic synthesis, in insecticides, and in combination with crotonic acid to form interpolymerization products suitable for wood sizing and sealing.

RISK ASSESSMENT: HEALTH**General Assessment**

Isobutylamine is a human poison and is toxic by *ingestion* and *inhalation*. It is also moderately toxic by skin contact (irritant). It will irritate the nose and throat (mucous membranes) and is a severe eye and skin irritant. There are no data on its carcinogenic, mutagenic, or teratogenic capabilities.

Inhalation will cause irritation to the nose, throat, and especially the lungs. It will cause cough, nausea, and headache. Its respiratory toxicity is primarily due to pulmonary effects. On high exposures, it may cause a fluid buildup in the lungs (pulmonary edema) which is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours, thereby creating a false sense of security relative to exposure risk.

Ingestion will result in digestive system irritation, unspecified but adverse gastrointestinal effects with irritation of the mouth and stomach. There may be nausea, vomiting, cramps, and headache.

Skin contact results in severe irritation and may produce dermatitis with drying, redness, rash, and itching. Eye contact can result in severe irritation with corneal edema.

☠ Acute Health Effects

The following acute (short-term) health effects may occur either immediately or shortly after (within hours or days) exposure to isobutylamine:

Skin: Irritation, inflammation, redness (erythema), itching, and possible dermatitis.

Eye: Severe irritation, inflammation, and possible damage to the cornea.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs) which is a medical emergency and can be fatal.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to isobutylamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, isobutylamine has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, isobutylamine has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Low, chronic exposures to skin may cause allergy or dermatitis.

🛡 Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around isobutylamine. No exposure levels have been established for this chemical. This does not mean, however, that human expo-

sure present no health risks. For relatively low, infrequent, or transient exposures, an organic vapor respirator may suffice. For higher or prolonged exposure, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or a powered air-purifying respirator operated in continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn. Butyl rubber, natural rubber, neoprene, nitrile rubber, polyvinyl alcohol, polyvinyl chloride, and Viton are not suitable protection. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with isobutylamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where isobutylamine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Consider chest X-ray after acute overexposure (may be negative if performed immediately after exposure or if symptoms have not yet appeared).
- Evaluation by a qualified allergist with careful evaluation of exposure history and administration of special tests (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful con-

sideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care.
- Wash thoroughly immediately after exposure to isobutylamine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of isobutylamine should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of isobutylamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Isobutylamine is considered a Class IB flammable liquid (per OSHA 29 CFR 1910.106). It can react with many common oxidizing materials to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of isobutylamine. Should isobutylamine ever come into contact with incompatible substances such as oxidizers and oxidizable materials, either during use, transportation, or storage, violent reactions can occur.

Isobutylamine can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to isobutylamine.

Isobutylamine has slight acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of isobutylamine to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of isobutylamine to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Isobutylamine is highly soluble in water. Concentrations of 1000 milligrams or more will mix with a liter of water.

🕒 *Persistence in the Environment*

Isobutylamine is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Isobutylamine is not expected to accumulate in the edible tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react

properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of isobutylamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. This chemical is not expected to adsorb significantly to terrestrial soil or aquatic sediments. It will remain in soil for extended periods and may leach to underground aquifers. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If isobutylamine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of isobutylamine. If isobutylamine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove all ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand and place in a sealed drum for disposal. Use non-sparking tools.
- ☑ It may be necessary to dispose of isobutylamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving isobutylamine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention

surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| | |
|---|---|
| Flash Point (method used) -105°F (-76°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.8% UEL: 9.6% |
| NFPA Classification Flammable Gas | Autoignition Temperature 869°F (465°C) |

Extinguishing Media

Stop flow of gas first (if possible). Use carbon dioxide, dry chemical, foam, or water spray on fire.

Special Fire Fighting Procedures

Isobutylene is an extremely flammable, very dangerous fire and explosion hazard. Poisonous gases are evolved from fire. Wear a self-contained breathing apparatus (SCBA) with full facepiece. Ensure ALL sources of escaping gas are controlled. Monitor area long after fire is extinguished. Move containers from fire area if it can be done without risk. Use water spray to knock down vapors.

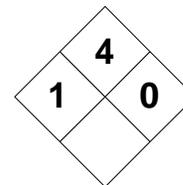

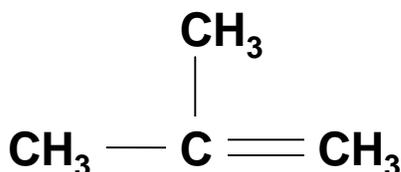

Unusual Fire and Explosion Hazards

Gas is explosive. Containers may explode in fire. Even if fire is extinguished, escaping gas can form explosive mixtures in air quickly and ignite without warning. Evacuate 2500 feet from fire area.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|--|--------------------|---|
| Stability | | Conditions to Avoid Isobutylene is normally stable in its closed containers, during routine operations (those that do not expose it to ignition sources). Avoid contact with heat, sparks, flame, lighted tobacco products, and steam lines. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Isobutylene is reactive in contact with strong oxidizers (nitrates and perchlorates), chlorine or chlorine dioxide, fluorine, other oxidizers, nickel carbonyl + oxygen, heat, sparks, and open flame. | | |

| May Occur | Will Not Occur X | Hazardous Decomposition or By-products If involved in fire, isobutylene can produce acrid smoke and irritating fumes, such as carbon monoxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: An asphyxiant gas. Initial symptoms are those of oxygen starvation. Feeling of "air hunger," diminished mental alertness, headache, dullness, shortness of breath, and an impairment in muscle coordination. Continued exposures lead to faulty judgment, depression of senses, rapid fatigue, unconsciousness, convulsions, coma, and death. SKIN & EYES: Contact with the compressed gas or refrigerated liquid can cause frostbite and burns. INGESTION: Not likely since isobutylene is a gas at normal working (room) temperatures. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Insufficient data | No | No | No | Central nervous system |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Immediately flush with large amounts of warm (tepid) water for 15 minutes (minimum), occasionally lifting eyelids; seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of tepid water. If blisters occur, seek medical attention. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If <u>swallowed:</u> Not a likely occupational exposure route. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. If gas has not yet ignited, use a water spray to knock down vapors and direct them from ignition source. | | | | |
| Preferred Waste Disposal Method None specified in the references (incineration of a gas may be the only alternative). | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible materials or in the presence of heat since violent reactions or explosions can occur. Store in tightly closed pressurized containers in a cool, dark, well-ventilated area away from sunlight. Keep away from ignition sources such as fire, sparks, and flame. | | | | |
| Other Precautions and Warnings Bulk storage of isobutylene is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Isobutylene is a simple asphyxiant. Do NOT use cartridge-type respirators (ineffective for this type of gas). Use a powered supplied-air respirator or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious, Thermal Protective | | Eye Protection Goggles and/or Face Mask | | Other Protective Clothing Leather Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

ISOBUTYLENEC₄H₈

CAS: 115-11-7

**IDENTIFICATION AND TYPICAL USES**

Isobutylene is an easily liquefied, colorless gas. It is usually shipped as a liquefied compressed gas. It is used in the production of other chemicals, including isooctane, high-octane aviation gasoline, butyl rubber, polyisobutene resins, tert-butyl chloride, tert-butanol methacrylates, copolymer resins with butadiene or acrylonitrile, and methyl-tert-butyl ether. Also used in the production of antioxidants for foods, plastics, and packaging food supplements.

RISK ASSESSMENT: HEALTH**General Assessment**

Isobutylene is a simple asphyxiant gas. As such, its primary route of entry into the body is through *inhalation*. It can displace oxygen levels to below that which is necessary to sustain life. At high concentrations, it is a narcotic and can cause anesthesia and unconsciousness. Skin contact with the liquid can be destructive to tissues due to the extremely cold temperatures but absorption is not a likely exposure route. Since isobutylene usually exists as a gas at room temperatures, ingestion is not likely to occur either.

Inhalation of isobutylene gas can cause headache, dullness, shortness of breath, and the symptoms of asphyxiation. These include rapid respiration and a feeling of "air hunger" or air starvation followed by a decrease in mental alertness, and impaired muscular coordination. If exposure continues, there can be narcosis, anesthesia, faulty judgment, depression of the senses, emotional instability, nausea, vomiting, prostration, unconsciousness, convulsions, coma, and death.

Skin or eye contact with the vapor poses no serious threat. The vapors have not been shown to cause any physiological response. On exposure to air, the liquid evaporates rapidly and may not have time to

cause damage. However, if the liquid should contact either the skin or the eyes, there can be serious irritation, burns, tissue damage, and frostbite.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to isobutylene:

Skin: Liquid threat only. Redness, pain, swelling, blisters, and severe frostbite.

Eye: Liquid threat only. Causes frostbite, redness, irritation, severe pain, and blurred vision.

Lung: Vapor is non-irritating and therefore poses no threat of damage to the lungs. However, in high concentrations, isobutylene can lead to symptoms of asphyxiation and oxygen deprivation up to and including irregular heartbeat, loss of consciousness, and death.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to isobutylene and can last for months or even years:

Cancer Hazards: There is insufficient evidence in the references to evaluate isobutylene for its ability to cause cancer in animals. It is a simple asphyxiant.

Reproductive Hazards: There are no reports to support any claims of reproductive hazards.

Other Chronic Effects: Isobutylene may be a cardiac sensitizer. More research is required in this regard.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with isobutylene. If another gas cannot be substituted for a isobutylene, then *engineering controls* are the most effective.

tive method of reducing exposures. The best protection is to separate operations and provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using equipment with explosion-proof designs and ensuring all metal containers and tools are electrically grounded and bonded can further reduce the potential for injury or damage. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with isobutylene. Air-purifying respirators (e.g., the cartridge-type or gas masks) cannot be used with isobutylene. These types of respirators only purify the air and can do nothing to protect in oxygen deficient atmospheres. A powered air-supplied respirator operated in pressure demand or other positive pressure mode, or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber or leather apron should be worn. To prevent hand and skin exposures with the liquid, thermal gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with isobutylene. Administrative controls as well as engineering controls must consider the effects of working with isobutylene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where isobutylene is used or stored.

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, consider installing automatic sensors that warn personnel of dropping oxygen levels and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- ☑ Wash thoroughly immediately after exposure to isobutylene and at the end of the work shift or before eating, drinking, or smoking. Clothing that has been contaminated with the vapor or compressed gas can present a serious fire hazard to personnel. Never wear contaminated clothing home where family members can be exposed.
- ☑ Safety shower and eyewash stations should be readily available in work areas where isobutylene is used or stored.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of isobutylene should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of isobutylene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air). Isobutylene is a highly flammable and explosive gas. Its extremely low flash point and boiling point present a serious fire hazard. Also, since it can react violently in the presence of oxidizers, such as chlorine, isobutylene requires special consideration during any emergency involving a leak or release of isobutylene gas or liquid.

Isobutylene can enter the environment through industrial discharges, unchecked venting to air, or through spills of the liquid. Since liquids will most likely vaporize rapidly, water and soil contamination are possible but improbable.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to isobutylene.

Insufficient data are available on the acute (short-term) effects of isobutylene on aquatic life, plants, birds, or land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of isobutylene to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Isobutylene is only slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Isobutylene is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.9% of isobutylene will eventually end up in air; the rest will end up in the water.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Isobutylene is not expected to accumulate in the tissues of fish.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of isobutylene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures using non-sparking tools. Contaminated soils should be removed for incineration and replaced with clean soil. When spills or leaks occur, it may be necessary to contact the local and/or state emergency response authorities. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of isobutylene.

If isobutylene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources from the area immediately.
- Ventilate area of spill or leak.
- If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty. Treat empty cylinders as containing some residue.
- Keep isobutylene out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- It may be necessary to dispose of isobutylene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving isobutylene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.
