CALCIUM PHOSPHATE, MONOBASICCa(H₂PO₄)₂

CAS: 7758-23-8

**IDENTIFICATION AND TYPICAL USES**

Calcium phosphate, monobasic, appears as a colorless pearly scale or powder that is deliquescent (absorbs moisture and melts away or turns to a liquid) in air. It is used in baking powders, in fertilizer compositions, as a mineral supplement, as a stabilizer for plastics, to control the pH in malt, in the manufacture of glass, as a buffer in some foods, and as a firming agent.

RISK ASSESSMENT: HEALTH**General Assessment**

Calcium phosphate is mildly toxic by *ingestion* and *inhalation*. There are no reports of carcinogenic, mutagenic, or teratogenic effects subsequent to exposure. While it is primarily characterized as a nuisance dust, there are some noted effects of exposure that must be assessed and managed if the monobasic form of calcium phosphate is used or handled in the work place.

Inhalation of calcium phosphates may cause irritation of the eyes (with tearing and redness), nose, throat, and respiratory tract. There is a possibility that inhalation may lead to the development of pulmonary lesions. However, the data are conflicting and inconclusive in this regard.

Skin contact can cause irritation with erythema (redness) and possible rash. Eye contact presents a more serious hazard since the phosphate may cause corneal burns, especially if the chemical is not removed immediately. Ingestion can cause gastrointestinal irritation with nausea, vomiting, and diarrhea.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium phosphate, monobasic:

Skin: Irritation and possible rash.

Eye: Irritation and possible burning of the cornea.

Lung: Irritation of the eyes, nose, throat, and mucosa of the respiratory tract. There may be coughing, sneezing, and other unspecified pulmonary effects.

Other: Gastrointestinal irritation with abdominal cramps, vomiting, nausea, and diarrhea.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to calcium phosphate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, calcium phosphate has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information available in the references, calcium phosphate has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Exposure may cause the development of pulmonary granulomatous lesions.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with calcium phosphate. While it is classified (by NIOSH and the ACGIH) as a nuisance dust, it can pose a toxic health hazard risk on unprotected exposure. If a less toxic chemical cannot be substituted for a hazardous material, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever

working with or around calcium phosphate. For low exposures, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter equipped with a dust/mist/fume pre-filter may suffice. However, for the best protection use a supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium phosphate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium phosphate is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for personnel with frequent or anticipated exposure to calcium phosphate:

- Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following may also be useful:

- Lung function tests.
- Consider chest X-ray following acute overexposure.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers exposed to lung irritants such as calcium phosphate dusts and fumes may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to calcium phosphate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium phosphate should be communicated to all potentially exposed workers.
- Eye wash stations and emergency showers should be located in the immediate work area.
- Work clothing that has been contaminated with calcium phosphate should never be worn home where family members can be exposed as well. Contaminated clothing should be laundered at work or by an authorized service by personnel who have been trained in the hazards associated with exposure to calcium phosphate and calcium compounds.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of calcium phosphate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Calcium phosphate is a non-flammable solid that can produce irritating and acrid smoke if it is involved in a fire. It may react violently in contact with strong acids, such as nitric, sulfuric, and hydrofluoric. These characteristics require special consideration during any emergency situation involving a leak or spill of calcium phosphate.

Calcium phosphate can enter the environment through industrial discharge, spills, or leaks.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium phosphate.

Insufficient data are available to evaluate the short-term effects of calcium phosphate exposure to aquatic life, plants, birds or land animals.

☼ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of calcium phosphate exposure to aquatic life, plants, birds or land animals.

💧 *Water Solubility*

Calcium phosphate is only very slightly soluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

⌚ *Persistence in the Environment*

Calcium phosphate is only moderately persistent in the aquatic environment, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of calcium phosphate found in fish is expected to be about the same as the average concentration of calcium phosphate in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. Proper labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Use damp mop to clean up residue. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If calcium phosphate should contact the water table, aquifer, or navigable waterway, time is of the essence. Calcium phosphate is slightly soluble in water. Therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium phosphate. If calcium phosphate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until clean-up is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak and remove all ignition sources.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do NOT dry sweep, use HEPA vacuum instead. Damp mop residue.
- ☑ It may be necessary to dispose of calcium phosphate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving calcium phosphate can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental dam-

age can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CALCIUM PHOSPHATE, TRIBASIC

CAS: 12167-74-7

**IDENTIFICATION AND TYPICAL USES**

Calcium phosphate, tribasic, appears as a white, odorless, tasteless, crystalline powder. It is used in ceramics; in producing calcium acid phosphate, phosphorous, and phosphoric acid; as a polishing powder; in cattle foods; clarifying sugar syrups; medicines; mordant for dyeing textiles (“Turkey Red”); fertilizers; dentifrice; stabilizer for plastics; in meat tenderizers; as an anti-caking agent in foods; as a buffer; as a nutrient supplement; and in the removal of Sr^{90} from milk products.

RISK ASSESSMENT: HEALTH**General Assessment**

Calcium phosphate is mildly toxic by *ingestion* and *inhalation*. There are no reports of carcinogenic, mutagenic, or teratogenic effects subsequent to exposure. While it is primarily characterized as a nuisance dust, there are some noted effects of exposure that must be assessed and managed if the tribasic form of calcium phosphate is used or handled in the work place.

Inhalation of calcium phosphates may cause irritation of the eyes (with tearing and redness), nose, throat, and respiratory tract. There is a possibility that inhalation may lead to the development of pulmonary lesions. However, the data are inconclusive in this regard.

Skin contact can cause irritation with erythema (redness) and possible rash. Eye contact presents a more serious hazard since the phosphate may cause corneal burns, especially if the chemical is not removed immediately. Ingestion can cause gastrointestinal irritation with nausea, vomiting, and diarrhea.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium phosphate, tribasic:

Skin: Irritation and possible rash.

Eye: Irritation and possible burning of the cornea.

Lung: Irritation of the eyes, nose, throat, and mucosa of the respiratory tract. There may be coughing, sneezing, and other unspecified pulmonary effects.

Other: Gastrointestinal irritation with abdominal cramps, vomiting, nausea, and diarrhea.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to calcium phosphate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, calcium phosphate has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information available in the references, calcium phosphate has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Exposure may cause the development of pulmonary granulomatous lesions.

🛑 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with calcium phosphate. While it is classified (by NIOSH and the ACGIH) as a nuisance dust, it can pose a toxic health hazard risk on unprotected exposure. If a less toxic chemical cannot be substituted for a hazardous material, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible,

isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around calcium phosphate. For low exposures, a full face piece respirator equipped with a high efficiency particulate air (HEPA) filter equipped with a dust/mist/fume pre-filter may suffice. However, for the best protection use a supplied-air respirator with a full face piece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full face-piece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium phosphate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium phosphate is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for personnel with frequent or anticipated exposure to calcium phosphate:

- Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following may also be useful:

- Lung function tests.
- Consider chest X-ray following acute overexposure.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers exposed to lung irritants such as calcium phosphate dusts and fumes may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to calcium phosphate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium phosphate should be communicated to all potentially exposed workers.
- Eye wash stations and emergency showers should be located in the immediate work area.
- Work clothing that has been contaminated with calcium phosphate should never be worn home where family members can be exposed as well. Contaminated clothing should be laundered at work or by an authorized service by personnel who have been trained in the hazards associated with exposure to calcium phosphate and calcium compounds.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of calcium phosphate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Calcium phosphate is a non-flammable solid that can produce irritating and acrid smoke if it is involved in a fire. It may react violently in contact with strong acids, such as nitric, sulfuric, and hydrofluoric. These characteristics require special consideration during any emergency situation involving a leak or spill of calcium phosphate.

Calcium phosphate can enter the environment through industrial discharge, spills, or leaks.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium phosphate.

Insufficient data are available to evaluate the short-term effects of calcium phosphate exposure to aquatic life, plants, birds or land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of calcium phosphate exposure to aquatic life, plants, birds or land animals.

💧 *Water Solubility*

Calcium phosphate is only very slightly soluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

⌚ *Persistence in the Environment*

Calcium phosphate is only moderately persistent in the aquatic environment, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of calcium phosphate found in fish is expected to be about the same as the average concentration of calcium phosphate in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. Proper labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Use damp mop to clean up residue. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If calcium phosphate should contact the water table, aquifer, or navigable waterway, time is of the essence. Calcium phosphate is slightly soluble in water. Therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium phosphate. If calcium phosphate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until clean-up is complete.
- ☑ Ventilate area of spill or leak and remove all ignition sources.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do NOT dry sweep, use HEPA vacuum instead. Damp mop residue.
- ☑ It may be necessary to dispose of calcium phosphate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving calcium phosphate can present a moderate threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: A nuisance dust causing minor irritation of the eyes, nose, throat, and upper respiratory tract. Long-term exposures to high concentrations may cause chronic cough. EYES & SKIN: Possible eye and skin irritation that is minimal and temporary. INGESTION: Not likely under normal conditions. Possible irritation of the mouth and esophagus. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Upper respiratory tract, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), gently lifting eyelids. Do not allow victim to keep eyes tightly shut. Seek medical attention. Skin contact: Immediately remove all contaminated clothing. Wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Give 1-2 glasses of water and induce vomiting by giving an emetic. Never attempt to give a convulsing or unconscious person anything by mouth. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. Use wet mop to clean residues. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area. Do not allow or cause the generation of dusty conditions during use, handling, storage, or disposal of calcium silicate. Always practice good housekeeping procedures. | | | | |
| Other Precautions and Warnings Protect containers from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) A nuisance dust. For low exposures, a full facepiece respirator with HEPA filter may suffice. For particularly dusty conditions, best protection is obtained using a supplied air respirator with a full facepiece, hood, or helmet, or a self-contained breathing apparatus (SCBA) with a full facepiece operated in positive pressure or other continuous flow mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Suit or Clothing |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CALCIUM SILICATECaSiO₃

CAS: 1344-95-2

**IDENTIFICATION AND TYPICAL USES**

Calcium silicate is a finely powdered, white, or cream-colored free-flowing solid. It is used as a binder for refractory materials, as an anti-caking agent food additive, and a suspension agent. It is used in paint pigments and in road construction. It is an absorbent, an antacid, a filler for paper and paper coatings, in cosmetics, in the manufacture of glass and Portland cement.

RISK ASSESSMENT: HEALTH***General Assessment***

Calcium silicate is considered a nuisance dust. Exposure occurs through *inhalation* of its dusts and powders. Its toxicity is considered relatively low. There are no reports of carcinogenic, mutagenic, or teratogenic effects subsequent to exposure. While it is primarily characterized as a nuisance dust, there are some noted effects of exposure that must be assessed and managed if calcium silicate is used or handled in the work place.

Inhalation of calcium silicates may cause minor or mild irritation of the eyes, nose, throat, and upper respiratory tract. Specific reaction of lung tissues is dependent upon conditions of exposure (level, duration) and individual response.

Skin contact can cause irritation and possible rash, depending upon individual sensitivity to the dusts. Eye contact can also cause irritation. Ingestion is not likely. It may cause irritation of the mouth and esophagus.

Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium silicate:

Skin: Irritation and possible rash.

Eye: Irritation.

Lung: Irritation of the eyes, nose, throat, and mucosa of the upper respiratory tract. There may be coughing, sneezing, and other unspecified pulmonary effects.

Other: If swallowed, may cause irritation of the mouth or esophagus.

Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to calcium silicate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, calcium silicate has not been adequately tested for its ability to cause cancer in test animals. As a nuisance dust, cancer is not considered likely to occur. More research is required.

Reproductive Hazard: According to information available in the references, calcium silicate has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Damaging effects to the upper respiratory tract may occur. But the extent of this damage is contingent upon the duration and severity of exposure.

Recommended Risk-Reduction Measures

Personnel should avoid direct contact with calcium silicate. While it is classified as a nuisance dust, it may pose a health hazard risk on unprotected exposure. If a less hazardous chemical cannot be substituted for a hazardous material, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemi-

cal release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around calcium silicate. For low exposures, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter equipped with a dust/mist/fume pre-filter may suffice. However, for the best protection use a supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium silicate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium silicate is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for personnel with frequent or anticipated exposure to calcium silicate:

- Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following may also be useful:

- Lung function tests.
- Consider chest X-ray following acute overexposure.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers exposed to lung irritants such as calcium silicate dusts may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper considera-

tion of *all* factors which may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to calcium silicate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium silicate should be communicated to all potentially exposed workers.
- Eye wash stations and emergency showers should be located in the immediate work area.
- Work clothing that has been contaminated with calcium silicate should never be worn home where family members can be exposed as well. Contaminated clothing should be laundered at work or by an authorized service by personnel who have been trained in the hazards associated with exposure to calcium silicate and calcium compounds.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of calcium silicate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Calcium silicate is a non-flammable solid. However, dusty conditions created during emergency response situations can pose a hazard to response personnel. These characteristics require special consideration during any emergency situation involving a leak or spill of calcium silicate.

If calcium silicate is released into the environment it poses no serious threat to ecosystems. However, this does not mean that uncontrolled emissions are

permissible. Calcium silicate can enter the environment through industrial discharge, spills, or leaks.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium silicate.

Insufficient data are available to evaluate the short-term effects of calcium silicate exposure to aquatic life, plants, birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of calcium silicate exposure to aquatic life, plants, birds or land animals.

💧 *Water Solubility*

Calcium silicate is only very slightly soluble in water. Concentrations of less than 1 milligram may mix with a liter of water. However, after prolonged contact with water, the solution reverts to soluble calcium salts and amorphous silica.

⌚ *Persistence in the Environment*

Calcium silicate is moderately persistent in the aquatic environment, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of calcium found in fish is expected to be about the same as the average concentration of calcium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. Proper labeling on all con-

tainers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Use damp mop to clean up residue. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If calcium silicate should contact the water table, aquifer, or navigable waterway, time is of the essence. Calcium silicate is nearly insoluble in water. But it can revert to calcium salts and amorphous silica on prolonged contact with water. Therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium silicate. If calcium silicate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Ventilate area of spill or leak and remove all ignition sources.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do NOT dry sweep, use HEPA vacuum instead. Damp mop residue.
- ☑ It may be necessary to dispose of calcium silicate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving calcium silicate can present a minor threat to business operations. The loss or damage of equipment or facilities is not likely, but possible and can significantly affect fiscal viability. Lawsuits that may result from personnel injury,

Risk Management for Hazardous Chemicals

public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: A nuisance dust causing minor irritation of the eyes, nose, throat, and upper respiratory tract with inflammation of the mucosa, nosebleeds, laryngitis, rhinitis, and pharyngitis. EYES & SKIN: Possible eye and skin irritation that is minimal and temporary. Conjunctivitis may occur. INGESTION: In large quantities, there could be potential fatal obstruction of the intestinal tract. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Upper respiratory tract, eyes, skin. |
| Medical Conditions Generally Aggravated by Exposure Pulmonary diseases may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), gently lifting eyelids. Do not allow victim to keep eyes tightly shut. Seek medical attention. Skin contact: Immediately remove all contaminated clothing. Wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Give 1-2 glasses of water and induce vomiting by giving an emetic. Never attempt to give a convulsing or unconscious person anything by mouth. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. Use wet mop to clean residues. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area. Do not allow or cause the generation of dusty conditions during use, handling, storage, or disposal of calcium sulfate. Always practice good housekeeping procedures. Keep away from aluminum, diazomethane, and phosphorus. | | | | |
| Other Precautions and Warnings Protect containers from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) A nuisance dust. For low exposures, a full facepiece respirator with HEPA filter may suffice. For particularly dusty conditions, best protection is obtained using a supplied air respirator with a full facepiece, hood, or helmet, or a self-contained breathing apparatus (SCBA) with a full facepiece operated in positive pressure or other continuous flow mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CALCIUM SULFATECaSO₄

CAS: 7778-18-9

**IDENTIFICATION AND TYPICAL USES**

Calcium sulfate is an odorless white powder, or a colorless crystalline solid. It may have a blue, gray or reddish tinge. It is used as a retarding agent in Portland cement, in tiles and plaster, as a source of sulfur and sulfuric acid, in polishing compounds and powders, as a white pigment in paints (also as a filler or drier), in paper as a size filler or surface coating, in dyeing and calico printing, in metallurgy as a reducing agent for zinc minerals, for drying industrial gases, solids and many organic liquids, in granulated form as a soil conditioner, in quick-set cements, in molds and surgical casts, in wallboard (gypsum drywall), as a food additive, and as a desiccant.

RISK ASSESSMENT: HEALTH**General Assessment**

Calcium sulfate is considered a nuisance dust. Exposure occurs through *inhalation* of its dusts and powders. Its toxicity is considered relatively low, however exposure still poses some degree of health risk that must be managed. There are no reports of carcinogenic, mutagenic, or teratogenic effects subsequent to exposure.

Inhalation of calcium sulfate may cause minor or mild irritation of the eyes, nose, throat, and upper respiratory tract, especially the larynx and pharynx. It can cause inflammation of the mucosa in the nose, which is referred to as rhinitis, accompanied by nosebleeds. Specific reaction of lung tissues is dependent upon conditions of exposure (level, duration) and individual response.

Skin contact can cause irritation and possible rash, depending upon individual sensitivity to the dusts. Eye contact can also cause irritation and possible conjunctivitis. Ingestion is not likely but can occur. It may cause irritation of the mouth and esophagus. If large

quantities are ingested, there may be potentially fatal blockage in the gastrointestinal tract.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to calcium sulfate:

Skin: Irritation and possible rash.

Eye: Irritation and conjunctivitis.

Lung: Irritation of the eyes, nose, throat, and mucosa of the upper respiratory tract. There may be coughing, sneezing, nosebleeds, and rhinitis.

Other: If swallowed, may cause irritation of the mouth or esophagus. In sufficient quantities, it can block the gastrointestinal tract and cause death.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to calcium sulfate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, calcium sulfate has not been adequately tested for its ability to cause cancer in test animals. As a nuisance dust, cancer is not considered likely to occur. More research is required.

Reproductive Hazard: According to information available in the references, calcium sulfate has not been adequately tested for its ability to adversely affect reproduction in laboratory animals.

Other Chronic Effects: Damaging effects to the upper respiratory tract may occur. Prolonged contact may cause laryngitis (inflammation of the larynx) and/or pharyngitis (inflammation of the pharynx). There may also be an impairment in the senses of smell and taste subsequent to repeated exposures.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with calcium sulfate. While it is classified as a nuisance dust, it may pose a health hazard risk on unprotected exposure. If a less hazardous chemical cannot be substituted for a hazardous material, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around calcium sulfate. For low exposures, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter equipped with a dust/mist/fume pre-filter may suffice. However, for the best protection use a supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with calcium sulfate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where calcium sulfate is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended for personnel with frequent or anticipated exposure to calcium sulfate:

- Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following may also be useful:

- Lung function tests.
- Consider chest X-ray after acute overexposure.
- Examination of the nasal cavity, larynx, and pharynx for inflammation or irritation.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and a number of other respiratory disorders, smokers exposed to lung irritants such as calcium sulfate dusts may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires proper consideration of *all* factors which may be causing the appearance of exposures symptoms in the work place.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to calcium sulfate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of calcium sulfate should be communicated to all potentially exposed workers.
- Eye wash stations and emergency showers should be located in the immediate work area.
- Work clothing that has been contaminated with calcium sulfate should never be worn home where family members can be exposed as well. Contaminated clothing should be laundered at work or by an authorized service by personnel who have been trained in the hazards associated with exposure to calcium sulfate and calcium compounds.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of calcium sulfate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possi-

ble contamination of the surrounding environmental mediums (water, soil, and air).

Calcium sulfate is a non-flammable solid. However, dusty conditions created during emergency response situations can pose a hazard to response personnel. It is also incompatible and reacts violently in contact with aluminum under heat (as in a fire). Also, at high temperature mixtures of calcium sulfate and phosphorus will ignite and burn fiercely. These characteristics require special consideration during any emergency situation involving a leak or spill of calcium sulfate.

If calcium sulfate is released into the environment it poses no known threat to ecosystems. However, this does not mean that uncontrolled emissions are permissible. Calcium sulfate can enter the environment through industrial discharge, spills, or leaks.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to calcium sulfate.

Insufficient data are available to evaluate the short-term effects of calcium sulfate exposure to aquatic life, plants, birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of calcium sulfate exposure to aquatic life, plants, birds or land animals.

💧 *Water Solubility*

Calcium sulfate is only very slightly soluble in water. Concentrations of less than 1 milligram may mix with a liter of water. However, after prolonged contact with water, it will react to form gypsum or Plaster of Paris, neither of which are considered hazardous or toxic to the aquatic environment.

🕒 *Persistence in the Environment*

Calcium sulfate is moderately persistent in the aquatic environment, with a half-life between 20 and 200 days.

The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of calcium found in fish is expected to be about the same as the average concentration of calcium in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. Proper labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Use damp mop to clean up residue. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If calcium sulfate should contact the water table, aquifer, or navigable waterway, time is of the essence. Calcium sulfate is nearly insoluble in water and total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of calcium sulfate. If calcium sulfate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.

- ☑ Ventilate area of spill or leak and remove all ignition sources.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do NOT dry sweep, use HEPA vacuum instead. Damp mop residue.
- ☑ It may be necessary to dispose of calcium sulfate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving calcium sulfate can present a minor threat to business operations. The loss or damage of equipment or facilities is not likely, but possible and can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any safety, health, or environmental procedures. An official company representative should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Camphor (derivation: "Natural" camphor derived by steam distillation of camphor-tree wood and crystallization. "Synthetic" camphor, most of which is optically inactive, derived from pinene which is converted into camphene, treated with acetic acid and nitrobenzene to become camphor). 1 ppm = 6.66 mg/m³ | PEL (8-hour): 0.3 ppm 2 mg/m³ STEL: Not Established | REL (10-hour): 0.3 ppm 2 mg/m³ STEL: Not Established | 200 mg/m³ | TLV: 2 ppm 12 mg/m³ STEL: 3 ppm 19 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 399°F (204°C) | Specific Gravity (H ₂ O = 1) 0.99 |
| Vapor Pressure (mm Hg) 0.2 at 69°F (20°C) | Molecular Weight 152.3 |
| Vapor Density (Air = 1) 5.24 | Freezing Point 345°F (174°C) |

Solubility

Slightly soluble (practically insoluble) in water. Soluble in aniline, benzene, alcohol, ether, chloroform, carbon disulfide, solvent naphtha, and fixed and volatile oils.

Appearance and Odor

Colorless or white crystals, granules, or easily broken masses with a penetrating, aromatic odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) 150°F (66°C) closed cup | Explosive Limits in Air % by Volume LEL: 0.6% UEL: 3.5% |
| NFPA Classification Combustible Solid | Autoignition Temperature 871°F (466°C) |

Extinguishing Media

Carbon dioxide, dry chemical, regular foam, water spray, or fog.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Heat will build pressure and may rupture closed storage containers. Fight fire from a distance if possible. Keep fire-exposed containers cool with water spray. Vapor is explosive when exposed to heat or flame.

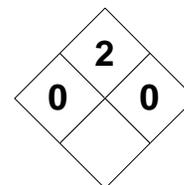

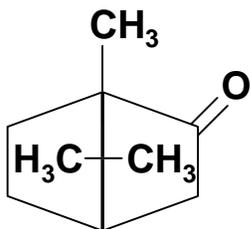

Unusual Fire and Explosion Hazards

Vapor burns rapidly with a flare-like effect. Vapors are heavier than air; they may travel some distance to flashback and cause fire or explosion.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|---|--|--|
| Stability | | Conditions to Avoid Sublimes at room temperature and pressure (goes from liquid directly to gaseous state). It can be kept stable if held in airtight containers. Do not add salts to camphor water. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Incompatible with potassium permanganate, chromic anhydride + naphthalene, oxidizers (such as chlorine, bromine, and fluoride) and steam (volatile reaction). | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of camphor will not occur. Avoid exposures to heat, ignition sources, and incompatibles. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, camphor emits acrid, irritating smoke and fumes. These include toxic carbon monoxide gas. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Causes nausea, anxiety, headache, dizziness, dilation of the pupils and vision changes, corneal inflammation, hearing effects, confusion, facial twitching, spastic movements, convulsions, and coma. Possible liver effects and/or injury. | | | | |
| ABSORPTION: Skin or eye contact can result in localized irritation. Skin absorption is likely to cause systemic effects on the central nervous system. When combined with other exposure routes, effects can be serious. | | | | |
| INGESTION: Irritation of the mouth, throat, and stomach with fainting, cyanosis, hypotension, and possible cardiac arrhythmia, convulsions, and grand-mal seizures. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 (Table Z-1) | Target Organs? Respiratory system; skin; eyes; CNS, liver, G.I. tract. |
| Medical Conditions Generally Aggravated by Exposure Respiratory function impairments (asthma, etc.); Nervous disorders; Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Seek medical attention immediately. Do NOT induce vomiting. Do NOT give an unconscious person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Remove all ignition sources. Restrict persons not wearing protective equipment from entering area of spill or leak until cleanup is complete. Ventilate area. Collect solid materials in safest manner possible and deposit in sealed drum. Do NOT dry sweep (generates dusts), use HEPA vacuum instead. | | | | |
| Preferred Waste Disposal Method | | | | |
| Dissolve in combustible solvent and burn in a chemical incinerator with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from fire, sparks, and flame. Use non-sparking tools on containers. Ground and bond metal containers during transfer operations. | | | | |
| Other Precautions and Warnings | | | | |
| Bulk storage of camphor is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For low exposures use a full facepiece respirator with organic vapor cartridge and HEPA filter. Greater protection is obtained from a supplied air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber or Polycarbonate | Eye Protection Chemical Goggles and/or Face Mask | Other Protective Clothing Protective Rubber Apron | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CAMPHORC₁₀H₁₆O

CAS: 76-22-2

**IDENTIFICATION AND TYPICAL USES**

Camphor is a colorless or white crystalline or granular solid with a penetrating, aromatic odor. It is used in medicines (internal and external), as a plasticizer for cellulose nitrate, in explosives, lacquers, in insecticides, in moth and mildew proofing, in tooth powders, as a flavoring, in embalming, in the manufacture of pyrotechnics, and as an intermediate. It also is used as a topical anti-infective and anti-itching agent. A liquid variant (camphor oil) is produced almost exclusively in Taiwan and was formerly used in the manufacture of sassafras oil. It is now used chiefly as a fragrance or flavoring material and to some extent as a pharmaceutical product.

RISK ASSESSMENT: HEALTH**General Assessment**

Camphor is a human poison by *ingestion* and possibly by *inhalation*, and skin contact (*absorption*). The central nervous system (CNS) seems to be the primary target of camphor exposure. There is no evidence of any carcinogenic or specific teratogenic effects resulting from exposure to camphor. However, mutation data have been reported and some scientists believe that mutagenic chemicals may pose a cancer risk in the long-term. The data are inconclusive in this regard and more research is required.

Inhalation of camphor may cause nausea, anxiety, headache, dizziness, excitement, confusion, facial twitching and spastic muscle movements, convulsions, and coma. There may also be visual disturbances (pupil dilation, corneal inflammation, and darkening of vision with flickering images) and hearing disturbances (ringing or noises in the ears). These effects appear to be primarily associated with camphor's specific ability to effect the CNS.

Ingestion causes irritation to the mouth, throat, and stomach. There may also be fainting, cyanosis due to lack of oxygenated blood in the body, hypotension, diarrhea, cardiac arrhythmia, convulsions, and, in some cases, grand-mal seizures following ingestion. The chemical is metabolized in the liver and may cause toxic action there as well.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to camphor:

Skin: Irritation and possible rash.

Eye: Irritation and possible inflammation.

Lung: Irritation causing coughing and/or shortness of breath. Camphor is readily absorbed through the respiration process to cause toxic systemic effects.

CNS: Primary CNS toxicity. There can be excitement, dizziness, nausea, headaches, convulsions, and even epileptic-like seizures in some cases.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to camphor and can last for months or even years:

Cancer Hazards: According to information presented in the references, camphor has not been adequately tested for its ability to cause cancer. Some mutagenic data have been recorded. Additional research is required.

Reproductive Hazards: There are no specific references to any teratogenic effects associated with exposure to camphor. However, it has been reported that camphor has the ability to cross the placenta barrier

and it has been suggested that camphor caused at least one fetal death while other newborns were apparently not effected. Additional research is required to determine the specific reproductive and fetal toxicity of camphor.

Other Chronic Effects: High exposures over time may damage the liver to the point of developing hepatitis. There may also be symptoms similar to Reye's syndrome which is a potentially fatal condition with swelling of the brain and kidneys, fatty liver, fever, and vomiting.

🔹 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with camphor. Its ability to rapidly affect the function of the central nervous system presents an extremely dangerous health hazard risk to exposed employees. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with camphor. A NIOSH-approved, full facepiece organic vapor respirator is sufficient for low exposures. A supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber or polycarbonate gloves should be worn when working with camphor.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with camphor.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where camphor is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests are suggested:

- Liver function tests.

- Evaluation of nervous system function by a qualified neurologist.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to camphor and at the end of the work shift or before eating, drinking, or smoking. Never wear clothes contaminated with camphor home. Family members can be exposed.
- Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of camphor should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of camphor. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Camphor is considered a combustible liquid. However, if ignited it may burn rapidly and fiercely in a manner similar to that of a road flare. Its vapor is explosive when exposed to heat or flame. It is also incompatible with a number of commodities. Potentially explosive reactions can occur if camphor is mixed or comes into contact with oxidizers. These characteristics require special consideration during any emergency involving a leak or spill of camphor. It will absorb into soils, especially those with high organic content, and may reach the water table.

The proper disposal/destruction method for camphor is to dissolve it in a combustible solvent and then burn it in a chemical incinerator equipped with an afterburner and air scrubber.

Camphor can enter the environment through manufacturing, unchecked discharge into effluents

from industrial or municipal waste treatment plants, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to camphor.

Insufficient data are available to evaluate or predict the acute (short-term) effects of camphor to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the chronic (long-term) effects of camphor to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Camphor is practically insoluble in water. Concentrations of less than 1 milligram may mix with a liter of water.

🕒 *Persistence in the Environment*

Camphor quickly sublimates (goes from solid to gaseous state) at normal room temperature and pressure. It is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of camphor found in fish tissues is expected to be about the same as the average concentration in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or

spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of camphor should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If camphor should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of camphor. If camphor is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Collect dry spills in safest manner possible. Do NOT dry sweep (generates dusts). Use a vacuum equipped with a high-efficiency particulate air (HEPA) filter instead. Damp mop residue. Absorb liquid spills in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- Keep camphor out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- It may be necessary to dispose of camphor as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving camphor can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures that deal with or address safety and health issues. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Call the poison control center and seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water to dilute. Do NOT induce vomiting. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect materials using vacuum equipped with HEPA filter and deposit in DOT-approved drum. Do NOT dry sweep (generates dusts). Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Do not store caprolactam in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Caprolactam is hygroscopic (absorbs moisture). Protect containers from physical damage and provide shade from radiant heat (including direct sunlight). | | | | |
| Other Precautions and Warnings Electrically ground and bond equipment, especially during transfer operations. Detached facility storage is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposures, use an organic vapor respirator. Otherwise, use an MSHA/NIOSH approved supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Rubber Gloves | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CAPROLACTAMC₆H₁₁NO

CAS: 105-60-2

**IDENTIFICATION AND TYPICAL USES**

Caprolactam is a white, crystalline or flaked solid with an unpleasant odor. It is used to manufacture synthetic fibers (especially nylon 6), plastics, bristles, film, coatings, synthetic leather, plasticizers and paint vehicles, as a cross-linking agent for polyurethane, and in the synthesis of amino acid lysine.

RISK ASSESSMENT: HEALTH**General Assessment**

Caprolactam is moderately toxic to humans by *ingestion* and *inhalation*. Skin contact also presents a mild to moderate health hazard risk. Its toxic effects appear to focus primarily on the respiratory system and the central nervous system (CNS). There are no reports to indicate that exposure to caprolactam poses a carcinogenic threat. However, mutation data have been reported and additional research is warranted before any definite determinations can be made with regard to cancer risk. Experimental teratogenic data have also been reported.

Inhalation of caprolactam dusts or vapors (from the solution) can cause immediate irritation to the eyes, nose, throat, and respiratory system with a pronounced and irritating cough and asthma. Respiratory sensitization may occur in some individuals. The development of pulmonary edema (fluid in the lungs) may be delayed up to 48 hours, thereby creating a false sense of security with regard to health exposure risk. Inhalation causes CNS depression with symptoms of headache, hypotension, fever, and nausea. Epigastric pain and possible leukocytosis may also develop.

Skin contact results in localized irritation and possible burns if allowed to remain in contact for prolonged periods. Eye contact causes intense irritation with possible progression to conjunctivitis. If ingested, caprolactam can cause irritation and burns to the mouth, throat (esophageal burns) and stomach. Sei-

zures may occur in some individuals depending upon susceptibility, sensitivity, and the conditions of the ingested exposure (quantity and duration).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to caprolactam:

Skin: Irritation, inflammation, redness, possible blistering, burns, and tissue damage.

Eye: Severe irritation, inflammation, with possible development of conjunctivitis.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs) which is a medical emergency and can be fatal.

CNS: Serious depression of the central nervous system causing fever, nausea, headache, hypotension, and other unspecified effects.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to caprolactam and can last for months or even years:

Cancer Hazards: According to the information presented in the references, caprolactam has not been adequately tested for its ability to cause cancer in test animals. Human mutation (genetic changes) data have also been reported.

Reproductive Hazard: According to the information presented in the references, caprolactam may cause reproductive toxicity in test animals. Human data have not been reported in this regard.

Other Chronic Effects: Repeated or long-term exposure may cause sleeping, loss of appetite, chronic head-

ache, chest pain or discomfort, mild hypotension, chronic fatigue, lymphocytosis (excessive white blood cells), seizures, nose bleeds, brittle nails, loss of sense of touch in fingertips, flatulence, and a foul taste in the mouth. Repeated skin contact may cause chronic dermatitis and eczema. There may be a dermal reaction similar to sunburn resulting from hypersensitivity in some people. Animal studies have shown liver and kidney injury.

🕒 **Recommended Risk-Reduction Measures**

Caprolactam is a moderately toxic chemical. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around caprolactam. For relatively low, infrequent, or transient exposures, an organic vapor respirator may suffice. For higher or prolonged exposure, a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand or other continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash or dust hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious chemical gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with caprolactam.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where caprolactam is used or stored. Before beginning employment and at regular intervals thereafter (e.g. annually), the following tests are recommended:

- Lung function tests (establish a baseline).

- Liver and kidney function tests.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Consider chest X-ray following acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- Complete blood count and blood gases (check BUN levels).
- For oral exposures, evaluate for esophageal burns.
- Evaluation by a qualified allergist, including careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart diseases, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are adequately trained in its use, care, and maintenance.
- Wash thoroughly immediately after exposure to caprolactam and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of caprolactam should be communicated to all exposed and potentially exposed workers.

- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of caprolactam. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Caprolactam is considered a class IIIB combustible solid (per OSHA 29 CFR 1910.106). It can react with some oxidizers (dinitrogen trioxide) with acetic acid to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of caprolactam. Should caprolactam ever come into contact with incompatible substances or heat either during use, transportation, or storage, violent reactions can occur.

Caprolactam can enter the environment through industrial discharges, municipal waste treatment discharges, and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to caprolactam.

This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of caprolactam to plant, birds, or land animals.

☠* *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Caprolactam has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of caprolactam to plants, birds, or land animals.

◆ *Water Solubility*

Caprolactam is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Caprolactam is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It is not expected to accumulate in aquatic sediments or terrestrial soils.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Bioaccumulation of caprolactam in aquatic tissues is not expected to occur.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of caprolactam should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.). Static sparks should be prevented by electrically grounding and bonding all containers, especially during transfer operations.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If caprolactam should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emer-

gency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of caprolactam. If caprolactam is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove all ignition sources.
- ☑ Use water spray to disperse vapors and dilute spills to non-flammable mixtures. Flush spills away from exposures. Dispose of accordingly.
- ☑ It may be necessary to dispose of caprolactam as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving caprolactam can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|---|------------------------------------|--|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials, primarily water and strong alkaline materials (e.g., hydrated lime). | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reacts on contact with water to give off poisonous gases. Corrosive to many metals. Keep away from heat, oil, strong alkalis, and hydrogen sulfide. | | |
| Hazardous Polymerization | | Conditions to Avoid Do not allow captan to become wet or moist. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products At high temperatures, captan decomposes and may produce poisonous gases, including oxides of sulfur and nitrogen, hydrogen chloride, and deadly phosgene. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: Primary irritant to the eyes and upper respiratory tract. May cause blurred vision, dyspnea, diarrhea, vomiting. ABSORPTION: Will pass through unbroken skin and enter the bloodstream. Contact may severely irritate the skin and eyes. Prolonged contact can cause allergies (sensitization). INGESTION: Moderately toxic to humans resulting in toxic systemic effects. May also cause severe gastroenteritis. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Suspected Animal | 5th Annual Report | Group 3 | No | Resp. system, skin, eyes, GI tract, liver, kidneys. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, persons with existing lung dysfunction may experience effects quicker. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. For inhalation: Remove the person from exposure. Maintain an open airway. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: If victim is conscious, induce vomiting. Save some liquid and vomitus for laboratory examination. Seek medical attention immediately. Call poison control center for advice. Never give anything by mouth to an unconscious or convulsing person. Do not make an unconscious person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in safest manner possible and deposit in sealed containers. Remove all sources of ignition. Ventilate area of spill. Use HEPA vacuum. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. Absorb any liquids containing captan in vermiculite, dry sand, earth, or similar material and deposit in sealed drum for disposal or reclamation. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers free from moisture. Keep in cool, well ventilated area. | | | | |
| Other Precautions and Warnings Do not store near water, heat, oil, strong alkalis, and hydrogen sulfide. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above 5.0 mg/m³, use a respirator with a pesticide cartridge. For high exposures, use a self-contained breathing apparatus with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Polycarbonate or Butyl Material | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Apron, Boots (avoid skin contact) |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CAPTANC₉H₈Cl₃NO₂S

CAS: 133-06-2

**IDENTIFICATION AND TYPICAL USES**

Captan is a white to cream colored crystalline solid in its pure form. However, it normally appears as a yellow, odorless powder. It is used in seed treatments and on food crops, as a fungicide (kills molds and mildew) in paints, plastics, leather, and some fabrics. Also used in preserving fruits and as a bacterial retardant in soaps.

RISK ASSESSMENT: HEALTH***General Assessment***

Captan is a poison by *ingestion*, *inhalation*, and skin contact (*absorption*). It is moderately toxic to humans through ingestion and inhalation. It is a questionable carcinogen in animals with some experimental teratogenic and reproductive effects reported. Human mutation, tumorigenic, and neoplastigenic data also reported.

Breathing its fine dusts can irritate the respiratory system, especially the nose and throat. It can cause blurred vision with other exposure symptoms such as diarrhea, vomiting, and dyspnea. The liver and kidneys may also be affected.

Contact with skin and eyes can be severely irritating. Prolonged contact can cause an allergic reaction (sensitization). Any exposures after that will result in a return of allergic symptoms (rash, irritation). Symptoms of toxic systemic exposure (dizziness, vomiting, nausea) can also occur as a result of captan passing through unbroken skin and directly entering the bloodstream.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to captan:

Skin: Possible irritation allergic reaction. Absorption is likely to occur.

Eye: Severe irritation and possible damage on contact.

Lung: Irritation of the nose and throat.

☛ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to captan and can last for months or even years:

Cancer Hazards: Captan is a mutagen (causes genetic changes). Such chemicals may have a cancer risk and there is limited evidence that captan does cause cancer in animals. Human carcinogenicity is suspected.

Reproductive Hazard: There is some evidence that exposure to captan cause damage to the developing fetus in test animals. Human teratogenicity is suspected.

Other Chronic Effects: Captan causes skin allergies. If allergy develops, very low future exposures can cause itching and skin rash.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with captan dusts or powders. If a less toxic material or compound cannot be substituted for captan, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of captan dust release. This may be practical in manufacturing operations, but is not feasible in application since it is used outdoors. While not always operationally possible, isolating operations involving captan manufacturing can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around captan. At exposures above the ACGIH TLV of 5 mg/m³ (TWA), use a MSHA/NIOSH approved respirator equipped with a pesticide cartridge and dust pre-filter. For high or frequent exposures, use a self-contained breathing apparatus (SCBA) with full face-

piece and pressure demand is recommended for the greatest possible respiratory protection. If a full face-piece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with captan.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where captan is used or stored.

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- ☑ Evaluation by a qualified allergist, including careful consideration of exposure history and special testing. Skin testing with dilute captan may help diagnose skin allergy, if done by a qualified allergist.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained in its use and care.
- ☑ Wash thoroughly immediately after exposure to captan and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of captan should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to captan, emergency shower facilities should also be provided.

- ☑ Workers whose clothing has been contaminated by captan should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to captan.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Because of its use as a fungicide and pesticide, captan can be present in the environment at any given time and at a variety of levels. The environment is also at risk of exposure during transportation, storage, disposal, or destruction of captan. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where captan contacts incompatible commodities can result in the release of hazardous fumes and gases (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air). In contact with water, it will form poisonous gases including oxides of nitrogen and sulfur, hydrogen chloride, and extremely hazardous phosgene.

In its powder form, captan is considered a combustible solid. However, it may be present (dissolved) in some flammable liquids such as benzene. Also, because it is incompatible with water and moisture, extreme caution is required in handling, storage, transportation, and disposal of captan. It is also incompatible with other common materials such as oil, and can react on exposure to heat or in the presence of hydrogen sulfide and strong alkalis. These characteristics also require special consideration during any emergency situation involving a leak or spill of captan powder or dust.

Captan can enter the environment from industrial and municipal discharges, through agricultural run-off, and from spills. Also, as a fungicide and pesticide, it will be present in the environment as a result of its intended use.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to captan.

Captan has high acute toxicity to aquatic life and birds, and can cause injury to plants. No data are

available on the short-term effects of captan to land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Captan has high chronic toxicity to aquatic life. No data are available to evaluate or predict the long-term effects of captan to plants, birds, or land animals.

💧 *Water Solubility*

Captan is very slightly soluble (practically insoluble) in water. Concentrations of less than 1 milligram will mix with a liter of water.

⌚ *Persistence in the Environment*

Captan is highly persistent in the water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 97% of captan will eventually end up in water; approximately 1.5% will end up in terrestrial soil and aquatic sediments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of captan found in fish tissues is expected to be somewhat higher than the average concentration of captan in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of captan dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of captan should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Proper ventilation and protective equipment should be used while handling the powders or while preparing aqueous solutions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If captan should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is only slightly soluble in water and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of captan. If captan powder is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources.
- ☑ Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts). If liquid solutions are spilled, absorb in vermiculite or other material and place in sealed drum for disposal or reclamation.
- ☑ It may be necessary to dispose of captan as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving captan can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|---|------------------------------------|
| Characterization Carbamate (Pesticide) | RCRA Number Not Listed | EPA Class Not Applicable |
| DOT Proper Shipping Name Carbaryl | Chemical Abstract Service (CAS) Number 63-25-2 | |
| DOT Hazard Class and Label Requirements ORM-A | DOT Emergency Guide Code 55 | |
| DOT Identification Number UN 2757 | Chemical Formula C₁₂H₁₁NO₂ | |

Synonyms

Sevin®; 1-naphthyl-N-methylcarbamate; methylcarbamic acid 1-naphthyl carbamate.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|---|---|--|
| Carbaryl (derivation: Synthesized directly from 1-naphthol and methyl isocyanate or from 1-naphthyl chloroformate (1-naphthol and phosgene) plus methylamine). | PEL: 5.0 mg/m³ STEL: Not Established | REL: 5.0 mg/m³ (10 hours) STEL: Not Established | 100 mg/m³ | TLV: 5.0 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point Decomposes | Specific Gravity (H ₂ O = 1) 1.23 |
| Vapor Pressure (mm Hg) 0 (approx.) at 69°F (20°C) | Molecular Weight (atomic weight) 200.1 |
| Vapor Density (Air = 1) 6.0 | Melting Point 293°F (145°C) |

Solubility

Slightly soluble in water (0.012% at 30°C), moderately soluble in acetone, cyclohexanone, and dimethylformamide. Hydrolyzed by alkalis.

Appearance and Odor

Carbaryl is a white or grayish-white odorless crystalline solid (sugar or sand-like).

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Non-combustible solid | Autoignition Temperature Not Found |

Extinguishing Media

Use water, carbon dioxide, dry chemical, water spray, or foam.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Structural fire-fighting equipment is permeable and may not provide sufficient protection (chemical can be absorbed through the skin). Remain clear of smoke, water fall-out and water run-off. Move containers from fire area if it can be done without risk. Cool exposed containers using water spray.

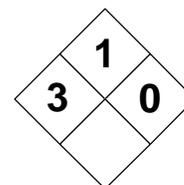

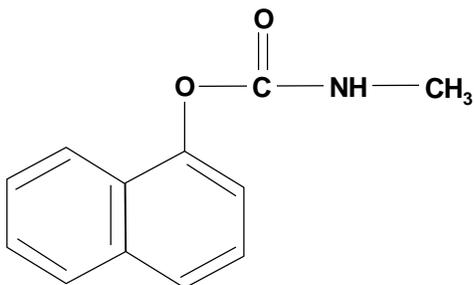

Unusual Fire and Explosion Hazards

Carbaryl is a non-combustible solid. However, in liquid form, it may be combustible. Also, it may be dissolved in some flammable liquids, such as benzene. Containers may explode in fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|---|--|---------------------------------------|--|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials. If mixed with flammable liquids, carbaryl becomes combustible. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Violent reactions can occur on contact with strong oxidizers (such as chlorine, bromine, and fluorine) and strongly alkaline pesticides. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of carbaryl is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, carbaryl will produce poisonous fumes, including oxides of nitrogen. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X | |
| Health Hazards INHALATION: Exposure can cause blurred vision, sweating, nausea and vomiting, and abdominal pain. Higher exposures can cause fluid to build up in the lungs (pulmonary edema) and death. ABSORPTION: Will pass through unbroken skin and enter the bloodstream. Contact may severely irritate the skin and eyes. Skin absorption is slow. May cause rash or burning feeling. INGESTION: Moderately toxic to humans resulting in toxic systemic effects. Symptoms include nausea, vomiting, diarrhea, abdominal cramps, miosis, lachrymation, and excessive salivation. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | No | Group 3 | 29 CFR 1910.1000 Table Z-1 | Lungs, skin, eyes, CNS, CVS, blood, repro. sys. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, persons with existing lung dysfunction may experience effects quicker. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of soap and water. For inhalation: Remove the person from exposure. Maintain an open airway. Provide respiratory assistance and CPR. Transfer to medical facility and observe for 48 hours for lung effects. If swallowed: If victim is conscious, induce vomiting. Seek medical attention immediately. Call poison control center for advice. Never give anything by mouth to an unconscious or convulsing person. Do not make an unconscious person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in safest manner possible and deposit in sealed containers. Remove all sources of ignition. Ventilate area of spill. Use HEPA vacuum. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. Absorb any liquids containing carbaryl in vermiculite, dry sand, earth, or similar material and deposit in sealed drum for disposal or reclamation. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers free from moisture. Keep in cool, well ventilated area. | | | | |
| Other Precautions and Warnings Do not store near sources of heat or ignition. Smoking should be prohibited in carbaryl storage areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above 5.0 mg/m³, use a supplied air respirator or an MSHA/NIOSH approved self-contained breathing apparatus with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Impervious Material | Chemical/Dust Goggles or Face Mask | Protective Apron, Boots (avoid skin contact) | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CARBARYLC₁₂H₁₁NO₂

CAS: 63-25-2

**IDENTIFICATION AND TYPICAL USES**

Carbaryl is a white or gray odorless crystalline solid powder (sugar or sand-like). It is a carbamate insecticide used in powder, liquid, or paste form.

RISK ASSESSMENT: HEALTH**General Assessment**

Carbaryl is a poison by *ingestion, inhalation,* and skin contact (*absorption*). Human systemic effects by ingestion have been reported, including sensory changes involving peripheral nerves and muscle weakness. Skin absorption is reported to be very slow. Rash may develop along with burning sensation. Carbaryl is a mutagen in humans with questionable carcinogenic, tumorigenic, and teratogenic properties.

Symptoms of exposure by all routes can include nausea and vomiting, abdominal pain and cramps, blurred vision, lachrymation (tearing), nasal discharge and rhinitis, miosis, excessive salivation, sweating, cyanosis, muscle twitching, diarrhea, tremor and convulsions, and coma. Carbaryl is not reported to accumulate in body tissues.

Breathing dusts of carbaryl and, to a lesser extent, vapors of liquids containing carbaryl, can cause a fluid to build up in the lungs (pulmonary edema) 2-4 days following exposure. This is a medical emergency and can result in death.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to carbaryl:

Skin: Possible irritation with burning and rash. Absorption is likely (although extremely slow).

Eye: Severe irritation and possible damage on contact.

Lung: Irritation of the respiratory system. Can result in pulmonary edema (fluid in lungs), which can be fatal.

CNS: Possible effects on peripheral nerves. Effects of exposure may include nausea, vomiting, diarrhea, abdominal cramps, cyanosis, convulsions, tremor, lachrymation, blurred vision, and coma.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to carbaryl and can last for months or even years:

Cancer Hazards: Carbaryl is a mutagen (causes genetic changes) in humans. Such chemicals may have a cancer risk and there is limited evidence that carbaryl does cause cancer in animals. Human carcinogenicity is questioned but requires further study.

Reproductive Hazard: Carbaryl is a possible teratogen in humans and has been shown to be a teratogen in animals. There is limited evidence that it reduces fertility in both males and females.

Other Chronic Effects: Carbaryl may damage the kidneys and nervous systems.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with carbaryl dusts, powders, liquids, or pastes. If a less toxic material or compound cannot be substituted for carbaryl, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventila-

tion at the site of carbaryl release. This may be practical in manufacturing operations, but is not always feasible in application since it is used outdoors. While not always operationally possible, isolating operations involving carbaryl manufacturing can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around carbaryl. At exposures above the OSHA PEL of 5.0 mg/m³ (TWA), use a MSHA/NIOSH approved supplied-air respirator operated in positive pressure mode or use a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with carbaryl.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where carbaryl is used or stored.

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- Kidney function test.
- Examination of the nervous system.
- If done within 2-3 hours of exposure, serum and red blood count cholinesterase levels may be helpful. Carbaryl is a cholinesterase inhibitor. Levels can return to normal before the person feels well again.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, persons exposed to other chemicals which affect body cholinesterase, such as organophosphates and other carbamates, may be at increased risk.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to carbaryl and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of carbaryl should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to carbaryl, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by carbaryl should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to carbaryl.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Because of its use as a pesticide, carbaryl can be present in the environment at any given time and at a variety of levels. The environment is also at risk of exposure during transportation, storage, disposal, or destruction of carbaryl. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where carbaryl contacts incompatible commodities can result in violent reaction, including explosion and fire. Contamination of the surrounding environmental mediums (water, soil, and air) is also possible.

In its powder form, carbaryl is considered a non-combustible solid. However, it may be present (dissolved) in some flammable liquids. Also, because it is incompatible with strong oxidizers and strongly alkaline pesticides, extreme caution is required in handling, storage, transportation, and disposal of carbaryl. These characteristics require special consideration during any emergency situation involving a leak or spill of carbaryl powder, dust, or liquid solutions containing carbaryl.

Carbaryl is a widely used synthetic insecticide. It is a broad-spectrum contact insecticide registered on more than 100 crops. It can therefore be present in the

environment as a result of its intended use. Also, it may enter the environment from industrial and municipal discharges, through agricultural run-off, and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to carbaryl.

Carbaryl has high acute toxicity to aquatic life and birds. It is highly-to-moderately toxic, acutely, to land animals. It has caused death and injuries of various kinds to agricultural and ornamental crops.

☹ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Carbaryl has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of carbaryl to plants, birds, or land animals.

💧 *Water Solubility*

Carbaryl is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Carbaryl is moderately persistent in the water, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 95% of carbaryl will eventually end up in water; approximately 1.5% will end up in air; and slightly less than 2% will end up in terrestrial soil and aquatic sediments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as those of humans.

The concentration of carbaryl found in fish tissues is expected to be somewhat higher than the average concentration of carbaryl in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of carbaryl dusts or powders into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of carbaryl should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Proper ventilation and protective equipment should be used while handling the powders or while preparing aqueous solutions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If carbaryl should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of carbaryl. If carbaryl powder is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources.
- Collect powdered materials in the safest manner possible and deposit in sealed containers. Recommend using vacuum with HEPA filter. Do not dry sweep (generates airborne dusts). If liquid solutions are spilled, absorb in vermiculite or other material and place in sealed drum for disposal or reclamation.
- It may be necessary to dispose of carbaryl as a hazardous waste. The responsible state agency or the regional office of the federal Environmental

Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving carbaryl can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

|---|--|---|--------------------------------|---|
| Stability | | Conditions to Avoid Do not allow carbon disulfide to come into contact with any of the incompatible chemicals listed below. Avoid contact with fire or high heat sources. Do not use in confined spaces. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, chemically-active metals (potassium, zinc), azides, rust, halogens, amines. Also incompatible with air. Vapors may ignite on contact with an ordinary lit light bulb. | | |
| Hazardous Polymerization | | Conditions to Avoid Working in confined spaces or closed, poorly ventilated areas with carbon disulfide. Do not mix with sodium or potassium-sodium alloys. Mixtures are powerful, shock-sensitive explosives. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, carbon disulfide emits highly toxic oxides of sulfur. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Symptoms include narcosis, headache, nausea, pulmonary irritation, and convulsions. Other symptoms may be acute hemolytic anemia, methemoglobinemia, and cyanosis. | | | | |
| ABSORPTION: Skin contact can result in irritating rash or burning feeling. Can cause severe eye burns leading to permanent damage. Can also cause toxic systemic effects (CNS involvement). | | | | |
| INGESTION: Gastroenteritis, possible kidney and liver effects. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Lung; skin; eyes; CNS, PNS, CVS, liver, kidneys. |
| Medical Conditions Generally Aggravated by Exposure Respiratory function impairments (asthma, etc.); Nervous disorders; Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If <u>swallowed:</u> Seek medical attention immediately. Never try to give an unconscious person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Restrict persons not wearing protective equipment from entering area of spill or leak until cleanup is complete. Ventilate area. Absorb liquid in dry sand or other material and deposit in sealed containers. Alert appropriate state or federal response agencies. | | | | |
| Preferred Waste Disposal Method For small amounts (10mL) - incineration (with afterburner and scrubber). Dilute larger amounts first. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from fire, sparks, and flame. Use non-sparking tools on containers. Ground and bond metal containers during transfer operations. | | | | |
| Other Precautions and Warnings Bulk storage of carbon disulfide is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposures above 1 ppm: MSHA/NIOSH approved full facepiece respirator with organic vapor cartridge. Greater protection is obtained from a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Solvent Resistant Butyl Rubber | Eye Protection Chemical Goggles and/or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CARBON DISULFIDECS₂

CAS: 75-15-0

**IDENTIFICATION AND TYPICAL USES**

Carbon disulfide is a colorless to faintly yellow liquid with a strong, foul, disagreeable odor. It is used in the manufacture of viscose rayon, soil disinfectants, cellophane, electronic vacuum tubes, carbon tetrachloride, and flotation agents. It is also used as a solvent and as an eluant for organics adsorbed on charcoal in air analysis.

RISK ASSESSMENT: HEALTH**General Assessment**

While carbon disulfide exhibits low toxicity in most experimental animals, its toxicity is relatively greater in humans. The primary route of exposure is *inhalation* of its vapors. But it may also enter the body through skin *absorption* and, in some cases, *ingestion*.

In both acute and chronic exposures, the toxic effect of exposure is primarily due to its action on the central and peripheral nervous systems. A single exposure may cause narcosis. It acts as a narcotic and anesthetic in acute poisoning with death following from respiratory failure. In chronic poisoning, damage to the nervous systems may be permanent and severe. Repeated exposures cause headache, dizziness, fatigue, nervousness, insomnia, psychosis, irritation, tremors, loss of appetite, indigestion, and gastric disturbances. Human reproductive and mutation effects by inhalation have also been reported. Overexposure to carbon disulfide has been associated with an increase in coronary heart disease. In extreme cases of intoxication, a Parkinson-like syndrome may result, characterized by speech disturbances, muscle spasms, tremor, memory loss, mental depression, and marked psychic symptoms with possible personality changes that may be permanent.

Liquid contact with the eyes causes immediate and severe irritation. May cause ocular changes (blind spot enlargement, contraction of peripheral field, corneal

anesthesia, diminished pupil reflexes, nystagmus, and microscopic aneurysms in the retina). Skin contact will result in rash, burning, dermatitis, and vesiculation.

Although ingestion is not common, it may cause coma and convulsions.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to carbon disulfide:

Skin: Irritation/rash or burning sensation on contact. There may be blistering and redness. Dermatitis may also appear.

Eye: Burns which can lead to permanent damage.

Lung: Irritation of the respiratory tract. Effects include headache, garlicky breath, vomiting, diarrhea (even after vapor exposure), and, occasionally, abdominal pain.

CNS: Inhalation of high concentrations of the vapor may cause weak pulse, heart palpitations, fatigue, weakness in legs, unsteady gait, vertigo, mania, hallucinations of sight, hearing, taste, and smell, dizziness, lightheadedness, central nervous system depression with respiratory paralysis, convulsion, loss of consciousness, and possible death.

🕒 Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to carbon disulfide and can last for months or even years:

Cancer Hazards: According to information presented in the references, carbon disulfide has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazards: According to information presented in the references, carbon disulfide has been

shown to have the ability to damage the developing fetus. It may decrease fertility in men and women, causing sperm abnormalities and spontaneous abortions.

Other Chronic Effects: Repeated exposures can cause severe changes in the brain and nervous system, causing tingling, pain, “pins and needles” feeling and weakness in the legs. There may also be stomach abnormalities and very severe mood, personality and thought changes, including total insanity. There may be nightmares, trouble concentrating and trouble with coordination and balance. Carbon disulfide may cause increased cholesterol and atherosclerosis (hardening of the arteries), high blood pressure, heart disease, and damage to the eyes and other organs from the effects on arteries. Carbon disulfide may also cause a skin allergy. If an allergy develops, very low future exposures can cause itching and skin rash.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with carbon disulfide. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with carbon disulfide. A NIOSH-approved, full facepiece organic vapor respirator is sufficient for low exposures. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with carbon disulfide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where carbon disulfide is used or stored.

Before beginning employment and at regular times thereafter, the following medical tests are recommended:

- ☑ Examination of the nervous system, including mental status exam.
- ☑ Measurement of neurological impairment.
- ☑ Examination of the cardiovascular system for signs of arteriosclerosis.
- ☑ Iodine azide test to determine the intensity of an exposure to carbon disulfide (detects carbon disulfide metabolites present in urine).

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to carbon disulfide and at the end of the work shift or before eating, drinking, or smoking. Never wear clothes contaminated with carbon disulfide home. Family members can be exposed.
- ☑ Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of carbon disulfide should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of carbon disulfide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Carbon disulfide is considered a highly flammable liquid. Because of its low flash point and relatively high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). Its low auto-ignition temperature and low flash point, together with its high vapor pressure make it a dangerous fire and explosion hazard. It is also incompatible with a

number of commodities. Potentially explosive reactions can occur if carbon disulfide is mixed or comes into contact with rust or iron, as well as any strong oxidizers. These characteristics require special consideration during any emergency involving a leak or spill of carbon disulfide.

The proper disposal/destruction method for small amounts of carbon disulfide (up to 10mL) is to burn it in a chemical incinerator equipped with an afterburner and air scrubber. Larger amounts should be mixed with a higher-boiling solvent and then burned.

Carbon disulfide can enter the environment through manufacturing, unchecked discharge into effluents from industrial or municipal waste treatment plants, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to carbon disulfide.

This chemical has moderate acute toxicity to aquatic life. No data are available on the short-term effects of carbon disulfide to plants, birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Carbon disulfide has high chronic toxicity in aquatic life. No data are available to evaluate the long-term effects of carbon disulfide to plants, birds, or land animals.

💧 *Water Solubility*

Carbon disulfide is moderately soluble in water. Concentrations between 1 and 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Carbon disulfide is virtually non-persistent in water, with an estimated half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 99.8% of carbon disulfide will eventually end up in air; the rest will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of carbon disulfide found in fish tissues is expected to be somewhat higher than the average concentration of carbon disulfide in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of carbon disulfide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If carbon disulfide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of carbon disulfide. If carbon disulfide is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources.
- Ventilate area of spill or leak.

- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep carbon disulfide out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- ☑ It may be necessary to dispose of carbon disulfide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving carbon disulfide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Solubility
Slightly soluble (2%) in water. Soluble in alcohol and benzene.

Appearance and Odor
Colorless gas, odorless gas. Shipped as a non-liquefied or liquefied compressed gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable (gas) | Explosive Limits in Air % by Volume LEL: 12.5% UEL: 74% |
| NFPA Classification Flammable Gas | Autoignition Temperature 1292°F (700°C) |

Extinguishing Media
Stop flow of gas before attempting to fight fire. Use water spray, fog, or regular foam.

Special Fire Fighting Procedures
Carbon monoxide is an extremely flammable gas and presents a serious explosion hazard when exposed to flame or in fire. Fires can produce toxic fumes: wear full protective clothing and self-contained breathing apparatus (SCBA). Heat will build pressure and may rupture closed storage containers. Keep fire-exposed containers cool with water spray.

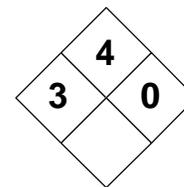

Unusual Fire and Explosion Hazards
For large fires, use monitor nozzles or unmanned equipment, if possible. Boiling liquid expanding vapor explosion (BLEVE) is possible: immediately evacuate if rising sound is heard from venting device or fire is causing a discoloration in tanks. Isolate area 1500 -2000 feet in all directions.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|---|--|--|
| Stability | | Conditions to Avoid Carbon monoxide is stable under normal operating conditions. Avoid contact with incompatible materials, heat, and sources of ignition. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) Carbon monoxide is incompatible with strong oxidizers, bromine trifluoride, chlorine trifluoride, and most other halogen compounds, and lithium. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of carbon monoxide cannot occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Thermal oxidative decomposition of carbon monoxide can produce toxic and irritating fumes and gases, including carbon and carbon dioxide. | | |

| Emergency and First-aid Procedures | | | | |
| Eye contact: Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. Skin contact: Remove all contaminated clothing. For frostbite, immediately wash area with large amounts of tepid water. Do NOT rub! For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. DOCTOR: Treat aggressively with 100% oxygen and non-breather mask. If swallowed: Not likely. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Wear SCBA. Remove all ignition sources. Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. | | | | |
| Preferred Waste Disposal Method | | | | |
| None specified in the references (incineration of a gas may be the only alternative). | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away heat. Keep away from ignition sources such as fire, sparks, and flame. Prevent damage to cylinders. Install carbon monoxide monitors with alarms. | | | | |
| Other Precautions and Warnings | | | | |
| Check containers for leaks using a soapy water solution upon arrival, whenever filling, and at least every three months if not used. Install Class I, Group C electrical equipment. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) | | | | |
| Gas is odorless and tasteless. Exposures can occur without warning. Always use an MSHA/NIOSH approved full facepiece gas mask or respirator with an carbon monoxide gas cartridge. Greater protection is obtained from a supplied air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand or other positive pressure or continuous flow mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | | Eye Protection Chemical Goggles and/or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CARBON MONOXIDE

CO

CAS: 630-08-0

**IDENTIFICATION AND TYPICAL USES**

Carbon monoxide is a colorless, odorless gas. It is usually shipped as a non-liquefied *or* liquefied compressed gas. It is used in the manufacture of metal carbonyls, zinc white pigments, as a reducing agent in metallurgy, and as an ingredient in many industrial gases used in heating boilers and furnaces. The primary source of industrial exposure is the use of internal combustion engines indoors or in enclosed areas.

RISK ASSESSMENT: HEALTH***General Assessment***

Carbon monoxide is a deadly human poison primarily through *inhalation*. Skin or eye contact with the liquid also presents some exposure risk (frostbite and burns) but absorption is not likely since carbon monoxide is normally a gas. There are no reports of carcinogenic episodes in humans or animals. It is an experimental teratogen and has the ability to cross the placenta barrier.

Inhalation of carbon monoxide gas will cause progressive chemical asphyxia with symptoms of rapid, irregular breathing (tachypnea), feeling of air starvation or "air hunger," headache, fatigue, mental confusion, nausea, vomiting, giddiness, poor judgment, weakness, hallucinations, cyanosis, angina, syncope (sudden loss of strength and possible fainting), exhaustion, collapse, loss of consciousness, coma, convulsions, myocardial infarction, and death. In non-fatal exposures, there may be serious damage or injury to the central nervous system (CNS), and possible cerebral edema (fluid on the brain). Carbon monoxide has an affinity for blood hemoglobin some 200 times greater than that of oxygen. This means that it will bond much more quickly than oxygen and will form carboxyhemoglobin, thereby preventing the normal distribution of oxygen throughout the body. The gas may also combine with myoglobin to form carboxymyoglobin which may affect mus-

cle metabolism and cause muscular disturbances, especially in the heart.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to carbon monoxide:

Skin: Irritation and burning (frostbite) on contact with liquid.

Eye: Irritation and burns (frostbite) on contact with the liquid which can cause permanent damage.

Lung: Mild irritation of the respiratory tract. However, there is usually no indication of exposure and no noticeable effects until asphyxiation begins.

CVS: May cause angina, heart changes (depressed S-T segment on electrocardiogram), and myocardial infarction (heart attack).

CNS: Depression of the nervous system resulting from oxygen starvation.

☪ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to carbon monoxide and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to carbon monoxide does not currently lead to carcinogenic effects.

Reproductive Hazards: Since carbon monoxide has the ability to cross the placenta barrier, it may be able to harm a developing fetus. Experimental teratogenic effects have been reported but human data in this regard are inconclusive.

Other Chronic Effects: Repeated exposure may cause auditory and visual disturbances, glycosuria (high sugar content in urine), and cardiac irregularities.

There can also be cerebral congestion and edema with long-lasting mental or nervous system damage.

🔊 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with carbon monoxide. It is extremely dangerous and provides no warning of its presence until after dangerous (life-threatening) exposures have occurred. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still required whenever working with carbon monoxide. A NIOSH-approved, full facepiece respirator or gas mask with carbon monoxide gas cartridge or canister is sufficient for low exposures. A supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with carbon monoxide. The most common cause of occupational carbon monoxide exposures occurs as a result of the operation of liquid fuel engines inside a plant or facility. Administrative policies and procedures regarding the use of forklift trucks or other vehicles must be properly enforced to ensure adequate exposure control.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where carbon monoxide is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Lung function tests.
- Complete blood count (CBC) with blood gas measurement. Carboxyhemoglobin levels should be checked.
- Electrocardiogram (EKG) with specific attention on the S-T segment (may be unusually depressed).
- Evaluation of the nervous system by a neurologist.

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for damage already present are not a substitute for controlling exposures. Also, the normal carboxyhemoglobin level in a non-smoker averages approximately 1%. It is common for smokers to carry a 5-10% level. Since exposure to carbon monoxide greatly increases the carboxyhemoglobin level, it is obvious that smokers will be affected more quickly by exposure than non-smokers under the same conditions of exposure. When levels reach 10-30%, there will be headache, nausea, and drowsiness (narcosis). At 40% and above, there can be confusion, weakness, and collapse. Levels of 50-60% can cause coma, convulsions, and death. Prudent risk management requires careful consideration of *all* possible exposure factors.

Other methods to reduce exposure to chemicals include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances and that personnel are adequately trained in its use, care, and maintenance.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of carbon monoxide should be communicated to all exposed and potentially exposed workers.
- Carbon monoxide gas monitors should be installed in work areas to provide adequate audible and visible alarms in the event of a leak or spill of carbon monoxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

As an extremely volatile gas that is slightly lighter than air, the risk to the environment is primarily concerned with atmospheric pollution than with any other medium (soil or water). However, the environment is still at risk of exposure during transportation, storage, disposal, or destruction of carbon monoxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the air and atmosphere.

Carbon monoxide is an extremely dangerous flammable gas. Its vapors can explode violently in the presence of heat or flame. It can react with many metals and common oxidizers to cause fire or explosion. These characteristics require special consideration during any emergency involving a leak or spill of carbon monoxide.

Carbon monoxide can enter the environment through the use of any internal combustion, liquid-fueled engine as an exhaust product. It can also enter the environment through municipal waste treatment plant discharges, oil refinery and chemical manufacturing effluents, or from atmospheric fallout.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to carbon monoxide.

The toxicity of liquid carbon monoxide is primarily due to its super-cold temperatures. The gas presents a similar hazard to animals as it does to humans. It is also more toxic under conditions of decreased oxygen concentrations.

Carbon monoxide has a moderate acute toxicity to birds and land animals. Insufficient data are available to evaluate or predict the short-term effects of carbon monoxide on plants or aquatic life.

☠ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Carbon monoxide has a moderate chronic toxicity to birds and land animals. Insufficient

data are available to evaluate or predict the long-term effects of carbon monoxide on plants or aquatic life.

💧 Water Solubility

Carbon monoxide is very slightly soluble in water. Concentrations of 1 milligram may mix with a liter of water.

⌚ Persistence in the Environment

Carbon monoxide is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of carbon monoxide will eventually end up in the air.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Carbon monoxide is not expected to accumulate in the edible tissues of fish.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of carbon monoxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers). Explosion proof design (to Class 1, Group C standards) is recommended. All containers and equipment should be electrically grounded and bonded to prevent static sparks.

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures. When such spills occur, it may be necessary to notify the local and/or state emergency response authorities. A com-

prehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of carbon monoxide. If carbon monoxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ Keep carbon monoxide out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- ☑ It may be necessary to dispose of carbon monoxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS General Assessment

Accidents or mishaps involving carbon monoxide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and

policies should be developed, approved, and implemented long before any need for such arises.

| 4 | 0 | 0 | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|---|---|------------------------------------|
| Characterization Aliphatic Chlorinated Hydrocarbon | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name Carbon Tetrabromide | Chemical Abstract Service (CAS) Number 558-13-4 | |
| DOT Hazard Class and Label Requirements Poison B; St. Andrews Cross | DOT Emergency Guide Code 53 | |
| DOT Identification Number UN 2516 | Chemical Formula CB₄ | |

Synonyms

Carbon bromide; tetrabromide methane; tetrabromomethane; methane tetrabromide.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| Carbon tetrabromide (derivation: A brominated hydrocarbon). 1 ppm = 13.78 mg/m³ | PEL: 0.1 ppm 1.4 mg/m³ STEL: 0.3 ppm 4 mg/m³ | REL: 0.1 ppm 1.4 mg/m³ STEL: 0.3 ppm 4 mg/m³ | Not Determined | TLV: 0.1 ppm 1.4 mg/m³ STEL: 0.3 ppm 4 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 373°F (189°C) | Specific Gravity (H ₂ O = 1) 3.42 |
| Vapor Pressure (mm Hg) 40 at 205°F (96°C) | Molecular Weight 331.7 |
| Vapor Density (Air = 1) Not Found | Freezing Point 194°F (90°C) |

Solubility

Practically insoluble (0.02%) in water. Soluble in alcohol, ether, and chloroform.

Appearance and Odor

Colorless to yellow-brown crystals with a slight odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A% |
| NFPA Classification Non-Combustible Solid | Autoignition Temperature Not Applicable |

Extinguishing Media

Use extinguishing media suitable to the surrounding fire. Carbon tetrabromide by itself is non-combustible and does not burn.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Move containers from fire area if it can be done without risk. Fight fire from a distance if possible. Keep fire-exposed containers cool with water spray. Dike area for control and containment to prevent entry into sewers, drain, and waterways. Evacuate non-essential personnel 2500 feet from fire area. Consider down-wind conditions

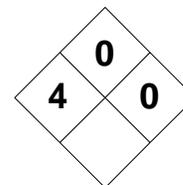

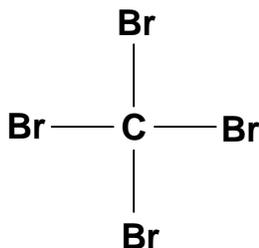

Unusual Fire and Explosion Hazards

Containers may explode in fire.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|------------------------------|--|
| Stability | | Conditions to Avoid Normally stable under routine conditions of handling and storage. Avoid contact with fire or high heat sources. Do not use in confined spaces. Keep away from incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (chlorine, fluorine, bromine, bromine trifluoride, chlorine trifluoride) lithium, and hexa-cyclohexyllead. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of carbon tetrabromide is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, carbon tetrabromide emits highly toxic fumes of carbon dioxide and vapors of bromine. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Irritation of the eyes, nose, throat, and respiratory tract, with injury to the lungs, kidneys, and liver. There can be narcosis. Eye tearing (lachrymation) may also develop. | | | | |
| EYES & SKIN: Skin and eye irritation. Corneal damage may occur in some cases. Prolonged contact with skin (from contaminated clothing or shoes) may cause hyperemia (concentration of blood in a body part), and moderate edema. | | | | |
| INGESTION: Poisonous on ingestion. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Eyes,; skin, liver, CNS, kidneys. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Give 1 - 2 glasses of milk or water. Seek medical attention immediately. Unless advised otherwise, do NOT induce vomiting. Never try to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Restrict persons not wearing protective equipment from entering area of spill or leak until cleanup is complete. Ventilate area. Collect solid materials using a HEPA vacuum and deposit in sealed containers. Alert appropriate state or federal response agencies. Do NOT dry sweep (generates dusts). | | | | |
| Preferred Waste Disposal Method No citation. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away heat. Provide explosion proof ventilation in storage areas. Smoking is prohibited in this area. | | | | |
| Other Precautions and Warnings | | | | |
| Bulk storage of carbon tetrabromide is not recommended. Empty containers can still contain sufficient residues to present a hazard exposure risk. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| At low exposures, use an organic vapor respirator with a dust/mist pre-filter. For higher exposures, use a supplied air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Solvent Resistant Butyl Rubber | Eye Protection Chemical Goggles and/or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CARBON TETRABROMIDECBr₄

CAS: 558-13-4

**IDENTIFICATION AND TYPICAL USES**

Carbon tetrabromide is a colorless to yellow-brown crystalline solid with a slight odor. It is used almost exclusively in organic synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

Carbon tetrabromide is a moderately to highly toxic compound, primarily through *ingestion* and *inhalation*. Skin contact can also produce exposure risks and, in some instances *absorption* through intact skin has been reported (although occurrence is considered rare). It can have narcotic effects at high concentrations. There are no reports of any carcinogenic, teratogenic, or mutagenic hazards resulting from exposure to carbon tetrabromide.

Inhalation of high concentrations of carbon tetrabromide dusts or vapors (from the solution) can cause irritation of the eyes, nose, and upper respiratory tract producing coughing, congestion, labored breathing, lachrymation (tearing), and other symptoms of respiratory irritation.

Skin contact with the solid material or the liquid solution can produce severe localized irritation. Eye contact is more dangerous, resulting in severe irritation with burns and possible permanent damage to the cornea. Prolonged skin contact (from contaminated clothing or soaked/contaminated shoes) may cause hyperemia, a condition characterized by a congestion of blood in one area or part of the body.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to carbon tetrabromide:

Skin: Irritation/rash on contact. Possible burns and the development of hyperemia if chemical is not quickly removed.

Eye: Irritation and possible damage to the cornea which may be permanent.

Lung: Irritation of the respiratory tract, possible lung damage.

CNS: At high concentrations, narcotic effects may occur. These include headache, dizziness, fatigue, nervousness, vomiting, diarrhea, renal damage, and liver injury.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to carbon tetrabromide and can last for months or even years:

Cancer Hazards: According to information in the references, carbon tetrabromide has not been shown to cause cancer or mutations in test animals.

Reproductive Hazards: According to information presented in the references, carbon tetrabromide has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated exposures can cause severe chronic liver, kidney, and lung damage.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with carbon tetrabromide. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce ex-

posure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with carbon tetrabromide. For relatively low or infrequent exposures, a organic vapor respirator equipped with a dust/mist pre-filter may provide suitable protection. Better respiratory protection is provided by a supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with carbon tetrabromide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where carbon tetrabromide is used or stored.

Before beginning employment and at regular times thereafter, the following medical tests are recommended:

- ☑ Liver function test.
- ☑ Lung function tests.
- ☑ Kidney function test, to include urinalysis.

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for damage already present are not a substitute for controlling exposures. Also, because more than light or infrequent alcohol consumption can cause liver damage, it can increase the liver damage caused by exposure to carbon tetrabromide.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.

- ☑ Emergency eyewash and shower stations should be located in areas where exposure to carbon tetrabromide is possible.
- ☑ Wash thoroughly immediately after exposure to carbon tetrabromide and at the end of the work shift or before eating, drinking, or smoking. Never wear clothes contaminated with carbon tetrabromide home. Family members can be exposed.
- ☑ Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of carbon tetrabromide should be communicated to all exposed or potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of carbon tetrabromide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Carbon tetrabromide is considered a non-combustible solid. However, it is incompatible with a number of commodities. Potentially explosive reactions can occur if carbon tetrabromide is mixed or comes into contact with oxidizers or some metallic compounds. These characteristics require special consideration during any emergency involving a leak or spill of carbon tetrabromide.

Carbon tetrabromide can enter the environment through manufacturing, unchecked discharge into effluents from industrial or municipal waste treatment plants, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to carbon tetrabromide.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of carbon tetrabromide to plants, birds or land animals.

☪* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Carbon tetrabromide has high chronic toxicity in aquatic life. No data are available to evaluate the long-term effects of carbon tetrabromide to plants, birds, or land animals.

◆ *Water Solubility*

Carbon tetrabromide is nearly insoluble in water. Concentrations between 1 and 10 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Carbon tetrabromide is moderately persistent in water, with a half-life between 20 and 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of carbon tetrabromide found in fish tissues is expected to be somewhat higher than the average concentration of carbon tetrabromide in water from which the fish was taken.

🕒 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of carbon tetrabromide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage facilities should be designed for maximum explosion-proof capability. Static sparks should be prevented, especially during transfer operations, with electrical grounds and bonds between all equipment involved.

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified imme-

diately. Cleanup should be attempted only by those trained in proper spill containment procedures using non-sparking tools and equipment. Contaminated soils should be removed for incineration and replaced with clean soil. If carbon tetrabromide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble in water and, therefore, total containment and remediation may be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of carbon tetrabromide.

If carbon tetrabromide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak. If in confined area, recommend using explosion-proof ventilation.
- ☑ Remove and restrict all ignition sources from area.
- ☑ Collect dry materials using safest and most convenient manner possible. Do NOT dry sweep (generates dangerous airborne dusts). Use a vacuum equipped with a high-efficiency particulate air (HEPA) filter instead. Damp mop residue.
- ☑ Absorb liquid solution spills in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools!
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ It may be necessary to dispose of carbon tetrabromide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving carbon tetrabromide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or

Risk Management for Hazardous Chemicals

environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards | | | | |
| INHALATION: Symptoms include nausea, vomiting, pupillary constriction, coma, antipsychotic effects, tremors, somnolence, anorexia, unspecified respiratory system effects. | | | | |
| ABSORPTION: Skin contact can result in irritating rash or burning feeling. Can cause severe eye burns leading to permanent damage. Contact dermatitis is likely. | | | | |
| INGESTION: Same symptoms as those of inhalation with gastroenteritis also possible. | | | | |
| Carcinogenicity Suspected Human Confirmed Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2B | OSHA Regulated? No | Target Organs? Lung; skin; eyes; CNS, liver, kidneys. |
| Medical Conditions Generally Aggravated by Exposure Respiratory function impairments (asthma, etc.); Nervous disorders; Skin conditions (dermatitis). | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Immediately flush large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Induce vomiting if victim is conscious. Seek medical attention immediately. Never try to give an unconscious person anything by mouth or make an unconscious or convulsing person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Restrict persons not wearing protective equipment from entering area of spill or leak until cleanup is complete. Ventilate area. Absorb liquid in dry sand or other material and deposit in sealed containers. Alert appropriate state or federal response agencies. | | | | |
| Preferred Waste Disposal Method | | | | |
| Mix with vermiculite, caustic soda, or slacked lime followed by burning in a chemical incinerator. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away heat. A regulated, marked area should be established where carbon tetrachloride is handled, used, or stored. Smoking is prohibited in this area. | | | | |
| Other Precautions and Warnings | | | | |
| Bulk storage of carbon tetrachloride is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| At any exposure level to a suspected human carcinogen, use a MSHA/NIOSH approved supplied air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Solvent Resistant Butyl Rubber | | Eye Protection Chemical Goggles and/or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CARBON TETRACHLORIDECCl₄

CAS: 56-23-5

**IDENTIFICATION AND TYPICAL USES**

Carbon tetrachloride is a colorless, heavy liquid with a characteristic ether-like odor. It is used as a solvent, in fire extinguishers, in dry cleaning, and in the manufacture of fluorocarbon propellants. Also used in refrigerants, metal degreasing, as an agricultural fumigant, a chlorinating organic compound, and in the production of semiconductors. It is no longer permitted in products intended for home use.

RISK ASSESSMENT: HEALTH**General Assessment**

Carbon tetrachloride is a confirmed carcinogen in animals and suspected in humans. It is a human poison by *ingestion* and possible other routes. It can also enter the body through skin *absorption* and *inhalation*. Human systemic effects by inhalation and ingestion include nausea or vomiting, pupillary constriction, coma, antipsychotic effects, tremors, somnolence, anorexia, unspecified respiratory system and gastrointestinal system effects. Experimental teratogenic and reproductive effects have also been reported. It is an eye irritant and skin irritant with dermatitis reaction possible. Mutation data have also been reported. It is known to damage the liver, kidney, and lungs.

Carbon tetrachloride has a narcotic action resembling that of chloroform, though not as strong. High exposures can cause loss of consciousness and death from respiratory failure.

Ingestion can be fatal in humans, death resulting from acute liver or kidney necrosis. Prolonged exposure to even small amounts has been reported to cause cirrhosis of the liver. There may be symptoms of dark urine, sometimes jaundice, and liver enlargement, followed by scanty urine, albumenuria and renal casts. Uremia may develop and cause death.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to carbon tetrachloride:

Skin: Irritation/rash on contact. Dermatitis may also appear.

Eye: Irritation and possible damage which may be permanent.

Lung: Irritation of the respiratory tract, possible lung damage and death due to respiratory arrest. May also cause irregular heartbeat.

CNS: Effects include headache, dizziness, fatigue, nervousness, stupor, nausea, pupillary constriction, vomiting, diarrhea, renal damage, and liver injury. There may be coma, antipsychotic effects, tremors, somnolence, and anorexia.

☪* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to carbon tetrachloride and can last for months or even years:

Cancer Hazards: Carbon tetrachloride is a probable human carcinogen. There is some evidence that it causes liver cancer in humans and it has been shown to cause liver cancer in animals.

Reproductive Hazards: According to information presented in the references, there is limited evidence that carbon tetrachloride has the ability to damage the developing fetus.

Other Chronic Effects: Repeated exposures can cause severe chronic liver, kidney, and lung damage. Repeated or prolonged contact with the skin may cause skin thickening and cracking. Prolonged exposure to small amounts of carbon tetrachloride may cause cirrhosis of the liver.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with carbon tetrachloride. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with carbon tetrachloride. For any exposure level to a suspected or probable human carcinogen, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with carbon tetrachloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where carbon tetrachloride is used or stored.

Before beginning employment and at regular times thereafter, the following medical tests are recommended:

- Liver function test.
- Kidney function test, to include urinalysis.

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for damage already present are not a substitute for controlling exposures. Also, because more than light or infrequent alcohol consumption can cause liver damage, it can increase the liver damage caused by exposure to carbon tetrachloride.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Emergency eyewash and shower stations should be located in areas where exposure to carbon tetrachloride is possible.
- Wash thoroughly immediately after exposure to carbon tetrachloride and at the end of the work shift or before eating, drinking, or smoking. Never wear clothes contaminated with carbon tetrachloride home. Family members can be exposed.
- Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of carbon tetrachloride should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of carbon tetrachloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Carbon tetrachloride is considered a non-combustible liquid (per OSHA 29 CFR 1910.106). However, it is incompatible with a number of commodities. Potentially explosive reactions can occur if carbon tetrachloride is mixed or comes into contact with fluorine, boranes, methanol, and most chemically-active metals. It forms impact-sensitive explosive mixtures with particulates of metals such as aluminum. These characteristics require special consideration during any emergency involving a leak or spill of carbon tetrachloride.

To dispose of carbon tetrachloride waste, it should be mixed with vermiculite, caustic soda, and slacked lime, followed by burning in a chemical incinerator equipped with an afterburner and scrubber. Incomplete combustion may produce chloroform. It may be mixed with a non-halogenated solvent (combustible) and incinerated. Carbon tetrachloride can enter the environment through manufacturing, unchecked discharge into effluents from industrial or municipal waste treatment plants, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to carbon tetrachloride.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of carbon tetrachloride to plants, birds or land animals.

☀ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Carbon tetrachloride has high chronic toxicity in aquatic life. No data are available to evaluate the long-term effects of carbon tetrachloride to plants, birds, or land animals.

💧 *Water Solubility*

Carbon tetrachloride is moderately soluble in water. Concentrations between 1 and 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Carbon tetrachloride is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 99.9% of carbon tetrachloride will eventually end up in air; the rest will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of carbon tetrachloride found in fish tissues is expected to be somewhat higher than the average concentration of carbon tetrachloride in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill

to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of carbon tetrachloride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If carbon tetrachloride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of carbon tetrachloride. If carbon tetrachloride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak. If in confined area, recommend using maximum explosion-proof ventilation, if possible.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Use non-sparking tools and equipment during cleanup operations.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ It may be necessary to dispose of carbon tetrachloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.
- ☑ Carbon tetrachloride laboratory wastes may be placed in a lab pack and disposed of in an approved landfill.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving carbon tetrachloride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CARBONYL SULFIDE

COS

CAS: 463-58-1

**IDENTIFICATION AND TYPICAL USES**

Carbonyl sulfide appears most commonly as a colorless gas with a typical sulfur-like odor. It may also be present as a cold liquid (boils at -58°F). It is used to make carbonate chemicals which are, in turn, used in many organic syntheses such as the manufacture of pharmaceuticals, solvents, agricultural chemicals, dyestuffs, and optical safety eye wear.

RISK ASSESSMENT: HEALTH***General Assessment***

Carbonyl sulfide can enter the body either through *inhalation* or by passing through unbroken skin (*absorption*). Ingestion is not likely since carbonyl sulfide normally exists as a gas.

Breathing carbonyl sulfide gas can irritate the nose, throat, and lungs causing coughing and sneezing. High exposures cause nausea, vomiting, weakness, and muscle cramps. It may also cause the heart to beat faster (tachycardia) or irregularly (arrhythmia). Prolonged exposures to high concentrations may result in adverse effects to the nervous system, up to and including death. It may also damage the liver over prolonged periods of time and exposure.

On contact with the skin and eyes, it can cause burns. Even as a compressed gas, it is extremely cold and the resultant damage to tissues can therefore be quite severe.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to carbonyl sulfide:

Skin: Irritation and burns (frostbite) on contact.

Eye: Irritation and possible damage which may be permanent. Tissue burning as a result from

contact with cold gas or liquid can be quite severe.

Lung: Irritation of the respiratory tract and possible lung damage. May also cause irregular or fast heartbeat.

CNS: Effects include headache, dizziness, fatigue, confusion, salivation, nausea, vomiting, diarrhea, weakness, muscle cramps, and memory loss. Higher concentrations can cause loss of consciousness, convulsions, coma, sudden collapse, and death.

☹ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to carbonyl sulfide and can last for months or even years:

Cancer Hazards: According to information presented in the references, carbonyl sulfide has not been adequately tested for its ability to cause cancer in animals.

Reproductive Hazards: According to information presented in the references, carbonyl sulfide has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated exposures may cause brain damage. Effects could include reduced memory, inability to concentrate and/or personality changes (e.g., mood swings, irritability). Carbonyl sulfide may damage the liver. Repeated exposure may increase blood cholesterol and increase risk of cholesterol and fatty deposits in the blood vessels (“hardening of the arteries”).

🛑 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with carbonyl sulfide. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best

protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with carbonyl sulfide. For any exposure level to a suspected or probable human carcinogen, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, insulated rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with carbonyl sulfide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where carbonyl sulfide is used or stored.

Before beginning employment and at regular times thereafter, for those with frequent or potentially high exposures, the following medical tests are recommended:

- ☑ Interview for brain effects, including recent memory, mood (irritability, withdrawal), concentration, headaches, malaise, and altered sleep patterns.
- ☑ Consider cerebellar, autonomic, and peripheral nervous system evaluation. Positive and borderline individuals should be referred for neuropsychological testing.
- ☑ Test for blood cholesterol levels.

If symptoms develop or overexposure is suspected, the following additional tests may be useful:

- ☑ Test for liver function.
- ☑ Complete nervous system evaluation by a qualified neurologist.

Any medical evaluation should include a careful history of past and present symptoms with an examination. Medical tests that look for damage already present are not a substitute for controlling exposures. Because more than light consumption of alcohol can cause liver

damage, it can increase the liver damage potentially caused by exposure to carbonyl sulfide.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Transfer of carbonyl sulfide from storage containers to process containers should be done automatically wherever possible.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Emergency eyewash and shower stations should be located in areas where exposure to carbonyl sulfide is possible.
- ☑ Wash thoroughly immediately after exposure to carbonyl sulfide and at the end of the work shift or before eating, drinking, or smoking. Never wear clothes contaminated with carbonyl sulfide home. Family members can be exposed.
- ☑ Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of carbonyl sulfide should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of carbonyl sulfide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water and air).

Carbonyl sulfide is a very dangerous fire hazard and a moderate explosion hazard when exposed to heat or flame. Potentially explosive reactions can occur if carbonyl sulfide is mixed or comes into contact with oxidizing materials such as perchlorates, peroxides, permanganates, chlorates, and nitrates. These characteristics require special consideration during any emergency involving a liquid leak or gas release of carbonyl sulfide.

Carbonyl sulfide can enter the environment through acute industrial discharges and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to carbonyl sulfide.

Insufficient data are available on the short-term effects of carbonyl sulfide to aquatic life, plants, birds or land animals.

☀ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of carbonyl sulfide to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Carbonyl sulfide is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Carbonyl sulfide is slightly in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Carbonyl sulfide is very volatile and reacts slowly with water to form carbon dioxide and hydrogen sulfide. Due to its volatility, most carbonyl sulfide will escape to air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of carbonyl sulfide found in fish tissues is expected to be about the same as the average concentration of carbonyl sulfide in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill

to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of carbonyl sulfide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a liquid spill or gas leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Although this chemical's volatility makes soil contamination highly unlikely, it can occur with massive liquid spills. Contaminated soils should be removed for incineration and replaced with clean soil. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of carbonyl sulfide. If carbonyl sulfide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- ☑ It may be necessary to dispose of carbonyl sulfide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving carbonyl sulfide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources.

Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|--|
| Characterization Metallic Hydroxide | RCRA Number D002 | EPA Class Characteristic Waste |
| DOT Proper Shipping Name Cesium Hydroxide (solid) | Chemical Abstract Service (CAS) Number 21351-79-1 | |
| DOT Hazard Class and Label Requirements Corrosive Material | DOT Emergency Guide Code 60 | |
| DOT Identification Number UN 2682 (solid) UN 2681 (solution) | Molecular Formula CsOH | |

Synonyms

Cesium hydrate; cesium hydroxide dimer.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|--|---|--|
| Cesium hydroxide (derivation: From adding barium hydroxide to an aqueous solution of cesium sulfate). | PEL: Not Established STEL: Not Established | REL: 2 mg/m₃ STEL: Not Established | Not Determined | TLV: 2 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point Not Found | Specific Gravity (H ₂ O = 1) 3.68 |
| Vapor Pressure (mm Hg) 0 at 68°F (20°C) | Molecular Weight 149.9 |
| Vapor Density (Air = 1) Not Found | Melting Point 522°F (272°C) |

Solubility

Highly soluble in water. Cesium hydroxide is the strongest known base compound.

Appearance and Odor

Colorless or yellowish, fused, crystalline mass. Strong alkaline reaction. Deliquescent and hygroscopic (can become liquid by absorbing moisture from the air). No detectable odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Non-Combustible Solid | Autoignition Temperature Not Applicable |

Extinguishing Media

Use extinguishing agent suitable to surrounding fire (dry chemical, foam, or water).

Special Fire Fighting Procedures

Move containers from fire if it can be done without risk. Evacuate non-essential personnel 2500 feet from fire area. Fire fighters should take care to avoid dusty situations or wear appropriate respiratory protection where cesium hydroxide may be present. Avoid using carbon dioxide (may react!).

Unusual Fire and Explosion Hazards

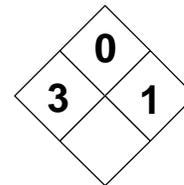

Cesium hydroxide will melt at 522°F (272°C). The molten material will react violently with water and may ignite nearby combustible materials. Poisonous gases are produced in fire.

| SECTION V - REACTIVITY DATA | | | | |
|---|-------------------|--|--|--|
| Stability | | Conditions to Avoid Normally stable under routine conditions of handling and storage. Avoid contact with heat, metals, and other incompatible materials as reactions can be violent and explosive. | | |
| Stable | Unstable | Incompatibility (<i>materials to avoid</i>) Cesium hydroxide may react in contact with water to liberate heat, carbon dioxide, oxygen, and many metals (such as aluminum, zinc, magnesium, potassium, and others) to produce explosive hydrogen gas. | | |
| X | | | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of cesium hydroxide is not expected to occur. | | |
| May Occur | Will Not Occur | Hazardous Decomposition or By-products | | |

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? | Absorption (skin/eye)? | Ingestion? |
| | | X | | X |
| Health Hazards | | | | |
| INHALATION: Irritating and corrosive to the eyes, nose, throat, and mucosa of the respiratory system. May cause cough, congestion, and sore throat. | | | | |
| SKIN & EYES: Contact with the skin or eyes can cause irritation and serious burns. Damage to eyes can be permanent up to and including loss of vision. | | | | |
| INGESTION: Burns to the mouth, esophagus, and stomach. Ingestion may be fatal. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| No Evidence Human No Evidence Animal | No | No | No | Eyes, skin, respiratory system. |
| Medical Conditions Generally Aggravated by Exposure | | | | |
| None reported. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Remove person to fresh air and seek medical attention immediately. If conscious, immediately give large amounts of water or milk to dilute. Do NOT induce vomiting (corrosive liquid may burn the throat or be aspirated into the lungs). Do NOT attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Ventilate area of spill or leak. Remove sources of ignition. Restrict those not involved in cleanup from entering area. Collect spilled powdered materials in safest manner possible and deposit in sealed drum for disposal. Do NOT dry sweep (generates dusts), use a HEPA vacuum instead. | | | | |
| Preferred Waste Disposal Method | | | | |
| Not listed. Check applicable federal, state, and/or local environmental regulations. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Cesium hydroxide is a non-combustible solid but a very powerful caustic. Store to avoid contact with acids. Store in tightly closed containers in cool, well-ventilated area away from heat or flame. | | | | |
| Other Precautions and Warnings | | | | |
| Always wear appropriate protective equipment when working with cesium hydroxide. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| If airborne concentrations exceed the TLV, a dust/mist respirator is recommended. For high exposures, or if concentrations exceed the capacity of the respirator, then a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode is advised. | | | | |
| Ventilation | | | | |
| Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | Impervious Gloves | Eye Protection | Chemical/Dust Goggles or Safety Glasses with Sides Shields Installed | Other Protective Clothing |
| | | | | Protective Clothing |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CESIUM HYDROXIDE

CsOH

CAS: 21351-79-1

**IDENTIFICATION AND TYPICAL USES**

Cesium hydroxide is a colorless or yellowish, fused, crystalline mass with no odor. It makes a strong alkaline solution. It is hygroscopic and deliquescent (absorbs moisture from air and can become liquid). It is the strongest base compound known. It is used as an electrolyte in alkaline storage batteries at subzero temperatures. It is also a polymerization catalyst for siloxanes.

RISK ASSESSMENT: HEALTH***General Assessment***

Cesium hydroxide is moderately toxic by *ingestion* and *inhalation*. Because of its extremely caustic nature, it can be dangerously corrosive and destructive to tissue on contact. There are no reports of any carcinogenic, mutagenic, or teratogenic effects subsequent to acute or chronic exposure to cesium hydroxide.

Inhalation of this material in dust or mist (from the solution) form can be immediately irritating to the eyes, nose, throat, and mucous membranes of the upper respiratory tract. There can be coughing, tearing, congestion, and sore throat. The data are limited with regard to lung injury or damage following high or concentrated exposures. However, it is an extremely corrosive material and caution is always warranted when using cesium hydroxide. Other less-caustic compounds have been known to cause serious lung injury, including potential fatal pulmonary edema (fluid in the lungs). It is not known whether exposure to cesium hydroxide will have this effect on humans.

Skin contact will cause localized irritation and possible burns. If allowed to remain in contact for long periods, the corrosive action may be quite severe. Eye contact will cause irritation and immediate burns. The damage to vision can be serious and permanent. Ingestion will cause burns to the mouth, esophagus, and stomach and can be fatal.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to cesium hydroxide:

- Skin:** Irritation with a potential for serious burns and tissue destruction.
- Eye:** Severe eye irritation, burns, and permanent damage is likely.
- Lung:** Can irritate the nose, throat, and mucous membranes of the respiratory tract.

☘* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to cesium hydroxide and can last for months or even years:

Cancer Hazards: According to the information presented in the references, cesium hydroxide has not been adequately tested for its ability to cause cancer in animals.

Reproductive Hazard: According to the information presented in the references, cesium hydroxide has not been adequately tested for its ability to affect reproduction. Human data are inadequate to evaluate the effects of exposure to cesium hydroxide on human reproduction.

Other Chronic Effects: Repeated exposure to large amounts of caustic materials such as cesium hydroxide may damage the lungs. It is not known if cesium hydroxide specifically will have this effect.

🛡 *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with cesium hydroxide. If a less toxic material cannot be substituted for cesium hydroxide, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of cesium hydroxide re-

lease. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection and other personal protective equipment (PPE) is less effective than the engineering controls mentioned above, but is still advisable whenever working with or around cesium hydroxide. Under normal operating conditions of low exposure potential, a dust/mist respirator should suffice. However, for maximum protection in large concentrations or when the capacity of the dust/mist respirator is exceeded, personnel should wear a self-contained breathing apparatus (SCBA) or a supplied-air respirator with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical/dust goggles, safety glass with side shields, or a face shield should be worn to protect the eyes. To prevent hand and skin exposures, impervious rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final selection is made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cesium hydroxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cesium hydroxide is used or stored.

If there has been a long history of high exposure, or if lung symptoms develop, the following medical tests are recommended:

- Chest X-ray.
- Pulmonary function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause lung cancer, emphysema, and a host of other medical problems, working with or around cesium hydroxide may aggravate these conditions further.

Other methods to reduce exposure to cesium hydroxide include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, then respiratory protection should be required.

- Always ensure that proper protective clothing is worn when using chemical substances. Never allow contaminated clothing to be taken home from the work place.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cesium hydroxide should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cesium hydroxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where cesium hydroxide contacts incompatible commodities can result in violent reactions as well as the possible contamination of the surrounding environmental mediums (water, soil, and air).

Cesium hydroxide is considered a noncombustible solid. However, because of its extremely basic nature it is highly incompatible with strong acids and extreme caution is required in handling, storage, transportation, and disposal of cesium hydroxide. In contact with water it can liberate enough heat to ignite combustible materials. If involved in fire, it will melt at 522°F (272°C). If the hot molten liquid should contact water (highly probable in a fire-fighting activity), a violent reaction may occur. These characteristics also require special consideration during any emergency situation involving a leak or spill of cesium hydroxide. Should cesium hydroxide ever come into contact with incompatible substances either during use, transportation, storage, or disposal, dangerous reactions are possible.

Cesium hydroxide can enter the environment through industrial discharges and/or spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cesium hydroxide.

Cesium hydroxide dissolves in water to create an strong alkaline solution. This may present a moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term toxic effects of cesium hydroxide to plants, birds, and land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term toxic effects of cesium hydroxide to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Cesium hydroxide is highly soluble in water. Concentrations of 1000 milligrams or more will mix with a liter of water.

🕒 *Persistence in the Environment*

Cesium hydroxide is moderately persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

It is not known if cesium hydroxide will accumulate in the edible tissues of aquatic life that are consumed by humans.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of cesium hydroxide into the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cesium hydroxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If cesium hydroxide should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cesium hydroxide.

If cesium hydroxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Do not allow exposure to incompatible materials.
- ☑ Close all ignition sources and ventilate area of spill.
- ☑ Collect powdered materials in the safest and most efficient manner possible. Place materials in a sealed drum. Do not dry sweep (generates dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter instead.
- ☑ It may be necessary to dispose of cesium hydroxide as a hazardous waste. Consult state, local, or federal environmental regulations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cesium hydroxide can present a moderate threat to business operations. Although not likely, equipment and facilities may be lost or their use disrupted as a result of an incident involving cesium hydroxide which can significantly affect fiscal viability. Lawsuits that may result from personnel injury, illness, and/or death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures that focus on emergency response, disaster preparedness, and disaster recovery. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|--|---------------------------------|
| Characterization Pesticide (polycyclic, chlorinated) | RCRA Number U036 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Chlordane (liquid) | Chemical Abstract Service (CAS) Number 57-74-9 | |
| DOT Hazard Class and Label Requirements Flammable Liquid | DOT Emergency Guide Code 28 | |
| DOT Identification Number UN 2762 | Chemical Formula C₁₀H₆Cl₈ | |

Synonyms

Chlordan; Toxichlor; Octaklor; Velsicol 1068; CD 68; Topichlor.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|--|
| Chlordane (derivation: By Diels-Alder addition of hexachlorocyclopentadiene to cyclopentadiene, followed by reaction with chlorine). 1 ppm = 17.04 mg/m³ | PEL: 0.5 mg/m³ (skin) STEL: Not Established | REL: 0.5 mg/m³ (skin) Possible Cancer Agent | 100 mg/m³ | TLV: 0.5 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 347°F (175°C) | Specific Gravity (H ₂ O = 1) 1.6 at 77°F (25°C) |
| Vapor Pressure (mm Hg) 0 (approx.) at 69°F (20°C) | Molecular Weight (atomic weight) 409.8 |
| Vapor Density (Air = 1) 1.6 | Freezing Point 217-228°F (103-109°C) |

Solubility

Insoluble in water (0.0001%). Soluble in most organic solvents. Miscible in deodorized kerosene. It releases chlorine and decomposes in the presence of alkalis.

Appearance and Odor

Pure chlordane is a colorless to amber, odorless, thick, viscous liquid. The commercial grade typically has a chlorine-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 132°F (55°C) closed cup | Explosive Limits in Air % by Volume LEL: 0.7% UEL: 5% |
| NFPA Classification Combustible Liquid | Autoignition Temperature 410°F (210°C) |

Extinguishing Media

Alcohol resistant foam, dry chemical, carbon dioxide, water. (Water may be ineffective on solution fire).

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Structural fire-fighting equipment is permeable and may not provide sufficient protection. Remain clear of smoke, water fall-out and water run-off. Move containers from fire area if it can be done without risk. Cool exposed containers. Toxic hydrogen chloride and phosgene gases are formed in fire.

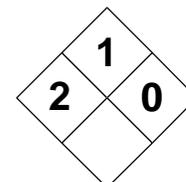

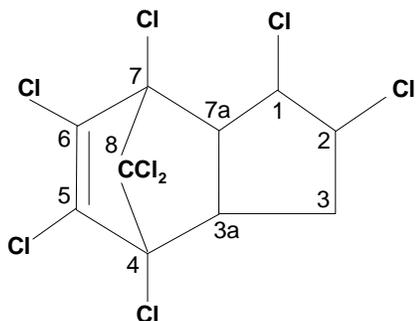

Unusual Fire and Explosion Hazards

Chlordane is a combustible liquid. It may be dissolved in some flammable liquids, such as benzene.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|---|---------------------------------------|--|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials and do not store near heat or heat source. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Reacts on contact with strong oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates. Also reacts in the presence of alkaline reagents. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of chlordane is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products At high temperatures, chlordane decomposes and may produce poisonous gases, including toxic chloride fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? X | Ingestion? X |
| Health Hazards INHALATION: Breathing vapors can cause convulsions, unconsciousness and death. Can irritate the nose, eyes, mouth, and throat. Long-term exposure can damage the liver. ABSORPTION: Will pass through unbroken skin and enter the bloodstream. Contact may severely irritate the skin and eyes. Prolonged contact can cause acne-like rash on skin. INGESTION: Poisonous to humans by ingestion. Systemic effects due to central nervous system action include tremors, convulsion, excitement, ataxia, and gastritis. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | 5th Annual Report | Group 3 | 29 CFR 1910.1000 Table Z-1 | Lungs, skin, eyes, CNS, liver, kidneys. |
| Medical Conditions Generally Aggravated by Exposure None reported. However, persons with existing lung dysfunction may experience effects quicker. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of water. DO NOT scrub. Inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: If victim is conscious, induce vomiting. Seek medical attention immediately. Never give anything by mouth to an unconscious or convulsing person. Do not make an unconscious person vomit. DOCTOR: Suggest gastric lavage and saline cathartics; ether and barbiturates may control convulsions. Oxygen and fluid therapy also recommended. Do not give epinephrine since it may induce ventricular fibrillation. Enforce complete rest. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all sources of ignition. Ventilate area of spill. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. Absorb any liquids containing chlordane in vermiculite, dry sand, earth, or similar material and deposit in sealed drum for disposal or reclamation. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well ventilated area away from heat. | | | | |
| Other Precautions and Warnings Avoid contact with oxidizers since violent reactions can occur. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above 0.5 mg/m³, use a NIOSH approved supplied air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron, Boots (avoid skin contact) |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CHLORDANEC₁₀H₆Cl₈

CAS: 57-74-9

**IDENTIFICATION AND TYPICAL USES**

Chlordane is a colorless or amber thick, viscous liquid with no odor. However, its commercial grade may have a characteristic chlorine-like odor. It is used primarily as an insecticide for the control of termites and as a fumigant.

RISK ASSESSMENT: HEALTH**General Assessment**

Chlordane is highly toxic to humans by *ingestion*. It is moderately toxic by *inhalation* and skin *absorption*. It is a suspected human carcinogen with experimental carcinogenic data reported. Chlordane has also been shown to have teratogenic properties in test animals. Human mutation data have been reported. This chemical is no longer permitted for use as a termiticide in residential properties.

Chlordane is a central nervous system stimulant. Symptoms of exposure by both ingestion and skin contact include nausea, vomiting, abdominal pain, irritation, confusion, ataxia (loss of muscle coordination), and gastritis. There may also be tremors, convulsions, blurred vision, and diarrhea.

Skin contact will result in moderate to severe irritation with rash or burning sensation. Eye contact may also result in irritation. Caution is warranted when inhalation and skin contact exposures are possible. Even though air levels may be within limits, personnel may be overexposed if chlordane should contact the skin. The dangerous chronic dose in humans is unknown. However, prolonged or long-term contact may lead to liver damage (fatty degeneration), a characteristic similar to that of chronic alcoholism.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chlordane:

Skin: Liquid can pass through unbroken skin. Contact may cause irritation and rash. Symptoms of exposure include headache, nausea, abdominal pain, and vomiting.

Eye: Severe irritation and possible damage on contact.

Lung: Irritation of the nose and throat. Breathing vapors can cause cough, convulsions, unconsciousness, and death.

CNS: A central nervous system stimulant. Symptoms include ataxia, excitement, tremors, convulsions, blurred vision, confusion, delirium, and irritability.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chlordane and can last for months or even years:

Cancer Hazards: Chlordane may be a carcinogen in humans since it has been shown to cause liver cancer in animals.

Reproductive Hazard: There is some evidence that exposure to chlordane causes damage to the developing fetus in test animals. Chlordane may decrease fertility in males and females.

Other Chronic Effects: Chlordane may damage the liver and kidneys. It may cause an acne-like rash following skin contact.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with chlordane. If a less toxic material or compound cannot be substituted for chlordane, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chlordane dust release. This may be practical in manufacturing operations, but is not feasible in application since it is used outdoors. While not always operationally possible, isolating operations involving chlordane manufacturing can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chlordane. At exposures above the ACGIH TLV of 5 mg/m³ (TWA), use a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, impervious gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chlordane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chlordane is used or stored.

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- Liver and kidney function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.

- Wash thoroughly immediately after exposure to chlordane and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chlordane should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to chlordane, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by chlordane should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to chlordane.
- Where possible, automatically pump liquid chlordane from drums or other storage containers to process containers.
- Specific engineering controls are recommended by NIOSH. Refer to NIOSH Criteria Document: Occupational Exposure During the Manufacture and Formulation of Pesticides (Publication Number 78-174).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Because of its use as a fumigant and pesticide, chlordane may be present in the environment at any given time and at a variety of levels. The environment is also at risk of exposure during transportation, storage, disposal, or destruction of chlordane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where chlordane contacts incompatible commodities can result in violent and even explosive reactions (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chlordane is considered a flammable liquid. It may also be present (dissolved) in some other flammable liquids such as benzene. Also, because it is incompatible with many common oxidizers, such as chlorine, extreme caution is required in handling, storage, trans-

portation, and disposal of chlordane. These characteristics also require special consideration during any emergency situation involving a leak or spill of chlordane powder or dust.

Chlordane is an insecticide of the polycyclic chlorinated hydrocarbon class of pesticides. It is a broad spectrum insecticide and was used for many years to control insects around the home, in gardens, in agricultural crops such as corn, and for termite control. In the U.S., chlordane is no longer permitted for residential use. However, because of its once widespread, general usage in the past in areas where termites are treated, chlordane enters the environment in agricultural and residential run-off.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chlordane.

Chlordane has high acute toxicity to aquatic life. Chlordane has caused injury and germination decrease in various agricultural and ornamental crops. Insufficient data are available on the short-term effects of chlordane to birds and land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chlordane has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of chlordane to plants, birds, or land animals.

💧 *Water Solubility*

Chlordane is very slightly soluble (practically insoluble) in water. Concentrations of less than 1 milligram will mix with a liter of water.

🕒 *Persistence in the Environment*

Chlordane is highly persistent in the water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. About 50.7% of chlordane will eventually end up in terrestrial soil; approximately

47.3% will end up in aquatic sediments; the remainder will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of chlordane found in fish tissues is expected to be considerably higher than the average concentration of chlordane in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of chlordane into the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chlordane should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Buildings or storage areas should be equipped with appropriate fire protection systems (alarms, sprinklers). Proper ventilation and protective equipment should be used while handling the powders or while preparing aqueous solutions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If chlordane should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is only slightly soluble in water and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chlordane. If chlordane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.

- ☑ Remove all ignition sources.
- ☑ Absorb in vermiculite or other material and place in sealed drum for disposal or reclamation.
- ☑ It may be necessary to dispose of chlordane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chlordane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CHLORINECl₂

CAS: 7782-50-5

**IDENTIFICATION AND TYPICAL USES**

Chlorine is a greenish-yellow gas, liquid, or rhombic crystalline solid. Its commercial grade may sometimes appear as a white powder or solid. It is used as a disinfectant, for purifying and sterilizing water supplies and swimming pools, in metal fluxing, in the manufacture of bleaching powder, chlorinated hydrocarbons, synthetic rubber, pulp and paper, and plastics. It is also used as a chlorinating and oxidizing agent. It was used by the military as a poison under the name Bertholite.

RISK ASSESSMENT: HEALTH**General Assessment**

Chlorine is a severely irritating gas, causing irritation of the eyes, nose, throat, and respiratory tract. It is considered moderately toxic to humans by *inhalation*. Human mutation data also reported. Other symptoms of exposure include burning of the mouth, coughing, choking, nausea, vomiting, headache, dizziness, pneumonia, muscle weakness, respiratory distress, changes in the trachea or bronchi, emphysema, chronic pulmonary edema, and congestion. A 30-minute exposure to 500-800 ppm can be fatal to humans.

Chlorine is extremely irritating to the eyes and mucous membranes in the respiratory tract at concentrations as low as 3 ppm. Because of chlorine's intense and irritating properties, severe industrial exposures seldom occur (the worker is forced to leave the area before serious physical effects can occur). In cases where such exposures do occur, the worker will feel a burning sensation in the eyes, nose and throat, followed by tightness and pain in chest. Pulmonary edema (fluid buildup in the lungs) can follow which can be fatal.

Skin contact can cause irritating rash to develop. Chronic exposures to low levels may result in corrosion of the teeth, inflammation of the mucous membranes, respiratory disorders, and an increased susceptibility to tuberculosis (an infectious lung disease).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chlorine:

Skin: Immediate irritation and burn on contact. May cause irritating rash and possible permanent damage to skin tissue.

Eye: Severe irritation; may cause burns and permanent damage.

Lung: Irritation of the nose, throat, and lungs following exposure. Pulmonary edema is possible (24 to 48 hours following a high exposure). It can cause tearing, choking, coughing, sputum, bloody nose, and chest pain.

Other: Headache, dizziness, loss of consciousness, muscle weakness, burning of the mouth, nausea, vomiting, and pneumonia.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chlorine and can last for months or even years:

Cancer Hazards: According to information presented in the references, chlorine has not been adequately tested for its ability to cause cancer in test animals. Chlorine may cause mutations (genetic changes) in living cells and many scientists believe such chemicals may pose a cancer risk in the long-term.

Reproductive Hazard: According to information presented in the references, chlorine has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Chlorine can irritate the lungs. Repeated exposure may cause bronchitis to develop with cough, phlegm, and/or shortness of breath. Long-term exposure can cause corrosion of the teeth, inflammation of the mucous membranes, respiratory ailments, and an increased susceptibility to tuberculosis.

☉ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with chlorine. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chlorine. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. For low concentrations (below the PEL), an organic vapor cartridge respirator (equipped with a chlorine gas cartridge) is acceptable protection. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, chemical resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chlorine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chlorine is used or stored.

For those personnel with frequent or potentially high exposure (half the PEL or greater), the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- ☑ Dental examination to check teeth for indications of erosion.
- ☑ Lung function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Lung function tests.
- ☑ Consider chest X-ray after acute overexposures.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because

smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, exposure to chlorine may worsen pre-existing respiratory conditions.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to chlorine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chlorine should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to chlorine, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of chlorine.
- ☑ Specific engineering controls are recommended for chlorine by NIOSH. Refer to NIOSH Criteria Document, publication number 76-176.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chlorine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chlorine is considered a non-flammable gas. However, it is a powerful oxidizing agent and reactions with incompatible commodities can result in fire and serious explosions. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with gasoline, and most petroleum

products, turpentine, alcohols, acetylene, hydrogen, ammonia, and sulfur and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of chlorine. Should chlorine ever come into contact with incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Chlorine is a natural element of common occurrence. It is also used extensively in many industrial and commercial processes. Discharges of chlorine to water are common because it is used to disinfect effluents and in various industrial processes (particularly in the food and paper industries). It can also enter the environment through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chlorine.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of chlorine exposure to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chlorine has high chronic toxicity in aquatic life. No data are available on the long-term effects of chlorine to plants, birds, or land animals.

💧 *Water Solubility*

Chlorine is highly soluble in water. Concentrations of 1000 milligrams and more will readily mix with a liter of water.

🕒 *Persistence in the Environment*

Chlorine is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

No data are available on the amount of chlorine that will remain in air or water.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Chlorine is not expected to accumulate in the tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chlorine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If chlorine should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and total remediation and containment may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chlorine. If chlorine is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of leak.
- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.

- ☑ If gas is leaking, stop the flow of gas. If the source is a cylinder and leak can not be stopped in place, remove cylinder to a safe place in the open air and repair or allow to empty.
- ☑ It may be necessary to dispose of chlorine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chlorine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CHLORINE DIOXIDEClO₂

CAS: 10049-04-4

**IDENTIFICATION AND TYPICAL USES**

Chlorine dioxide is a yellow to orange gas at ordinary temperatures with a pungent, irritating odor somewhat like that of chlorine. It liquefies at 52°F (11°C) to a reddish-brown liquid. It will solidify at -74°F (-59°C) to yellowish-red crystals. It is normally sold as a hydrate in its frozen form. Among its most common uses, chlorine dioxide is a bleaching agent to bleach fats, oils, textiles, cellulose, paper pulp, flour, and leather. It is also used for purifying water, as an oxidizing agent, as an antiseptic, and in the manufacture of many chlorite salts.

RISK ASSESSMENT: HEALTH**General Assessment**

Chlorine dioxide is highly irritating to the eyes, nose, and throat. Moderately toxic by *inhalation*. There is also some evidence that it has the ability to adversely affect reproduction in test animals. Human mutation data have also been reported.

Breathing chlorine dioxide vapors can cause coughing, nasal discharge, wheezing, respiratory distress, bronchitis, and congestion of the lungs. Its irritant effects can be intense at a concentration in air as low as 5 ppm. High exposures can damage the lungs, causing a buildup of fluid (pulmonary edema) which is a medical emergency and can be fatal. The chronic toxicity signs are primarily dyspnea and asthmatic bronchitis and, in some cases, irritation of the gastrointestinal tract. Ingestion of the liquid may cause somnolence and respiratory stimulation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chlorine dioxide:

Skin: Liquid may irritate the skin (cold temperature may cause burning sensation).

Eye: Severe irritation; may cause watery eyes.

Lung: Irritation of the nose, throat, and lungs following exposure. Pulmonary edema is possible (24 to 48 hours following a high exposure). It can cause chest pain, cough, bloody nose, and sputum.

Other: Headache, dizziness, loss of consciousness, muscle weakness, burning of the mouth, nausea, vomiting, and pneumonia.

☪* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chlorine dioxide and can last for months or even years:

Cancer Hazards: Chlorine dioxide may cause mutations (genetic changes) in living cells. It has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, there is some experimental evidence that chlorine dioxide can adversely affect reproduction in test animals.

Other Chronic Effects: Repeated exposures can cause bronchitis to develop with cough, phlegm, and/or shortness of breath. Permanent lung damage can occur, especially with repeated exposure to vapors.

🔧 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with chlorine dioxide. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or

around chlorine dioxide. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. For low concentrations (below the PEL), a full facepiece respirator equipped with a cartridge containing non-combustible sorbents and providing protection against chlorine dioxide gas is acceptable protection. Whenever working with the liquid and a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chlorine dioxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chlorine dioxide is used or stored.

For those personnel with frequent or potentially high exposure (half the PEL or greater), the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- Lung function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Lung function tests.
- Consider chest X-ray after acute overexposures.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, exposure to chlorine dioxide may worsen pre-existing respiratory conditions.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.

- Wash thoroughly immediately after exposure to chlorine dioxide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chlorine dioxide should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to chlorine dioxide, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of chlorine dioxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chlorine dioxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chlorine dioxide is considered a flammable gas. It is a powerful oxidizing agent and extremely reactive with many commonly encountered commodities such as dust and air. Contact with incompatible materials can result in fire and serious explosions. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with organic matter, combustible materials, powdered metals, and ammonia compounds. It will explode violently upon exposure to sunlight or when subjected to a spark. Detonation occurs at concentrations above 10% in air in the presence of an energy source or a catalyst. It undergoes violent reactions with organic matter; explosion occurs when the mixture is subjected to shock or spark. It is extremely unstable and highly reactive. These characteristics require special consideration during any emergency situation involving a leak or spill of chlorine dioxide. Should chlorine dioxide ever come

into contact with incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Chlorine dioxide is used extensively in many industrial and commercial processes. Discharges of chlorine dioxide to water are common because it is used to disinfect effluents and in various industrial processes (particularly in the food and paper industries). It can also enter the environment through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chlorine dioxide.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of chlorine dioxide exposure to plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chlorine dioxide has high chronic toxicity in aquatic life. No data are available on the long-term effects of chlorine dioxide to plants, birds, or land animals.

💧 *Water Solubility*

Chlorine dioxide decomposes in water to form a mixture of chlorite and chlorate.

🕒 *Persistence in the Environment*

Chlorine dioxide is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the amount of chlorine dioxide that will remain in air or water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated

in the tissues and internal organs of animals as well as humans.

Chlorine dioxide is not expected to accumulate in the tissues of fish.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. Transportation of pure chlorine dioxide is forbidden by the Department of Transportation (DOT). It must be kept frozen when shipped. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

When not in use, chlorine dioxide must be kept frozen. Storage of chlorine dioxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers should be kept tightly closed in a cool, dark, well-ventilated area at temperatures well below 266°F (130°C). Gas explosions occur above 266°F. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If chlorine dioxide should contact the water table, aquifer, or navigable waterway, time is of the essence. It decomposes in water and total remediation and containment may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chlorine dioxide. If chlorine dioxide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.

- ☑ If gas is leaking, stop the flow of gas. If the source is a cylinder and leak cannot be stopped in place, remove cylinder to a safe place in the open air and repair or allow to empty.
- ☑ It may be necessary to dispose of chlorine dioxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chlorine dioxide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of such procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|---|--|
| Characterization Interhalogen Compound | RCRA Number D003 | EPA Class Characteristic (R) Waste |
| DOT Proper Shipping Name Chlorine Pentafluoride | Chemical Abstract Service (CAS) Number 13637-63-3 | |
| DOT Hazard Class and Label Requirements Oxidizer & Poison Gas | DOT Emergency Guide Code 44 | |
| DOT Identification Number UN 2548 | Chemical Formula ClF₅ | |
| Synonyms None | | |

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|--|---|--|
| Chlorine pentafluoride (An inorganic fluoride). | PEL: 2.5 mg/m³ (as fluorine) STEL: Not Established | REL: 2.5 mg/m³ (as fluorine) STEL: Not Established | Not Determined | TLV: 2.5 mg/m³ (as fluorine) STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point Not Found | Specific Gravity (H ₂ O = 1) 1.77 |
| Vapor Pressure (atmospheres) Not Found | Molecular Weight 130.45 |
| Vapor Density (Air = 1) >1.0 | Melting Point Not Found |
| Solubility Reacts violently with water. | |
| Appearance and Odor Colorless gas with a suffocating odor. | |

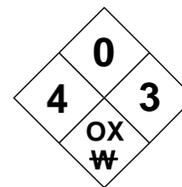

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) Not Determined | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non-Flammable Gas, Non-Combustible Liquid | Autoignition Temperature Not Determined |
| Extinguishing Media Stop flow of gas or liquid. Use bicarbonate-based dry chemical. Do NOT use water (reacts explosively!) | |
| Special Fire Fighting Procedures Chlorine pentafluoride is a powerful oxidizer. Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire. Isolate for 1/2 mile if rail or tank truck is involved. Containers may explode in fire or heat. | |
| Unusual Fire and Explosion Hazards Chlorine pentafluoride is hypergolic. It will ignite explosively in contact with a fuel or a spark. Dangerous fire and explosion hazard when exposed to any form of energy, including sunlight, heat, or sparks. | |

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|--------------------------------|--|
| Stability | | Conditions to Avoid Extremely reactive but can be kept stable in special cylinders. Avoid contact with combustible materials such as wood, paper, oil, and plastics since spontaneous combustion can occur. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Violent reacts with water, oxidizers, acids, combustible materials, sand, glass, and is corrosive to most metals. Reacts with water to form chlorine and extremely toxic and corrosive hydrofluoric acid. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of chlorine pentafluoride is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, chlorine pentafluoride can emit highly toxic/poisonous gases. Mixing with water or steam will produce toxic and corrosive fumes of chlorine and fluorine. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Extremely irritating to the lungs, throat, nose, and eyes. Coughing and shortness of breath that may persist for hours after exposure. Can cause permanent damage to the lungs. Fluid can build up in the lungs (pulmonary edema), which is a medical emergency. SKIN & EYES: Contact with the liquid can cause severe skin burns (due to its cold state). The liquid can cause severe eye burns leading to permanent damage. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, eyes, and skin. |
| Medical Conditions Generally Aggravated by Exposure Persons with existing pulmonary disease may be more susceptible to exposure symptoms. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 30 minutes (minimum), seek medical attention. Skin contact: Quickly remove all contaminated clothing. Immediately wash area with large amounts water for 15 minutes (minimum). Apply topical hydrogen fluoride neutralizing agent (calcium gluconate gel). Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Seek medical attention immediately. Drink large quantities of milk. Do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. If gas is leaked, stop source if possible or remove leaking cylinders to safe area outdoors and allow to empty. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Chlorine pentafluoride is a non-flammable gas but an extremely powerful oxidizer. Store to avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat and moisture (reacts violently with water). | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited around chlorine pentafluoride. Heat may cause containers to build up pressure and explode. An inert blanket of nitrogen inside containers is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures below the PEL, use a full facepiece respirator with organic vapor cartridge. For higher exposures, use a supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a SCBA operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious, Solvent-Resistant | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron or Full-Body Suit | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CHLORINE PENTAFLUORIDEClF₅

CAS: 13637-63-3

**IDENTIFICATION AND TYPICAL USES**

Chlorine pentafluoride is a colorless gas with a suffocating odor. It is normally shipped as a liquefied compressed gas. Commercial applications are somewhat limited. It is sometimes used as a fluorinating and oxidizing agent.

RISK ASSESSMENT: HEALTH***General Assessment***

Chlorine pentafluoride is human poison by *inhalation*. In liquid form, it can pose a moderate threat on contact with the skin and eyes (frostbite burns), although absorption has not been reported as an entry route. There are no reports of carcinogenic, mutagenic, or teratogenic cases subsequent to exposure to chlorine pentafluoride. It is a powerful oxidizer and is considered highly corrosive to human tissues.

Inhalation results in severe irritation and possible corrosive destruction to the mucous membranes in the nose, throat, and respiratory tract. Even relatively moderate concentrations can lead to a dangerous buildup of fluids in the lungs in a condition known as pulmonary edema. If this occurs, it is a medical emergency and can be fatal. Symptoms of cough with phlegm, congestion, tightness in the chest, headache, and difficulty in breathing (dyspnea) may be delayed up to 48 hours. This may create a false sense of security with regard to health exposure risk. If allowed to go untreated, death is very possible.

Eye contact can cause severe pain and irritation with watering (lachrymation), burns, corneal ulceration, and permanent blindness. Skin contact is seriously destructive to tissue and may cause injury equivalent to 2nd and 3rd degree burns. As a result of the fluoride ion and its affinity for calcium, deep corrosive destruction of tissues may reach the bone if it is not stopped in time (using calcium gluconate injections).

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to chlorine pentafluoride:

Skin: Liquid is destructive to skin tissue (cold temperature may cause burning frostbite). Deep and painful burns may result.

Eye: Severe irritation with may cause watery eyes. Corneal ulceration and blindness are extremely possible on contact with the liquid.

Lung: Irritation of the nose, throat, and lungs following exposure. Pulmonary edema is possible (24 to 48 hours following a high exposure). It can cause chest pain, cough, bloody nose, and sputum.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to chlorine pentafluoride and can last for months or even years:

Cancer Hazards: According to information presented in the references, chlorine pentafluoride has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, chlorine pentafluoride has not been tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated exposures can cause chronic coughing, sneezing, runny nose, frequent drooling, pneumonia, and death.

☠ *Recommended Risk-Reduction Measures*

Personnel should avoid direct contact with chlorine pentafluoride. It is extremely corrosive and moderately toxic, even at low concentrations. If a less toxic chemi-

cal cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chlorine pentafluoride. The PEL is relatively low (2.5 mg/m³) and difficult to monitor. While a full facepiece respirator equipped with a cartridge containing non-combustible sorbents and providing protection against chlorine pentafluoride gas may suffice for low or infrequent exposures, it is not the most optimum choice for respiratory protection. A supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. is acceptable protection. Whenever working with the liquid and a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chlorine pentafluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chlorine pentafluoride is used or stored.

For those personnel with frequent or potentially high exposure, the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- Lung function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Lung function tests.
- Consider chest X-ray after acute overexposures (may be negative if taken immediately following

exposure due to delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, smokers may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* exposure factors.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to chlorine pentafluoride and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chlorine pentafluoride should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to chlorine pentafluoride, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of chlorine pentafluoride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chlorine pentafluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills,

large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chlorine pentafluoride is considered a non-flammable gas. However, it is an extremely powerful oxidizing agent and highly reactive with many commonly encountered commodities such as acids, oxidizers, many metal and metallic compounds, even sand and water. Contact with incompatible materials can result in fire and serious explosions. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with organic matter, combustible materials, powdered metals, and many other compounds and materials. It may explode violently upon exposure to air or when subjected to a spark. It is extremely unstable and highly reactive. These characteristics require special consideration during any emergency situation involving a leak or spill of chlorine pentafluoride. Should chlorine pentafluoride ever come into contact with incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Chlorine pentafluoride can enter the environment through industrial discharges and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chlorine pentafluoride.

Because it reacts violently in water to form hydrogen fluoride and chlorine, insufficient data are available on the short-term effects of chlorine pentafluoride exposure to aquatic life, plants, birds, or land animals. However, both hydrogen fluoride and chlorine have moderate acute toxicity to aquatic life.

💧☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Because it reacts violently in water to form hydrogen fluoride and chlorine, insufficient data are available on the long-term effects of chlorine pentafluoride to aquatic life, plants, birds, or land animals. However, both hydrogen fluoride and chlorine have slight chronic toxicity to aquatic life.

💧 *Water Solubility*

Chlorine pentafluoride reacts violently in water to form a hydrogen fluoride and chlorine.

🕒 *Persistence in the Environment*

Chlorine pentafluoride is non-persistent in water, since it reacts violently on contact. It will form hydrogen fluoride and chlorine which are both slightly persistent in the aquatic environment with a half-life between than 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Chlorine pentafluoride is not expected to accumulate in the tissues of fish. However, the amount of hydrogen fluoride and chlorine (both by-products of the chlorine pentafluoride and water reaction) is expected to be about the same as the average concentration found in the water from which the fish was taken.

🚚 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. Transportation of pure chlorine pentafluoride is forbidden by the Department of Transportation (DOT). It must be kept frozen when shipped. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

When not in use, chlorine pentafluoride must be kept in tightly sealed and controlled containers. Storage of chlorine pentafluoride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immedi-

ately. Clean-up should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If chlorine pentafluoride should contact the water table, aquifer, or navigable waterway, time is of the essence. It reacts violently in water and total remediation and containment may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chlorine pentafluoride. If chlorine pentafluoride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Use non-sparking tools in cleanup.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of leak.
- ☑ Absorb liquids in vermiculite, earth, or similar material and deposit in sealed containers. DO NOT use sand (reacts!).
- ☑ If gas is leaking, stop the flow of gas. If the source is a cylinder and leak cannot be stopped in place, remove cylinder to a safe place in the open air and repair or allow to empty.
- ☑ It may be necessary to dispose of chlorine pentafluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chlorine pentafluoride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| | |
|--|--|
| Boiling Point <p style="text-align: center;">53°F (12°C)</p> | Specific Gravity (H ₂ O = 1) <p style="text-align: center;">1.77 (liquid at 53°F)</p> |
| Vapor Pressure (atmospheres) <p style="text-align: center;">1.4 at 69°F (20°C)</p> | Molecular Weight <p style="text-align: center;">92.5</p> |
| Vapor Density (Air = 1) <p style="text-align: center;">3.14</p> | Melting Point <p style="text-align: center;">-105°F (-76°C)</p> |

Solubility

Reacts violently with water.

Appearance and Odor

Colorless gas or a greenish-yellow, volatile liquid (below 53°F) with a somewhat sweet, but irritating and suffocating odor. It will solidify to a white solid at -105°F (-76.3°C).

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) <p style="text-align: center;">Not Determined</p> | Explosive Limits in Air % by Volume <p style="text-align: center;">LEL: Not Determined UEL: Not Determined</p> |
| NFPA Classification <p style="text-align: center;">Non-Flammable Gas, Non-Combustible Liquid</p> | Autoignition Temperature <p style="text-align: center;">Not Determined</p> |

Extinguishing Media

Stop flow of gas or liquid. Use bicarbonate-based dry chemical. Do NOT use water (reacts explosively!)

Special Fire Fighting Procedures

Chlorine trifluoride is a powerful oxidizer. Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire. Isolate for ½ mile if rail or tank truck is involved. Containers may explode in fire or heat.

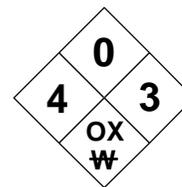

Unusual Fire and Explosion Hazards

Chlorine trifluoride is hypergolic. It will ignite explosively in contact with a fuel or a spark. Dangerous fire and explosion hazard when exposed to any form of energy, including sunlight, heat, or sparks.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|---|--|--|
| Stability | | Conditions to Avoid Extremely reactive but can be kept stable in special cylinders. It will thermally decompose at temperatures above 428°F (220°C). | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Violent reacts with water, oxidizers, acids, combustible materials, sand, glass, and is corrosive to most metals. Reacts with water to form chlorine and extremely toxic and corrosive hydrofluoric acid. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of chlorine trifluoride is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, chlorine trifluoride can emit highly toxic/poisonous gases. Mixing with water or steam will produce toxic and corrosive fumes of chlorine and fluorine. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Extremely irritating to the lungs, throat, nose, and eyes. Coughing and shortness of breath that may persist for hours after exposure. Can cause permanent damage to the lungs. Fluid can build up in the lungs (pulmonary edema), which is a medical emergency. SKIN & EYES: Contact with the liquid can cause severe skin burns (due to its cold state). The liquid can cause severe eye burns leading to permanent damage. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, and skin. |
| Medical Conditions Generally Aggravated by Exposure Persons with existing pulmonary disease may be more susceptible to exposure symptoms. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 30 minutes (minimum), seek medical attention. Skin contact: Quickly remove all contaminated clothing. Immediately wash area with large amounts water for 15 minutes (minimum). Apply topical hydrogen fluoride neutralizing agent (calcium gluconate gel). Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Seek medical attention immediately. Give large quantities of milk. Do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. If gas is leaked, stop source if possible or remove leaking cylinders to safe area outdoors and allow to empty. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Chlorine trifluoride is a non-flammable gas but an extremely powerful oxidizer. Store to avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat and moisture (reacts violently with water). | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited around chlorine trifluoride. Heat may cause containers to build up pressure and explode. An inert blanket of nitrogen inside containers is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures below the PEL, use a full facepiece respirator with organic vapor cartridge. For higher exposures, use a supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a SCBA operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious, Solvent-Resistant | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Apron or Full-Body Suit | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CHLORINE TRIFLUORIDEClF₃

CAS: 7790-91-2

**IDENTIFICATION AND TYPICAL USES**

Chlorine trifluoride is a colorless gas or a greenish-yellow liquid (below 53°F/12°C) with a sweet but irritating and suffocating odor. It is normally shipped as a liquefied compressed gas. It is used as a fluorinating agent, as an igniting agent and propellant for liquid fueled rocket engines, a pyrolysis inhibitor for fluorocarbon polymers, and an incendiary. It is also used in nuclear reactor fuel processing.

RISK ASSESSMENT: HEALTH**General Assessment**

Chlorine trifluoride is human poison by *inhalation*. In liquid form, it can pose a moderate threat on contact with the skin and eyes (frostbite burns), although absorption has not been reported as an entry route. There are no reports of carcinogenic, mutagenic, or teratogenic cases subsequent to exposure to chlorine trifluoride. It is a powerful oxidizer and is considered highly corrosive to human tissues.

Inhalation results in severe irritation and possible corrosive destruction to the mucous membranes in the nose, throat, and respiratory tract. Even relatively moderate concentrations can lead to the buildup of fluids in the lungs in a condition known as pulmonary edema. If this occurs, it is a medical emergency and can be fatal. Symptoms of cough with phlegm, congestion, tightness in the chest, headache, and difficulty in breathing (dyspnea) may be delayed up to 48 hours. This may create a false sense of security with regard to health exposure risk.

Eye contact can cause severe pain and irritation with watering (lachrymation), burns, corneal ulceration, and permanent blindness. Skin contact is destructive to tissue and may cause 2nd and 3rd degree burns. As a result of the fluoride ion and its affinity for calcium, corrosive destruction may reach the bone if it is not stopped in time.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chlorine trifluoride:

Skin: Liquid is destructive to skin tissue (cold temperature may cause burning frostbite). Deep and painful burns may result.

Eye: Severe irritation with may cause watery eyes. Corneal ulceration and blindness are extremely possible on contact with the liquid.

Lung: Irritation of the nose, throat, and lungs following exposure. Pulmonary edema is possible (24 to 48 hours following a high exposure). It can cause chest pain, cough, bloody nose, and sputum.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chlorine trifluoride and can last for months or even years:

Cancer Hazards: According to information presented in the references, chlorine trifluoride has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, chlorine trifluoride has not been tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Repeated exposures can cause chronic coughing, sneezing, runny nose, frequent drooling, pneumonia, and death.

🚫 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with chlorine trifluoride. It is extremely corrosive and moderately toxic, even at low concentrations. If a less toxic chemi-

cal cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chlorine trifluoride. The PEL (ceiling) is relatively low (0.1 ppm) and difficult to monitor. While a full facepiece respirator equipped with a cartridge containing non-combustible sorbents and providing protection against chlorine trifluoride gas may suffice for low or infrequent exposures, it is not the most optimum choice for respiratory protection. A supplied-air respirator or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode are the recommended respiratory protection methods. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. is acceptable protection. Whenever working with the liquid and a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chlorine trifluoride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chlorine trifluoride is used or stored.

For those personnel with frequent or potentially high exposure, the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- Lung function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Lung function tests.
- Consider chest X-ray after acute overexposures (may be negative if taken immediately following

exposure due to delayed development of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, smokers may experience symptoms much more quickly than non-smokers under the same conditions of exposure. Prudent risk management requires careful consideration of *all* exposure factors.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to chlorine trifluoride and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chlorine trifluoride should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to chlorine trifluoride, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of chlorine trifluoride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chlorine trifluoride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills,

large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chlorine trifluoride is considered a non-flammable gas. However, it is an extremely powerful oxidizing agent and highly reactive with many commonly encountered commodities such as acids, oxidizers, many metal and metallic compounds, even sand and water. Contact with incompatible materials can result in fire and serious explosions. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with organic matter, combustible materials, powdered metals, and many other compounds and materials. It may explode violently upon exposure to air or when subjected to a spark. It is extremely unstable and highly reactive. These characteristics require special consideration during any emergency situation involving a leak or spill of chlorine trifluoride. Should chlorine trifluoride ever come into contact with incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Chlorine trifluoride can enter the environment through industrial discharges and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chlorine trifluoride.

Because it reacts violently in water to form hydrogen fluoride and chlorine, insufficient data are available on the short-term effects of chlorine trifluoride exposure to aquatic life, plants, birds, or land animals. However, both hydrogen fluoride and chlorine have moderate acute toxicity to aquatic life.

💧☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Because it reacts violently in water to form hydrogen fluoride and chlorine, insufficient data are available on the long-term effects of chlorine trifluoride to aquatic life, plants, birds, or land animals. However, both hydrogen fluoride and chlorine have slight chronic toxicity to aquatic life.

💧 *Water Solubility*

Chlorine trifluoride reacts violently in water to form a hydrogen fluoride and chlorine.

🕒 *Persistence in the Environment*

Chlorine trifluoride is non-persistent in water, since it reacts violently on contact. It will form hydrogen fluoride and chlorine which are both slightly persistent in the aquatic environment with a half-life between than 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Chlorine trifluoride is not expected to accumulate in the tissues of fish. However, the amount of hydrogen fluoride and chlorine (both by-products of the chlorine trifluoride and water reaction) is expected to be about the same as the average concentration found in the water from which the fish was taken.

🚚 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. Transportation of pure chlorine trifluoride is forbidden by the Department of Transportation (DOT). It must be kept frozen when shipped. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

When not in use, chlorine trifluoride must be kept in tightly sealed and controlled containers. Storage of chlorine trifluoride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immedi-

ately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If chlorine trifluoride should contact the water table, aquifer, or navigable waterway, time is of the essence. It reacts violently in water and total remediation and containment may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chlorine trifluoride. If chlorine trifluoride is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Use non-sparking tools in cleanup.
- Remove all ignition sources.
- Ventilate area of leak.
- Absorb liquids in vermiculite, earth, or similar material and deposit in sealed containers. DO NOT use sand (reacts!).
- If gas is leaking, stop the flow of gas. If the source is a cylinder and leak cannot be stopped in place, remove cylinder to a safe place in the open air and repair or allow to empty.
- It may be necessary to dispose of chlorine trifluoride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chlorine trifluoride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CHLOROACETALDEHYDE

CAS: 107-20-0

**IDENTIFICATION AND TYPICAL USES**

Chloroacetaldehyde is a colorless liquid with an acrid, penetrating odor that is typically found in 40% aqueous solution. It is used in the manufacture of other chemicals, such as 2-aminothiazole. It is also used to facilitate bark removal from tree trunks, as a fungicide, in dentistry, and in the spinning solution of poly B-alanine.

RISK ASSESSMENT: HEALTH**General Assessment**

Chloroacetaldehyde is a human poison by *ingestion* and *inhalation*, and by skin *absorption*. While there are no reports on its carcinogenicity, it has been shown to cause mutations (genetic changes) in living cells. There are no data to indicate it poses any teratogenic effects in humans or animals.

Inhalation causes irritation of the eyes, nose, throat and mucous membranes of the respiratory tract with coughing, choking, constriction of bronchial tubes, increased respiratory rate (tachypnea). It can also cause respiratory tract sensitization. Pulmonary edema (fluid buildup in the lungs) may develop up to 48 hours after exposure. This is a dangerous medical emergency and can be fatal. Because of the delayed development of symptoms, it may create a false sense of security with regard to health exposure risk. As with other aldehydes, it may be toxic and injurious to the central nervous system (CNS) and possibly the kidneys. It may also cause blood changes.

Skin contact with the liquid causes burns, irritation and rash. There may be skin allergies following long-term exposures. The liquid can injure the eyes and cause permanent blindness. The vapor is also irritating and may cause pain and swollen eyelids.

Ingestion burns the mouth, throat, and gastrointestinal tract. Systemic effects may occur depending on

the conditions of exposure (quantity ingested, potency of solution).

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chloroacetaldehyde:

Skin: Irritation and rash or burning sensation on contact.

Eye: Irritation, swollen lids, and burns leading to permanent damage, even blindness.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can cause a buildup of fluid in the lungs (pulmonary edema).

CNS: Inhalation of high concentrations of the vapor may cause sleepiness, dizziness, loss of consciousness, and other unspecified effects.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chloroacetaldehyde and can last for months or even years:

Cancer Hazards: Chloroacetaldehyde causes mutations (genetic changes). Such chemicals may have a cancer or reproductive risk. However, there is no evidence that chloroacetaldehyde causes cancer in animals. Chloroacetaldehyde may be a teratogen in humans since it has been shown to cause birth defects in animals.

Reproductive Hazards: According to the information presented in the references, chloroacetaldehyde has not been adequately tested for its ability to cause reproductive effects in animals.

Sensitivity: Exposure to the skin may result in allergy (sensitization). If allergy develops, very low future exposure can result in skin irritation and rash. Re-

peated exposure can cause chronic irritation of the eyes and lungs. Sensitization of the respiratory system may occur. There is also a possibility that aldehydes cause kidney damage and blood changes in the long-term.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with chloroacetaldehyde. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chloroacetaldehyde. The exposure ceiling of 1 ppm is extremely low and difficult to monitor. For low exposures, a full facepiece respirator with an organic vapor cartridge may suffice. However, for high exposures or when the exposure level is unknown (as in an emergency situation), a self-contained breathing apparatus (SCBA) with full facepiece operated pressure demand is the recommended respiratory protection method of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chloroacetaldehyde.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chloroacetaldehyde is used or stored.

Before beginning employment with chloroacetaldehyde and at regular intervals thereafter (e.g., annually), the following medical examinations are suggested:

- Lung function tests (establish baseline).

If symptoms develop or overexposure is suspected, the following additional tests are recommended:

- Lung function tests (compare to baseline).
- Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to the delayed onset of pulmonary edema).
- Evaluation by a qualified allergist with careful consideration of exposure history and special tests (may help diagnose skin allergy).
- Monitor arterial blood gases.
- Consider renal function tests and urinalysis for significant exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to chloroacetaldehyde and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chloroacetaldehyde should be communicated to all potentially exposed workers.
- Never eat, drink, or smoke in areas where chloroacetaldehyde is used, handled or stored.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chloroacetaldehyde. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chloroacetaldehyde is considered a combustible liquid. Because of its moderate flash point and boiling point, it is classified as a Class 111A combustible liquid (per OSHA 29 CFR 1910.106). It is also incompatible with commonly encountered oxidizers and acids. These characteristics require special consideration during any emergency situation involving a leak or spill

of chloroacetaldehyde. Should chloroacetaldehyde ever come into contact with any incompatible substances either during use, transportation, or storage, the formation of highly toxic and/or highly explosive commodities is extremely possible.

The proper disposal/destruction method for chloroacetaldehyde is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

Chloroacetaldehyde can enter the environment through manufacturing, unchecked discharge into effluents, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chloroacetaldehyde. This chemical has high acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term (acute) effects of chloroacetaldehyde to plants, birds, or terrestrial animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Chloroacetaldehyde has high chronic toxicity in aquatic life. No data are available on the long-term effects of chloroacetaldehyde to plants, birds, or land animals.

💧 *Water Solubility*

Chloroacetaldehyde is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Chloroacetaldehyde is moderately persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. Approximately 73% of chloroacetaldehyde will eventually end up in air; the rest will end up in water or aquatic sediments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contami-

nated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of chloroacetaldehyde found in fish tissues is expected to be about the same as the average concentration of chloroacetaldehyde in water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chloroacetaldehyde should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If chloroacetaldehyde should contact the water table, aquifer, or navigable waterway, time is of the essence. It is readily miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chloroacetaldehyde. If chloroacetaldehyde is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.

- ☑ Keep chloroacetaldehyde out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- ☑ It may be necessary to dispose of chloroacetaldehyde as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chloroacetaldehyde can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, chloroacetic acid can emit highly toxic/poisonous fumes including chlorine and phosgene. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Extremely irritating to the eyes, nose, throat, and respiratory system. Inhaled vapors may cause feeling of anxiety, blurred vision, "pins and needles," muscle twitching, hallucinations and convulsions, and death. EYES & SKIN: Skin contact can result in burns. Can cause severe eye burns and/or irritation. INGESTION: Poisonous by ingestion. Questionable carcinogenic. May damage the kidneys. | | | | |
| Carcinogenicity | NTP Listed? 5th Annual Report | IARC Cancer Review Group? No | OSHA Regulated? No Specific Listing | Target Organs? Respiratory system, eyes, skin, kidneys. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis); Renal or liver disorders. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in most convenient and safe manner possible and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by SARA III, if applicable. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Chloroacetic acid is a combustible solid. Avoid contact with strong oxidizers such as chlorine since violent reactions occur. Store in tightly closed containers in cool, well-ventilated area away from heat, metals, or combustibles. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where chloroacetic acid is used, handled, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) When potential for high exposures exist, use a MSHA/NIOSH approved supplied air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a full facepiece operated in pressure demand or other positive pressure mode. Use half-mask respirator with acid cartridge and a high efficiency particulate air (HEPA) filter for low or transient exposures (cartridge should be designed to protect against acid vapor or mist). | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Acid resistant synthetic rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CHLOROACETIC ACIDClCH₂COOH

CAS: 79-11-8

**IDENTIFICATION AND TYPICAL USES**

Chloroacetic acid is a colorless to light brown crystalline (sugar or sand-like) solid. May also appear as a liquid. It is used primarily as an herbicide but also serves as a disinfectant, a preservative, a bacteriostat, as an intermediate in the production of carboxymethylcellulose, ethyl chloroacetate, glycine, synthetic caffeine, sacrosine, and thioglycolic acid. Also used in the manufacture of dyes and other chemicals.

RISK ASSESSMENT: HEALTH**General Assessment**

Chloroacetic acid is a poison by *ingestion* and *inhalation*. It is also an extremely corrosive skin, eye, and mucous membrane irritant. It is a questionable carcinogen with human mutation data reported.

Inhalation of chloroacetic acid dusts or sprays can irritate the nose, throat, and bronchial tubes. This may cause nose bleeds, sore throat, hoarseness, and/or cough with phlegm. Exposure can cause severe and quite serious effects that may be delayed for several hours after exposure has ceased. Symptoms may begin with a feeling of anxiety, restlessness, “pins and needles,” blurred vision, and/or hallucinations (hearing things). This can continue on to convulsions (seizures or “fits”) and even death. These symptoms can occur even if the victim feels no effects during the actual exposure, and even after a delay of several hours. Death, if it occurs, is usually from irregular heartbeat (ventricular fibrillation). Other causes of death may be glottis spasm or suffocation. High or repeated exposure can damage the kidneys.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chloroacetic acid:

Skin: Possible irritation/rash or burning feeling.

Eye: Severe irritation; may cause burns and damage.

Lung: Irritation of the nose, throat, and lungs (bronchial tubes) following exposure. Symptoms may be delayed for several hours.

Other: Possible CNS effects by unknown mode. Symptoms include anxiety, blurred vision, “pins and needles,” muscle twitching, hallucinations, convulsions, and death.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chloroacetic acid and can last for months or even years:

Cancer Hazards: Chloroacetic acid may cause mutations in living cells. There is limited evidence that chloroacetic acid causes cancer in test animals. Its carcinogenicity in humans may be suspect, but the data are inconclusive.

Reproductive Hazard: According to the data presented in the references, chloroacetic acid has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated or long-term skin contact may cause rash from irritation. Repeated exposure can also damage the kidneys and may affect liver and/or thyroid function. Very irritating substance can damage the lungs. It is not known whether long-term exposure to chloroacetic acid will cause permanent damage to the lungs.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with chloroacetic acid. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chloroacetic acid. A supplied-air respirator with a full facepiece operated in positive pressure mode or a MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. For lower exposures, an MSHA/NIOSH approved full facepiece respirator with high efficiency particulate air (HEPA) filter may suffice. In either case, if a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical/dust splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chloroacetic acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chloroacetic acid is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures, the following medical tests are recommended:

- Lung function tests.
- Kidney function tests.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Liver function tests.
- Consider chest X-ray after acute overexposure.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Where possible, automatically transfer chloroacetic acid from drums or other storage containers to process containers.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to chloroacetic acid and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chloroacetic acid should be communicated to all exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chloroacetic acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chloroacetic acid is considered a combustible liquid. It is also corrosive to many materials. It is incompatible with oxidizing agents and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of chloroacetic acid. Should chloroacetic acid ever come into contact with incompatible substances such as strong oxidizers, strong bases, and strong reducing agents, violent and explosive reactions are possible. Chloroacetic acid can enter the environment mainly industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chloroacetic acid.

Chloroacetic acid has slight acute toxicity to aquatic life. It has caused death and injury to several agricultural and ornamental crops. Insufficient data are available to evaluate the acute (short-term) effects of chloroacetic acid exposure to birds or land animals.

☪ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and

changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chloroacetic acid has slight chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of chloroacetic acid to plants, birds, or land animals.

◆ *Water Solubility*

Chloroacetic acid is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Chloroacetic acid is moderately persistent in the aquatic environment, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Approximately 97% of chloroacetic acid will eventually end up in water; the remainder will end up in air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of chloroacetic acid found in fish tissues is expected to be about the same as the average concentration of chloroacetic acid in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chloroacetic acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If chloroacetic acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly miscible in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chloroacetic acid. If chloroacetic acid is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ If liquid is spilled, absorb in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. If powders are spilled, collect in most convenient manner possible and dispose of in sealed drum. Recommend use of vacuum equipped with a high efficiency particulate air (HEPA) filter. Do not dry sweep.
- ☑ It may be necessary to dispose of chloroacetic acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chloroacetic acid can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🚫 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the

development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Toxic symptoms include drowsiness, lack of coordination, and liver injuries. May also cause changes in the lungs, liver, and kidneys. Narcosis possible at high exposures. ABSORPTION: Skin contact can result in rash and burns. Can cause severe eye burns and/or irritation. INGESTION: Toxic by ingestion. Symptoms of ataxia, respiratory distress, and liver damage. | | | | |
| Carcinogenicity | NTP Listed? 5th Annual Report | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, CNS, liver. |
| Medical Conditions Generally Aggravated by Exposure Respiratory impairments (bronchitis, asthma); Skin conditions (dermatitis); Liver disorders. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Seek medical attention immediately. Do not attempt to give a convulsing or unconscious person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Remove all ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, as required by SARA III, if applicable. | | | | |
| Preferred Waste Disposal Method Chlorobenzene is burned in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Chlorobenzene is a flammable liquid. Avoid contact with strong oxidizers such as chlorine since violent reactions occur. Store in tightly closed containers in cool, well-ventilated area away from heat, sparks, or flames. Sources of ignition are prohibited where chlorobenzene is used, handled, or stored. | | | | |
| Other Precautions and Warnings Metal containers involving the transfer of 5 gallons or more should be grounded and bonded. Drums should be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) When potential for exposures over 75 ppm, use a full facepiece respirator with an organic vapor cartridge or an MSHA/NIOSH approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CHLOROBENZENEC₆H₅Cl

CAS: 108-90-7

**IDENTIFICATION AND TYPICAL USES**

Chlorobenzene is a colorless liquid with a faint, almond-like odor. It is used primarily as a solvent for paints, as a heat transfer medium, and in the manufacture of phenol and aniline. It is also used as a feedstock to produce ortho- and para-nitrochlorobenzenes, and as a pesticide intermediate (DDT).

RISK ASSESSMENT: HEALTH**General Assessment**

Chlorobenzene is a moderately toxic by *ingestion* and *inhalation*. It may also pass through unbroken skin (*absorption*) and enter the bloodstream directly. The liquid can irritate and even burn the skin if allowed to remain in contact (soaked clothing or shoes). Human mutation data have been reported. This compound may be carcinogenic to animals. There is some evidence in the references to show that a potential for carcinogenicity in some test animals, although this is not fully confirmed.

The acute inhalation and oral toxicity of chlorobenzene is considered to be relatively low. The target organs are the respiratory system, the skin, eyes, central nervous system, and the liver. The vapors will irritate the eyes and nose. Chlorobenzene is a CNS depressant. The toxic symptoms from inhalation of chlorobenzene vapors include drowsiness, loss of coordination (ataxia), and possible liver injury. Repeated exposures at 1000 ppm can cause changes in the lungs, liver, and kidneys. Exposures above 1000 ppm may cause narcosis. Ingestion of chlorobenzene can produce ataxia, respiratory distress, and liver damage. Little is known of the effects or repeated exposures at lower concentrations, but there is some evidence to show that it may cause liver and kidney damage.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chlorobenzene:

- Skin: Possible irritation/rash or burning feeling.
- Eye: Severe irritation; may cause burns and damage.
- Lung: Irritation of the nose, throat, and lungs following exposure.
- CNS: A CNS depressant causing systemic effects including drowsiness, ataxia, weakness, lethargy, malaise, fatigue, lightheadedness, and loss of consciousness.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chlorobenzene and can last for months or even years:

- Cancer Hazards: Chlorobenzene may cause mutations in living cells. There is limited and inconclusive evidence that chlorobenzene may cause cancer in some test animals.
- Reproductive Hazard: According to the data presented in the references, chlorobenzene has not been adequately tested for its ability to adversely affect reproduction.
- Other Chronic Effects: Long-term exposure to chlorobenzene may cause liver damage. Repeated exposure to the liquid may cause skin burns and eye damage. Repeated exposures may also cause lung and kidney damage. This chemical has not been adequately evaluated to determine whether brain or other nerve damage could occur with repeated exposures. However, many organic solvents and other petroleum-based distillates have been shown to cause such damage. Effects may

include reduced memory and concentration, personality changes (withdrawal, irritability), fatigue, sleep disturbances, reduced coordination, and/or effects on nerves supplying internal organs (autonomic nerves) and/or nerves to the arms and legs (weakness, “pins and needles”).

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with chlorobenzene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chlorobenzene. A supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. For lower exposures, an MSHA/NIOSH approved full facepiece respirator with an organic vapor cartridge may suffice. In either case, if a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chlorobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chlorobenzene is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures, the following medical tests are recommended:

- ☑ Lung function tests.
- ☑ Interview for brain effects, including recent memory, mood (irritability, withdrawal) changes, con-

centration problems, headaches, malaise, and altered sleep patterns.

- ☑ Consider cerebellar, autonomic and peripheral nervous system evaluation. Positive and borderline individuals should be referred for neuropsychological testing.

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Liver function tests.
- ☑ Kidney function tests and urinalysis.

Also, because smoking can cause heart disease as well as lung cancer, emphysema, and other respiratory problems, chemical exposures can seriously compound the effects of smoking on the human body. Therefore, smokers should avoid unprotected exposures to chlorobenzene. Heavy alcohol consumption can cause liver damage and may increase the liver damage potential caused by exposure to chlorobenzene.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Where possible, automatically transfer chlorobenzene from drums or other storage containers to process containers. Metal containers involving transfers of 5 or more gallons of chlorobenzene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use, care, and maintenance.
- ☑ Wash thoroughly immediately after exposure to chlorobenzene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chlorobenzene should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chlorobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chlorobenzene is considered a class 1C flammable liquid (per OSHA 29 CFR 1910.106). It will also form explosive mixtures with air in the range 1.3% to 9.6%. It is incompatible with oxidizing agents and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of chlorobenzene.

Should chlorobenzene ever come into contact with incompatible substances such as strong oxidizers, many metal perchlorates (such as mercury or silver), shock-sensitive compounds may form that may violently explode on impact. It is a dangerous fire hazard and a moderate explosive hazard when exposed to heat or flames. Potentially explosive reaction when mixed with powdered sodium or phosphorus trichloride plus sodium.

Chlorobenzene can enter the environment mainly through industrial and municipal discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chlorobenzene.

Chlorobenzene has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of chlorobenzene exposure to plants, birds, or terrestrial animals.

☠ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chlorobenzene has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of chlorobenzene to plants, birds, or terrestrial animals.

◆ Water Solubility

Chlorobenzene is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

⌚ Persistence in the Environment

Chlorobenzene is slightly persistent in the aquatic environment, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Approximately 99.25% of chlorobenzene will eventually end up in air; the remainder will end up in water.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of chlorobenzene found in fish tissues is expected to be somewhat higher than the average concentration of chlorobenzene in the water from which the fish was taken.

🚫 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chlorobenzene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings or facilities should be equipped with proper fire protection equipment (sprinklers/extinguishers, alarms).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If chlorobenzene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and, therefore, total containment and remediation may

not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chlorobenzene. If chlorobenzene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources.
- ☑ If liquid is spilled, absorb in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of chlorobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chlorobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to hazardous chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Chloroform (derivation: Reaction of chlorinated lime with acetone, acetaldehyde, or ethanol; by-product from the chlorination of methane). 1 ppm = 4.96 mg/m³ | PEL: 2 ppm 10 mg/m³ STEL: (ceiling) 50 ppm 240 mg/m³ | REL: Possible Cancer Agent STEL (60 min): 2 ppm 10 mg/m³ | 500 ppm | TLV: Suspected Cancer Agent STEL: 10 ppm 49 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 142°F (61°C) | Specific Gravity (H ₂ O = 1) 1.5 |
| Vapor Pressure (mm Hg) 7 at 69°F (20°C) | Molecular Weight 119.4 |
| Vapor Density (Air = 1) 4.1 | Melting Point -81°F (-63°C) |

Solubility

Slightly soluble in water (0.5% at 77°F). Miscible with alcohol, ether, benzene, carbon disulfide, carbon tetrachloride, fixed and volatile oils.

Appearance and Odor

Colorless, highly, refractive, heavy, volatile liquid with a characteristic sweet odor and taste. Odor Threshold = 85 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Non-combustible Liquid | Autoignition Temperature Not Applicable |

Extinguishing Media

Use extinguishing agent suitable to surrounding fire. Chloroform itself will not burn.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire, including chlorine gas.

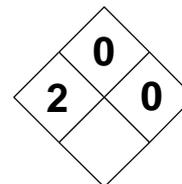

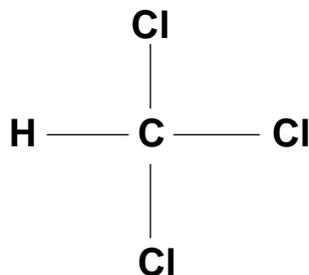

Unusual Fire and Explosion Hazards

Potentially explosive reaction with strong oxidizing compounds. Containers may explode in fire. Move containers from fire area if it can be done without risk.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|--|---|
| Stability | | Conditions to Avoid Keep away from incompatible materials since explosions can occur. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Alkali metals, (sodium, potassium, lithium); finely divided magnesium or aluminum; sodium-potassium alloy; nitrogen tetroxide; and perchloric acid-phosphorus pentoxide. Strong caustics and oxidizers. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of chloroform is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, chloroform can emit highly toxic/poisonous fumes including chlorine and phosgene gas. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Toxic symptoms include dizziness, lightheadedness, dullness, hallucination, nausea, headache, distorted perceptions, fatigue, and anesthesia. May cause irregular heartbeat. ABSORPTION: Skin contact can result in irritation and rash. Can cause eye irritation with inflammation of the conjunctiva. Will pass through unbroken skin and cause toxic systemic effects. INGESTION: Toxic by ingestion. May cause vomiting and other unspecified gastrointestinal effects. | | | | |
| Carcinogenicity | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 2B | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Liver, CNS, kidney, heart, skin, eyes. |
| Medical Conditions Generally Aggravated by Exposure None Reported. However, existing skin conditions, heart and/or liver disorders may be affected. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: If victim is conscious, induce vomiting. Seek medical attention immediately. Do not attempt to give a convulsing or unconscious person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method Mix with vermiculite, wrap in paper, burn in a chemical incinerator (with an afterburner and scrubber). | | | | |
| Precautions to be Taken in Handling and Storage Chloroform is a non-combustible liquid. But contact with strong oxidizers such as chlorine will cause violent reactions. Store in tightly closed containers in cool, well-ventilated area. A regulated, marked work area should be established where chloroform is used, handled, or stored. | | | | |
| Other Precautions and Warnings Prior to working with chloroform, personnel should be trained on its proper handling and storage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At any exposure level, use an MSHA/NIOSH approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Polyvinyl Chloride, Viton, or Neoprene | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Suit or Clothing |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CHLOROFORMCHCl₃

CAS: 67-66-3

**IDENTIFICATION AND TYPICAL USES**

Chloroform is a colorless, highly refractive, heavy, volatile liquid with a characteristic sweet odor and taste. It is used in industry as a solvent, as a cleansing agent, in the manufacture of refrigerant, and in fire extinguishers. Also used in the manufacture of fluorocarbon plastics, in analytical chemistry, as a fumigant, and an insecticide. In the past, it was used extensively as an anesthetic. However, due to its toxic effects, this use has been abandoned.

RISK ASSESSMENT: HEALTH**General Assessment**

Chloroform is a confirmed carcinogen with human mutation data reported. It is a human poison by *ingestion* and *inhalation*. It may also pass through unbroken skin (*absorption*) and enter the bloodstream directly. The liquid can irritate the skin if allowed to remain in contact. There is some evidence in the references to show that chloroform may cause damage to the developing fetus in some test animals, although this is not fully confirmed.

The acute inhalation toxicity of chloroform is considered to be relatively low. The target organs are the liver, kidney, central nervous system, skin, and heart. The vapors will irritate the eyes and nose. Chloroform is a CNS stimulant.

The toxic symptoms from inhalation of chloroform vapors include dizziness, lightheadedness, dullness, hallucination, nausea, headache, fatigue, and anesthesia. Inhalation of concentrated vapors causes dilation of the pupils with reduced reaction to light. In initial stages, there is a feeling of warmth on the face and body, then an irritation of the mucous membranes,

conjunctiva, and skin; followed by excitation, loss of reflexes, sensation, and consciousness. Prolonged inhalation will bring on paralysis accompanied by cardiac respiratory failure and finally death.

Ingestion of chloroform can produce digestive disturbances, vomiting, necrosis of the liver, and kidney damage. Little is known of the effects of repeated exposures at lower concentrations, but there is some evidence to show that it may cause liver and kidney damage.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chloroform:

Skin: Irritation and possible rash or burning feeling on contact.

Eye: Severe irritation; may cause burns and damage.

Lung: Irritation of the nose and throat following exposure.

CNS: A CNS stimulant causing systemic effects including dizziness, lightheadedness, dullness, hallucination, nausea, headache, fatigue, and anesthesia.

Other: Exposure can cause the heart to beat irregularly or even stop which can be fatal.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chloroform and can last for months or even years:

Cancer Hazards: Chloroform is a probable carcinogen in humans. It has been shown to cause liver, kidney,

and thyroid cancer in animals. It may cause mutations in living cells.

Reproductive Hazard: There is limited evidence that chloroform is a teratogen in animals. It has produced embryo toxicity causing a high incidence of fetal resorption and retarded fetal growth. Until further testing has been performed, it should be treated as a possible teratogen in humans.

Other Chronic Effects: Long-term exposure to chloroform may cause liver damage. Repeated exposure to the liquid may produce skin drying and cracking. Repeated exposures may affect the kidneys and nervous system.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with chloroform. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chloroform. For any exposure level, a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, solvent-resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chloroform. A regulated controlled work area should be established where chloroform is used, handled, or stored.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chloroform is used or stored. Before beginning employment and at regular intervals thereafter

(e.g., annually), for those with frequent or potentially high exposures (half the TLV or greater, or significant skin contact), the following medical tests are recommended:

- ☑ Lung function tests.
- ☑ Kidney function tests.

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Special 24 hour EKG (holster monitor) to examine for irregular heart beat.

Also, heavy alcohol consumption can cause liver damage and may increase the liver damage potential caused by exposure to chloroform.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to chloroform and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chloroform should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chloroform. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chloroform is considered a non-combustible liquid. However, mixing chloroform with incompatible substances can produce explosions. These materials include strong caustics, alkaline metals such as potassium or lithium, finely divided magnesium or aluminum, and other chemically-active metals. It will also

react with strong oxidizers. These characteristics require special consideration during any emergency situation involving a leak or spill of chloroform.

Chloroform can enter the environment through industrial effluents, municipal waste treatment plant discharges, or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chloroform.

Chloroform has moderate acute toxicity to aquatic life. Chloroform has caused damage to various plants, including brittle roots and chromosomal damage. Insufficient data are available to evaluate the short-term effects of chloroform exposure to birds or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chloroform has moderate chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of chloroform to plants, birds, or land animals.

💧 *Water Solubility*

Chloroform is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Chloroform is non-persistent in the aquatic environment, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Approximately 99.67% of chloroform will eventually end up in air; the remainder will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated

in the tissues and internal organs of animals as well as humans.

The concentration of chloroform found in fish tissues is expected to be somewhat higher than the average concentration of chloroform in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chloroform should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. To dispose of chloroform, it can be mixed with vermiculite, sodium carbonate, and slated lime, wrapped in paper, and burned in a chemical incinerator equipped with an afterburner and scrubber.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If chloroform should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chloroform. If chloroform is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect liquid for reclamation or absorb in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of chloroform as a hazardous waste. The responsible state agency or the regional office of the federal Environmental

Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chloroform can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CHLOROMETHYL METHYL ETHER

CAS: 107-30-2

**IDENTIFICATION AND TYPICAL USES**

Chloromethyl methyl ether (CMME) is a colorless, corrosive liquid with an ether-like odor. It is one of several chloroalkyl ethers. It is used primarily as a methylating agent in the synthesis of chloromethylated compounds. It is also used in the manufacture of plastics and other chemicals (as an intermediate), in the treatment of textiles, to make polymers and insecticides, and in the preparation of ion-exchange resins.

RISK ASSESSMENT: HEALTH**General Assessment**

CMME is a confirmed human carcinogen with human mutation data also reported. In humans, exposure can cause lung cancer. It is a human poison by *ingestion* and *inhalation*. It may also pass through unbroken skin (*absorption*) and enter the bloodstream. The liquid can irritate and possibly burn the skin if allowed to remain in contact. CMME is corrosive and forms hydrochloric acid in contact with water. Effects of skin exposure may therefore be more severe if there is excessive perspiration on the skin surface at the time of CMME contact.

The acute inhalation toxicity of CMME, like that of other lower aliphatic haloethers, is greater than the acute oral or dermal toxicity. The target organs are the eyes, skin, and respiratory system. The vapors will irritate the eyes and nose. High exposures can damage the lungs, causing fluid to build up (pulmonary edema), which is a medical emergency and can be fatal. Such reactions may be delayed up to 48 hours following exposure.

The toxic symptoms from inhalation of CMME vapors include irritation of the eyes, skin, mucous membranes, pulmonary edema, pulmonary congestion, pneumonia-like symptoms (chemical pneumonia),

cough, wheeze, blood-stained sputum, and bronchial secretions.

Ingestion of CMME can produce digestive disturbances, vomiting, and other unspecified gastrointestinal disturbances. Little is known of the effects of repeated oral exposures at lower concentrations.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to CMME:

Skin: Irritation and possible rash or burning feeling on contact.

Eye: Severe irritation; may cause burns and permanent damage.

Lung: Irritation of the nose, throat, and lungs causing coughing and shortness of breath. Higher acute exposures can cause a buildup of fluid in the lungs (pulmonary edema) leading to death.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to CMME and can last for months or even years:

Cancer Hazards: CMME is a confirmed carcinogen in humans. There is sufficient evidence to show that it causes lung cancer in humans. It has been shown to cause cancer of the skin and lungs in test animals. It may cause mutations in living cells.

Reproductive Hazard: According to information available in the references, CMME has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: CMME can irritate the lungs. Repeated, low-level exposures may cause bronchitis to develop with symptoms of cough, phlegm, and/or shortness of breath.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with CMME. It is a confirmed human carcinogen and, therefore, there may be no safe exposure level. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around CMME. For any exposure level, a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. Because CMME reacts on contact with water to form corrosive hydrochloric acid, eye contact can result in serious and perhaps permanent damage. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with CMME. A regulated controlled work area should be established where CMME is used, handled, or stored (per OSHA 29 CFR 1910.1006).

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where CMME is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the TLV or greater, or significant skin contact), the following medical tests are recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Consider chest X-ray after acute overexposure.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to CMME may be more pronounced in smokers than in non-smokers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to CMME and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of CMME should be communicated to all potentially exposed workers.
- Additional, more detailed administrative and engineering control requirements are specified in OSHA 29 CFR 1910.1006 (Methyl Chloromethyl Ether).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of CMME. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

CMME is considered a class 1B flammable liquid (per OSHA 29 CFR 1910.106). Its low flash point and relatively low boiling point make it a serious fire hazard. It will also react on contact with water to form hydrochloric acid and formaldehyde. In a fire, CMME will decompose and emit toxic and poisonous gases, including hydrogen chloride (hydrochloric acid) and phosgene. These characteristics require special consideration during any emergency situation involving a leak

or spill of CMME. CMME can enter the environment through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to CMME.

Insufficient data are available to evaluate the short-term effects of CMME exposure to aquatic life, plants, birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate the long-term effects of CMME exposure to aquatic life, plants, birds or land animals.

💧 *Water Solubility*

CMME is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

CMME is slightly persistent in the aquatic environment, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Approximately 91% of CMME will eventually end up in air; the remainder will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of CMME found in fish tissues is expected to be somewhat higher than the average concentration of CMME in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of CMME should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. To dispose of CMME, it can be burned in a chemical incinerator equipped with an afterburner and scrubber.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. To neutralize a spill, flood area with copious amounts of water and rinse with sodium bicarbonate or lime solution. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If CMME should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of CMME. If CMME is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Evacuate non-essential personnel a minimum of 1500 feet from the spill/hazard area. Wind direction must be considered for all evacuations (down-wind is preferable).
- ☑ Collect liquid for reclamation or absorb in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of CMME as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving CMME can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the words "carcinogen" or "cancer" are used, public awareness and emotions can run high leading to irrational decisions and over-reaction to the situation.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Fatigue, psychic changes, irritability, oppression in the chest, substernal pain, tachycardia on exertion. At high concentrations, may cause temporary unconsciousness and can lead to death. May cause nausea, giddiness, and possible temporary hair loss. CNS depression is likely and high exposures may result in lung, liver, and kidney damage. SKIN & EYES: Eye contact with the liquid can cause conjunctivitis and focal cornea necrosis. Skin contact can cause chemical burns, irritation, and possible dermatitis. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | 5th Annual Report | No | 29 CFR 1910.1000 Table Z-1 | Respiratory system, eyes, skin, CNS, liver, kidney. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Keep victim warm and at rest. If swallowed: If unconscious, do not give anything to drink. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Chloroprene is a flammable liquid. Store to avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat and flame. Ideal storage conditions in temperatures below 50°F (10°C). | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where chloroprene is used, handled, or stored. Heat may cause containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For any exposures to a suspected carcinogen, use a supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Solvent-resistant Rubber | | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Rubber Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CHLOROPRENEH₂C:CHCl:CH₂

CAS: 126-99-8

**IDENTIFICATION AND TYPICAL USES**

Chloroprene is a clear, colorless liquid with a pungent, ether-like odor. It is used in the manufacture of neoprene and other polymers.

RISK ASSESSMENT: HEALTH**General Assessment**

Chloroprene is a highly toxic chemical by *inhalation*, and is considered moderately toxic by *ingestion* and skin *absorption*. Its carcinogenicity is suspect in humans, although studies have proven inconclusive in this regard. It has been confirmed that exposure to chloroprene can cause mutations in living cells and there have also been some studies to indicate that it may damage the developing fetus in test animals. A conservative approach to exposure risk management is recommended for chloroprene since the exact nature of its cancer risk is unresolved.

Inhalation of chloroprene vapors can act as a central nervous system (CNS) depressant. There will be symptoms of fatigue, changes in personality, nervousness, oppression of the chest, occasionally substernal pain, tachycardia on exertion, and reversible hair loss (after approximately one month after last exposure, hair begins to return). The primary effects of acute high-level exposures are CNS depression, lung, liver, and kidney damage. It is important to note that chloroprene vapors are very irritating such that personnel will not usually tolerate moderate or high exposures.

Liquid contact with the eyes may result in conjunctivitis, corneal necrosis, and edema of the eyelids. Skin contact may cause chemical burns, dermatitis, and temporary loss of hair. Chloroprene is readily absorbed through the skin to cause toxic systemic effects similar to those of inhalation.

Ingestion can produce gastrointestinal disorders along with headache, insomnia, and dizziness.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chloroprene:

Skin: Immediate irritation and burn on contact. May cause irritating rash, possible dermatitis, and reversible hair loss.

Eye: Severe irritation, conjunctivitis, and corneal necrosis. May cause burns and permanent damage.

Lung: Irritation of the respiratory tract. High-level exposures may cause CNS effects, lung, liver, and kidney damage. There may be oppression of the chest, chest pain, tachycardia upon exertion, nausea, headache, fatigue, giddiness, loss of consciousness, and death on high exposures. Exposure to vapors may also cause reversible hair loss.

CNS: A primary CNS depressant. May cause headache, dizziness, loss of consciousness, nausea, irritability, changes in personality, and nervousness.

🕒 Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chloroprene and can last for months or even years:

Cancer Hazards: Chloroprene may cause mutations (genetic changes) in living cells. Although there is insufficient and conflicting information available in the references to adequately evaluate chloroprene for its ability to cause cancer, there are some studies that suggest an increase in lung and skin cancer may occur in workers exposed to chloroprene.

Reproductive Hazard: According to information presented in the references, chloroprene may damage the

developing fetus, cause spontaneous abortions, and interfere with sperm production.

Other Chronic Effects: Chronic exposure may cause headache, respiratory irritation, gastrointestinal disorders, dizziness, and insomnia. Repeated exposures caused CNS effects, lung edema, liver, and kidney damage in experimental animals. Chloroprene can also cause primary respiratory tract irritation, followed by respiratory depression and asphyxia.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with chloroprene or any other chemical with suspected or unconfirmed human carcinogenic characteristics. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chloroprene. For any concentration, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chloroprene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chloroprene is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Lung function tests.
- ☑ Kidney and liver function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical

tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to chloroprene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chloroprene should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to chloroprene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of chloroprene.
- ☑ Specific engineering controls are recommended for chloroprene by NIOSH. Refer to NIOSH Criteria Document, Occupational Exposure to Chloroprene (Publication Number 77-210).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chloroprene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chloroprene is considered a class 1B flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point make this chemical a serious fire and explosion hazard concern. These characteristics require extreme caution in

handling, storage, transportation, and disposal. It is incompatible with a number of peroxides and other oxidizers and contact can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of chloroprene. Should chloroprene ever come into contact with incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities (including hydrogen chloride) is extremely possible.

Chloroprene may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chloroprene.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of chloroprene exposure to plants, birds, or land animals.

☞ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chloroprene has moderate chronic toxicity in aquatic life. No data are available on the long-term effects of chloroprene to plants, birds, or land animals.

💧 *Water Solubility*

Chloroprene is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Chloroprene is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.25% of chloroprene will eventually end up in air; the remainder will end up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contami-

nated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of chloroprene found in fish tissue is expected to be somewhat higher than the average concentration of chloroprene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chloroprene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If chloroprene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and total remediation and containment may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chloroprene. If chloroprene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of leak.
- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- If gas is leaking, stop the flow of gas. If the source is a cylinder and leak cannot be stopped in

place, remove cylinder to a safe place in the open air and repair or allow to empty.

- ☑ It may be necessary to dispose of chloroprene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chloroprene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|--|------------------------------------|
| Characterization Acid | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name Chlorosulfonic Acid | Chemical Abstract Service (CAS) Number 7790-94-5 | |
| DOT Hazard Class and Label Requirements Corrosive Material | DOT Emergency Guide Code 39 | |
| DOT Identification Number UN 1754 | Chemical Formula ClSO₃H | |

Synonyms

Sulfuric chlorohydrin, monochlorosulfuric acid, monochloride sulfonic acid.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Chlorosulfonic acid (derivation: By treating sulfur trioxide or fuming sulfuric acid with hydrochloric acid). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 304°F (151°C) | Specific Gravity (H ₂ O = 1) 1.8 |
| Vapor Pressure (mm Hg) 1 at 69°F (20°C) | Molecular Weight 116.5 |
| Vapor Density (Air = 1) 4.0 | Melting Point -112°F (-80°C) |

Solubility

Decomposes in water to form sulfuric and hydrochloric acids. Also decomposed by alcohol and other acids.

Appearance and Odor

Colorless to light yellow, fuming, slightly cloudy liquid with a pungent odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: Not Applicable UEL: Not Applicable |
| NFPA Classification No Citation | Autoignition Temperature Not Determined |

Extinguishing Media

Avoid water. Use dry chemicals or carbon dioxide to fight fire.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. DO NOT get water inside containers. Poisonous gases are produced in fire, including chloride fumes.

Unusual Fire and Explosion Hazards

Containers may explode in fire. Move containers from fire area if it can be done without risk. Vapors are heavier than air and may travel for some distance to an ignition source to flash-back and cause fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|--------------------------------------|---|------------------------------------|---------------------------------------|
| Stability | | Conditions to Avoid Keep away from incompatible materials since violent and or explosive reactions can occur. | | |

| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of chlorosulfonic acid is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, chlorosulfonic acid can emit highly toxic/poisonous gases of chloride and sulfur oxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the respiratory system, especially the lungs. Can cause buildup of fluid in the lungs (pulmonary edema) which can be fatal. May cause loss of consciousness. SKIN & EYES: A severe irritant. Causes burns and possibly permanent damage to the skin and eyes. It may cause conjunctivitis, even in vapor exposures. INGESTION: Moderately toxic by ingestion. A human poison. Serious irritation of the mouth, esophagus, and stomach. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Eyes, skin, respiratory system |
| Medical Conditions Generally Aggravated by Exposure None Reported. However, existing skin conditions or respiratory problems may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24 - 48 hours for lung effects (pulmonary edema). If swallowed: If victim is conscious, DO NOT give any liquids unless under doctor orders. Seek medical attention immediately. Support breathing if necessary. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area of spill or leak. Neutralize using agricultural lime, soda ash, crushed limestone, or sodium bicarbonate and deposit in sealed containers. Keep those not involved in cleanup from area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Presents a serious explosion hazard when exposed to water, alcohol, or acids. Store in tightly closed containers in cool, well-ventilated area. Vent stored drums twice per month to control pressure of hydrogen produced by action of acid on metal of drum. Bulk storage is not recommended. | | | | |
| Other Precautions and Warnings Prior to working with chlorosulfonic acid, personnel should be trained on proper handling and storage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At any exposure level, use an MSHA/NIOSH approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | | Other Protective Clothing | |
| Impervious Rubber | Chemical Goggles or Face Mask | | Protective Suit or Clothing | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CHLOROSULFONIC ACIDClSO₃H

CAS: 7790-94-5

**IDENTIFICATION AND TYPICAL USES**

Chlorosulfonic acid is a colorless to light yellow fuming, slightly cloudy liquid with a pungent odor. It is used in the manufacture of synthetic detergents, in pharmaceuticals, as a sulfonating agent for dyes, in pesticides and intermediates, in ion-exchange resins, in the manufacture of hydrogen chloride and smoke-producing chemicals.

RISK ASSESSMENT: HEALTH***General Assessment***

Chlorosulfonic acid is a poisonous irritant. Primary exposures occur through *inhalation* and *ingestion*. It may also absorb through the skin if allowed to remain in contact, although its corrosive properties make prolonged contact extremely painful and absorption unlikely. As a corrosive chemical, it can cause severe burns to human tissue. Its vapors are extremely irritating to the eyes, lungs, and mucous membranes. It can cause acute toxic effects either in the liquid or vapor state.

Inhalation of its vapors can result in loss of consciousness with serious, life-threatening damage to lung tissue. Its irritating and corrosive properties can cause fluid to buildup in the lungs in a condition known as pulmonary edema, which is a medical emergency and can be fatal. Exposure may also result in chemical pneumonitis with symptoms of cough, congestion and even pain in chest. Other symptoms include headache, nausea, laryngitis, and lachrymation.

Because chlorosulfonic acid reacts with water, contact of the liquid with the eyes can cause severe burns and, if not immediately and completely removed, permanent damage to vision. It may cause conjunctivitis, even in its vapor form. It also causes severe skin burns due to its highly corrosive action and may cause contact dermatitis as well. Perspiration levels on skin

surface may affect the rapidity of corrosive action of chlorosulfonic acid on skin tissue.

Ingestion of chlorosulfonic acid will cause severe irritation of the mouth, esophagus, and stomach.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to chlorosulfonic acid:

Skin: Irritation and/or burning feeling on contact. May produce contact dermatitis.

Eye: Severe irritation; may cause burns and permanent damage.

Lung: Irritation of the nose, throat, and lungs causing coughing, congestion, and shortness of breath. Higher acute exposures can cause a buildup of fluid in the lungs (pulmonary edema) leading to death.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to chlorosulfonic acid and can last for months or even years:

Cancer Hazards: According to information available in the references, chlorosulfonic acid has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information available in the references, chlorosulfonic acid has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Chlorosulfonic acid can irritate the lungs. Repeated, low-level exposures may cause bronchitis to develop with symptoms of cough, phlegm, and/or shortness of breath.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with chlorosulfonic acid. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chlorosulfonic acid. For any exposure level, a supplied-air respirator with a full facepiece operated in continuous flow or other positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. Because chlorosulfonic acid reacts on contact with water, eye contact can result in serious and perhaps permanent damage. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chlorosulfonic acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chlorosulfonic acid is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the TLV or greater, or significant skin contact), the following medical tests are recommended:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Any evaluation should include a careful history of past and present symptoms with a medical examination.

Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to chlorosulfonic acid may be more pronounced in smokers than in non-smokers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to chlorosulfonic acid and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chlorosulfonic acid should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chlorosulfonic acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chlorosulfonic acid is considered a non-flammable liquid. However, because it is incompatible with so many other commodities, including water, it presents serious fire and explosion concerns. It decomposes explosively on contact with water, acids, or alcohols. It will also react explosively with phosphorus and violently with silver nitrate. In a fire, chlorosulfonic acid will decompose and emit toxic and poisonous gases, including toxic gases of chloride and sulfur oxide. It is also incompatible with many common combustible materials (such as paper, wood, and oil). These characteristics require special consideration during any emergency situation involving a leak or spill of chlorosulfonic acid.

Chlorosulfonic acid can enter the environment through industrial effluents or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chlorosulfonic acid. Insufficient data are available to evaluate the short-term effects of chlorosulfonic acid exposure to aquatic life, plants, birds or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the long-term effects of chlorosulfonic acid exposure to aquatic life, plants, birds or land animals.

💧 *Water Solubility*

Chlorosulfonic acid decomposes in water and, therefore, will not remain in the aquifer as chlorosulfonic acid. However, it will form sulfuric and hydrochloric acids on contact with water which are both highly soluble. Concentrations of 1000 milligrams and more of hydrochloric or sulfuric acid will mix with a liter of water.

🕒 *Persistence in the Environment*

Chlorosulfonic acid is non-persistent (decomposes) in the aquatic environment, with a half-life of less than 2 days). The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans. Chlorosulfonic acid is not expected to accumulate in fish tissues.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill

to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chlorosulfonic acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage drums should be vented twice monthly to control the pressure of hydrogen gas which is produced by action of chlorosulfonic acid on most metal storage containers.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. To neutralize a spill, mix with agricultural lime (slaked lime), sodium bicarbonate, crushed limestone, soda ash, or lime. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If chlorosulfonic acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It decomposes in water to form hydrochloric acid and sulfuric acid and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chlorosulfonic acid. If chlorosulfonic acid is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Neutralize liquids and deposit in sealed containers.
- ☑ It may be necessary to dispose of chlorosulfonic acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chlorosulfonic acid can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result

from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Extinguishing Media
Use dry chemical, carbon dioxide, water spray, or foam to fight fire.

Special Fire Fighting Procedures
A carcinogen. Chromic acetate may burn, but does not readily ignite. Wear full protective clothing (structural fire-fighting clothing is permeable and may not provide adequate protection). Use a self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Remain clear of smoke, water fall-out and water run-off. Poisonous gases are produced in fire.

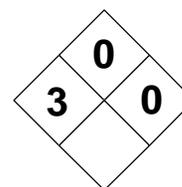

Unusual Fire and Explosion Hazards
Containers may explode in fire. Cool exposed containers.

CHROMIC ACETATE

$\text{Cr}(\text{C}_2\text{H}_3\text{O}_2)\cdot\text{H}_2\text{O}$

CAS: 1066-30-4

IDENTIFICATION AND TYPICAL USES

Chromic acetate is a grayish-green powder or a bluish-green pasty mass. It is used to fix certain textile dyes, to harden photographic emulsions, in tanning, and as a polymerization and oxidation catalyst.

RISK ASSESSMENT: HEALTH

General Assessment

Chromic acetate is a confirmed human carcinogen with experimental tumorigenic data reported. Human mutation data also reported. Certain chromium compounds, known as hexavalent chromium (or chromium VI) compounds and trivalent (or chromium III) compounds, have been determined to be human carcinogens. Chromic acetate is a trivalent compound. Therefore, in terms of exposure risk assessment and management, it is recommended that chromic acetate be handled with extreme caution.

Primary exposures occur through *inhalation*. However, *ingestion* of chromic acetate powders or dusts is also a considered possibility and can result in toxic effects. Skin contact may cause irritation, especially if repeated or prolonged. Also, skin allergy (dermatitis) sometimes occurs with itching, redness, and/or eczema-like rash. If this happens, then any future exposures will prompt a return of symptoms.

Inhalation of chromic acetate can result in irritation of the nose, throat, and bronchial tubes with symptoms of coughing and wheezing. Prolonged inhalation of chromium compounds, including chromic acetate, may result in sores or even a perforation in the bones of the nasal septum (a condition known as “chrome holes”), which can cause bleeding, discharge, or crusting. May also cause pneumonitis and/or bronchial carcinoma.

Ingestion can produce ulceration in the mouth, throat, and stomach. There can be abdominal pain and unspecified gastrointestinal effects.

Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chromic acetate:

Skin: Irritation and/or burning feeling on contact. May produce contact dermatitis and/or an eczema-like rash with redness and itching.

Eye: Severe irritation; possible conjunctivitis, and may cause burns and permanent damage.

Lung: Large (high-level) acute exposures may cause irritation of the nose with a potential to cause sores or holes in the nasal septum. Also may irritate the throat and lungs causing coughing and shortness of breath.

Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chromic acetate and can last for months or even years:

Cancer Hazards: Chromic acetate has been shown to cause lung and throat cancers in humans.

Reproductive Hazard: According to information available in the references, chromic acetate has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Chromic acetate may irritate the nasal septum and cause holes or perforations to appear in the bones separating the nasal cavity (“chrome holes”). Irritation, discharge, bleeding and/or formation of a crust in the inner nose may occur. Exposed persons may develop a skin allergy with a rash similar to eczema. Once this occurs, the person is “sensitized” to chromic acetate. Any future skin contact, even slight, can trigger a severe rash. Repeated exposures may cause irritation of the bronchial tubes (bronchitis).

with symptoms of cough with phlegm and may lead to bronchial carcinoma and/or pneumonitis. Lung allergy, with wheezing and shortness of breath, sometimes develops. In such cases, even small future exposures can cause symptoms to reappear.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with chromic acetate and all other known human carcinogens. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chromic acetate. For any exposures to a confirmed carcinogen, use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and operated in pressure demand as the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chromic acetate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chromic acetate is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the TLV or greater, or significant skin contact), the following tests are suggested:

- ☑ Lung function tests.
- ☑ Examination of the mouth and larynx.
- ☑ Examination of the nasal septum.

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Examination of the nasal septum.
- ☑ Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to chromic acetate may be more pronounced in smokers than in non-smokers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to chromic acetate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chromic acetate should be communicated to all potentially exposed workers.
- ☑ Where possible, automatically transfer chromic acetate from drums or other storage containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chromic acetate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chromic acetate may burn, but will not easily ignite. It has no listed incompatibilities with other commodities. However, in a fire, chromic acetate will decompose and emit toxic and poisonous gases. It may

also intensify burning of many common combustible materials (such as paper, wood, plastics, and oil). These characteristics require some consideration during any emergency situation involving a leak or spill of chromic acetate.

Chromic acetate can enter the environment through effluents from the metal plating industries, from municipal waste treatment plant discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chromic acetate.

Chromium is more toxic in soft water than in hard water. Chromium (III) compounds, such as chromic acetate, have moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of chromic acetate exposure to plants, birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chromium (III) compounds have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of chromic acetate exposure to plants, birds or land animals.

💧 *Water Solubility*

Water solubility of chromium and its salts ranges from low to high. Chromic acetate is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

🕒 *Persistence in the Environment*

Chromic acetate is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contami-

nated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of chromium found in fish is expected to be somewhat higher than the average concentration of chromium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Chromic acetate should be stored in cool, dry, well-ventilated areas. Bulk storage of chromic acetate, or any other carcinogenic materials, should be avoided.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. To neutralize a spill, rinse with sodium bicarbonate solution, flood with water, agricultural lime (slaked lime) crushed limestone, soda ash, or lime and collect material in safest manner possible. Deposit in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Do not dry sweep (creates airborne dusts). Use vacuum equipped with HEPA filter instead. Contaminated soils should be removed for incineration and replaced with clean soil. If chromic acetate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chromic acetate. If chromic acetate is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill.
- If possible, neutralize and deposit in sealed containers for proper disposal.

- ☑ It may be necessary to dispose of chromic acetate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chromic acetate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Always remember that anytime the terms “carcinogen” or “cancer” are used, public emotion and hysteria can run equally high. Risk managers must take this into consideration when preparing any release of information to the community.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Health Hazards

INHALATION: Irritation of the respiratory system. Can cause sores or “chrome holes” to appear in the nasal cavity. Lung allergy, with wheezing and shortness of breath, sometimes occurs. Exposure may result in chemical pneumonitis or pulmonary edema (fluid in lungs).

ABSORPTION: A severe irritant. Exposure may cause burns. Prolonged exposures will allow chromic acid to enter the body through the affected skin areas. Eye contact can damage vision.

| | | | | |
|---|-------------------------------------|---------------------------|---------------------------------------|--|
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Confirmed Human Confirmed Animal | 5th Annual Report | Group 3 | 29 CFR 1910.1000 Table Z-1 | Blood, respiratory system, skin, eyes, liver, kidneys |

Medical Conditions Generally Aggravated by Exposure

None Reported. However, existing skin conditions or respiratory problems may be aggravated.

Emergency and First-aid Procedures

Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. **Skin contact:** Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For **inhalation:** Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24 - 48 hours for lung effects (pulmonary edema). If **swallowed:** If victim is conscious, DO NOT induce vomiting. Seek medical attention immediately. Support breathing if necessary. Never attempt to give anything by mouth to an unconscious or convulsing person.

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled

Ventilate area of spill or leak. Rinse with sodium bicarbonate solution, flood with water, agricultural lime, crushed limestone, soda ash, or lime. Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from area.

Preferred Waste Disposal Method

No Citation.

Precautions to be Taken in Handling and Storage

Store in tightly closed containers in cool, well-ventilated area and protect from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where chromic acid is used, handled, or stored. Bulk storage of chromic acid is not recommended.

Other Precautions and Warnings

Prior to working with chromic acid, personnel should be trained on its proper handling and storage.

SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT

Respiratory Protection (*specify type*)

For exposures above the PEL, use a full facepiece respirator with a high efficiency particulate air (HEPA) filter. Greater protection is provided by an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) operated in positive pressure mode.

Ventilation

Local exhaust or general mechanical systems recommended.

Work/Hygiene Practices

Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals.

CHROMIC ACIDCrO₃

CAS: 1333-82-0

**IDENTIFICATION AND TYPICAL USES**

Chromic acid is a dark purplish-red, odorless, crystalline solid. It is used in the manufacture of chromates, oxidizing agents, and catalysts. It is also used as an intermediate in chromium plating, in medicine (caustic), process engraving, anodizing, ceramic glazes, colored glass, metal cleaning, inks, tanning, paints, textile mordant, and as an etchant for plastics.

RISK ASSESSMENT: HEALTH***General Assessment***

Chromic acid is a poison and a powerful irritant of the eyes, skin, and mucous membranes. Some sources list chromic acid as a confirmed human carcinogen while others infer its carcinogenicity. Such inference appears to be based upon the fact the certain chromium compounds, known as hexavalent chromium (or chromium VI) compounds, have been determined to be human carcinogens. Chromic acid is such a compound. In terms of risk assessment and management, it is recommended that chromic acid be handled with extreme caution. Primary exposures occur through *inhalation* and *absorption*, although *ingestion* of chromic acid powders or dusts is also a considered possibility. It is a corrosive chemical and can pass through inner layers of skin and cause severe burns to human tissue. Skin contact may also cause deep, slow-healing ulcers or an allergic skin rash (dermatitis).

Inhalation of chromic acid can result in irritation of the nose, throat, and bronchial tubes with symptoms of coughing and wheezing. Prolonged inhalation of chromium compounds, including chromic acid, can result in sores or even a perforation in the bones of the nasal septum (a condition known as “chrome holes”), which can cause bleeding, discharge, or crusting. Prolonged or repeated exposures may damage the liver, kidneys, blood, and can cause lung cancers.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to chromic acid:

Skin: Irritation and/or burning feeling on contact. May produce contact dermatitis and/or a deep skin ulceration.

Eye: Severe irritation; conjunctivitis, and may cause burns and permanent damage (loss of vision possible).

Lung: Large (high-level) acute exposures will cause irritation of the nose with a potential to cause sores or holes in the nasal septum. Also may irritate the throat and lungs causing coughing and shortness of breath.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to chromic acid and can last for months or even years:

Cancer Hazards: Chromic acid is a hexavalent chromium compound. These compounds have been shown to cause cancer in humans and test animals.

Reproductive Hazard: According to information available in the references, chromic acid has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Chromic acid can irritate the nasal septum and cause holes or perforations to appear in the bones separating the nasal cavity (“chrome holes”). Irritation, discharge, bleeding and/or formation of a crust in the inner nose may occur. Exposed persons may develop a skin allergy with a rash similar to eczema. Once this occurs, the person is “sensitized” to chromic acid. Any future skin contact, even slight, can trigger a severe rash. When chromic acid enters skin cuts or sores, slow healing ulcers can result. Exposure can also erode or discolor the teeth and cause growths (polyps) on the voice box. Repeated exposures

may cause irritation of the bronchial tubes (bronchitis) with symptoms of cough with phlegm. Lung allergy, with wheezing and shortness of breath, sometimes develops. In such cases, even small future exposures can cause symptoms to reappear. Repeated or severe exposures may cause kidney or liver damage.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with chromic acid. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chromic acid. For low exposures (up to the PEL), use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter. Greater protection is provided with a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chromic acid.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chromic acid is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the TLV or greater, or significant skin contact), the following medical tests are recommended:

- ☑ Lung function tests.
- ☑ Examination of the mouth and larynx.

- ☑ Examination of the nasal septum.

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Kidney and liver function tests.
- ☑ Examination of the nasal septum.
- ☑ Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Workers should also check their skin daily for tiny bumps or blisters which are the first indications of “chrome ulcers.” If not treated early, these can persist for years following exposure. Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to chromic acid may be more pronounced in smokers than in non-smokers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to chromic acid and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chromic acid should be communicated to all exposed workers.
- ☑ Where possible, automatically transfer chromic acid from drums or other storage containers to process containers.
- ☑ Specific engineering controls are recommended by NIOSH. Refer to NIOSH Criteria Documents: Occupational Exposure to Chromic Acid, (Publication Number 73-11021) and Chromium VI (Publication Number 76-129).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chromic acid. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chromic acid is considered a non-flammable liquid. However, it is an oxidizer and, because it is incompatible with so many other commodities, it presents serious fire and explosion concerns. In a fire, chromic acid will decompose and emit toxic and poisonous gases. It is also incompatible with many common combustible materials (such as paper, wood, plastics, and oil). These characteristics require special consideration during any emergency situation involving a leak or spill of chromic acid. Chromic acid can enter the environment through effluents from metal plating industry, from municipal waste treatment plants, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chromic acid.

Chromium is more toxic in soft water than in hard water. Chromium (VI) has high acute toxicity to aquatic life, and chromium (III) has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of chromic acid exposure to plants, birds or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chromium (III) and chromium (IV) both have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of chromic acid exposure to plants, birds or land animals.

💧 *Water Solubility*

Water solubility of chromium and its salts ranges from low to high. Chromic acid is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Chromic acid is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of chromium found in fish is expected to be somewhat higher than the average concentration of chromium in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chromic acid should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage of chromic acid should be avoided.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. To neutralize a spill, rinse with sodium bicarbonate solution, flood with water, agricultural lime (slaked lime) crushed limestone, soda ash, or lime and collect material in safest manner possible. Deposit in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Do not dry sweep (creates airborne dusts). Use vacuum equipped with HEPA filter instead. Contaminated soils should be removed for incineration and replaced with clean soil. If chromic acid should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be

notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chromic acid. If chromic acid is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill.
- Neutralize and deposit in sealed containers.
- It may be necessary to dispose of chromic acid as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chromic acid can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

U *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | | | | |
|---|-------------------------|--|-------------|-----------|-----------------------|
| Characterization | Metallic Nitrate | RCRA Number | None | EPA Class | Not Applicable |
| DOT Proper Shipping Name | Chromium Nitrate | Chemical Abstract Service (CAS) Number | | | |
| | | 13548-38-4 | | | |
| DOT Hazard Class and Label Requirements | Oxidizer | DOT Emergency Guide Code | | | |
| | | 35 | | | |
| DOT Identification Number | UN 2720 | Chemical Formula | | | |
| | | Cr(NO₃)₃ | | | |

Synonyms

Chromium (III) nitrate; chromium nitrate; chromium trinitrate; nitric acid; chromium (3+) salt.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|--|--|---|
| Chromic nitrate (derivation: By action of nitric acid on chromium hydroxide). | PEL: 0.5 mg(Cr)/m³ (maximum) Suspected Cancer Agent | REL (10 hour): .025 mg(Cr)/m³ (carcinogen) STEL (15 min): .05 mg(Cr)/m³ | 15 mg(Cr)/m³ as Cr(VI) | TLV: (8 hour) .5 mg(Cr)/m³ Confirmed Human Carcinogen |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|-------------------------|-----------------------|---|-----------------------|
| Boiling Point | Not Applicable | Specific Gravity (H ₂ O = 1) | Not Determined |
| Vapor Pressure (mm Hg) | Not Applicable | Molecular Weight | 238 |
| Vapor Density (Air = 1) | Not Applicable | Melting Point | 140°F (60°C) |

Solubility

Soluble in water and alcohol.

Appearance and Odor

Dark blue to purple crystalline solid. Odorless.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|-----------------------|-------------------------------------|---|
| Flash Point (method used) | Not Applicable | Explosive Limits in Air % by Volume | LEL: Not Applicable UEL: Not Applicable |
| NFPA Classification | No Citation | Autoignition Temperature | Not Determined |

Extinguishing Media

Use extinguishing media suitable to surrounding fires. Chromium nitrate itself does not burn.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Remain clear of smoke, water fall-out and water run-off. Poisonous gases are produced in fire, including nitrogen oxides and chromium oxide fumes.

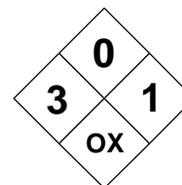

Unusual Fire and Explosion Hazards

Containers may explode in fire. Cool exposed containers. Can cause violent explosions upon contact with powerful reducing agents. May react with organic materials to cause ignition.

| SECTION V - REACTIVITY DATA | | | | |
|--|---|--|--|---|
| Stability | | Conditions to Avoid Keep away from incompatible materials since violent and or explosive reactions can occur. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Ordinary combustible materials (such as wood, paper, cloth, oil), halogens and ethers, reducing agents, organic compounds. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of chromic nitrate is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, chromic nitrate can emit highly toxic/poisonous fumes and gases, including nitrogen oxides and chromium oxides. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the upper respiratory tract. May cause headache and nausea. Lung allergy with wheezing and shortness of breath sometimes occurs. SKIN & EYES: An irritant, especially on prolonged exposures. Skin allergy sometimes occurs, with itching, redness, and/or eczema-like rash. Eye contact can damage vision. INGESTION: Gastrointestinal disturbances. A human poison by ingestion. | | | | |
| Carcinogenicity | NTP Listed? 5th Annual Report | IARC Cancer Review Group? Group 3 | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, skin, eyes |
| Medical Conditions Generally Aggravated by Exposure None Reported. However, existing skin conditions or respiratory problems may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), holding eyelids open (person may need assistance), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Contact poison control center for information. Seek medical attention immediately. Support breathing and provide CPR if necessary. Do NOT give anything by mouth to an unconscious person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Ventilate area of spill or leak. Collect powdered material in most convenient manner possible and deposit in sealed drum. Do not dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. Keep those not involved in cleanup from area. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area and protect from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where chromic nitrate is used, handled, or stored. Keep away from flammable or combustible materials. | | | | |
| Other Precautions and Warnings Prior to working with chromic nitrate, personnel should be trained on its proper handling and storage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above the PEL, use a full facepiece respirator with a high efficiency particulate air (HEPA) filter. Greater protection is provided by an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CHROMIC NITRATECr(NO₃)₃

CAS: 13548-38-4

**IDENTIFICATION AND TYPICAL USES**

Chromic nitrate is a dark blue to purplish, odorless, crystalline solid. It is used in the preparation of chrome catalysts, in textile printing operations, and as a corrosion inhibitor. .

RISK ASSESSMENT: HEALTH***General Assessment***

Chromic nitrate is a poison and an irritant of the eyes, skin, and mucous membranes. It has been shown to cause mutations in living cells. While its specific carcinogenic properties require further study, several related chromium compounds have caused cancer in humans and animals. In terms of risk assessment and management, it is recommended that chromic nitrate be handled with extreme caution.

Primary exposures occur through *inhalation*, although *ingestion* of chromic nitrate powders or dusts is also a considered possibility. It is a skin and eye irritant as well. Prolonged contact can cause skin allergy to occur resulting in rash, itching, and an eczema-like reaction. Once this occurs, any future exposures will cause a return of symptoms. Chromic nitrate will also cause irritation to the eyes and may result in permanent damage to vision.

Inhalation of chromic nitrate can result in irritation of the nose, throat, and bronchial tubes with symptoms of coughing and wheezing.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chromic nitrate:

Skin: Irritation and/or burning feeling on contact. May produce contact dermatitis and/or a redness and rash.

Eye: Severe irritation; conjunctivitis, and may cause burns and permanent damage (loss of vision possible).

Lung: Irritation of the upper respiratory tract and mucous membranes. Also may irritate the throat and lungs causing coughing and shortness of breath.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chromic nitrate and can last for months or even years:

Cancer Hazards: Chromic nitrate may cause mutations in living cells. Whether or not it poses a cancer hazard risk requires further study. While chromium nitrate has not yet been specifically identified as a carcinogen, it should be handled with extreme caution since several related chromium compounds are known to cause cancers in humans and test animals.

Reproductive Hazard: According to information available in the references, chromic nitrate has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Exposed persons may develop a skin allergy with a rash similar to eczema. Once this occurs, the person is “sensitized” to chromic nitrate. Any future skin contact, even slight, can trigger a severe rash. Lung allergy, with wheezing and shortness of breath, sometimes develops. In such cases, even small future exposures can cause symptoms to reappear. Repeated or severe exposures may cause kidney or liver damage.

🚫 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with chromic nitrate. If a less toxic chemical cannot be substituted for

a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chromic nitrate. For low exposures (up to the PEL), use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist/fume pre-filter. Greater protection is provided with a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical splash/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chromic nitrate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chromic nitrate is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.

- ☑ Wash thoroughly immediately after exposure to chromic nitrate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chromic nitrate should be communicated to all potentially exposed workers.
- ☑ Where possible, automatically transfer chromic nitrate from drums or other storage containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chromic nitrate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chromic nitrate is considered a non-flammable solid. However, it is an oxidizer and incompatible with many other commodities and presents serious fire and explosion concerns. In a fire, chromic nitrate will decompose and emit toxic and poisonous gases, including oxides of nitrogen and chromium. It is also incompatible with many common combustible materials (such as paper, wood, plastics, and oil). These characteristics require special consideration during any emergency situation involving a leak or spill of chromic nitrate.

Chromic nitrate can enter the environment through effluents from the metal plating industries, from municipal waste treatment plant discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chromic nitrate.

Chromium is more toxic in soft water than in hard water. Chromium (VI) has high acute toxicity to aquatic life, and chromium (III) has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of chromic nitrate exposure to plants, birds or land animals.

☛ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chromium (III) and chromium (IV) both have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of chromic nitrate exposure to plants, birds or land animals.

💧 *Water Solubility*

Water solubility of chromium and its salts ranges from low to high. Chromic nitrate is moderately soluble in water. Concentrations of 1 to 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

Chromic nitrate is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of chromium found in fish is expected to be somewhat higher than the average concentration of chromium in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chromic nitrate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage of chromic nitrate should be avoided.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Do not dry sweep (creates airborne dusts). Use a vacuum equipped with HEPA filter instead. Contaminated soils should be removed for incineration and replaced with clean soil. If chromic nitrate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is moderately soluble in water and, therefore, total containment and remediation may not be entirely possible. CHROMIUM

Cr

CAS: 7440-47-3

**IDENTIFICATION AND TYPICAL USES**

Chromium is a hard, brittle, semi-gray, often lustrous metal. It commonly appears in industrial applications in powdered form. It is used as an alloying and plating element on metal and plastic substrates for corrosion resistance, in chromium-containing and stainless steels, as a protective coating for automotive and equipment accessories, in nuclear and high-temperature research, as a constituent of inorganic pigments, and in the tanning of leathers.

RISK ASSESSMENT: HEALTH**General Assessment**

Chromium is a confirmed human carcinogen. It is a human poison by *ingestion* with gastrointestinal effects. It can also be toxic by *inhalation*. The toxicity of chromium alloys and compounds varies significantly. Chromium metal has not been shown to be toxic. However, divalent and trivalent compounds of chromium have a low order of toxicity in humans. Exposure to the dusts of chromite and ferrochrome alloys may cause lung diseases, including pulmonary fibrosis and pneumoconiosis.

Among the chromium compounds, only the hexavalent salts are considered to be extremely hazardous to human health. Occupational exposure can produce skin ulceration, dermatitis, perforation of the nasal septa, and kidney damage. Examples of hexavalent salts are the chromates and dichromates of sodium, potassium, and other metals. The water-soluble hexavalent chromium salts are absorbed into the bloodstream through inhalation. Many chromium (VI) compounds are confirmed carcinogens in humans and/or animals (causes lung cancers).

Inhalation of chromium fumes can cause “metal fume fever,” which is a flu-like illness lasting up to 24

hours with characteristic symptoms of chills, aches, cough, and fever.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chromium:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Chromium particles can irritate the eyes.

Lung: Inhalation of chromium may cause a condition known as “metal fume fever” (flu-like symptoms).

●* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chromium and can last for months or even years:

Cancer Hazards: Many chromium compounds are confirmed human carcinogens. They have been shown to cause cancer of the lung and throat in humans and test animals.

Reproductive Hazard: According to information available in the references, chromium has been tested for its ability to adversely affect reproduction in laboratory animals. There is no evidence to indicate that chromium adversely affects reproduction.

Other Chronic Effects: Chromium ore has been reported to cause lung allergy. Once allergy develops, even small future exposures may cause coughing, wheezing, or dyspnea. Repeated or severe exposures may cause lung cancer and/or thyroid cancers.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with chromium. If the specific chromium compound in question is un-

known, adequate risk management dictates that it be handled and treated as though it were a carcinogen. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chromium. For any exposure level, use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand as the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chromium.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chromium is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the TLV or greater, or significant skin contact), the following medical tests are recommended:

- ☑ Lung function tests (these may be normal if person is not displaying symptoms at the time of the test).

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Consider urine chromium levels. Persons without workplace exposure usually have levels below 15 micrograms per liter of urine.
- ☑ Lung function tests (these may be normal if person is not displaying symptoms at the time of the test).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not

a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to chromium may be more pronounced in smokers than in non-smokers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to chromium and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chromium should be communicated to all exposed and potentially exposed workers.
- ☑ Where possible, automatically transfer chromium from drums or other storage containers to process containers.
- ☑ Specific engineering controls are recommended by NIOSH. Refer to NIOSH Criteria Documents: Occupational Exposure to Chromium VI. Publication Number 76-129.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chromium. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Chromium powder will explode spontaneously in air. It will ignite and is potentially explosive in atmospheres of carbon dioxide. When heated in the presence of ammonium nitrate, violent or explosive reactions can result. In a fire, chromium will emit toxic and poisonous gases. It is also incompatible with strong oxidizers (such as chlorine, fluorine, bromine, and hydrogen peroxide), and many alkalis. These characteristics require

special consideration during any emergency situation involving a leak or spill of chromium.

Chromium can enter the environment through effluents from the metal plating industries, from municipal waste treatment plant discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chromium.

Chromium is more toxic in soft water than in hard water. Chromium (VI) has high acute toxicity to aquatic life, and chromium (III) has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of chromium exposure to plants, birds or land animals.

💧 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chromium (III) and chromium (IV) both have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of chromium exposure to plants, birds or land animals.

💧 *Water Solubility*

Water solubility of chromium and its salts ranges from low to high.

⌚ *Persistence in the Environment*

Chromium is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of chromium found in fish is expected to be somewhat higher than the average con-

centration of chromium in the water from which the fish was taken.

🔑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chromium should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage of chromium should be avoided.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum or wet method to reduce dust during cleanup. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. If chromium should contact the water table, aquifer, or navigable waterway, time is of the essence. Chromium compounds may be moderately soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chromium.

If chromium is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- ☑ It may be necessary to dispose of chromium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental

Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chromium can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CHROMIUM (III) OXIDECr₂O₃

CAS: 1308-38-9

**IDENTIFICATION AND TYPICAL USES**

Chromium (III) oxide is a bright green, extremely hard, crystalline, odorless powder. It is used primarily as a paint pigment, in metallurgy, as a fixative for certain textile dyes, in ceramics, as green granules in asphalt roofing, as a component in refractory brick, as an abrasive, and as a catalyst in organic synthesis.

RISK ASSESSMENT: HEALTH***General Assessment***

Chromium (III) oxide is a confirmed human carcinogen with experimental teratogenic and mutagenic data also reported. It is a human poison by *ingestion* with gastrointestinal effects. It can also be toxic by *inhalation*.

Among the chromium compounds, the trivalent salts are normally considered to be of low toxicity. However, chromium (III) oxide has been shown to be extremely hazardous to human health. Occupational exposure can produce skin allergy (dermatitis), severe irritation to the eyes, nose, and mucous membranes of the respiratory tract. Chronic exposures may lead to lung and/or throat cancers.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to chromium:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Chromium particles can irritate the eyes.

Lung: Acute effects on lung tissues appear to manifest as irritation of the mucous membranes of the respiratory tract. May cause congestion, cough with phlegm, tightness in chest, and other symptoms of respiratory irritation and inflammation. Possible nausea and headache.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to chromium and can last for months or even years:

Cancer Hazards: Chromium (III) oxide is a confirmed human carcinogen. It has been shown to cause lung and throat cancers. Repeated or long-term exposures to this compound may also cause mutations in living cells.

Reproductive Hazard: Chromium (III) oxide may be a teratogen in humans since it has been shown to be a teratogen in test animals.

Other Chronic Effects: Skin allergy can develop with red, itching rash resembling that of eczema. When this occurs, even small future exposure can trigger symptoms. Repeated or severe exposures may cause lung cancer and/or throat cancers.

🚫 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with chromium. It is a confirmed human carcinogen and many experts believe there is no safe exposure level to such compounds. Adequate risk management dictates that it be handled and treated with extreme caution. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around chromium. For any exposure to a carcinogen, use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure de-

mand as the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with chromium (III) oxide. A regulated, marked work area must be established wherever chromium (III) oxide is used, handled, or stored.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where chromium (III) oxide is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the PEL or greater, or significant skin contact), the following medical tests are recommended:

- ☑ Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Consider urine chromium levels. Persons without workplace exposure usually have levels below 15 micrograms per liter of urine.
- ☑ Lung function tests (these may be normal if person is not displaying symptoms at the time of the test).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.

- ☑ Wash thoroughly immediately after exposure to chromium and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of chromium should be communicated to all potentially exposed workers.
- ☑ Where possible, automatically transfer chromium from drums or other storage containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of chromium compounds, including chromium (III) oxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Some chromium powders may explode spontaneously in air. In a fire, chromium will emit toxic and poisonous gases. It is also incompatible with strong oxidizers (such as chlorine, fluorine, bromine, and hydrogen peroxide), and will react violently in the presence of chlorine trifluoride. These characteristics require special consideration during any emergency situation involving a leak or spill of chromium.

Chromium can enter the environment through effluents from the metal plating industries, from municipal waste treatment plant discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to chromium.

Chromium is more toxic in soft water than in hard water. Chromium (III) oxide has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of chromium exposure to plants, birds or land animals.

☼ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Chromium (III) oxide has high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of chromium exposure to plants, birds or land animals.

💧 *Water Solubility*

Water solubility of chromium and its salts ranges from low to high.

⌚ *Persistence in the Environment*

Chromium is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of chromium found in fish is expected to be somewhat higher than the average concentration of chromium in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of chromium (III) oxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage should be avoided.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immedi-

ately. Use a vacuum or wet method to reduce dust during cleanup. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. If chromium compounds should contact the water table, aquifer, or navigable waterway, time is of the essence. Chromium compounds may be moderately soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of chromium. If chromium is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use vacuum equipped with a high efficiency particulate air (HEPA) filter instead.
- ☑ It may be necessary to dispose of chromium as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving chromium can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the words "carcinogen" or "cancer" are used, public reaction and emotion run equally high.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the respiratory system. Exposure can cause allergic lung reaction with chest pain, coughing, wheezing, and shortness of breath. Repeated exposure may cause lung scarring (fibrosis), even if no symptoms are noticed. May also cause pulmonary edema. SKIN & EYES: An irritant to the eyes and skin. The powder may cause contact dermatitis. INGESTION: A poison with gastrointestinal effects with nausea and vomiting. | | | | |
| Carcinogenicity | NTP Listed? 5th Annual Report | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, skin, eyes |
| Confirmed Human Confirmed Animal | | | | |
| Medical Conditions Generally Aggravated by Exposure None Reported. However, existing skin conditions or respiratory problems may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24 - 48 hours for lung effects (pulmonary edema). If swallowed: Provide breathing assistance if necessary. Never attempt to give a convulsing or unconscious person anything by mouth. Seek medical attention immediately. Contact poison control center for assistance. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. If spill involves radioactive cobalt, evacuate area and delay cleanup until instructed by qualified radiation authorities. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area and protect from physical damage. Sources of ignition are prohibited where cobalt is used, handled, or stored. | | | | |
| Other Precautions and Warnings A regulated, marked area should be established where radioactive cobalt is handled, used, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposure to non-radioactive cobalt, use a full facepiece respirator with a high efficiency particulate air (HEPA) filter. For exposure to radioactive cobalt, use a full facepiece supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical/Dust Goggles or Face Mask | | Other Protective Clothing Protective Suit or Clothing |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

COBALT

Co

CAS: 7440-48-4

**IDENTIFICATION AND TYPICAL USES**

Cobalt is a steel-gray, shining, hard, ductile, somewhat malleable metal. It is ferromagnetic (highly magnetic, like iron), with permeability two-thirds that of iron. It is a natural element present in certain ores of the earth's crust, and is essential to life in trace amounts. It exists in the form of various salts. Cobalt and its salts are used in nuclear medicine, enamels and semi-conductors, grinding wheels, painting on glass and porcelain, hygrometers and electroplating, as a foam stabilizer in beer, in vitamin B12 manufacture, as a drier for lacquers, varnishes, and paints, in steel alloys in jet engines, and as a catalyst for organic chemical reactions. Cobalt has several artificial radioactive isotopes, the most important being cobalt 60. Cobalt 60 is a beta and gamma emitter and is used in radiation therapy, in level gauges, and research.

RISK ASSESSMENT: HEALTH**General Assessment**

Cobalt is a confirmed carcinogen. Human mutation data have also been reported. It is moderately toxic by *ingestion* with gastrointestinal irritation, nausea and vomiting. It can also be toxic by *inhalation*, with severe pulmonary damage (pulmonary edema) possible. Exposure to the dusts of cobalt may cause other lung effects, including pulmonary fibrosis and pneumoconiosis.

Occupational exposure can produce skin rash, itching, possible burning feeling on contact, and allergy (dermatitis). Eye contact will result in irritation, possible inflammation, and damage to vision which may be temporary or permanent, depending on the nature of the exposure.

Many synthetic versions of cobalt exist that are radioactive. Overexposure to such compounds can pose a significant hazard risk to human health.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cobalt:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Cobalt particles can irritate the eyes and may cause damage to vision.

Lung: Inhalation of the dust and fumes can irritate the nose, mouth, and throat. High levels can irritate the lungs, causing a buildup of fluid (pulmonary edema), which is a medical emergency and can be fatal.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cobalt and can last for months or even years:

Cancer Hazards: Cobalt compounds may cause mutations (genetic changes) in living cells. It is a confirmed carcinogen in animals and is suspected to cause cancer in humans, although its specific carcinogenicity requires further study. Some isotopes of cobalt do emit ionizing radiation. Exposure to ionizing radiation is associated with an increased risk of developing cancer.

Reproductive Hazard: According to information available in the references, cobalt has been tested and has not been shown to adversely affect reproduction in humans.

Other Chronic Effects: Cobalt can cause skin allergy. If an allergy develops, very low future exposures can cause itching and a skin rash. Cobalt may cause an asthma-like allergy. Future exposures can cause cough, shortness of breath, wheezing, and/or chest tightness. Cobalt can also damage the heart, leading to heart failure. Long-term exposure may damage the thyroid and liver. Repeated exposure can cause scarring of the lungs (pulmonary fibrosis), even if no

symptoms are noticed. This condition can be disabling or may be fatal.

🔑 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cobalt. If the specific cobalt compound in question is unknown, adequate risk management dictates that it be handled and treated as though it were a carcinogen. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cobalt. For exposure to non-radioactive cobalt at levels above the PEL (0.05 mg/m³), an MSHA/NIOSH approved respirator with a high efficiency particulate air (HEPA) filter is recommended. For higher exposures, or exposures to any levels of radioactive cobalt, use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cobalt. A regulated, controlled work area should be established where cobalt is used, handled, or stored.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cobalt is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the PEL or greater, or significant skin contact), the following medical tests are recommended:

- ☑ Lung function tests.
- ☑ Chest X-ray for scarring should be performed every two to three years after five or more years of exposure.

- ☑ Evaluation for heart failure.

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Liver, thyroid, and lung function tests.
- ☑ Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to cobalt may be more pronounced in smokers than in non-smokers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to cobalt and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cobalt should be communicated to all potentially exposed workers.
- ☑ Where possible, automatically transfer cobalt from drums or other storage containers to process containers.
- ☑ Specific engineering controls are recommended by NIOSH. Refer to NIOSH Occupational Hazard Assessment: Criteria for Controlling Occupational Exposure to Cobalt (Publication Number 82-107).
- ☑ Guidelines and regulations for radioactive cobalt have been established by the Nuclear Regulatory Commission at 10 CFR 20.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cobalt. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cobalt powder will explode spontaneously in air. It will ignite and is potentially explosive in contact with bromine pentafluoride. When heated in the presence of ammonium nitrate or hydrazinium nitrate, violent or explosive reactions can result. It is also incompatible with strong oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), and strong acids (hydrochloric, sulfuric, and nitric). These characteristics require special consideration during any emergency situation involving a leak or spill of cobalt.

Cobalt can occur in the environment as a natural element in certain ores in the earth's crust. It can also enter the environment through industrial and municipal discharges, or from spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cobalt.

Cobalt and its salts have high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of cobalt exposure to plants, birds, or land animals.

☠ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Cobalt and its salts have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of cobalt exposure to plants, birds or land animals.

💧 Water Solubility

Water solubility of cobalt and its salts ranges from highly soluble to practically insoluble.

⌚ Persistence in the Environment

Cobalt and its salts are highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cobalt found in fish is expected to be somewhat higher than the average concentration of cobalt in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cobalt should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage of radioactive cobalt should be avoided.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum method to reduce dust during cleanup. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. If radioactive cobalt is spilled, evacuate area and delay until instructions from qualified radiation personnel can be obtained. Contaminated soils should be removed and replaced with clean soil. If cobalt should contact the water table, aquifer, or navigable waterway, time is of the essence. Some cobalt compounds may be moderately to highly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities

must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cobalt. If cobalt is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- ☑ It may be necessary to dispose of cobalt as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cobalt can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Always remember that anytime the term “radiation” or “radioactive” are used, public emotion and anxiety can run equally high. This must be considered when dealing with the public following an incident involving cobalt.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|--|------------------------------------|
| Characterization Cobalt Compound | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name No Citation | Chemical Abstract Service (CAS) Number 71-48-7 | |
| DOT Hazard Class and Label Requirements No Citation | DOT Emergency Guide Code No Citation | |
| DOT Identification Number No Citation | Chemical Formula (CH₃COO)₂Co | |

Synonyms

Acetic acid, cobalt (2+) salt; bis(acetato)cobalt; cobalt (2+) acetate; cobalt (II) acetate; cobaltous acetate.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|--|
| Cobalt acetate (derivation: From cobaltous hydroxide or carbonate and an excess of dilute acetic acid). | PEL (8-hour): 0.1 mg/m³ (as cobalt) STEL: Not Established | PEL (10-hour): 0.05 mg/m³ (as cobalt) STEL: Not Established | 20 mg/m³ as Co | TLV: 0.1 mg/m³ (as cobalt) STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point Not Found | Specific Gravity (H ₂ O = 1) 1.7 |
| Vapor Pressure (mm Hg) 0 (approx.) at 69°F (20°C) | Molecular Weight 177.03 |
| Vapor Density (Air = 1) Not Found | Melting Point Not Found |

Solubility

Readily soluble in water. Soluble in acids and alcohol.

Appearance and Odor

Reddish-violet, deliquescent crystals with a vinegar-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: Not Applicable UEL: Not Applicable |
| NFPA Classification Non-Combustible Solid | Autoignition Temperature Not Determined |

Extinguishing Media

Use extinguishing media suitable to surrounding fire. Cobalt acetate will not burn.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Water may not be totally effective on fire by itself. Remain clear of smoke, water fall-out and water run-off.

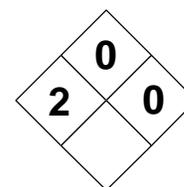

Unusual Fire and Explosion Hazards

Can cause violent explosions upon contact with strong oxidizers. Finely divided powders in air may ignite and burn fiercely when exposed to heat or flame.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|---|------------------------------|---|
| Stability | | Conditions to Avoid Normally stable at room temperature and pressure in closed containers under routine conditions of handling and storage. Keep away from incompatible materials since violent or explosive reactions can occur. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with strong oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of cobalt acetate is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, toxic and acrid fumes and gases are produced, including cobalt oxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the respiratory system. Exposure can cause allergic lung reaction with chest pain, coughing, wheezing, and shortness of breath. Repeated exposure may cause lung scarring (fibrosis), even if no symptoms are noticed. May also cause pulmonary edema. SKIN & EYES: An irritant to the eyes and skin. The powder may cause contact dermatitis. INGESTION: A poison with gastrointestinal effects with nausea and vomiting, flushing of the face and ears, hypertension (mild), rash, tinnitus, and nerve deafness. | | | | |
| Carcinogenicity Suspected Human Confirmed Animal | NTP Listed? 5th Annual Report | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, skin, eyes |
| Medical Conditions Generally Aggravated by Exposure None Reported. However, existing skin conditions or respiratory problems may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24 - 48 hours for lung effects (pulmonary edema). If swallowed: Provide breathing assistance if necessary. Never attempt to give a convulsing or unconscious person anything by mouth. Seek medical attention immediately. Contact poison control center for assistance. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area and protect from physical damage. Sources of ignition are prohibited where cobalt acetate is used, handled, or stored. | | | | |
| Other Precautions and Warnings A regulated, marked area should be established where radioactive cobalt compounds are handled, used, or stored. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For relatively low exposures, use a full facepiece respirator with a high efficiency particulate air (HEPA) filter. For higher exposures, use a full facepiece supplied-air respirator or a self-contained breathing apparatus (SCBA) operated in positive pressure or other continuous flow mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

COBALT ACETATE $(\text{CH}_3\text{COO})_2\text{Co}$

CAS: 71-48-7

**IDENTIFICATION AND TYPICAL USES**

Cobalt acetate appears as light pink or reddish-violet deliquescent crystals with a mild, vinegar-like odor. It is used as a bleaching agent, as a drier for lacquers and varnishes, as an anodizing agent, a mineral supplement in feed additives, as a catalyst, and in the manufacture of sympathetic inks. It was also used in the beer production industry as a foam stabilizer for malts.

RISK ASSESSMENT: HEALTH***General Assessment***

Cobalt acetate is a confirmed carcinogen in animal studies and cobalt itself is a known human carcinogen. Human mutation data have also been reported. Cobalt acetate is moderately toxic by *ingestion* and *inhalation*. Skin contact also produces a health risk but absorption is not likely to occur.

Inhalation causes severe, life-threatening pulmonary damage (pulmonary edema). The development of pulmonary edema, characterized by a fluid buildup in the lungs with cough, congestion, and tightness in chest, may be delayed up to 48 hours thereby creating a false sense of security with regard to health exposure risk. Exposure to the dusts of cobalt compounds, including cobalt acetate may cause other lung effects, including pulmonary fibrosis and pneumoconiosis. It can cause coughing and shortness of breath (dyspnea).

Occupational exposure can produce skin rash, itching, possible burning feeling on contact, and allergy (dermatitis). Eye contact will result in irritation, possible inflammation, and damage to vision which may be temporary or permanent, depending on the nature of the exposure.

Ingestion causes intense abdominal pain, vomiting, digestive tract irritation, and numerous systemic effects such as flushing of the face and ears, decreased blood pressure, rash, tinnitus (ringing in the ears), and even

nerve deafness. It may also have the ability to produce myocardial dysfunction.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to cobalt acetate:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Cobalt acetate particles can irritate the eyes and may cause damage to vision.

Lung: Inhalation of the dust and fumes can irritate the nose, mouth, and throat. High levels can irritate the lungs, causing a buildup of fluid (pulmonary edema), which is a medical emergency and can be fatal.

Other: Ingestion can cause a number of toxic systemic effects associated initially with gastrointestinal irritation and progressing to central nervous system (CNS) involvement.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to cobalt acetate and can last for months or even years:

Cancer Hazards: Cobalt compounds may cause mutations (genetic changes) in living cells. Cobalt acetate is a confirmed carcinogen in animals and is suspected to cause cancer in humans, although its specific carcinogenicity requires further study. Some isotopes of cobalt do emit ionizing radiation. Exposure to ionizing radiation is associated with an increased risk of cancer.

Reproductive Hazard: According to information available in the references, cobalt has been tested and has not been shown to adversely affect reproduction in humans. The specific teratogenicity of cobalt acetate has not been determined and requires further study.

Other Chronic Effects: Cobalt acetate can cause skin allergy. If an allergy develops, very low future exposures can cause itching and a skin rash. Cobalt acetate may cause an asthma-like allergy. Future exposures can cause cough, shortness of breath, wheezing, and/or chest tightness. Cobalt acetate can also damage the heart, leading to heart failure. Long-term exposure may damage the thyroid and liver. Repeated exposure can cause scarring of the lungs (pulmonary fibrosis), even if no symptoms are noticed. This condition can be disabling or fatal.

🔊 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cobalt acetate. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cobalt acetate. For exposure to cobalt acetate at levels above the established PEL (0.1 mg/m^3), an MSHA/NIOSH approved respirator with a high efficiency particulate air (HEPA) filter is recommended. For higher exposures use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cobalt acetate. A regulated, controlled work area should be established where cobalt acetate is used, handled, or stored.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cobalt acetate is used or stored. Before beginning employment and at regular intervals thereafter

(e.g., annually), for those with frequent or potentially high exposures (half the PEL or greater, or significant skin contact), the following medical tests are recommended:

- Lung function tests.
- Chest X-ray for scarring should be performed every two to three years after five or more years of exposure.
- Evaluation for heart failure.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Liver, thyroid, and lung function tests.
- Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to cobalt acetate may be more pronounced in smokers than in non-smokers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to cobalt acetate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cobalt acetate should be communicated to all potentially exposed workers.
- Where possible, automatically transfer cobalt acetate from drums or other storage containers to process containers.
- Specific engineering controls are recommended by NIOSH. Refer to NIOSH Occupational Hazard Assessment: Criteria for Controlling Occupa-

tional Exposure to Cobalt (Publication Number 82-107).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cobalt acetate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cobalt acetate is a non-combustible solid. However, it is incompatible with strong oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), and may ignite or explode on contact. Finely divided airborne dust particles may ignite explosively in confined areas. These characteristics require special consideration during any emergency situation involving a leak or spill of cobalt acetate. Cobalt can occur in the environment as a natural element in certain ores in the earth's crust. It can enter the environment through industrial and municipal discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cobalt acetate. Cobalt and its salts have high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of cobalt exposure to plants, birds, or land animals.

☪ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Cobalt and its salts have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of cobalt exposure to plants, birds or land animals.

💧 *Water Solubility*

Water solubility of cobalt and its salts ranges from highly soluble to practically insoluble. Cobalt acetate

is considered highly soluble in the aquatic environment. Concentration of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Cobalt and its salts are highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cobalt found in fish is expected to be somewhat lower than the average concentration of cobalt in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cobalt acetate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Bulk storage of radioactive cobalt acetate should be avoided.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum method to reduce dust during cleanup. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. If cobalt acetate should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and, therefore, total containment and remediation may not be possible. When such spills occur, the local

and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cobalt acetate. If cobalt acetate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- ☑ It may be necessary to dispose of cobalt acetate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cobalt acetate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term “radiation” or “radioactive” are used, public emotion and anxiety can run equally high. This must be considered when dealing with the public following an incident involving cobalt acetate.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

COBALT CARBONYLC₈Co₂O₈

CAS: 10210-68-1

**IDENTIFICATION AND TYPICAL USES**

Cobalt carbonyl is an orange to dark-brown crystalline solid. There is no odor. The pure substance is white. It is used as a catalyst for hydroformulation, hydrogenation, hydrosilation, isomerization, carboxylation, carbonylation, and polymerization. It is also a catalyst for amino acids, in anti-knock gasoline, and in high-purity cobalt salts.

RISK ASSESSMENT: HEALTH**General Assessment**

Cobalt carbonyl is particularly toxic upon decomposition because it produces carbon monoxide, a deadly gas. Cobalt dust is also toxic by *inhalation* and can produce asthma-like symptoms with cough and dyspnea. There may be bronchospasm and respiratory disturbances. Specific carcinogenicity for cobalt carbonyl has not been determined. However, cobalt itself is a confirmed carcinogen. Human mutation data have also been reported. It is a moderately toxic by *ingestion* with gastrointestinal irritation, nausea and vomiting. It can also be toxic by *inhalation*, with severe pulmonary damage (pulmonary edema) possible. Exposure to the dusts of cobalt and possibly cobalt carbonyl may cause other lung effects, including pulmonary fibrosis and pneumoconiosis.

Occupational exposure can produce skin rash, itching, possible burning feeling on contact, and allergy (dermatitis) with the appearance of urticaria (elevated and itching white patches) and erythema (red papules). Eye contact will result in irritation, possible inflammation, and damage to vision which may be temporary or permanent, depending on the nature of the exposure.

Inhalation of carbon monoxide gas will cause progressive chemical asphyxia with symptoms of rapid,

irregular breathing (tachypnea), feeling of air starvation or "air hunger," headache, fatigue, mental confusion, nausea, vomiting, giddiness, poor judgment, weakness, hallucinations, cyanosis, angina, syncope (sudden loss of strength and possible fainting), exhaustion, collapse, loss of consciousness, coma, convulsions, myocardial infarction, and death. In non-fatal exposures, there may be serious damage or injury to the central nervous system (CNS), and possible cerebral edema (fluid on the brain). Carbon monoxide has an affinity for blood hemoglobin some 200 times greater than that of oxygen. This means that it will bond much more quickly than oxygen and will form carboxyhemoglobin, thereby preventing the normal distribution of oxygen throughout the body. The gas may also combine with myoglobin to form carboxymyoglobin which may affect muscle metabolism and cause muscular disturbances, especially in the heart.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cobalt carbonyl:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Cobalt carbonyl particles can irritate the eyes and may cause damage to vision.

Lung: Irritation of the dust and fumes can irritate the nose, mouth, and throat. High levels can irritate the lungs, causing a buildup of fluid (pulmonary edema), which is a medical emergency and can be fatal.

Other: On decomposition, carbon monoxide is produced. Inhalation can cause air-starvation, chemical asphyxia, and death.

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to cobalt carbonyl and can last for months or even years:

Cancer Hazards: Cobalt carbonyl is a questionable carcinogen in test animals. However, cobalt compounds may cause mutations (genetic changes) in living cells. Cobalt is a confirmed carcinogen in animals and is suspected to cause cancer in humans, although its specific carcinogenicity requires further study. Some isotopes of cobalt carbonyl do emit ionizing radiation. Exposure to ionizing radiation is associated with an increased risk of developing cancer.

Reproductive Hazard: According to information available in the references, cobalt carbonyl has been shown to cause teratogenic effects in limited studies.

Other Chronic Effects: Cobalt carbonyl can cause skin allergy. If an allergy develops, very low future exposures can cause itching and a skin rash. Cobalt carbonyl may cause an asthma-like allergy. Future exposures can cause cough, shortness of breath, wheezing, and/or chest tightness. Cobalt carbonyl can also damage the heart, leading to heart failure. Long-term exposure may damage the thyroid and liver. Repeated exposure can cause scarring of the lungs (pulmonary fibrosis), even if no symptoms are noticed. This condition can be disabling or fatal.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cobalt carbonyl. If the specific cobalt carbonyl compound in question is unknown, adequate risk management dictates that it be handled and treated as though it were a carcinogen. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cobalt carbonyl. For exposure to cobalt carbonyl at levels above the PEL (0.1 mg/m³), an MSHA/NIOSH approved respirator with a high efficiency particulate air (HEPA) filter is recommended. For higher exposures, use a supplied-air respirator with a full facepiece operated in positive pressure mode or

an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode. If a full facepiece is not available, then chemical splash goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cobalt carbonyl. A regulated, controlled work area should be established where cobalt compounds are used, handled, or stored.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cobalt carbonyl is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), for those with frequent or potentially high exposures (half the PEL or greater, or significant skin contact), the following medical tests are recommended:

- Lung function tests.
- Chest X-ray for scarring should be performed every two to three years after five or more years of exposure.
- Evaluation for heart failure.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Liver, thyroid, and lung function tests.
- Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, since smoking can cause heart disease, as well as lung cancer, emphysema, and other related respiratory problems, the effects of exposure to cobalt carbonyl may be more pronounced in smokers than in non-smokers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release.

If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to cobalt carbonyl and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cobalt carbonyl should be communicated to all exposed workers.
- ☑ Where possible, automatically transfer cobalt carbonyl from drums or other storage containers to process containers.
- ☑ Specific engineering controls are recommended for cobalt by NIOSH. Refer to NIOSH Occupational Hazard Assessment: Criteria for Controlling Occupational Exposure to Cobalt (Publication Number 82-107).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cobalt carbonyl. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cobalt carbonyl is considered a non-combustible solid. However, when exposed to air or heat, or if involved in fire, it will decompose and produce highly flammable and explosive carbon monoxide gas. It is also incompatible with acids (hydrochloric, sulfuric, and nitric). These characteristics require special consideration during any emergency situation involving a leak or spill of cobalt carbonyl.

Cobalt can occur in the environment as a natural element in certain ores in the earth's crust. It can also enter the environment through industrial and municipal discharges, or from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cobalt.

Cobalt and its salts have high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of cobalt exposure to plants, birds, or land animals.

🌱* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Cobalt and its salts have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of cobalt exposure to plants, birds or land animals.

💧 *Water Solubility*

Water solubility of cobalt and its salts ranges from highly soluble to practically insoluble. Cobalt carbonyl is considered insoluble. Concentrations of less than 1 milligram may not mix in a liter of water.

⌚ *Persistence in the Environment*

Cobalt and its salts are highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cobalt found in fish is expected to be somewhat higher than the average concentration of cobalt in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react

properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cobalt compounds should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum method to reduce dust during cleanup. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed and replaced with clean soil. If cobalt carbonyl should contact the water table, aquifer, or navigable waterway, time is of the essence. It is insoluble in water and, therefore, total containment and remediation may be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cobalt carbonyl. If cobalt carbonyl is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- It may be necessary to dispose of cobalt carbonyl as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cobalt carbonyl can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious

expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "radiation" or "radioactive" are used, public emotion and anxiety can run equally high. This must be considered when dealing with the public following an incident involving cobalt carbonyl.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

COPPER

Cu

CAS: 7440-50-8

**IDENTIFICATION AND TYPICAL USES**

Copper is a commonly occurring element (atomic number 29). It appears as a reddish-brown, lustrous, malleable, odorless, solid. It also exists commonly in a powdered form. It is used extensively in electric wiring and switches, (an excellent conductor), plumbing, heating, roofing and building construction, chemical and pharmaceutical machinery, alloys (brass, bronze, Monel metal, beryllium-copper), electroplated protective coatings and undercoats for nickel, chromium, zinc, and others. It is used in cooking utensils, corrosion-resistant piping, insecticides, as a catalyst, and in antifouling paints. Copper flakes are sometimes used as insulation for liquid fuels. Copper “whiskers” are used in thermal and electrical composites.

RISK ASSESSMENT: HEALTH
General Assessment

Copper is a questionable carcinogen with tumorigenic data reported in test experiments. There is also some evidence in the references of teratogenic and reproductive effects in laboratory tests, but these results appear inconclusive especially regarding human exposures. It is a human poison by *ingestion* with systemic effects including vomiting and nausea. It can also be toxic by *inhalation*.

Occupational skin exposure can produce localized irritation and possible rash which can lead to dermatitis in sensitive individuals. Copper is also extremely irritating to the eyes. It can lead to temporary and/or permanent damage to vision up to and including blindness.

Inhalation of copper fumes can cause “metal fume fever,” which is a flu-like illness lasting up to 24 hours with characteristic symptoms of chills, aches, cough, and fever. The dusts are extremely irritating to the nose and throat and may, on prolonged exposure, cause nasal ulcers with symptoms of extreme irritation and chronic nosebleeds.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to copper:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Copper particles and dusts can be extremely irritating to the eyes. Exposure can damage vision and lead to total loss of sight.

Lung: Inhalation of copper may cause a condition known as “metal fume fever” (flu-like symptoms). Copper dusts and fumes can irritate the nose and throat. It may cause the appearance of ulcers in the nasal cavity accompanied by nosebleeds.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to copper and can last for months or even years:

Cancer Hazards: There is evidence that workers in copper smelters have an increased risk of lung cancer, but this is thought to be due to arsenic trioxide exposure and not copper. There is also some evidence that exposure to copper dusts and fumes may cause cancer in laboratory test animals. Human data, however, are inconclusive in this regard.

Reproductive Hazard: According to information available in the references, there is some evidence to indicate that copper may adversely affect reproduction in laboratory animals.

Other Chronic Effects: Repeated exposures can cause chronic irritation of the nose and may cause ulcers. Copper may cause a skin allergy. If allergy develops, very low future exposures can cause itching and a skin rash. Repeated exposures can cause thickening of the skin and may cause a greenish color to the skin and hair. Repeated or very high exposures to copper can damage the liver and/or kidneys.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with copper. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around copper. For exposures above the PEL, use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist/fume pre-filter. For higher exposures, use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with copper.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where copper is used or stored.

If symptoms develop or overexposure is suspected, the following may also be useful:

- Urine and serum copper levels.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Copper metal often contains arsenic as an impurity. Therefore, exposure to copper dusts or fumes may also be mixed with varying levels of arsenic exposure as well. Also, "Wilson's Disease" is a rare condition that interferes with the body's ability to metabolize copper. Persons with this disease may be seriously affected by copper exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to copper and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of copper should be communicated to all potentially exposed workers.
- Where possible, automatically transfer copper from drums or other storage containers to process containers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Copper is a naturally occurring element and is therefore present in the environment. However, the environment is still at risk of exposure during transportation, storage, disposal, or destruction of copper. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Liquid copper will explode on contact with water. It will ignite and is potentially explosive in contact with acetylene compounds; 3-bromopropyne; ethylene oxide; lead azide; and ammonium nitrate. It also ignites on contact with chlorine, chlorine trifluoride, fluorine (above 121°C), and hydrazinium nitrate (above 70°C). When heated in the presence of ammonium nitrate, violent or explosive reactions can result. In a fire, copper will emit toxic and poisonous gases. It is also incompatible with strong oxidizers (such as chlorine, fluorine, bromine, and hydrogen peroxide), and many chemically active metals (potassium, sodium, magnesium, and zinc). These characteristics require special consideration during any emergency situation involving a leak or spill of copper.

Copper is a naturally occurring element in natural water aquifers. At low concentrations, it is an essential element for both plants and animals. At slightly higher concentrations, it is toxic to aquatic life. The toxicity

of copper and its compounds to aquatic life varies with the physical and chemical conditions of the water. Factors such as water hardness, alkalinity, and pH influence copper toxicity.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to copper.

Copper and its compounds have high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of copper exposure to plants, birds or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Copper and its compounds have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of copper exposure to plants, birds or land animals.

💧 *Water Solubility*

Copper and its salts are highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Copper is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of copper found in fish is expected to be considerably higher than the average concentration of copper in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum or wet method to reduce dust during cleanup. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If copper should contact the water table, aquifer, or navigable waterway, time is of the essence. Copper compounds may be moderately to highly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of copper. If copper is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- It may be necessary to dispose of copper as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving copper can present a significant threat to business operations. The loss or

damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|---|---|
| Chemical Family Inorganic cyanide | RCRA Number P029 | EPA Class Acute Hazardous Waste |
| DOT Proper Shipping Name Copper or cupric cyanide | Chemical Abstract Service (CAS) Number 14763-77-0 | |
| DOT Hazard Class and Label Requirements Poison B | DOT Emergency Guide Code 53 | |
| DOT Identification Number UN 1587 | Chemical Formula Cu(CN)₂ | |

Synonyms

Cupric cyanide; copper cyanamide.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| Copper cyanide (derivation: Addition of potassium cyanide to a solution of copper sulfate; cupric cyanide is precipitated. This can be dried but is not stable). | PEL: dust/mist: 1.0 mg(Cu)/m³ STEL: Not Established | REL: Not Established STEL: Not Established | 50 mg/m³ as Cu | TLV: dust/mist: 1.0 mg(Cu)/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point Not Applicable | Specific Gravity (H ₂ O = 1) Not Determined |
| Vapor Pressure (mm Hg) Not Applicable | Molecular Weight 115.58 |
| Vapor Density (Air = 1) Not Applicable | Melting Point Decomposes |

Solubility in Water

Insoluble in water. Soluble in acids and alkalis.

Appearance and Odor

Green-colored powder, no distinguishable odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) Not Applicable | Explosive Limits in Air % by Volume LEL: Not Applicable UEL: Not Applicable |
| NFPA Classification No Citation | Autoignition Temperature Not Determined |

Extinguishing Media

Use dry chemical, carbon dioxide, water spray, or foam.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Poisonous gases are produced in fire, including cyanide gas, nitrous oxide. In the presence of moisture, hydrogen cyanide may be emitted which is extremely flammable and toxic.

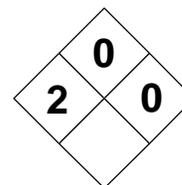

Unusual Fire and Explosion Hazards

Can cause violent explosions upon contact with chemically active metals. Potentially explosive in contact with acetylene compounds.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|--|---|---|
| Stability | | Conditions to Avoid Keep away from incompatible materials since violent and or explosive reactions can occur. Keep containers free of moisture since hydrogen cyanide gas will collect inside moist containers of copper cyanide. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Incompatible with strong oxidizers (such as perchlorates, permanganates, peroxides, chlorates, and nitrates), and chemically active metals (such as potassium, sodium, magnesium, and zinc). | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of copper cyanide is not known to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, copper cyanide can emit highly toxic/poisonous fumes and gases, including cyanide and nitrous oxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the respiratory system. Exposure to some copper compounds can cause severe throat and nose irritation and may cause nosebleeds. Exposure can cause "metal fume fever," a flu-like illness lasting about 24 hours with chills, aches, and cough. SKIN & EYES: Eye contact can cause severe irritation and can damage vision or cause blindness. INGESTION: A poison with gastrointestinal effects. Will cause nausea and vomiting. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? As Copper | Target Organs? |
| Unknown Human Suspected Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Respiratory system, skin, eyes, liver, kidneys |
| Medical Conditions Generally Aggravated by Exposure Wilson's disease. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Provide breathing assistance if necessary. Never attempt to give a convulsing or unconscious person anything by mouth. If victim is conscious, administer inhalation of amyl nitrate pearls 15-30 seconds of every minute until medical attention is received. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered material in most convenient manner possible and deposit in sealed drum. Keep those not involved in cleanup from entering area. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store in tightly closed containers in cool, well-ventilated area and protect from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where copper cyanide is used, handled, or stored. Keep environment moisture-free to avoid generation of hydrogen cyanide. | | | | |
| Other Precautions and Warnings Keep away from acetylene gas since contact will produce flammable hydrogen gas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At exposures above PEL, use an MSHA/NIOSH approved supplied-air respirator with a full facepiece, hood, or helmet operated in the continuous flow mode, or a self-contained breathing apparatus (SCBA) operated in positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Material | | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Suit or Clothing | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

COPPER CYANIDECu(CN)₂

CAS: 14765-77-0

**IDENTIFICATION AND TYPICAL USES**

Copper cyanide is a greenish powder with no distinguishable odor. It is used in the electroplating of copper onto iron, as an intermediate in some aromatic organic compounds (introduction of the cyanide group in place of the amino radical). It may also be used as an insecticide and a catalyst.

RISK ASSESSMENT: HEALTH**General Assessment**

Copper cyanide is not known to cause cancer in humans. However, many other copper compounds are either confirmed or suspected human and/or animal carcinogens. Proper risk management dictates treatment of copper compounds as extremely hazardous commodities unless firm data exist to the contrary. It is a human poison by *ingestion* with systemic effects including vomiting and nausea. It can also be toxic by *inhalation*.

Occupational skin exposure can produce localized irritation and possible rash which can lead to dermatitis in sensitive individuals. Copper cyanide is also extremely irritating to the eyes. It can lead to temporary and/or permanent damage to vision up to and including blindness.

Inhalation of copper fumes can cause "metal fume fever," which is a flu-like illness lasting up to 24 hours with characteristic symptoms of chills, aches, cough, and fever. The dusts are extremely irritating to the nose and throat and may, on prolonged exposure, cause nasal ulcers with symptoms of extreme irritation and chronic nosebleeds. Following severe exposure to the dusts of copper cyanide, symptoms of cyanide poisoning may develop.

Ingestion causes anxiety, confusion, dizziness, sudden loss of consciousness, odor of bitter almonds on

breath or in vomitus, rapid or weak pulse, convulsions, and paralysis.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to copper cyanide:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Copper cyanide particles and dusts can be extremely irritating to the eyes. Exposure can damage vision and lead to total loss of sight.

Lung: Inhalation of copper cyanide may cause a condition known as "metal fume fever" (flu-like symptoms). Copper cyanide dusts and fumes can irritate the nose and throat. It may cause the appearance of ulcers in the nasal cavity accompanied by nosebleeds.

Other: Possible CNS effects occurring upon ingestion may include anxiety, confusion, dizziness, loss of consciousness, convulsions, and paralysis.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to copper cyanide and can last for months or even years:

Cancer Hazards: There is evidence that workers in copper smelters have an increased risk of lung cancer, but this is thought to be due to arsenic trioxide exposure and not copper. There is also some evidence that exposure to copper dusts and fumes may cause cancer in laboratory test animals. Human data, however, are inconclusive in this regard. According to information presented in the references, copper cyanide specifically has not been adequately tested for its ability to cause cancer in laboratory test animals.

Reproductive Hazard: According to information available in the references, copper cyanide has not been tested for its ability to adversely affect reproduction in laboratory animals. There is some evidence to indicate that other copper compounds may adversely affect reproduction.

Other Chronic Effects: Repeated exposures can cause copper to deposit in the liver and in other body organs, causing damage. Copper deposits in the skin and hair also occur, leaving a green color. Repeated exposure can also cause shrinking (atrophy) of the inner lining of the nose, with a watery discharge. There may also be a metallic taste. Exposure may cause skin allergy, with rash and itching. If allergy develops, even low future exposures may trigger a rash. Very irritating substances can irritate the lungs. It is not known whether prolonged exposure to copper cyanide will result in lung damage.

🔗 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with copper cyanide. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around copper cyanide. For exposures above the PEL, use a supplied-air respirator with a full facepiece operated in positive pressure or continuous flow mode or, use an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with copper cyanide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where copper cyanide is used or stored.

For those personnel with frequent or potentially high exposure (half the PEL or greater), the following medical tests are recommended at the time of initial assignment and at regular intervals thereafter (e.g., annually):

- ☑ Lung function tests (pulmonary functions, including Forced Vital Capacity or FVC test).

If symptoms develop or overexposure is suspected, the following may also be useful:

- ☑ Urine copper cyanide level tests.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Because smoking can cause heart disease as well as lung cancer, emphysema, and other respiratory problems, exposure to copper cyanide may be more hazardous for smokers than for non-smokers. Proper risk assessment requires consideration of all exposure factors. Also, “Wilson’s Disease” is a rare condition that interferes with the body’s ability to metabolize copper cyanide. Persons with this disease may be seriously affected by copper cyanide exposures.

Other methods to reduce exposure risk include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances. Chemical dusts goggles or full facepiece should be worn unless a full facepiece respirator is used.
- ☑ Wash thoroughly immediately after exposure to copper cyanide and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of copper cyanide should be communicated to all potentially exposed workers.
- ☑ Eyewash stations and safety showers should be provided in the immediate work area for emergency use.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Copper is a naturally occurring element and is therefore present in the environment. However, copper cyanide is not particularly a “naturally occurring” compound. The environment is at risk of exposure during transportation, storage, disposal, or destruction of copper cyanide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Copper will ignite and is potentially explosive in contact with acetylene compounds; 3-bromopropyne; ethylene oxide; lead azide; and ammonium nitrate. It also ignites on contact with chlorine, chlorine trifluoride, fluorine (above 121°C), and hydrazinium nitrate (above 70°C), and other strong oxidizers. In a fire, copper cyanide will emit toxic and poisonous gases, including cyanide and nitrous oxide. In a moist atmosphere, hydrogen cyanide gas will collect inside sealed containers of copper cyanide. Hydrogen cyanide is extremely flammable and highly toxic. It is also incompatible with strong oxidizers (such as chlorine, fluorine, bromine, and hydrogen peroxide), and many chemically active metals such as potassium, sodium, magnesium, and zinc. These characteristics require special consideration during any emergency situation involving a leak or spill of copper cyanide.

Copper is a naturally occurring element in natural water aquifers. At low concentrations, it is an essential element for both plants and animals. At slightly higher concentrations, it is toxic to aquatic life. The toxicity of copper and its compounds to aquatic life varies with the physical and chemical conditions of the water. Factors such as water hardness, alkalinity, and pH influence copper toxicity.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to copper cyanide.

Copper and its compounds have high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of copper exposure to plants, birds or land animals.

☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Copper and its compounds have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of copper exposure to plants, birds or land animals.

💧 *Water Solubility*

Copper and its salts are highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Copper is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of copper found in fish is expected to be considerably higher than the average concentration of copper cyanide in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum or wet method to reduce dust during cleanup. Do not dry sweep. When vacuuming,

a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If copper should contact the water table, aquifer, or navigable waterway, time is of the essence. Copper compounds may be moderately to highly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of copper cyanide. If copper cyanide is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal. Do not dry sweep, use HEPA vacuum instead.
- ☑ It may be necessary to dispose of copper cyanide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving copper cyanide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Always remember that anytime the term "cyanide" is used, public anxiety and emotion will run equally high and the media will focus on this issue more than any other. This should be seriously considered in any risk management program or policy.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| NFPA Classification No Citation | Autoignition Temperature Not Determined |

Extinguishing Media

Use flooding amounts of water in early stages of fire. Use dry chemical or carbon dioxide.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Use a water spray to keep fire-exposed containers cool. Water may not be totally effective on fire. Poisonous oxides of nitrogen are produced in fire.

Unusual Fire and Explosion Hazards

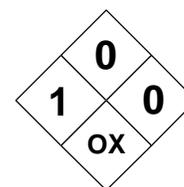

Can cause violent explosions upon contact with strong oxidizers. Can increase intensity of fire in contact with combustible materials.

COPPER NITRATE

CAS: 3251-23-8

IDENTIFICATION AND TYPICAL USES

Copper nitrate appears as large, greenish-blue, deliquescent, orthorhombic crystals. It may also be in powdered (sugar or sand-like) form. It is used in the manufacture of light-sensitive papers, as an analytical reagent, as a mordant in textile dyeing, as a nitrating agent, an insecticide, herbicide, and fungicide for vines, for coloring copper metal black, in electroplating, and to produce a burnished effect on iron. It is also used in paints, varnishes, and enamels, in pharmaceutical preparations, and as a catalyst.

RISK ASSESSMENT: HEALTH

General Assessment

Copper nitrate is moderately toxic by *ingestion* producing systemic effects which appear to be consistent with that seen following exposure to other nitrates. This may indicate that the biological effects of this compound are linked directly to the toxicity of the nitrate group. It can also be toxic by *inhalation*.

Inhalation of copper nitrate fumes can cause “metal fume fever,” which is a flu-like illness lasting up to 24 hours with characteristic symptoms of chills, aches, cough, and fever. The dusts are extremely irritating to the nose and throat and may, on prolonged exposure, cause nasal ulcers with symptoms of extreme irritation and chronic nosebleeds.

Ingestion of copper nitrate can cause nausea and headaches. Swallowing large amounts can cause violent vomiting and purging, intense abdominal pain, collapse, coma, convulsions, and paralysis.

Skin exposure can produce localized irritation and possible rash which can lead to dermatitis in sensitive individuals. Copper nitrate is also extremely irritating to the eyes. It can lead to temporary and/or permanent damage to vision.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to copper nitrate:

Skin: Irritation, rash, and possible contact dermatitis.

Eye: Copper nitrate particles and dusts can be extremely irritating to the eyes. Exposure can damage vision and cause burns.

Lung: Inhalation of copper nitrate may cause a condition known as “metal fume fever” (flu-like symptoms). Copper nitrate dusts and fumes can irritate the nose and throat. It may cause the appearance of ulcers in the nasal cavity accompanied by nosebleeds.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to copper nitrate and can last for months or even years:

Cancer Hazards: According to information presented in the references, copper nitrate has not been adequately tested for its ability to cause cancer in test animals. Other copper compounds are suspected to cause human cancers and still others are confirmed human carcinogens.

Reproductive Hazard: According to information available in the references, copper nitrate has not been tested for its ability to adversely affect reproduction in laboratory animals. There is some evidence to indicate that other copper compounds and other nitrates may adversely affect reproduction.

Other Chronic Effects: Repeated exposures can cause chronic irritation of the nose, a shrinking of the inner lining of the nasal cavity, and may cause sores to appear prompting watery discharge and/or nosebleeds.

Copper nitrate may cause a skin allergy. If allergy develops, very low future exposures can cause itching and a skin rash. Repeated exposures can cause thickening of the skin (not caused by the allergy). Repeated contact can also cause copper to deposit in various parts of the body. Large deposits may cause a greenish color to the skin and hair. Large deposits in the liver can cause liver damage. A metallic taste may also occur. Very irritating substances can damage lung tissues. It is not known whether copper nitrate dust and heated fumes cause lung damage.

🕒 **Recommended Risk-Reduction Measures**

Copper compounds are often used in “hot” operations (welding, brazing, soldering, plating, cutting, for example). At the high temperatures reached in these operations, metals often form metal fumes which have different health effects and exposure standards than the original compounds and, therefore, require specialized controls. Proper risk management requires evaluation for both dusts *and* fumes to ensure adequate controls in the workplace.

Personnel should avoid direct contact with copper nitrate. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures.

The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around copper nitrate. For exposures above the PEL, use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist/fume pre-filter. For higher exposures, use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with copper nitrate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where copper nitrate is used or stored.

For those with frequent or potentially high exposures (half the PEL or greater), the following medical test is recommended before beginning employment and at regular intervals after that:

Lung function tests, including Forced Vital Capacity (FVC).

If symptoms develop or overexposure is suspected, the following may also be useful:

Urine test for copper (can measure recent exposure).

Serum copper levels.

Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Liver function test.

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, “Wilson’s Disease” is a rare condition that interferes with the body’s ability to metabolize copper nitrate. Persons with this disease may be seriously affected by copper nitrate exposures. Smokers may also be more seriously affected since smoking causes heart disease, emphysema, lung cancer, and other respiratory problems which may be further aggravated by exposure to copper nitrate.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to copper nitrate and at the end of the work shift or before eating, drinking, or smoking. Eyewash stations and safety showers should be readily available for emergency use.

Hazard warning information should be posted in the work area. In addition, as part of an on-going

education and training program, all information on the health and safety hazards of copper nitrate should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of copper nitrate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Copper nitrate will ignite and is potentially explosive in contact with acetylene compounds. It will react violently in contact with acetic anhydride, nitromethane, and hydrazine. It can even ignite if allowed to remain in contact with paper for a prolonged period of time. Concentrated solutions can ignite in contact with common tin foil. In a fire, copper nitrate will emit toxic and poisonous gases, including oxides of nitrogen. It is also incompatible with strong reducing agents, ordinary combustible materials, other easily oxidized materials, and many chemically active metals (potassium, sodium, magnesium, and zinc). These characteristics require special consideration during any emergency situation involving a leak or spill of copper nitrate.

Copper is a naturally occurring element in natural water aquifers. At low concentrations, it is an essential element for both plants and animals. At slightly higher concentrations, it is toxic to aquatic life. The toxicity of copper and its compounds to aquatic life varies with the physical and chemical conditions of the water. Factors such as water hardness, alkalinity, and pH influence copper toxicity.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to copper nitrate.

Copper and its compounds have high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of copper exposure to plants, birds or land animals.

☠ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Copper and its compounds have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of copper exposure to plants, birds or land animals.

💧 Water Solubility

Copper and its salts are highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ Persistence in the Environment

Copper is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of copper found in fish is expected to be considerably higher than the average concentration of copper nitrate in the water from which the fish was taken.

🛑 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum or wet method to reduce dust during cleanup. Do not dry sweep. When vacuuming,

a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If copper nitrate should contact the water table, aquifer, or navigable waterway, time is of the essence. Copper compounds, including copper nitrate, may be moderately to highly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of copper nitrate. If copper nitrate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal.
- ☑ It may be necessary to dispose of copper nitrate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving copper nitrate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be

pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

COPPER SULFATECuSO₃

CAS: 7758-98-7

**IDENTIFICATION AND TYPICAL USES**

Copper sulfate appears as blue crystals or blue, crystalline granules or powder. It is slowly efflorescent in air and turns white when dehydrated. It is generally odorless but may produce a nauseating metallic taste. It is used heavily in the agricultural industry as a soil additive, a pesticide, in Bordeaux mixture, as a feed additive, and a germicide. It is also used in the leather industry, in pigments, in electric batteries, in electroplating coatings, in copper salts, as a reagent in analytical chemistry, in medicines, as a wood preservative (preservation of pulp wood and ground pulp), in process engraving and lithography, for ore flotation, in the petroleum industry, in the manufacture of synthetic rubber, in steel manufacturing, and in the treatment of natural asphalt. The anhydrous salt is used as a dehydrating agent.

RISK ASSESSMENT: HEALTH**General Assessment**

Copper sulfate is extremely toxic by *ingestion* producing systemic effects. It can also be toxic by *inhalation* and *absorption* through unbroken skin. Mutagenic and teratogenic data have been reported for this compound.

Inhalation of copper sulfate fumes can cause "metal fume fever," which is a flu-like illness lasting up to 24 hours with characteristic symptoms of chills, aches, cough, and fever. The dusts are extremely irritating to the nose and throat and may, on prolonged exposure, cause nasal ulcers with symptoms of extreme irritation and chronic nosebleeds.

Ingestion of copper sulfate can cause severe gastrointestinal irritation and pain. Symptoms include vomiting, localized corrosion, and hemorrhages. There may be prostration, anuria, hematuria, anemia, increased white blood cells, icterus, coma, respiratory difficulty, and circulatory failure resulting in death. It

can also cause nausea, metallic taste, sweating, headache, burning sensation in the throat and stomach, hemorrhagic gastritis, weak pulse, hypotension, and turgidity. Other symptoms may include watery and bloody stools, burning in the mouth and throat, liver damage with jaundice, hemolysis, tenesmus, retching, collapse, and convulsions. Uremia, shock, and renal failure have also been reported.

Skin exposure can produce localized irritation, smarting, first degree burns, and, if prolonged exposure, second degree burns. Copper sulfate is also extremely irritating to the eyes. It can lead to temporary and/or permanent damage to vision.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to copper sulfate:

Skin: Irritation, redness, and deep, painful burns.

Eye: Copper sulfate particles and dusts can be extremely irritating to the eyes. Exposure can damage vision and cause burns.

Lung: Inhalation of copper sulfate may cause a condition known as "metal fume fever" (flu-like symptoms). Copper sulfate dusts and fumes can irritate the nose and throat. It may cause the appearance of ulcers in the nasal cavity accompanied by nosebleeds.

Other: Ingestion of copper sulfate is extremely poisonous and can be fatal. Severe gastrointestinal irritation with toxic systemic effects.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to copper sulfate and can last for months or even years:

Cancer Hazards: According to information presented in the references, copper sulfate has not been adequately tested for its ability to cause cancer in test animals. Other copper compounds are suspected to cause human cancers and still others are confirmed human carcinogens. Copper sulfate has been reported to cause mutations in some test animals. Human data are inconclusive in this regard.

Reproductive Hazard: According to information available in the references, there is some evidence to indicate that cupric sulfate may adversely affect the developing fetus and may decrease fertility in female animals.

Other Chronic Effects: Repeated exposures can cause chronic irritation of the nose, a shrinking of the inner lining of the nasal cavity, and may cause sores to appear prompting watery discharge and/or nosebleeds. Copper sulfate may cause a skin allergy. If allergy develops, very low future exposures can cause itching and a skin rash. Repeated exposures can cause thickening of the skin (not caused by the allergy). Repeated contact can also cause copper to deposit in various parts of the body. Large deposits may cause a greenish color to the skin and hair. Large deposits in the liver can cause liver damage. A metallic taste may also occur. Very irritating substances can damage lung tissues. It is not known whether copper sulfate dust and heated fumes cause lung damage.

🔑 **Recommended Risk-Reduction Measures**

Copper compounds are often used in “hot” operations (welding, brazing, soldering, plating, cutting, for example). At the high temperatures reached in these operations, metals often form metal fumes which have different health effects and exposure standards than the original compounds and, therefore, require specialized controls. Proper risk management requires evaluation for both dusts *and* fumes to ensure adequate controls in the workplace.

Personnel should avoid direct contact with copper sulfate. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around copper sulfate. For exposures above the PEL, use a full facepiece respirator equipped

with a high efficiency particulate air (HEPA) filter and a dust/mist/fume pre-filter. For higher exposures, use a supplied-air respirator with a full facepiece operated in positive pressure mode or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever a chemical dust hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with copper sulfate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where copper sulfate is used or stored.

For those with frequent or potentially high exposures (half the PEL or greater), the following medical test is recommended before beginning employment and at regular intervals after that:

Liver function test.

If symptoms develop or overexposure is suspected, the following may also be useful:

Urine test for copper (can measure recent exposure).

Serum copper levels.

Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Lung function tests, including Forced Vital Capacity (FVC).

Any evaluation should include a careful history of past and present symptoms with a medical examination. Medical tests that look for damage already done are not a substitute for controlling exposure. Also, “Wilson’s Disease” is a rare condition that interferes with the body’s ability to metabolize copper sulfate. Persons with this disease may be affected by copper sulfate exposures. Smokers may also be more seriously affected since smoking causes heart disease, emphysema, lung cancer, and other respiratory problems which may be further aggravated by exposure to copper sulfate.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of copper sulfate from storage containers to process containers is recommended where possible.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to copper sulfate and at the end of the work shift or before eating, drinking, or smoking. Eyewash stations and safety showers should be readily available for emergency use.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of copper sulfate should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of copper sulfate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Copper sulfate will ignite and is potentially explosive in contact with acetylene compounds. It is also incompatible with finely divided metals and can corrode iron and steel. It can react in contact with alkalis, phosphates, hydrazine, or nitro-methane. It is sensitive to heat and moisture. In a fire, copper sulfate will emit toxic and poisonous gases, including oxides of sulfur. These characteristics require special consideration during any emergency situation involving a leak or spill of copper sulfate.

Copper is a naturally occurring element in natural water aquifers. At low concentrations, it is an essential element for both plants and animals. At slightly higher concentrations, it is toxic to aquatic life. The toxicity of copper and its compounds to aquatic life varies with the physical and chemical conditions of the water.

Factors such as water hardness, alkalinity, and pH influence copper toxicity.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to copper sulfate.

Copper and its compounds have high acute toxicity to aquatic life. Insufficient data are available to evaluate the short-term effects of copper exposure to plants, birds or land animals.

☠* Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Copper and its compounds have high chronic toxicity to aquatic life. Insufficient data are available to evaluate the long-term effects of copper exposure to plants, birds or land animals.

◆ Water Solubility

Copper and its salts are highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ Persistence in the Environment

Copper is highly persistent in the aquatic environment, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of copper found in fish is expected to be considerably higher than the average concentration of copper sulfate in the water from which the fish was taken.

🕒 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Use a vacuum or wet method to reduce dust during cleanup. Do not dry sweep. When vacuuming, a high efficiency particulate air (HEPA) filter should be used, not a standard shop vacuum. Deposit collected materials in sealed drum for disposal. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils may need to be removed and replaced with clean soil. If copper sulfate should contact the water table, aquifer, or navigable waterway, time is of the essence. Copper compounds, including copper sulfate, may be moderately to highly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of copper sulfate. If copper sulfate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered materials in most convenient and safe manner possible and place in sealed drums for disposal.
- ☑ It may be necessary to dispose of copper sulfate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving copper sulfate can present a significant threat to business operations. The loss or damage of equipment or facilities can signifi-

cantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. If swallowed: If conscious, give large amounts of water or milk, do NOT induce vomiting. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite, dry sand, earth, or other non-reactive material and deposit in sealed drum. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where cresol is used, handled, or stored. Heat may cause solids to liquefy and containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above the PEL, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Rubber | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CRESOL

CAS: 1319-77-3

**IDENTIFICATION AND TYPICAL USES**

Cresol is a mixture of the three isomeric cresols, *m*- (*meta*), *o* (*ortho*), and *p* (*para*). It is obtained from coal tar and appears as a colorless or yellowish to brown-yellow or pink liquid with a phenolic-like odor. It is a white powder or crystalline solid with a sweet, tarry odor. It is used in making synthetic resins, photographic developers, explosives, and as a disinfectant and a fumigant.

RISK ASSESSMENT: HEALTH**General Assessment**

Cresol is a human poison by *inhalation*, *ingestion*, and skin *absorption*. It is a severe irritant to the eyes, skin and respiratory system. Human mutation data have been reported for cresol. It is a questionable carcinogen in humans and animals, although the data are inconclusive in this area of study. The toxic actions of the cresol isomers are similar to that of phenol (the "*p*" or *para*-isomer is somewhat more toxic than the other two).

Inhalation can cause irritation to the respiratory system and associated mucosa. It can cause cough, congestion, with narcotic effects associated with the depression of the central nervous system (CNS). These include weakness, dyspnea, nausea, personality changes (irritability, mood changes), collapse, coma, and death (from respiratory failure).

Skin contact can produce burns, possible skin eruptions, and dermatitis. The liquid will pass through unbroken skin to cause toxic systemic effects similar to the effects on the CNS caused by inhalation. If cresol

should contact the eyes, there may be serious damage up to and including loss of vision.

Ingestion of cresol can lead to gastrointestinal disorders, nervous disorders (CNS action), tremor, confusion, skin eruptions, oliguria (a diminishing of urinary secretion over a 24-hour period), jaundice, and liver damage. High doses will depress the CNS and may cause a reduction in body weight.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cresol:

Skin: Severe irritation and possible burns. Will pass through unbroken skin to cause toxic systemic effects, including weakness, nausea, collapse, and death.

Eye: Severe irritation with damage and possible loss of vision likely.

Lung: Severe irritation to the respiratory tract and associated mucosa. Can cause weakness, nausea, confusion, collapse, coma, and death (respiratory failure).

CNS: A CNS depressant. Weakness, confusion, mood changes and other personality changes, nausea, collapse.

Other: Ingestion will cause irritation to the gastrointestinal system with nausea, vomiting, convulsions, dyspnea, oliguria, jaundice, tremor, confusion, and nervousness. It has also been found to be hepatotoxic (toxic to the liver) and nephrototoxic (toxic to the kidneys).

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to cresol and can last for months or even years:

Cancer Hazards: Some studies have suggested that exposure to cresol causes mutations (genetic changes) in humans. While there is no evidence of carcinogenicity of this chemical in humans or animals, it is still considered a *questioned* carcinogen primarily because of its mutagenic properties. It is suggested that mutagenic chemicals be regarded as carcinogens during use and handling.

Reproductive Hazard: According to information presented in the references, cresol has not been adequately tested for its ability to adversely affect reproduction in animals.

Other Chronic Effects: High or repeated lower skin or inhalation exposures can cause liver or kidney disorders. Repeated skin contact may cause sensitization, dermatitis, chronic rash, and associated irritation. Once an allergy develops, the slightest future exposures will cause a recurrence of the symptoms.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cresol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cresol. For exposures above the PEL (5 ppm), use an MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which spec-

ify the methods and techniques that will be practiced whenever personnel are to work with cresol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cresol is used or stored.

Before beginning employment with cresol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

Kidney and liver function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

Consider chest X-ray.

Evaluation by a qualified allergist, with careful evaluation of exposure history and special testing (may help diagnose allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, liquids should be transferred automatically from storage containers to process containers.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to cresol and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cresol should be communicated to all potentially exposed workers.

Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cresol, emergency shower facilities should also be provided.

Personnel should never wear contaminated clothing home (family members can be exposed).

Clothing should be laundered by personnel who have been trained on the hazards of cresol.

- ☑ Specific engineering controls are recommended for this chemical by NIOSH. Refer to NIOSH Criteria Document: Occupational Exposure to Cresol (Publication Number 78-133).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cresol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cresol is considered a class IIIA combustible liquid (per OSHA 29 CFR 1910.106). However, its vapors can form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, oleum, and acids. Contact with either can cause fire or explosion. It is also a corrosive and, therefore, special consideration is required during any emergency situation involving a leak or spill of cresol. Should cresol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Cresol may enter the environment through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cresol.

Cresol has moderate acute toxicity to aquatic life. Insufficient data are available on the short-term effects of cresol exposure to plants, birds or land animals.

🕒 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Cresol has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of cresol to plants, birds, or land animals.

💧 Water Solubility

Cresol is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 Persistence in the Environment

Cresol is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 56% of cresol will eventually end up in water; approximately 42.7% in air, and about 0.6% in terrestrial soil and aquatic sediments.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cresol found in fish tissue is expected to be somewhat higher than the average concentration of cresol in the water from which the fish was taken.

🛑 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cresol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and

replaced with clean soil. If cresol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cresol. If cresol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of cresol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cresol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☛ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

***m*-CRESOL**CH₃C₆H₄OH

CAS: 108-39-4

**IDENTIFICATION AND TYPICAL USES**

m-Cresol is a colorless to yellow liquid with a sweet, tarry odor. It is one of three isomers of the chemical cresol (cresylic acid). The other two, *o*-cresol and *p*-cresol, are similar in structure and hazard level. The *m*-cresol isomer is used in making synthetic resins, photographic developers, explosives, and as a disinfectant and a fumigant.

RISK ASSESSMENT: HEALTH***General Assessment***

m-Cresol is a human poison by *inhalation*, *ingestion*, and skin *absorption*. It is a severe irritant to the eyes, skin and respiratory system. Human mutation data have been reported for *m*-cresol. It is a questionable carcinogen in humans and animals, although the data are inconclusive in this areas of study. The toxic actions of the cresol isomers are similar to that of phenol (the "*p*" or *para*-isomer is somewhat more toxic than the other two).

Inhalation can cause irritation to the respiratory system and associated mucosa. It can cause cough, congestion, with narcotic effects associated with the depression of the central nervous system (CNS). These include weakness, dyspnea, nausea, personality changes (irritability, mood changes), collapse, coma, and death (from respiratory failure).

Skin contact can produce burns, possible skin eruptions, and dermatitis. The liquid will pass through unbroken skin to cause toxic systemic effects similar to the effects on the CNS caused by inhalation. If *m*-

cresol should contact the eyes, there may be serious damage up to and including loss of vision.

Ingestion of *m*-cresol can lead to gastrointestinal disorders, nervous disorders (CNS action), tremor, confusion, skin eruptions, oliguria (a diminishing of urinary secretion over a 24-hour period), jaundice, and liver damage. High doses will depress the CNS and may cause a reduction in body weight.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to *m*-cresol:

Skin: Severe irritation and possible burns. Will pass through unbroken skin to cause toxic systemic effects (weakness, nausea, collapse, and death).

Eye: Severe irritation with damage and possible loss of vision likely.

Lung: Severe irritation to the respiratory tract and associated mucosa. Can cause weakness, nausea, confusion, collapse, coma, and death (respiratory failure).

CNS: A CNS depressant. Weakness, confusion, mood changes and other personality changes, nausea, collapse.

Other: Ingestion will cause irritation to the gastrointestinal system with nausea, vomiting, convulsions, dyspnea, oliguria, jaundice, tremor, confusion, and nervousness. It has also been found to be hepatotoxic (toxic to the liver) and nephrototoxic (toxic to the kidneys).

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to *m*-cresol and can last for months or even years:

Cancer Hazards: Some studies have suggested that exposure to *m*-cresol causes mutations (genetic changes) in humans. While there is no evidence of carcinogenicity of this chemical in humans or animals, it is still considered a *questioned* carcinogen primarily because of its mutagenic properties. It is suggested that mutagenic chemicals be regarded as carcinogens during use and handling.

Reproductive Hazard: According to information presented in the references, *m*-cresol has not been adequately tested for its ability to adversely affect reproduction in animals.

Other Chronic Effects: High or repeated lower skin or inhalation exposures can cause liver or kidney disorders. Repeated skin contact may cause sensitization, dermatitis, chronic rash, and associated irritation. Once an allergy develops, the slightest future exposures will cause a recurrence of the symptoms.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with *m*-cresol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around *m*-cresol. For exposures above the PEL (5 ppm), use an MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which spec-

ify the methods and techniques that will be practiced whenever personnel are to work with *m*-cresol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *m*-cresol is used or stored.

Before beginning employment with *m*-cresol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

Kidney and liver function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

Consider chest X-ray.

Evaluation by a qualified allergist, with careful evaluation of exposure history and special testing (may help diagnose allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, liquids should be transferred automatically from storage containers to process containers.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to *m*-cresol and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of *m*-cresol should be communicated to all exposed workers.

Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to *m*-cresol, emergency shower facilities should also be provided.

Personnel should never wear contaminated clothing home (family members can be exposed).

Clothing should be laundered by personnel who have been trained on the hazards of *m*-cresol.

- ☑ Specific engineering controls are recommended for this chemical by NIOSH. Refer to NIOSH Criteria Document: Occupational Exposure to Cresol (Publication Number 78-133).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *m*-cresol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

m-Cresol is considered a class IIIA combustible liquid (per OSHA 29 CFR 1910.106). Its vapors can form explosive mixtures in air. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, oleum, and acids. Contact with either can cause fire or explosion. It is also a corrosive and, therefore, special consideration is required during any emergency situation involving a leak or spill of *m*-cresol. Should *m*-cresol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

m-Cresol may enter the environment through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *m*-cresol.

Cresol has moderate acute toxicity to aquatic life. Insufficient data are available on the short-term effects of *m*-cresol exposure to plants, birds or land animals.

●* Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Cresol has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of *m*-cresol to plants, birds, or land animals.

◆ Water Solubility

Cresol is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ Persistence in the Environment

Cresol is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 56% of cresol will eventually end up in water; approximately 42.7% in air, and about 0.6% in terrestrial soil and aquatic sediments.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cresol found in fish tissue is expected to be somewhat higher than the average concentration of cresol in the water from which the fish was taken.

🚫 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *m*-cresol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and

replaced with clean soil. If *m*-cresol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *m*-cresol. If *m*-cresol is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- It may be necessary to dispose of *m*-cresol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving *m*-cresol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

U *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

***o*-CRESOL**CH₃C₆H₄OH

CAS: 95-48-7

**IDENTIFICATION AND TYPICAL USES**

o-Cresol is a white powder or crystalline solid with a sweet, tarry odor. It will appear as a liquid at temperatures above 88°F (31°C). It is one of three isomers of the chemical cresol (cresylic acid). The other two, *m*-cresol and *p*-cresol, are similar in structure and hazard level. The *o*-cresol isomer is used in making synthetic resins, photographic developers, explosives, and as a disinfectant and a fumigant.

RISK ASSESSMENT: HEALTH***General Assessment***

o-Cresol is a human poison by *inhalation*, *ingestion*, and skin *absorption*. It is a severe irritant to the eyes, skin and respiratory system. Human mutation data have been reported for *o*-cresol. It is a questionable carcinogen in humans and animals, although the data are inconclusive in this areas of study. The toxic actions of the cresol isomers are similar to that of phenol (the “*p*” or *para*-isomer is somewhat more toxic than the other two).

Inhalation can cause irritation to the respiratory system and associated mucosa. It can cause cough, congestion, with narcotic effects associated with the depression of the central nervous system (CNS). These include weakness, dyspnea, nausea, personality changes (irritability, mood changes), collapse, coma, and death (from respiratory failure).

Skin contact can produce burns, possible skin eruptions, and dermatitis. The liquid will pass through unbroken skin to cause toxic systemic effects similar to the effects on the CNS caused by inhalation. If *o*-

cresol should contact the eyes, there may be serious damage up to and including loss of vision.

Ingestion of *o*-cresol can lead to gastrointestinal disorders, nervous disorders (CNS action), tremor, confusion, skin eruptions, oliguria (a diminishing of urinary secretion over a 24-hour period), jaundice, and liver damage. High doses will depress the CNS and may cause a reduction in body weight.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to *o*-cresol:

Skin: Severe irritation and possible burns. Will pass through unbroken skin to cause toxic systemic effects, including weakness, nausea, collapse, and death.

Eye: Severe irritation with damage and possible loss of vision likely.

Lung: Severe irritation to the respiratory tract and associated mucosa. Can cause weakness, nausea, confusion, collapse, coma, and death (respiratory failure).

CNS: A CNS depressant. Weakness, confusion, mood changes and other personality changes, nausea, collapse.

Other: Ingestion will cause irritation to the gastrointestinal system with nausea, vomiting, convulsions, dyspnea, oliguria, jaundice, tremor, confusion, and nervousness. It has also been found to be hepatotoxic (toxic to the liver) and nephrototoxic (toxic to the kidneys).

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to *o*-cresol and can last for months or even years:

Cancer Hazards: Some studies have suggested that exposure to *o*-cresol causes mutations (genetic changes) in humans. While there is no evidence of carcinogenicity of this chemical in humans or animals, it is still considered a *questioned* carcinogen primarily because of its mutagenic properties. It is suggested that mutagenic chemicals be regarded as carcinogens during use and handling.

Reproductive Hazard: According to information presented in the references, *o*-cresol has not been adequately tested for its ability to adversely affect reproduction in animals.

Other Chronic Effects: High or repeated lower skin or inhalation exposures can cause liver or kidney disorders. Repeated skin contact may cause sensitization, dermatitis, chronic rash, and associated irritation. Once an allergy develops, the slightest future exposures will cause a recurrence of the symptoms.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with *o*-cresol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around *o*-cresol. For exposures above the PEL (5 ppm), use an MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which spec-

ify the methods and techniques that will be practiced whenever personnel are to work with *o*-cresol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *o*-cresol is used or stored.

Before beginning employment with *o*-cresol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

Kidney and liver function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

Consider chest X-ray.

Evaluation by a qualified allergist, with careful evaluation of exposure history and special testing (may help diagnose allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, liquids should be transferred automatically from storage containers to process containers.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to *o*-cresol and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of *o*-cresol should be communicated to all potentially exposed workers.

Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to *o*-cresol, emergency shower facilities should also be provided.

Personnel should never wear contaminated clothing home (family members can be exposed).

Clothing should be laundered by personnel who have been trained on the hazards of *o*-cresol.

- ☑ Specific engineering controls are recommended for this chemical by NIOSH. Refer to NIOSH Criteria Document: Occupational Exposure to Cresol (Publication Number 78-133).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *o*-cresol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

o-Cresol is considered a combustible solid. However, its vapors can form explosive mixtures in air and it will liquefy at temperatures above 88°F (31°C). In liquid form, volatility is higher and more explosive vapors may be present. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, oleum, and acids. Contact with either can cause fire or explosion. It is also a corrosive and, therefore, special consideration is required during any emergency situation involving a leak or spill of *o*-cresol. Should *o*-cresol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

o-Cresol may enter the environment through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *o*-cresol.

Cresol has moderate acute toxicity to aquatic life. Insufficient data are available on the short-term effects of *o*-cresol exposure to plants, birds or land animals.

🌿 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals.

These effects can be seen long after first exposure(s) to toxic chemicals.

Cresol has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of *o*-cresol to plants, birds, or land animals.

💧 Water Solubility

Cresol is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ Persistence in the Environment

Cresol is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 56% of cresol will eventually end up in water; approximately 42.7% in air, and about 0.6% in terrestrial soil and aquatic sediments.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cresol found in fish tissue is expected to be somewhat higher than the average concentration of cresol in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *o*-cresol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If *o*-cresol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *o*-cresol. If *o*-cresol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ If powders are spilled, do not dry sweep. Use a vacuum equipped with a HEPA filter instead. Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of *o*-cresol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving *m*-cresol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific

training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Solubility

Soluble in alcohol, ether, chloroform, and hot water.

Appearance and Odor

Crystalline solid with a sweet, tarry odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) 187°F (86°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.1% UEL: Not Found |
| NFPA Classification Combustible Solid; Class IIIA Combustible Liq. | Autoignition Temperature 1138°F (558°C) |

Extinguishing Media

Use water to blanket fire, use dry chemical, foam, fog, or mist.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Use water spray to keep fire-exposed containers cool.

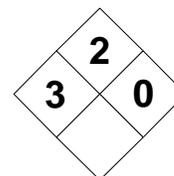

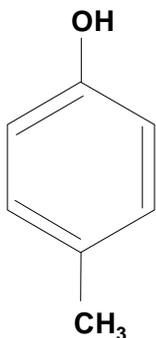

Unusual Fire and Explosion Hazards

Dangerous fire and explosion hazard when exposed to heat or flame. Containers may explode in fire. Chemical will react on contact with oxidizable materials. Moderate explosion hazard when in the form of vapor. Vapors form explosive mixtures in air. The flammability range has not been established.

| SECTION V - REACTIVITY DATA | | | | |
|--|---|---|--------------------------------|--|
| Stability | | Conditions to Avoid Keep away from heat or flame and incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, (such as chlorine, bromine, and fluorine), and many acids (such as chlorosulfonic and nitric), and oleum. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of <i>p</i>-cresol is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, <i>p</i>-cresol can emit highly toxic/poisonous gases. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards INHALATION: Symptoms include weakness, confusion, depression of the central nervous system, dyspnea, anemia, and respiratory failure. Possible liver and kidney damage. ABSORPTION: Severe skin irritant causing burns and dermatitis. There may be skin eruptions. Eye contact can cause damage to and/or loss of vision. Will pass through skin to cause toxic systemic effects, including liver damage. INGESTION: Gastrointestinal disorders, nervous disorders, tremor, convulsions, oliguria, jaundice. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | No | No | No | Respiratory system, eyes, skin, CNS, liver, kidney. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. If <u>swallowed</u>: If conscious, give large amounts of water or milk, do NOT induce vomiting. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Collect powdered materials in most convenient and safest manner possible and deposit in sealed drums. Do NOT dry sweep. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Will liquefy above 95°F (35°C). | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where <i>p</i>-cresol is used, handled, or stored. Heat may cause solids to liquefy and containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above the PEL, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Impervious Rubber | Chemical/Dust Goggles or Face Mask | Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

***p*-CRESOL**CH₃C₆H₄OH

CAS: 106-44-5

**IDENTIFICATION AND TYPICAL USES**

p-Cresol is a white powder or crystalline solid with a sweet, tarry odor. It will appear as a liquid at temperatures above 95°F (35°C). It is one of three isomers of the chemical cresol (cresylic acid). The other two, *m*-cresol and *o*-cresol, are similar in structure and hazard level. The *p*-cresol isomer is used in making synthetic resins, photographic developers, explosives, and as a disinfectant and a fumigant.

RISK ASSESSMENT: HEALTH***General Assessment***

p-Cresol is a human poison by *inhalation*, *ingestion*, and skin *absorption*. It is a severe irritant to the eyes, skin and respiratory system. Human mutation data have been reported for *p*-cresol. It is a questionable carcinogen in humans and animals, although the data are inconclusive in this areas of study. The toxic actions of the cresol isomers are similar to that of phenol (the “*p*” or *para*-isomer is somewhat more toxic than the other two).

Inhalation can cause irritation to the respiratory system and associated mucosa. It can cause cough, congestion, with narcotic effects associated with the depression of the central nervous system (CNS). These include weakness, dyspnea, nausea, personality changes (irritability, mood changes), collapse, coma, and death (from respiratory failure).

Skin contact can produce burns, possible skin eruptions, and dermatitis. The liquid will pass through unbroken skin to cause toxic systemic effects similar to the effects on the CNS caused by inhalation. If *p*-

cresol should contact the eyes, there may be serious damage up to and including loss of vision.

Ingestion of *p*-cresol can lead to gastrointestinal disorders, nervous disorders (CNS action), tremor, confusion, skin eruptions, oliguria (a diminishing of urinary secretion over a 24-hour period), jaundice, and liver damage. High doses will depress the CNS and may cause a reduction in body weight.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to *p*-cresol:

Skin: Severe irritation and possible burns. Will pass through unbroken skin to cause toxic systemic effects, including weakness, nausea, collapse, and death.

Eye: Severe irritation with damage and possible loss of vision likely.

Lung: Severe irritation to the respiratory tract and associated mucosa. Can cause weakness, nausea, confusion, collapse, coma, and death (respiratory failure).

CNS: A CNS depressant. Weakness, confusion, mood changes and other personality changes, nausea, collapse.

Other: Ingestion will cause irritation to the gastrointestinal system with nausea, vomiting, convulsions, dyspnea, oliguria, jaundice, tremor, confusion, and nervousness. It has also been found to be hepatotoxic (toxic to the liver) and nephrototoxic (toxic to the kidneys).

☛ **Chronic Health Effects**

The following chronic (long-term) health effects may occur at some time after exposure to *p*-cresol and can last for months or even years:

Cancer Hazards: Some studies have suggested that exposure to *p*-cresol causes mutations (genetic changes) in humans. While there is no evidence of carcinogenicity of this chemical in humans or animals, it is still considered a *questioned* carcinogen primarily because of its mutagenic properties. It is suggested that mutagenic chemicals be regarded as carcinogens during use and handling.

Reproductive Hazard: According to information presented in the references, *p*-cresol has not been adequately tested for its ability to adversely affect reproduction in animals.

Other Chronic Effects: High or repeated lower skin or inhalation exposures can cause liver or kidney disorders. Repeated skin contact may cause sensitization, dermatitis, chronic rash, and associated irritation. Once an allergy develops, the slightest future exposures will cause a recurrence of the symptoms.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with *p*-cresol. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around *p*-cresol. For exposures above the PEL (5 ppm), use an MSHA/NIOSH approved full facepiece respirator equipped with an organic vapor cartridge. Increased protection is obtained from a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which spec-

ify the methods and techniques that will be practiced whenever personnel are to work with *p*-cresol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where *p*-cresol is used or stored.

Before beginning employment with *p*-cresol and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

Kidney and liver function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

Consider chest X-ray.

Evaluation by a qualified allergist, with careful evaluation of exposure history and special testing (may help diagnose allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, liquids should be transferred automatically from storage containers to process containers.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to *p*-cresol and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of *p*-cresol should be communicated to all potentially exposed workers.

Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to *p*-cresol, emergency shower facilities should also be provided.

Personnel should never wear contaminated clothing home (family members can be exposed).

Clothing should be laundered by personnel who have been trained on the hazards of *p*-cresol.

- ☑ Specific engineering controls are recommended for this chemical by NIOSH. Refer to NIOSH Criteria Document: Occupational Exposure to Cresol (Publication Number 78-133).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of *p*-cresol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

p-Cresol is considered a combustible solid. However, its vapors can form explosive mixtures in air and it will liquefy at temperatures above 95°F (35°C). In liquid form, volatility is higher and more explosive vapors may be present. These characteristics require caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, oleum, and acids. Contact with either can cause fire or explosion. It is also a corrosive and, therefore, special consideration is required during any emergency situation involving a leak or spill of *p*-cresol. Should *p*-cresol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

p-Cresol may enter the environment through industrial effluents or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to *p*-cresol.

Cresol has moderate acute toxicity to aquatic life. Insufficient data are available on the short-term effects of *p*-cresol exposure to plants, birds or land animals.

☠* Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals.

These effects can be seen long after first exposure(s) to toxic chemicals.

Cresol has moderate chronic toxicity to aquatic life. Insufficient data are available on the long-term effects of *p*-cresol to plants, birds, or land animals.

💧 Water Solubility

Cresol is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ Persistence in the Environment

Cresol is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 56% of cresol will eventually end up in water; approximately 42.7% in air, and about 0.6% in terrestrial soil and aquatic sediments.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cresol found in fish tissue is expected to be somewhat higher than the average concentration of cresol in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of *p*-cresol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If *p*-cresol should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in the aquatic environment and total remediation may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of *p*-cresol. If *p*-cresol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ If powders are spilled, do not dry sweep. Use a vacuum equipped with a HEPA filter instead. Absorb liquid spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of *p*-cresol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving *p*-cresol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press.

Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|---------------------------------|
| Characterization Solvent, Aromatic Hydrocarbon | RCRA Number U055 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Cumene | Chemical Abstract Service (CAS) Number 98-82-8 | |
| DOT Hazard Class and Label Requirements Flammable Liquid | DOT Emergency Guide Code 28 | |
| DOT Identification Number UN 1918 | Chemical Formula C₂H₅CH(CH₃)₂ | |

Synonyms

Isopropylbenzene; 2-phenylpropane; (1-methylethyl)benzene; Cumol.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|--|---|---|
| Cumene (derivation: Alkylation of benzene with propylene (phosphoric acid catalyst), distillation from coal tar naphtha fractions or from petroleum). 1 ppm = 5.00 mg/m³ | PEL (skin): 50 ppm 250 mg/m³ STEL: Not Established | REL (skin): 50 ppm 245 mg/m³ STEL: Not Established | 9000 ppm | TLV: 50 ppm 250 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 306°F (152°C) | Specific Gravity (H ₂ O = 1) .09 |
| Vapor Pressure (gas) 8 at 69°F (20°C) | Molecular Weight 120.2 |
| Vapor Density (Air = 1) 4.1 | Melting Point -141°F (-96°C) |

Solubility

Insoluble in water. Soluble in alcohol, benzene, carbon tetrachloride, chlorinated solvents, and ether.

Appearance and Odor

Colorless liquid with a sharp, penetrating, aromatic odor. Odor threshold = 0.088 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) 111°F (44°C) | Explosive Limits in Air % by Volume LEL: 0.9% UEL: 6.5% |
| NFPA Classification Class 1C Flammable Liquid | Autoignition Temperature 795°F (424°C) |

Extinguishing Media

Use dry chemical, carbon dioxide, water spray, or alcohol foam.

Special Fire Fighting Procedures

Cumene is a flammable liquid. Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Move containers from fire if it can be done without risk.

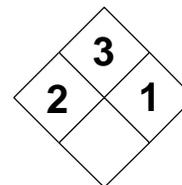

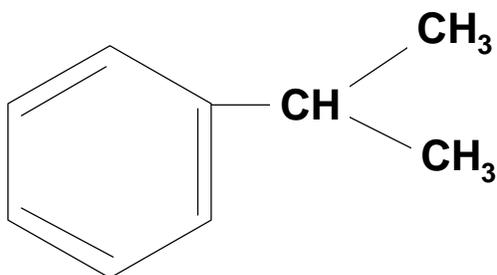

Unusual Fire and Explosion Hazards

Dangerous fire and explosion hazard when exposed to heat or flame. Containers may explode in fire. Immediately withdraw if rising sound from venting device is heard or if fire is causing a discoloration of tank. Vapors are heavier than air and may flash-back to ignition source to cause fire or explosion.

| SECTION V - REACTIVITY DATA | | | | |
|---|--------------------------------------|---|--------------------|--|
| Stability | | Conditions to Avoid Cumene is normally stable but can become unstable over a long period in aqueous solutions above 140°F. It may form explosive peroxides on prolonged contact with air. Keep away from incompatible materials. | | |
| Stable | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (such as permanganates, nitrates, peroxides, chlorates, and perchlorates), heat, strong acids (such as nitric, hydrochloric, sulfuric, chlorosulfonic), and oleum. | | |
| X | | | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of cumene is not expected to occur. However, it can react with oxidizers to form cumene hydroperoxide, which is explosive. | | |
| May Occur | Will Not Occur | Hazardous Decomposition or By-products | | |
| | X | When heated to decomposition, cumene can emit highly toxic/poisonous gases. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? | Absorption (skin)? | Ingestion? |
| | | X | X | |
| Health Hazards | | | | |
| INHALATION: At high concentrations, causes headaches, dizziness, loss of coordination, and loss of consciousness. May cause lung damage. Central nervous system depression is also likely to occur. May also lead to liver and kidney damage. A potent narcotic. | | | | |
| ABSORPTION: Cumene is a skin irritant and may be absorbed slowly through unbroken skin to cause toxic systemic effects. Eye contact can cause irritation and conjunctivitis. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Respiratory system, eyes, skin, CNS, liver, kidney. |
| Medical Conditions Generally Aggravated by Exposure | | | | |
| None reported. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum), lifting and holding eyelids open. Seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water for 15 minutes (minimum). Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Keep victim warm and at rest. If swallowed: Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method | | | | |
| No Citation. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Cumene is a flammable liquid. Store to avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat and flame. A nitrogen purge inside containers is recommended since cumene can react with air to form explosive cumene hydroperoxide. | | | | |
| Other Precautions and Warnings | | | | |
| Sources of ignition are prohibited where cumene is used, handled, or stored. Heat may cause containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For exposures over the PEL, use an organic vapor respirator. At higher exposures, use a supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Solvent-resistant Rubber | Chemical Goggles or Face Mask | Rubber Apron | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CUMENE

CAS: 98-82-2

**IDENTIFICATION AND TYPICAL USES**

Cumene is a clear, colorless liquid with a sharp, penetrating, aromatic odor. It is used in the manufacture of phenol, acetone, styrene, and acetophenone. It is a high-octane blending component in some aviation fuels and is used as a thinner for cellulose paints. It is a constituent of many commercial petroleum solvents and a good solvent to cut fats and resins. It is also used in the perfume industry.

RISK ASSESSMENT: HEALTH**General Assessment**

Cumene is an irritant to the respiratory tract, eyes, and skin. On exposure, it has a tendency to accumulate in fatty tissues, the endocrine glands, spleen, and liver. However, it is metabolized without producing phenol metabolites and has not been shown to cause damage to bone marrow. Cumene can enter the body primarily through *inhalation* of its vapors and/or by slow *absorption* through unbroken skin.

Inhalation at high concentrations causes headaches, dizziness, loss of coordination, and loss of consciousness. It has caused lung damage in test animals. Vapor inhalation will also cause central nervous system (CNS) depression and there may be kidney and liver damage potential. Cumene is a potent narcotic and antipsychotic, characterized by slow induction into the system and long duration (relative to benzene and toluene). There may be unspecified changes in the sense of smell and in the respiratory system itself.

On skin contact, cumene will cause irritation and possibly rash. If allowed to remain in contact, slow absorption will occur to produce toxic systemic effects.

Eye contact will also be irritating and conjunctivitis may occur.

The toxicity of ingestion is reported to be relatively low, with symptoms of nausea, mild narcosis, and gastritis. A major portion of ingested (and absorbed) cumene is metabolized by the liver and excreted. The urinary metabolites appear as conjugated alcohols and acids.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cumene:

Skin: Immediate irritation, rash, and burning feeling on contact.

Eye: Irritation, conjunctivitis, and possible damage if allowed to remain in contact. May cause burns.

Lung: Irritation of the respiratory tract, including the nose and mouth. High level exposures may cause CNS effects, lung, liver, and kidney damage. There may be depression of the CNS, dizziness, lightheadedness, and loss of consciousness.

CNS: A primary CNS depressant. May cause headache, dizziness, loss of consciousness, nausea, irritability, changes in personality, and nervousness.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cumene and can last for months or even years:

Cancer Hazards: According to information presented in the references, cumene has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, cumene has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Long-term exposure can cause drying and cracking of the skin. Exposure may damage the lungs, liver, and kidneys. This chemical has not been adequately evaluated to determine whether brain or other nerve damage could occur with repeated exposure. However, many solvents and other petroleum-based chemicals have been shown to cause such damage. Effects may include reduced memory and concentration, personality changes (withdrawal, irritability), fatigue, sleep disturbances, reduced concentration and/or effects on the nerves supplying internal organs (autonomic nervous system) and/or nerves in the arms and legs (weakness, “pins and needles”).

🔑 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cumene. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cumene. For concentrations at or slightly above the PEL, use an organic vapor respirator. For higher or prolonged concentrations, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cumene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where cumene is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Lung function tests.
- ☑ Interview for brain effects, including recent memory, mood, or concentration changes or problems. There may be headaches, malaise, and altered sleeping patterns as well. Consider cerebellar, autonomic, and peripheral nervous system evaluation. Positive or borderline individuals should be referred for neuropsychological testing.
- ☑ Urinalysis using gas chromatography to check for increased metabolites of cumene, primarily glucuronides of phenylpropanediol.
- ☑ Kidney and liver function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of cumene from storage containers to process containers is highly desirable, if possible.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to cumene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cumene should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cumene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of cumene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cumene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cumene is considered a class 1C flammable liquid (per OSHA 29 CFR 1910.106). Its relatively low flash point and moderate boiling point make this chemical a moderate fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with strong oxidizers, oleum, and acids and contact can cause violent fire or explosion. It reacts with oxidizers to form cumene hydroperoxide, which is extremely explosive. Vapors of cumene form explosive atmospheres above 88°F (31°C). Therefore, special consideration is required during any emergency situation involving a leak or spill of cumene. Should cumene ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Cumene may enter the environment through industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cumene.

This chemical has moderate acute toxicity to aquatic life and high acute toxicity to birds. Insufficient data are available on the short-term effects of cumene exposure to plants or land animals.

🌱 Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Cumene has moderate chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of cumene to plants, birds, or land animals.

💧 Water Solubility

Cumene is either very slightly soluble or totally insoluble in water (depending on concentration, water pH, and other variables). Concentrations of less than 100 milligrams may mix with a liter of water.

🕒 Persistence in the Environment

Cumene is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 99.6% of cumene will eventually end up in air; the remainder will end up in water.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cumene found in fish tissue is expected to be somewhat higher than the average concentration of cumene in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cumene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If cumene should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or dis-

aster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cumene. If cumene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources and ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ If gas is leaking, stop the flow of gas. If the source is a cylinder and leak cannot be stopped in place, remove cylinder to a safe place in the open air and repair or allow to empty.
- ☑ It may be necessary to dispose of cumene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cumene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

CUMENE HYDROPEROXIDE

CAS: 80-15-9

**IDENTIFICATION AND TYPICAL USES**

Cumene hydroperoxide is a colorless to pale yellow liquid. It is used in the production of acetone and phenol and as a polymerization catalyst, particularly in redox systems, to initiate rapid polymerization.

RISK ASSESSMENT: HEALTH**General Assessment**

Cumene hydroperoxide is an irritant to the respiratory tract, eyes, and skin. Exposure may cause mutations in living cells and it should, therefore, be handled with extreme caution. Cumene hydroperoxide can enter the body primarily through *inhalation* of its vapors and/or by slow *absorption* through unbroken skin.

Inhalation can cause irritation of the nose, throat, and lungs. There may be headaches, dizziness, loss of coordination, and loss of consciousness. Other symptoms of exposure to vapors include nosebleeds, sore throat, hoarseness, cough and phlegm, increased saliva, and shortness of breath. Higher levels can cause fluid to buildup in the lungs (pulmonary edema), which is considered a medical emergency and can lead to death.

On skin contact, cumene hydroperoxide will cause irritation and possibly rash. If allowed to remain in contact, slow absorption will occur to produce toxic systemic effects. Eye contact will also be irritating and conjunctivitis may occur. Contact may also damage vision and can lead to permanent loss of some visual acuity.

Ingestion is not likely due to the sharp and irritating aromatic odor of cumene. The toxicity of ingestion is reported to be relatively low, with symptoms of nausea, mild narcosis, and gastritis. A major portion of ingested (and absorbed) cumene hydroperoxide is me-

tabolized by the liver and excreted. The urinary metabolites appear as conjugated alcohols and acids.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cumene hydroperoxide:

Skin: Immediate irritation, rash, and burning feeling on contact.

Eye: Irritation, conjunctivitis, and possible damage if allowed to remain in contact. May cause burns.

Lung: Irritation of the respiratory tract, including the nose and mouth. There may be nosebleeds, sore throat, hoarseness, cough with phlegm, salivation, and shortness of breath. Pulmonary edema possible at higher levels, which can be fatal. There may also be dizziness, lightheadedness, and loss of coordination and consciousness.

Other: High exposures *may* damage the bone marrow, causing reduced white blood cells (lower resistance to infection), blood platelets (bleeding tendency), and red blood cells (anemia). The studies on this effect, however, are conflicting and highly inconclusive.

●* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cumene hydroperoxide and can last for months or even years:

Cancer Hazards: According to information presented in the references, cumene hydroperoxide may cause

mutations (genetic changes) in living cells. Its carcinogenic properties are questioned in animals and unknown in humans and requires more testing.

Reproductive Hazard: According to information presented in the references, cumene hydroperoxide has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated exposures may lead to lung damage (emphysema) and may damage the liver and kidneys. It can cause skin allergies with rash, itching, and redness. Once such an allergy develops, a person is "sensitized" to cumene hydroperoxide and any future small exposures can cause a recurrence of the symptoms.

🔗 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cumene hydroperoxide. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cumene hydroperoxide. No exposure limits have been established for this chemical. However, this does not mean that it poses no risks to human health. For any concentration, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, protective gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cumene hydroperoxide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where cumene hydroperoxide is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), or for those having frequent or potentially high exposures, the following medical tests are recommended:

Lung function tests.

If symptoms develop or overexposure is suspected, the following tests are recommended:

Lung function tests.

Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).

Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Kidney and liver function tests.

Complete blood count (CBC) test.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause lung cancers, emphysema, heart disease, and a number of other respiratory problems, the effects of exposure to cumene hydroperoxide in smokers may appear to be significantly higher than that which is seen in non-smokers. This must be taken into consideration for proper risk assessment and management.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of cumene hydroperoxide from storage containers to process containers is highly desirable, if possible.

Always ensure that proper protective clothing is worn when using chemical substances and that personnel have been trained on its use and care.

Wash thoroughly immediately after exposure to cumene hydroperoxide and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on

the health and safety hazards of cumene hydroperoxide should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cumene hydroperoxide, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of cumene hydroperoxide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cumene hydroperoxide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cumene hydroperoxide is considered a class IIIB combustible liquid (per OSHA 29 CFR 1910.106). Its moderately low flash point presents a fire and explosion hazard concern. It is, however, highly reactive and can, on contact with incompatible materials, present a significant fire and explosion risk. These characteristics warrant extreme caution in handling, storage, transportation, and disposal of cumene hydroperoxide. It is incompatible with strong oxidizers, strong acids, organic materials, combustibles, reducing agents, copper, copper and lead alloys, cobalt, and mineral acids. Contact can cause violent fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of cumene hydroperoxide. Should cumene hydroperoxide ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible. Cumene hydroperoxide may enter the environment through industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate

in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cumene hydroperoxide.

Cumene hydroperoxide has moderate acute toxicity to aquatic life. Insufficient data are available on the short-term effects of cumene hydroperoxide exposure to plants, birds, or land animals.

☠* Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Cumene hydroperoxide has moderate chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of cumene hydroperoxide to plants, birds, or land animals.

💧 Water Solubility

Insufficient data are available on the properties of cumene hydroperoxide to estimate or predict its water solubility.

🕒 Persistence in the Environment

Insufficient data are available on the properties of cumene hydroperoxide to estimate or predict its distribution in the environment. Limited data suggest that cumene hydroperoxide will be moderately persistent in water, with a half-life of between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Insufficient data are available on the properties of cumene hydroperoxide to estimate or predict its bioaccumulation in aquatic organisms.

🛑 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accidents resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and

rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cumene hydroperoxide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. It is highly reactive, and such contact should be avoided. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If cumene hydroperoxide should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cumene hydroperoxide. If cumene hydroperoxide is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources and ventilate area of leak.
- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- It may be necessary to dispose of cumene hydroperoxide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cumene hydroperoxide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can

also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? |
| Health Hazards INHALATION: Symptoms of respiratory obstruction. Will cause irritation of the nose, throat, and upper respiratory system. Other symptoms include lachrymation, somnolence, red lips, headache, tachypnea, vertigo, convulsions, dizziness, confusion, loss of weight. SKIN & EYES: Contact with the liquid can cause frostbite and eye damage. Gas is extremely irritating to the eyes and skin. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Respiratory system, eyes, skin, CNS, CVS. |
| Medical Conditions Generally Aggravated by Exposure Tuberculosis, asthma, chronic obstructive pulmonary disease, or heart disease may be aggravated. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Antidote for hydrogen cyanide may be effective. Break an amyl nitrate pearl in a cloth and hold lightly under victim's nose for 15 seconds. Repeat five times at 15 second intervals. If <u>swallowed:</u> Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Evacuate area and ventilate. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. If gas leak cannot be stopped, remove leaking cylinders to safe area outdoors and allow to empty. | | | | |
| Preferred Waste Disposal Method Dissolve in a combustible liquid; burn in a chemical incinerator with a scrubber and afterburner. | | | | |
| Precautions to be Taken in Handling and Storage Cyanogen is a highly flammable gas. Store to avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat and sunlight. Ship in steel pressure cylinders and tank cars. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where cyanogen is used, handled, or stored. Heat may cause containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For any exposure level, use a supplied-air respirator with full facepiece, hood, or helmet set in continuous flow mode, or use a NISH/MSHA approved self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Insulated and Impervious | Chemical Goggles or Face Mask | Neoprene Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CYANOGEN

CAS: 460-19-5

**IDENTIFICATION AND TYPICAL USES**

Cyanogen is a colorless gas with an almond-like odor that becomes acrid and pungent at high concentrations. When it burns, it produces a purple-tinged flame. It is used as a fumigant, as a fuel gas for welding and cutting metals, as a propellant, and in organic synthesis. It occurs in blast furnaces.

RISK ASSESSMENT: HEALTH**General Assessment**

Cyanogen is an extremely toxic and highly poisonous gas with symptoms of exposure similar to that of hydrogen cyanide. As a gas, the primary route of entry is through *inhalation*. Exposure can result in death by asphyxiation. It may also affect the body through skin contact with the liquid (frostbite is likely to occur). General symptoms of exposure may include vomiting, nausea, headache, confusion, and weakness. There is an apparent action to depress the central nervous system (CNS) and on the function of the cardiovascular system (CVS).

Inhalation and general exposure to the gas will produce irritation to the eyes, nose, throat, and upper respiratory system. Symptoms may include lachrymation, the appearance of cherry-red lips, tachypnea (rapid breathing), bradycardia (slow heart rate), headache, vertigo, convulsions, dizziness, loss of appetite, and low body weight.

Skin contact with the liquid will result in the destruction of tissue due to the extremely cold temperatures (frostbite). In gaseous form, it can still irritate the skin surface. Eye contact with the gas or liquid can be irritating and potentially destructive.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cyanogen:

Skin: Immediate irritation and possible burn on contact. The liquid will cause frostbite and possible permanent damage to skin tissue.

Eye: Severe irritation; conjunctivitis, and may cause burns and damage.

Lung: Irritation of the nose, throat, and lungs following exposure. May cause damage to the olfactory nerves. It can cause tearing, headache, nausea, and symptoms related to central nervous system (CNS) depression.

CNS: A depressant. May cause headache, dizziness, loss of appetite, weight loss, convulsions, vertigo, loss of consciousness.

CVS: Can affect the rate of heartbeat, slowing it to less than 60 beats per minute.

☪ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cyanogen and can last for months or even years:

Cancer Hazards: According to information presented in the references, cyanogen has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, cyanogen has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Cyanogen can irritate the lungs. Repeated exposure may cause bronchitis to develop with cough, phlegm, and/or shortness of breath.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with cyanogen. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best

protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cyanogen. Because the odor threshold of cyanogen is 250 ppm, personnel may have no indications of lethal exposure. The PEL (8-hour time weighted average) is only 10 ppm. Therefore, the only recommended respiratory protection must be a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cyanogen.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cyanogen is used or stored.

For those personnel with frequent or potentially high exposure (half the PEL or greater), the following are recommended medical tests to be provided before initial assignment and at regular intervals thereafter (e.g., annually):

- Lung function tests.
- Electrocardiogram (establish baseline).

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Lung function tests.
- Electrocardiogram (compare to baseline).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, exposure to cyanogen may worsen pre-existing respiratory conditions.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to cyanogen and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cyanogen should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cyanogen, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of cyanogen.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cyanogen. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (air, and to a lesser degree, water and soil).

Cyanogen is considered an extremely flammable gas. Its vapors are heavier than air and will travel, low to the ground, for a considerable distance to an ignition source and flashback. As a gas, it can easily form explosive mixtures in air. As a liquid, it can explode on contact when mixed with liquid oxygen. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with most acids, water, strong oxidizers (fluorine, for example) and contact can cause fire or explosion. It will slowly hydrolyze with water to form toxic hydrogen cyanide, oxalic acid, or ammonia. This can also occur if heated or mixed with acid. These characteristics re-

quire special consideration during any emergency situation involving a leak or spill of cyanogen. Should cyanogen ever come into contact with incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Cyanogen can enter the environment through industrial discharges and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cyanogen.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of cyanogen exposure to plants, birds, or land animals.

☠ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Cyanogen has high chronic toxicity in aquatic life. No data are available on the long-term effects of cyanogen to plants, birds, or land animals.

💧 *Water Solubility*

Cyanogen is highly soluble in the aquatic environment. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Cyanogen is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the amount of cyanogen that will remain in air or water. However, as a gas, nearly 100% of cyanogen might be expected to reach the air and virtually nothing will remain behind in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated

in the tissues and internal organs of animals as well as humans.

Cyanogen is not expected to accumulate in the tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cyanogen should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If cyanogen should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and total remediation and containment may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cyanogen. If cyanogen is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Use non-sparking tools!
- ☑ If gas is leaking, stop the flow of gas. If the source is a cylinder and leak cannot be stopped in place, remove cylinder to a safe place in the open air and repair or allow to empty.

- ☑ It may be necessary to dispose of cyanogen as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cyanogen can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Antidote: Break amyl nitrate pearl in a cloth and hold under victim's nose for 15 seconds. Repeat five times at 15 second intervals. Transfer to medical facility. Observe for 24 - 48 hours for lung effects (pulmonary edema). If swallowed: If conscious, give large amounts of water or milk. Do NOT induce vomiting. Seek medical attention immediately. (Never try to give anything by mouth to an unconscious person). | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Evacuate area and ventilate. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. Collect powdered materials in most convenient way possible and deposit in sealed drum. Do NOT dry sweep. Use a vacuum equipped with a HEPA filter. | | | | |
| Preferred Waste Disposal Method Add slowly to an aqueous solution of caustic soda with an addition of excess laundry bleach. Nontoxic sodium thiocyanate and unreacted bleach are then washed down the drain with large amounts of water. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat and moisture. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where cyanogen bromide is used, handled, or stored. Heat may cause emission of toxic cyanide and bromide fumes. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For any exposure level, use a supplied-air respirator with full facepiece, hood, or helmet set in continuous flow mode, or use a NISH/MSHA approved self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | | Other Protective Clothing | |
| Butyl or Neoprene Rubber | Chemical Goggles or Face Mask | | Neoprene Rubber Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CYANOGEN BROMIDE

CBrN

CAS: 506-68-3

**IDENTIFICATION AND TYPICAL USES**

Cyanogen bromide appears as colorless, needle-like, crystalline solid or powdered material with a pungent odor. It is used in organic synthesis, as a paraciticide, in fumigating compositions, in rodenticides, and as a cyaniding reagent in gold extraction processing.

RISK ASSESSMENT: HEALTH**General Assessment**

Cyanogen bromide is an extremely toxic and highly poisonous gas with symptoms of exposure similar to that of hydrogen cyanide, although not as severe. Since it is readily volatile at ambient temperatures, the primary route of entry is through *inhalation*. It may also affect the body through skin contact, causing burns and tissue damage. Absorption, however, is not likely. General symptoms of exposure may include vomiting, nausea, headache, confusion, and weakness.

Inhalation will produce irritation to the eyes, nose, throat, and upper respiratory system. Symptoms may include irritation of the throat, palpitation, difficulty breathing, reddening of the eyes, salivation, nausea, headache, weakness in the arms and legs, giddiness, followed by collapse and convulsions.

Skin contact with the liquid will result in dermatitis at low concentrations and/or the destruction of tissue due to the extremely corrosive properties of cyanogen bromide. It may even cause second or third degree burns over a relatively short period of time. Eye contact can be irritating and potentially destructive, with permanent loss of vision likely.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cyanogen bromide:

Skin: Immediate irritation and possible serious burns on contact.

Eye: Severe irritation; conjunctivitis, and may cause burns and damage (blindness).

Lung: Irritation of the nose, throat, and lungs following exposure. Can instigate and lead to chronic lung disorders. May cause fluid to build up on the lungs (pulmonary edema) and death.

Other: A possible CNS depressant. May cause headache, dizziness, loss of appetite, weight loss, convulsions, vertigo, loss of consciousness. It may also affect the rate of heartbeat and breathing.

☪ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cyanogen bromide and can last for months or even years:

Cancer Hazards: According to information presented in the references, cyanogen bromide has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, cyanogen bromide has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Cyanogen bromide can irritate the lungs. Repeated exposure may cause bronchitis to develop with cough, phlegm, and/or shortness of breath. In weak solution, it may lead to dermatitis and rash.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with cyanogen bromide. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls*

are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cyanogen bromide. Because no exposure limits have been established for this chemical and, because exposure can be extremely hazardous to human health, prudent risk management requires a conservative approach to respiratory protection. Hence, the recommended respiratory protection is a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cyanogen bromide.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cyanogen bromide is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Lung function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, exposure to cyanogen bromide may worsen pre-existing respiratory conditions.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.

- Wash thoroughly immediately after exposure to cyanogen bromide and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cyanogen bromide should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cyanogen bromide, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of cyanogen bromide.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cyanogen bromide. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (air, and to a lesser degree, water and soil).

Cyanogen bromide is not a flammable material. However, it is known to be violently reactive with most acids and will decompose in water to release toxic gases. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is also incompatible with strong oxidizers (fluorine, for example) and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of cyanogen bromide.

Cyanogen bromide can enter the environment through industrial discharges and through spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cyanogen bromide.

This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of cyanogen bromide exposure to plants, birds, or land animals.

Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Cyanogen bromide has high chronic toxicity in aquatic life. No data are available on the long-term effects of cyanogen bromide to plants, birds, or land animals.

Water Solubility

Cyanogen bromide is highly soluble in the aquatic environment. Concentrations of 1000 milligrams and more will mix with a liter of water. It will decompose in water to release toxic gases.

Persistence in the Environment

Cyanogen bromide is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the amount of cyanogen bromide that will remain in air or water. However, as a gas, nearly 100% of cyanogen bromide might be expected to reach the air and virtually nothing will remain behind in water.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Cyanogen bromide is not expected to accumulate in the tissues of fish.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and

quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cyanogen bromide should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If cyanogen bromide should contact the water table, aquifer, or navigable waterway, time is of the essence. It is highly soluble in water and will decompose. Total remediation and containment may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cyanogen bromide. If cyanogen bromide is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of leak.
- Collect powdered materials in most convenient way possible and deposit in sealed drums. Do NOT dry sweep, use a HEPA vacuum instead. Do NOT use wet method.
- It may be necessary to dispose of cyanogen bromide as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cyanogen bromide can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding

an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

May cause second and third degree burns. May Cause conjunctivitis and edema of the eyelids. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, eyes, skin, CNS, CVS. |
| Medical Conditions Generally Aggravated by Exposure None noted. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Antidote: Break amyl nitrate pearl in a cloth and hold under victim's nose for 15 seconds. Repeat five times at 15 second intervals. Transfer to medical facility. Observe for 24 - 48 hours for lung effects (pulmonary edema). If swallowed: If conscious, give large amounts of water or milk. Do NOT induce vomiting. Seek medical attention immediately. (Never try to give anything by mouth to an unconscious person). | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Evacuate area and ventilate. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. If gas leak cannot be stopped, remove leaking cylinders to safe area outdoors and allow to empty. | | | | |
| Preferred Waste Disposal Method Dissolve in combustible solvent and burn in chemical incinerator with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials since violent reactions can occur. Store in tightly closed containers in cool, well-ventilated area away from heat and moisture. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where cyanogen chloride is used, handled, or stored. Heat may cause emission of toxic cyanide and bromide fumes. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For any exposure level, use a supplied-air respirator with full facepiece, hood, or helmet set in continuous flow mode, or use a NISH/MSHA approved self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl or Neoprene Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Neoprene Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CYANOGEN CHLORIDE

ClCN

CAS: 506-77-4

**IDENTIFICATION AND TYPICAL USES**

Cyanogen chloride is a colorless gas (or liquid, below 55°F) with an irritating odor. It is used in the organic synthesis of other chemicals, as a warning agent in fumigant gases, and as a military poisonous gas (tear gas).

RISK ASSESSMENT: HEALTH**General Assessment**

Cyanogen chloride is an extremely toxic and highly poisonous gas with symptoms of exposure similar to that of hydrogen cyanide, although not as severe. As a gas, the primary route of entry is through *inhalation*. It may also affect the body through skin contact, causing burns and tissue damage, in either its gas or liquid state, although adverse effects are more likely with the latter. Absorption may also occur; however, the liquid is more prone to tissue destruction than simple absorption. The toxicity of cyanogen chloride is attributed to its relatively easy decomposition to cyanide ion in an aqueous environment (such as that which exists inside the human body). The cyanide then attacks the cells and interferes with cellular metabolism. General symptoms of exposure may include vomiting, nausea, headache, confusion, and weakness.

Inhalation will produce irritation to the eyes, nose, throat, and the respiratory tract followed by hemorrhage of the bronchi and trachea, and pulmonary edema (fluid buildup in the lungs), which can lead to death. Indications of illness may not appear for 24 - 48 hours following exposure, creating a false sense of security and well-being. Symptoms of exposure may include lachrymation, headache, congestion, convulsions, somnolence, dizziness, loss of appetite, and low body weight. It is improbable that anyone will remain in areas with high vapor concentrations for very long since the irritating properties of cyanogen chloride make it

virtually impossible to withstand for more than short periods of time.

Skin contact with the liquid will result in the destruction of tissue due to the extremely corrosive properties of cyanogen chloride. It may even cause second or third degree burns over a relatively short period of time. Dermatitis is also a possibility over long periods of exposure to low concentrations. Eye contact can be irritating and potentially destructive, with conjunctivitis, edema of the eyelid and possible permanent loss of vision.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cyanogen chloride:

- Skin:** Immediate irritation and possible serious burns on contact.
- Eye:** Severe irritation; conjunctivitis, and may cause burns and damage (blindness).
- Lung:** Irritation of the nose, throat, and lungs following exposure. Can instigate and lead to chronic lung disorders. May cause fluid to buildup on the lungs (pulmonary edema) and death.
- Other:** A possible CNS depressant and can affect the CVS. May cause headache, dizziness, loss of appetite, weight loss, convulsions, vertigo, loss of consciousness. It may also affect the rate of heartbeat and breathing.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cyanogen chloride and can last for months or even years:

Cancer Hazards: According to information presented in the references, cyanogen chloride has not been ade-

quately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to information presented in the references, cyanogen chloride has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Cyanogen chloride can irritate the lungs. Repeated exposure may cause bronchitis to develop with cough, phlegm, and/or shortness of breath. In weak solution, it may lead to dermatitis and rash.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cyanogen chloride. It is extremely toxic and can cause death in short periods of time at high concentrations. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cyanogen chloride. Because such low exposure limits have been established for this chemical and, because even the slightest exposure can be extremely hazardous to human health, prudent risk management requires a conservative approach to respiratory protection. Hence, the recommended respiratory protection is a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. This chemical is extremely corrosive and destructive to human tissues. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cyanogen chloride.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cyanogen chloride is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Lung function tests.
- ☑ Consider chest X-ray following acute over exposure.
- ☑ Evaluation by a qualified allergist with careful consideration of exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Also, because smoking can cause heart disease, as well as lung cancer, emphysema, and other respiratory problems, exposure to cyanogen chloride may worsen pre-existing respiratory conditions. Proper risk assessment requires consideration of *all* possible reasons for the appearance of exposure symptoms in workers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of liquids from storage containers to process containers is recommended whenever possible.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to cyanogen chloride and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cyanogen chloride should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cyanogen chloride, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the specific hazards of working with cyanogen chloride.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cyanogen chloride. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (air, and to a lesser degree, water and soil).

Cyanogen chloride is not a flammable material. However, it is known to be violently reactive with most acids and will decompose in water to release toxic cyanide. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is also incompatible with strong oxidizers (fluorine, for example) and contact can cause fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of cyanogen chloride. Also, should cyanogen chloride ever come into contact with any incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Cyanogen chloride can enter the environment through industrial discharges and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cyanogen chloride. This chemical has high acute toxicity to aquatic life. No data are available on the short-term effects of cyanogen chloride exposure to plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Cyanogen chloride has high chronic toxicity in aquatic life. No data are available on the long-term effects of cyanogen chloride to plants, birds, or land animals.

💧 *Water Solubility*

Cyanogen chloride is highly soluble in the aquatic environment. Concentrations of 1000 milligrams and more

will mix with a liter of water. It will decompose in water to form cyanide.

⌚ *Persistence in the Environment*

Cyanogen chloride is very slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. No data are available on the amount of cyanogen chloride that will remain in air or water. However, as a gas, nearly 100% of cyanogen chloride might be expected to reach the air and virtually nothing will remain behind in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Cyanogen chloride is not expected to accumulate in the tissues of fish. However, it may cause an increase in cyanide concentrations, but this is only a theory and requires additional testing.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cyanogen chloride should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If cyanogen chloride should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in water but will decompose rapidly to form cyanide. Total reme-

diation and containment may not be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cyanogen chloride. If cyanogen chloride is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove ignition sources, ventilate area of leak.
- ☑ If possible, remove leaking cylinders to a safe location, preferably outdoors, and repair or allow to vent until empty.
- ☑ It may be necessary to dispose of cyanogen chloride as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cyanogen chloride can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. Keep victim warm and at rest. If swallowed: Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| For small spills, absorb in paper towels and evaporate in a safe place (fume hood). Afterwards, burn paper away from combustible materials. Absorb large spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method | | | | |
| No Citation. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Use only non-sparking tools to open and close containers. | | | | |
| Other Precautions and Warnings | | | | |
| Sources of ignition are prohibited where cyclohexane is used, handled, or stored. Heat may cause containers to build up pressure and explode. Containers must be grounded and bonded during transfer. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For exposures above the PEL, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Nitrile Rubber, Viton, or Teflon | Chemical Goggles or Face Mask | Rubber Apron | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CYCLOHEXANEC₆H₁₂

CAS: 110-87-7

**IDENTIFICATION AND TYPICAL USES**

Cyclohexane is a colorless, mobile liquid with a pungent, sweet, chloroform-like odor. It is used in the manufacture of nylon, as a solvent for cellulose ethers, fats, oils, waxes, bitumen, resins, crude rubber, and for extracting essential oils from other products. It is also used in organic synthesis and as a re-crystallizing medium in the chemical industry. It is found in paint and varnish removers, in glass substitutes, in solid fuels (for camp stoves and catering applications), in fungicides, and is also used in analytical chemistry. It is used in the manufacture of benzene, cyclohexanol, caprolactam, and other chemicals.

RISK ASSESSMENT: HEALTH**General Assessment**

Cyclohexane is an acute irritant of low-order toxicity by *inhalation* and *ingestion*. Skin contact can also produce some adverse topical effects. It is generally considered to be a safe solvent for industrial use when done so according to manufacturer's instructions. However, in sufficient or high concentrations, there can be toxic systemic effects through both routes of exposure.

Significant inhalation may cause irritation of the respiratory tract and depress the central nervous system. Symptoms include nausea, dizziness, vomiting, and depression. At high concentrations, it is a narcotic and can lead to coma and death due to respiratory failure. It is of low chronic toxicity due to its efficient metabolism and excretion. It does *not* produce toxic

changes to nerve cells and peripheral neuropathy normally associated with exposure to *n*-hexane.

Skin and eye contact may produce mild to moderate irritation on contact. Ingestion can produce narcotic effects as those noted for inhalation above.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cyclohexane:

Skin: Mild irritation.

Eye: Mild to moderate irritation.

Lung: May cause dizziness, vomiting, and nausea. Primary result of inhalation of cyclohexane is its action on the CNS.

CNS: A CNS depressant causing headache, dizziness, depression, excitement, and changes in mood.

☛ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cyclohexane and can last for months or even years:

Cancer Hazards: According to information presented in the references, cyclohexane has not been adequately tested for its ability to cause cancer in animals. Limited studies indicate an increased incidence of Hodgkin's disease in workers exposed to organic solvents. It is not known, however, whether cyclohexane will have this effect.

Reproductive Hazard: According to information presented in the references, cyclohexane has not been tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged skin contact may cause drying, cracking, and chapping of the affected area. Repeated or long-term exposures to cyclohexane may affect the liver and kidneys.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cyclohexane. Even though the toxicity of this chemical is considered to be of relatively low order, it can still cause significant health effects if improperly used or if overexposures occur. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cyclohexane. For exposures above the PEL (300 ppm), a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cyclohexane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cyclohexane is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- Kidney and liver function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical

tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to cyclohexane and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cyclohexane should be communicated to all exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cyclohexane, emergency shower facilities should also be provided.
- Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of cyclohexane.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cyclohexane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cyclohexane is considered a class 1B flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point make this chemical a serious fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with common peroxides and other oxidizers and contact can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of cyclohexane.

Should cyclohexane ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities (including hydrogen chloride) is extremely possible.

Cyclohexane may enter the environment through industrial discharges or spills.

☠ **Acute Ecological Effects**

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cyclohexane.

This chemical has high acute toxicity to aquatic life. It causes membrane damage in ornamental crop species. Insufficient data are available on the short-term effects of cyclohexane exposure to birds or land animals.

☞ **Chronic Ecological Effects**

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Cyclohexane has moderate chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of cyclohexane to plants, birds, or land animals.

💧 **Water Solubility**

Cyclohexane is nearly insoluble in water. Concentrations of less than 100 milligrams may mix with a liter of water, depending on water pH and chemical concentration of cyclohexane.

⌚ **Persistence in the Environment**

Cyclohexane is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of cyclohexane will eventually end up in air.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated

in the tissues and internal organs of animals as well as humans.

The concentration of cyclohexane found in fish tissue is expected to be somewhat higher than the average concentration of cyclohexane in the water from which the fish was taken.

🛡️ **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cyclohexane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If cyclohexane should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cyclohexane. If cyclohexane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ For small spills (laboratory spills), absorb liquid in paper towels. Allow evaporation in a safe place (a fume hood or open air). After sufficient time has passed for evaporation, burn paper towels away from other combustibles. For larger spills, absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ If gas is leaking, stop the flow of gas. If the source is a cylinder and leak cannot be stopped in

place, remove cylinder to a safe place in the open air and repair or allow to empty.

- ☑ It may be necessary to dispose of cyclohexane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cyclohexane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety and emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Extinguishing Media

Use dry chemical, carbon dioxide, water, or alcohol foam.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Use water spray to keep fire-exposed containers cool. Containers may explode in fire.

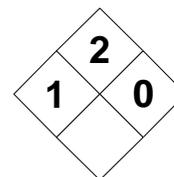

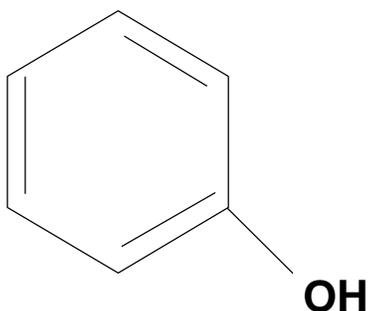

Unusual Fire and Explosion Hazards

Dangerous fire hazard when exposed to heat. Chemical will react on contact with oxidizable materials. Moderate explosion hazard when in the form of vapor.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|--|--|---|
| Stability | | Conditions to Avoid Keep away from sources of heat (including direct sunlight) or flame. Large quantities should be stored in metal tanks or drums. Keep away from incompatible materials. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, such as permanganates, peroxides, nitrates, chlorates, and perchlorates. Can react with nitric acid to form violently explosive materials and ignites on contact with divided chromium trioxide. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of cyclohexanol is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, cyclohexanol can emit highly toxic/poisonous and acrid fumes and gases. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X | |
| Health Hazards INHALATION: Can produce human systemic effects, including conjunctivitis and changes in the olfactory and respiratory systems. Can cause damage to the kidneys, liver, and blood vessels. Has narcotic-like action on high or prolonged exposures (headaches, dizziness). Also lachrymation, loss of coordination, convulsions, and possible effects on target organs. ABSORPTION: Irritating to the skin, absorbed in toxic amounts. Eye contact may injure cornea. INGESTION: Irritation and narcosis, including drowsiness. Toxic effects on liver and spleen. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes, skin, liver, kidney, spleen. |
| Medical Conditions Generally Aggravated by Exposure None reported. Skin conditions (dermatitis) or respiratory problems (asthma) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation</u>: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. Keep victim warm and at rest. If <u>swallowed</u>: Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb large spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method Burn in chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Use only non-sparking tools to open and close containers. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where cyclohexanol is used, handled, or stored. Heat may cause containers to build up pressure and explode. Containers must be grounded and bonded during transfer. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above the PEL, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Nitrile Rubber, Viton, or Teflon | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CYCLOHEXANOLC₆H₁₁OH

CAS: 110-87-7

**IDENTIFICATION AND TYPICAL USES**

Cyclohexanol is a colorless, hygroscopic, viscous liquid with a camphor- or methanol-like odor. It is used in the manufacture of soap (to incorporate solvents and phenolic insecticides). It is a source of adipic acid for nylon 66. It is also used in textile finishing, as a solvent for alkyd and phenolic resins, as a blending agent in lacquers, paints, and varnishes, in finish removers and in emulsified products. Other applications are found in leather degreasing, in polishes, plasticizers, in plastics, and in germicidal agents.

RISK ASSESSMENT: HEALTH***General Assessment***

Cyclohexanol is a human poison and is moderately toxic by *ingestion* and *inhalation*. It will also pass through unbroken skin (*absorption*) to cause toxic systemic effects. Its carcinogenicity in humans is not known but is questioned in animal studies. It has been shown to cause mutations in humans. Experimental teratogenic data have also been reported in animal tests.

Inhalation results in lachrymation, intoxication, loss of coordination, narcosis, and convulsions. It will irritate the nose, throat, and eyes. Narcotic effects include pronounced headache and may cause depression of the central nervous system, although this effect is not completely confirmed in the references.

Skin and eye contact may produce mild to moderate irritation on contact. It will pass through unbroken skin to cause toxic systemic effects including tremors and hypothermia. Absorption through the skin or inhalation of cyclohexanol vapors may cause toxic reactions in the brain, liver, kidney, and heart (in animal studies, it pro-

duced degenerative changes in the brain, heart, liver, and kidneys).

On ingestion, cyclohexanol is expected to produce symptoms of irritation and narcosis with toxic effects on target organs such as the liver and kidneys.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to cyclohexanol:

Skin: Moderate irritation with redness and possibly painful itching. Will pass through unbroken skin.

Eye: Severe irritation with a potential for corneal injury which may be irreversible depending upon length of contact and concentration of solution.

Lung: Nose and throat irritation. Produces intoxicating effects and may cause lung effects as well.

CNS: Unconfirmed effects by all routes of exposure. There may be tremor, hypothermia, and other unspecified effects.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to cyclohexanol and can last for months or even years:

Cancer Hazards: According to information presented in the references, cyclohexanol has not been adequately tested for its ability to cause cancer in animals. Some studies indicate that it causes mutations in humans,

while others are inconclusive in this regard. Some studies have listed its cancer causing properties as questioned in animal studies.

Reproductive Hazard: According to information presented in the references, cyclohexanol has produced an increase in the mortality of the offspring of test animals (mice). The teratogenicity of cyclohexanol in humans has not been adequately studied.

Other Chronic Effects: Prolonged skin contact may cause drying, cracking, and chapping of the affected area. Repeated or long-term exposures to cyclohexanol may affect the liver and kidneys.

🔑 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cyclohexanol. The exact nature of the toxicity of this chemical is not entirely understood in the references. Therefore, prudent risk management requires it be treated as though it posed a significant health risk in the event of overexposure. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cyclohexanol. For exposures above the PEL, a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, nitrile rubber, viton, or Teflon gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cyclohexanol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cyclohexanol is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

☑ Kidney and liver function tests.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to cyclohexanol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cyclohexanol should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cyclohexanol, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of cyclohexanol.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cyclohexanol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cyclohexanol is considered a class IIIA combustible liquid (per OSHA 29 CFR 1910.106). It presents a moderate fire hazard in contact with incompatible ma-

terials or in vapor form. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with common peroxides and other oxidizers and contact can cause fire or explosion. It will ignite on contact with chromium trioxide. Therefore, special consideration is required during any emergency situation involving a leak or spill of cyclohexanol. Should cyclohexanol ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities (including hydrogen chloride) is extremely possible.

The proper disposal method for cyclohexanol is to burn it in a chemical incinerator equipped with an afterburner and scrubber.

Cyclohexanol may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cyclohexanol.

Insufficient data are available on the short-term effects of cyclohexanol exposure to aquatic life, birds, plants, or land animals.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of cyclohexanol exposure to aquatic life, birds, plants, or land animals.

💧 *Water Solubility*

Cyclohexanol is nearly insoluble in water. Concentrations of less than 100 milligrams may mix with a liter of water, depending on water pH and chemical concentration of cyclohexanol.

🕒 *Persistence in the Environment*

Cyclohexanol is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of cyclohexanol will eventually end up in air.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cyclohexanol found in fish tissue is expected to be somewhat higher than the average concentration of cyclohexanol in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cyclohexanol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If cyclohexanol should contact the water table, aquifer, or navigable waterway, cleanup should be started immediately. It is only slightly soluble in water and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cyclohexanol. If cyclohexanol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.

- ☑ If gas is leaking, stop the flow of gas. If the source is a cylinder and the leak cannot be stopped in place, remove cylinder to a safe place in the open air and repair or allow to empty.
- ☑ It may be necessary to dispose of cyclohexanol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cyclohexanol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Symptoms include salivation, hypothermia, decreased breathing rate, and anesthesia. May also cause central nervous system depression with lung congestion and cell proliferation in the spleen. There can be slight kidney and liver damage with mild narcosis. Can also lead to pulmonary edema (fluid buildup in the lungs). SKIN & EYES: Irritating to the skin, may cause irritation and dermatitis. An eye irritant with possibility of corneal damage. INGESTION: Irritation and narcosis, anesthesia, and respiratory difficulties. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Questioned Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Respiratory system, eyes, skin, liver, kidney, spleen. |
| Medical Conditions Generally Aggravated by Exposure None reported. Skin conditions (dermatitis) or respiratory problems (asthma) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. Keep victim warm and at rest. Observe for 24-48 hours for lungs effects (pulmonary edema). If swallowed: Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb in vermiculite, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. | | | | |
| Preferred Waste Disposal Method Burn in chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Use only non-sparking tools to open and close containers. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where cyclohexanone is used, handled, or stored. Heat may cause containers to build up pressure and explode. Containers must be grounded and bonded during transfer. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above the PEL, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Nitrile Rubber, Viton, or Teflon | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CYCLOHEXANONEC₆H₁₀O

CAS: 108-94-1

**IDENTIFICATION AND TYPICAL USES**

Cyclohexanone is a colorless to pale yellow, oily liquid with an acetone and peppermint-like odor. It is used in the production of adipic acid for making nylon. It is also used in the preparation of cyclohexane resins, fats, waxes, shellac and wood stains, rubber, paint and varnish removers, spot removers, for the degreasing of metals, in polishes, as a leveling agent, in dyeing and delustering silk, as a lubricating oil additive, and in the manufacture of some pesticides (e.g., DDT).

RISK ASSESSMENT: HEALTH**General Assessment**

Cyclohexanone is moderately toxic by *ingestion* and *inhalation*. It will also pass through unbroken skin (*absorption*) to cause toxic systemic effects. Its carcinogenicity in humans is not known but is questioned in some animal studies. It has been shown to cause mutations (genetic changes) in human cells. Experimental teratogenic data have also been reported in animal tests.

Inhalation can cause changes in the sense of smell, conjunctiva irritation, and unspecified respiratory changes. It will irritate the nose, throat, and eyes. Mild narcotic properties have also been recorded, including pronounced headache and may cause depression of the central nervous system, although this effect is not completely confirmed in the references. Other symptoms on inhalation include salivation, hypothermia, decreased breathing rate, and anesthesia. There may also be lung congestion and cell proliferation in the spleen. Kidney and liver damage with mild narcosis (but no blood effects) may also be possible.

Skin and eye contact may produce mild to moderate irritation. There are also reports of skin absorption

occurring on exposure to cyclohexanone. Pure liquid in contact with the eye may result in corneal damage.

On ingestion, cyclohexanone is expected to produce symptoms of irritation and narcosis, anesthesia, and some respiratory difficulties.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cyclohexanone:

Skin: Will defat the skin and cause irritation and dermatitis. Absorption is likely. Pure liquid will cause severe irritation.

Eye: Severe irritation with a potential for corneal injury or damage.

Lung: Nose and throat irritation. Produces intoxicating effects and may cause lung effects as well.

CNS: Unconfirmed effects by all routes of exposure. There may be depression, anesthesia, hypothermia, and other unspecified effects.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cyclohexanone and can last for months or even years:

Cancer Hazards: According to information presented in the references, cyclohexanone has not been adequately tested for its ability to cause cancer in animals. Some studies indicate that it causes mutations in humans, while others are inconclusive in this regard. Some studies have listed its cancer causing properties as questioned animal studies.

Reproductive Hazard: According to information presented in the references, cyclohexanone may have the ability to adversely affect reproduction in animals. The teratogenicity of cyclohexanone in humans has not been adequately studied.

Other Chronic Effects: Prolonged skin contact may cause drying, cracking, and chapping of the affected area. There may be skin sensitization and/or dermatitis in some individuals. Repeated or long-term exposures to cyclohexanone may affect the liver and kidneys.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cyclohexanone. The exact nature of the toxicity of this chemical is not entirely understood in the references. Therefore, prudent risk management requires it be treated as though it posed a significant health risk in the event of overexposure. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cyclohexanone. For exposures above the PEL, a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn. Glove manufacturers should be contacted to obtain permeation studies *before* glove selection has been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cyclohexanone.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cyclohexanone is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney and liver function tests.
- ☑ Evaluation by a qualified allergist, with careful consideration of exposure history and special skin tests (may help diagnose allergy).
- ☑ Lung function tests, including Forced Vital Capacity (FVC).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures. Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, symptoms of exposure to cyclohexanone may be more pronounced (inflated) than those displayed by non-smokers. Proper risk assessment requires careful consideration of *all* possible factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatic transfer of cyclohexanone from storage containers to process or work containers is recommended.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to cyclohexanone and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cyclohexanone should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cyclohexanone, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who

have been trained on the hazards of cyclohexanone.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cyclohexanone. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cyclohexanone is considered a class IIIA combustible liquid (per OSHA 29 CFR 1910.106). It presents a moderate fire and explosion hazard risk, especially in contact with incompatible materials. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with common peroxides and other oxidizers and contact can cause fire or explosion. It explodes violently when added to nitric acid and, on mixing with hydrogen peroxide, it produces oily, explosives peroxides. Therefore, special consideration is required during any emergency situation involving a leak or spill of cyclohexanone. Should cyclohexanone ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities (including hydrogen chloride) is extremely possible.

The proper disposal method for cyclohexanone is to burn it in a chemical incinerator equipped with an afterburner and scrubber.

Cyclohexanone may enter the environment through industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cyclohexanone.

Insufficient data are available on the short-term effects of cyclohexanone exposure to aquatic life, birds, plants, or land animals.

💧* Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and

changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of cyclohexanone exposure to aquatic life, birds, plants, or land animals.

💧 Water Solubility

Cyclohexanone is nearly insoluble in water. Concentrations of less than 100 milligrams may mix with a liter of water, depending on water pH and chemical concentration of cyclohexanone.

🕒 Persistence in the Environment

Cyclohexanone is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of cyclohexanone will eventually end up in air.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cyclohexanone found in fish tissue is expected to be somewhat higher than the average concentration of cyclohexanone in the water from which the fish was taken.

🛑 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cyclohexanone should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immedi-

ately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If cyclohexanone should contact the water table, aquifer, or navigable waterway, cleanup should be started immediately. It is only slightly soluble in water and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cyclohexanone. If cyclohexanone is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources, ventilate area of leak.
- Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- It may be necessary to dispose of cyclohexanone as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cyclohexanone can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

U *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and

policies should be developed, approved, and implemented long before any need for such arises.

CYCLOHEXENEC₆H₁₀

CAS: 110-83-8

**IDENTIFICATION AND TYPICAL USES**

Cyclohexene is a colorless liquid with a sweet odor. It is used in the making of adipic acid, maleic acid, and butadiene. It is also used in oil extraction, as a stabilizer for high-octane gasoline, and in organic synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

Cyclohexene is an acute irritant of moderate toxicity by *inhalation* and *ingestion*. The references contain relatively little information on the exact toxicological nature of this chemical. However, in sufficient or high concentrations, it has been shown to cause some toxic systemic effects through both routes of exposure. Skin contact can also produce some adverse topical effects and *absorption* has been reported but not confirmed.

Significant inhalation may cause irritation of the respiratory tract, eyes, and possible depression of the central nervous system. Symptoms may include nausea, dizziness, vomiting, and depression. At high concentrations, it is a narcotic and can lead to coma and death due to respiratory failure.

Skin and eye contact may produce mild to moderate irritation on contact. Ingestion can produce narcotic effects as those noted for inhalation above.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cyclohexene:

Skin: Mild to severe irritation possible.

Eye: Mild to moderate irritation. Damage is possible depending upon concentration of liquid and duration of contact.

Lung: May cause dizziness, vomiting, and nausea. Primary result of inhalation of cyclohexene is its action on the CNS.

CNS: A CNS depressant. Headache, dizziness, depression, and changes in mood.

☛ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cyclohexene and can last for months or even years:

Cancer Hazards: According to information presented in the references, cyclohexene has not been adequately tested for its ability to cause cancer in animals. Limited studies indicate an increased incidence of Hodgkin's disease in workers exposed to organic solvents. It is not known, however, whether cyclohexene will have this effect.

Reproductive Hazard: According to information presented in the references, cyclohexene has not been tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged skin contact may cause drying, cracking, and chapping of the affected area. Repeated or long-term exposures to cyclohexene may affect the liver and kidneys.

🛑 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with cyclohexene. Even though the toxicity of this chemical is considered

to be of relatively low order, it can still cause significant health effects if improperly used or if overexposures occur. If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cyclohexene. For exposures above the PEL (300 ppm), a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cyclohexene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cyclohexene is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney and liver function tests.
- ☑ Lung function tests (including Forced Vital Capacity (FVC)).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, liquids should be transferred automatically from storage to process containers.

- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to cyclohexene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cyclohexene should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cyclohexene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of cyclohexene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cyclohexene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cyclohexene is considered a class 1B flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and relatively low boiling point make this chemical a serious fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with a common peroxides and other oxidizers and contact can cause fire or explosion. Therefore, special consideration is required during any emergency situation involving a leak or spill of cyclohexene. Should cyclohexene ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Cyclohexene may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cyclohexene.

This chemical has high acute toxicity to aquatic life. Insufficient data are available on the short-term effects of cyclohexene exposure to plants, birds or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Cyclohexene has moderate chronic toxicity in aquatic life. Insufficient data are available on the long-term effects of cyclohexene to plants, birds, or land animals.

💧 *Water Solubility*

Cyclohexene is nearly insoluble in water. Concentrations of less than 100 milligrams may mix with a liter of water.

🕒 *Persistence in the Environment*

Cyclohexene is non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Virtually 100% of cyclohexene will eventually end up in air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cyclohexene found in fish tissue is expected to be somewhat higher than the average concentration of cyclohexene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill

to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cyclohexene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If cyclohexene should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cyclohexene. If cyclohexene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ If gas is leaking, stop the flow of gas. If the source is a cylinder and leak cannot be stopped in place, remove cylinder to a safe place in the open air and repair or allow to empty.
- ☑ It may be necessary to dispose of cyclohexene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cyclohexene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly

affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Health Hazards INHALATION: Irritation to the respiratory system and mucous membranes. Symptoms include cough, drowsiness, lightheadedness, dizziness, diarrhea, nausea, vomiting, and pulmonary edema (fluid buildup in the lungs) which can lead to death. Narcotic effects possible. ABSORPTION: Severe skin irritant causing burns and sensitization. Eye contact with pure liquid can cause damage to and/or loss of vision. Will pass through skin to cause systemic effects. INGESTION: Gastrointestinal irritation, diarrhea, vomiting, nausea, dizziness. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? No | Target Organs? Respiratory system, eyes, skin, CNS. |
| Questioned Human Questioned Animal | | | | |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. Observe for 24 - 48 hours for lung effects (pulmonary edema). If swallowed: Do NOT induce vomiting. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers using non-sparking tools. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. Decontaminate spill area using water (collect as waste). | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat, flame, air, and light. Use only non-sparking tools to open and close containers. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where cyclohexylamine is used, handled, or stored. Heat may cause containers to build up pressure and explode. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures above the PEL, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or use a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Nitrile Rubber, Viton, or Teflon | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Rubber Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CYCLOHEXYLAMINE

CAS: 108-91-8

**IDENTIFICATION AND TYPICAL USES**

Cyclohexylamine is a colorless to yellow liquid with a strong, fishy, amine-like odor. It is used in the manufacture of numerous products, including plasticizers, dry-cleaning soaps, insecticides, and emulsifying agents. It is also used as a corrosion inhibitor and in organic synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

Cyclohexylamine is a human poison by *inhalation*, *ingestion*, and skin *absorption*. It is a severe irritant to the eyes, skin and respiratory system. Human mutation data have been reported for cyclohexylamine. It is a questionable human and animal carcinogen as well as a suspected teratogen.

Inhalation can cause irritation to the respiratory system and associated mucous membranes. It can cause cough, congestion, with narcotic effects associated with the depression of the central nervous system (CNS). These include dizziness, drowsiness, lightheadedness, and possible convulsions. The most serious effect of inhalation is the potential for pulmonary edema (fluid buildup on the lungs), which is a medical emergency and may be fatal. Symptoms of congestion, cough with phlegm, nausea, vomiting, and loss of consciousness may not appear for 24 - 48 hours after exposure (giving a misleading or false sense of security).

Skin contact can produce burns and sensitization. The liquid will pass through unbroken skin to cause toxic systemic effects similar to the effects on the CNS caused by inhalation. Contact of the pure liquid or its concentrated solutions with the eyes may cause serious damage up to and including loss of vision.

The acute oral toxicity of cyclohexylamine (in test animals) appears to be moderate. Effects include nau-

sea, vomiting, and degenerative changes in the brain, liver, and kidney.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cyclohexylamine:

Skin: Severe irritation and possible burns. Will pass through unbroken skin to cause toxic systemic effects.

Eye: Severe irritation with damage and possible loss of vision likely (liquid contact).

Lung: Severe irritation to the respiratory tract and associated mucosa. Can cause dizziness, vomiting, and nausea. Pulmonary edema (fluid in the lungs) is likely following acute exposure.

CNS: A CNS depressant. Headache, dizziness, drowsiness, possible convulsions.

Other: Ingestion will cause irritation to the gastrointestinal system with nausea, vomiting, convulsions, other toxic systemic effects. Liver and/or kidney damage possible.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cyclohexylamine and can last for months or even years:

Cancer Hazards: Some studies have suggested that cyclohexylamine causes mutations (genetic changes) in humans. While there is no evidence of carcinogenicity of this chemical in humans or animals, it is still considered a *questioned* carcinogen primarily because of its mutagenic properties. It has been suggested that mutagenic chemicals should be regarded as carcinogens during use and handling.

Reproductive Hazard: According to information presented in the references, cyclohexylamine has been shown to cause adverse effects on the reproductive systems of test animals. Testicular atrophy and changes in organ weights have also been reported. These studies, however, are inconclusive.

Other Chronic Effects: Repeated skin contact may cause sensitization, dermatitis, chronic rash, and associated irritation. Once an allergy develops, the slightest future exposures will cause a recurrence of the symptoms. Repeated or long-term exposures to cyclohexylamine may affect the liver and kidneys.

🔊 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with cyclohexylamine. The long-term (chronic) toxicity of this chemical is not completely understood. However, it is known to cause serious health effects in the short-term and is also a known human mutagenic. Prudent risk management requires extreme caution and a conservative approach when assessing the hazard of such chemicals.

If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cyclohexylamine. For exposures above the PEL (10 ppm), a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cyclohexylamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard

Communication), prior to the first assignment in an area where cyclohexylamine is used or stored.

Before beginning employment with cyclohexylamine and at regular intervals thereafter (e.g., annually), those persons with high or frequent exposures should be provided the following recommended medical tests:

- ☑ Lung function tests (including Forced Vital Capacity, or "FVC").

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney and liver function tests.
- ☑ Lung function tests (including Forced Vital Capacity, or "FVC").
- ☑ Consider chest X-ray.
- ☑ Evaluation by a qualified allergist, with careful evaluation of exposure history and special testing (may help diagnose allergy).

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, liquids should be transferred automatically from storage containers to process containers.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to cyclohexylamine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cyclohexylamine should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cyclohexylamine, emergency shower facilities should be provided.

- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of cyclohexylamine.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cyclohexylamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cyclohexylamine is considered a class 1C flammable liquid (per OSHA 29 CFR 1910.106). Its low flash point and boiling point make this chemical a moderate fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is incompatible with oxidizers, organic compounds, acids, and contact can cause fire or explosion. It is corrosive to many common metals (copper, aluminum, lead). Therefore, special consideration is required during any emergency situation involving a leak or spill of cyclohexylamine. Should cyclohexylamine ever come into contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Cyclohexylamine may enter the environment through industrial discharges or spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cyclohexylamine.

Insufficient data are available on the short-term effects of cyclohexylamine exposure to aquatic life, plants, birds or land animals.

☠ Chronic Ecological Effects

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals.

These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of cyclohexylamine to aquatic life, plants, birds, or land animals.

💧 Water Solubility

Cyclohexylamine is moderately soluble in water. Concentrations between 1 and 1000 milligrams will mix with a liter of water (forms an azeotropic solution in water).

🕒 Persistence in the Environment

Cyclohexylamine is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cyclohexylamine found in fish tissue is expected to be about the same as the average concentration of cyclohexylamine in the water from which the fish was taken.

🛡 Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cyclohexylamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If cyclohexylamine should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cyclohexylamine. If cyclohexylamine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of cyclohexylamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cyclohexylamine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Remember that anytime the term "reproductive hazard" is used, public emotion and hysteria can run equally high. This requires careful consideration in the development of company policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and

policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|---|------------------------------------|
| Characterization Alicyclic Hydrocarbon | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name Cyclopentadiene | Chemical Abstract Service (CAS) Number 542-92-7 | |
| DOT Hazard Class and Label Requirements Not Found | DOT Emergency Guide Code No Citation | |
| DOT Identification Number Not Found | Chemical Formula C₅H₆ | |

Synonyms

1,3-Cyclopentadiene; pentole; pyropentylene; r-pentine.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Cyclopentadiene (derivation: From coal tar and cracked petroleum oils). 1 ppm = 2.75 mg/m³ | PEL: 75 ppm 200 mg/m³ STEL: Not Established | REL: 75 ppm 200 mg/m³ STEL: Not Established | 750 ppm | TLV: 75 ppm 200 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 109°F (43°C) | Specific Gravity (H ₂ O = 1) 0.809 |
| Vapor Pressure (gas) 400 at 69°F (20°C) | Molecular Weight 66.1 |
| Vapor Density (Air = 1) Not Determined | Melting Point -121°F (-85°C) |

Solubility

Insoluble in water. Soluble in most organic solvents.

Appearance and Odor

Colorless liquid with an irritating, terpene-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 77°F (25°C) opened cup | Explosive Limits in Air % by Volume LEL: 1.5% UEL: 9.4% |
| NFPA Classification Class 1C Flammable Liquid | Autoignition Temperature Not Determined |

Extinguishing Media

Use dry chemical, foam, or carbon dioxide. Water spray may be used to cool surrounding areas.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Poisonous gases are produced in fire. Evacuate 1500 feet radius if fire becomes uncontrollable or container is exposed to flame.

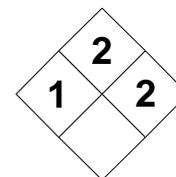

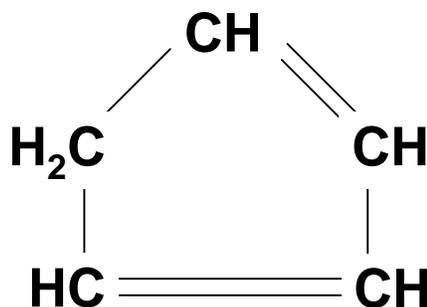

Unusual Fire and Explosion Hazards

Dangerous fire and explosion hazard when exposed to heat or flame. Containers may explode in fire. Prolonged exposure to air may cause the formation of explosive peroxides. Moderate explosion hazard when in the form of vapor. Violent decomposition at high temperatures.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|--|--|
| Stability | | Conditions to Avoid Keep away from heat or flame and incompatible materials. Very reactive with incompatible materials. Reactions can be violent and even explosive. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, (such as permanganates, peroxides, nitrates, chlorates, and perchlorates), fuming nitric acid and sulfuric acid. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of cyclopentadiene is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Cyclopentadiene decomposes violently at high temperatures and pressures. Reaction is highly exothermic. When heated to decomposition, emits acrid smoke and fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Possible irritation of the eyes and upper respiratory tract with symptoms of headache and nausea. May depress the circulatory system and respiratory systems. High doses may cause narcosis, convulsions, liver and kidney damage, and death (human exposure data inconclusive). SKIN & EYES: Mild to moderate irritation of the skin and eyes (vapor and liquid states). INGESTION: No firm data reported. Possible gastrointestinal irritation, with diarrhea and nausea. | | | | |
| Carcinogenicity No Citation | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Respiratory system, eyes. |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance, if necessary. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR, if required. Transfer to medical facility. If <u>swallowed:</u> Never give an unconscious or convulsing person anything by mouth. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb spills in vermiculite, dry sand, earth, or similar material and deposit in sealed containers using non-sparking tools. Ventilate area of spill or leak. Restrict those not involved in cleanup from entering area. Remove all sources of ignition. Contact state or local authorities, if required. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Store to avoid contact with incompatible materials in tightly closed containers in cool, well-ventilated area away from heat and flame. Use only non-sparking tools to open and close containers. | | | | |
| Other Precautions and Warnings Sources of ignition are prohibited where cyclopentadiene is used, handled, or stored. Heat may cause containers to build up pressure and explode. Very reactive in presence of incompatible materials. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposures (up to PEL), use an organic vapor respirator. For higher exposures, use a supplied-air respirator with full facepiece, hood, or helmet in continuous flow mode, or a self-contained breathing apparatus (SCBA) operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

CYCLOPENTADIENEC₅H₆

CAS: 542-92-7

**IDENTIFICATION AND TYPICAL USES**

Cyclopentadiene is a colorless liquid with an irritating, terpene-like odor. It is used as a chemical intermediate, in organic synthesis, as a starting material for synthetic prostaglandin, in the chlorination of insecticides, and in the formation of sandwich compounds for chelation. It is also used in the manufacture of resins and as a ligand in the preparation of metal compounds.

RISK ASSESSMENT: HEALTH**General Assessment**

Cyclopentadiene has exhibited low toxicity in test animals. Human exposure risk is primarily by *inhalation*. Skin and eye contact with the liquid or vapor can be mildly irritating.

Inhalation of cyclopentadiene vapors can be irritating to the eyes, nose, and upper respiratory system. There may be headache and nausea. High concentrations (3 mL) administered by injection to test animals produced narcosis, convulsions, and death. Prolonged exposures to vapors in animals tests led to liver and kidney injuries.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to cyclopentadiene:

Skin: Mild irritation with possibility for rash.

Eye: Mild to moderate irritation (liquid or vapor contact) with tearing and redness. Prolonged contact can result in inflammation.

Lung: Irritation of the upper respiratory tract and depression of the respiratory system. There may be headache and nausea.

Other: Ingestion may cause irritation to the gastrointestinal system. There may be depression of the circulatory system.

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to cyclopentadiene and can last for months or even years:

Cancer Hazards: According to information presented in the references, cyclopentadiene has not been adequately tested for its ability to cause cancer in animals.

Reproductive Hazard: According to information presented in the references, cyclopentadiene has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated or long-term exposures to cyclopentadiene may affect the liver and kidneys.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with cyclopentadiene. The long-term (chronic) toxicity of this chemical is not completely understood. Prudent risk management requires caution and a conservative approach when assessing the hazard of such chemicals.

If a less toxic chemical cannot be substituted for a hazardous substance, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local

exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around cyclopentadiene. For exposures above the PEL (75 ppm), a full facepiece respirator equipped with an organic vapor cartridge is suggested. For high or prolonged exposures, a supplied-air respirator with full facepiece operated in continuous flow mode, or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, acid resistant gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with cyclopentadiene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where cyclopentadiene is used or stored.

If symptoms develop or overexposure is suspected, the following tests are recommended:

- ☑ Kidney and liver function tests.
- ☑ Lung function tests (including Forced Vital Capacity, or "FVC").

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, liquids should be transferred automatically from storage containers to process containers.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances and that personnel are trained on its use and care

- ☑ Wash thoroughly immediately after exposure to cyclopentadiene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of cyclopentadiene should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to cyclopentadiene, emergency shower facilities should also be provided.
- ☑ Personnel should never wear contaminated clothing home (family members can be exposed). Clothing should be laundered by personnel who have been trained on the hazards of cyclopentadiene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of cyclopentadiene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Cyclopentadiene is considered a class 1C flammable liquid (per OSHA 29 CFR 1910.106). Its relatively low flash point and boiling point make this chemical a moderate fire and explosion hazard concern. These characteristics require extreme caution in handling, storage, transportation, and disposal. It is a dangerous fire hazard when exposed to heat and flame. It is also a moderate explosion hazard in the form of a gas when exposed to heat or by chemical reaction. It decomposes violently at high temperatures and pressure. It is incompatible with oxidizers and will react explosively with fuming nitric acid. Mixed with oxygen, it forms a flame-sensitive explosive product. It will react vigorously in the presence of potassium hydroxide and is incompatible with acids (sulfuric), and oxides of nitrogen. Therefore, special consideration is required during any emergency situation involving a leak or spill of cyclopentadiene. Should cyclopentadiene ever come into

contact with these incompatible substances during use, transportation, storage, or disposal, the formation of highly toxic and/or highly explosive commodities is extremely possible.

Cyclopentadiene may enter the environment through industrial discharges or spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to cyclopentadiene.

Insufficient data are available on the short-term effects of cyclopentadiene exposure to aquatic life, plants, birds or land animals.

☞ *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available on the long-term effects of cyclopentadiene to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Cyclopentadiene is nearly insoluble in water. Concentrations of less than 100 milligrams may mix with a liter of water.

⌚ *Persistence in the Environment*

Cyclopentadiene is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of cyclopentadiene found in fish tissue is expected to be about the same as the average concentration of cyclopentadiene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of cyclopentadiene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If cyclopentadiene should contact the water table, aquifer, or navigable waterway, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of cyclopentadiene. If cyclopentadiene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Remove all ignition sources, ventilate area of leak.
- ☑ Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers.
- ☑ It may be necessary to dispose of cyclopentadiene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving cyclopentadiene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result

from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Vapor Density (Air = 1) 12 | Melting Point 227°F (108°C) |

Solubility

Insoluble in water, soluble in most organic solvents.

Appearance and Odor

Colorless crystals or white to slightly off-white powder, odorless or with slight aromatic odor. Odor Threshold = 0.2 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 162-171°F (72-77°C) closed cup | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Combustible Solid | Autoignition Temperature Not Applicable |

Extinguishing Media

Use dry chemical, carbon dioxide, foam, water, or water spray.

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Move containers from fire if it can be done without risk.

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Exercise extreme caution when attempting to move or relocate containers that may have been exposed to high heat. DDT is a toxic waste; by-products of fire fighting operations should be handled as hazardous waste as well.

SECTION V - REACTIVITY DATA

| | | |
|---------------------------------|----------------------------|--|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials. DDT is sensitive to exposure to ultraviolet light. It is also sensitive to high temperatures. Solutions with water, ethanol or acetone should remain stable for 24 hours. |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (such as chlorine, bromine, fluorine) and alkalis. May react with iron, aluminum and iron salts, ferric chloride and aluminum chloride. |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of DDT is not expected to occur. |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating gases are produced when DDT is involved in fire. |

SECTION VI - HEALTH HAZARD DATA

| | | | |
|-----------------------------------|-------------------------|--------------------------------|------------------------|
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X |
|-----------------------------------|-------------------------|--------------------------------|------------------------|

Health Hazards

INHALATION: Symptoms include tremors of the head and neck muscles, tonic and clonic convulsions, cardiac or respiratory failure, and death. Prolonged exposures cause CNS depression and degeneration, weakness, convulsions, and coma.

ABSORPTION: Headache, dizziness, nausea, vomiting, tremor, ataxia, convulsions, CNS depression, respiratory failure, and may cause renal damage. May cause skin allergy.

INGESTION: May cause anesthesia, convulsions, headache, analgesia, cardiac arrhythmia, nausea, vomiting, sweating, and unspecified pulmonary changes.

| | | | | |
|---|---|---------------------------|--|--|
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | 5th Annual Report | Group 2B | 29 CFR 1910.1000 Table Z-1 (skin) | CNS, liver, kidneys, skin, eyes, PNS, lymph glands. |

Medical Conditions Generally Aggravated by Exposure

Renal and/or liver function problems; Skin conditions (dermatitis).

Emergency and First-aid Procedures

Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. **Skin contact:** Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For **inhalation:** Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If **swallowed:** If victim is conscious, give large amounts of water and milk. Do NOT induce vomiting. Never attempt to give an unconscious or convulsing person anything by mouth. Seek medical attention immediately.

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled

Collect powdered material in the most convenient (safe) way possible and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable.

Preferred Waste Disposal Method

Chemical incinerator equipped with scrubber and afterburner.

Precautions to be Taken in Handling and Storage

Do not store DDT in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, dark, well-ventilated area. Personnel working with DDT should be trained on its proper handling and storage prior to being assigned to such responsibilities.

Other Precautions and Warnings

The use of this compound was prohibited in the United States in 1973. It is still manufactured for use in other countries. Bulk storage is of DDT is not recommended.

SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT

Respiratory Protection (*specify type*)

At any exposure level: Use a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode.

Ventilation

Local exhaust or general mechanical systems recommended.

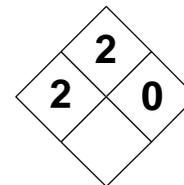

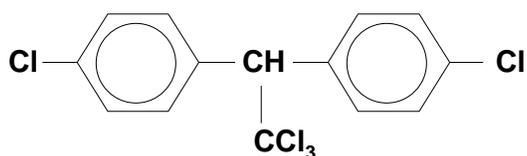

| | | |
|---|---|---|
| Protective Gloves Rubber or Latex | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Apron |
|---|---|---|

Work/Hygiene Practices

Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals.

DDT (dichlorodiphenyltrichloroethane) $(\text{ClC}_6\text{H}_4)_2\text{CHCCl}_3$

CAS: 50-29-3

**IDENTIFICATION AND TYPICAL USES**

DDT appears as colorless crystals or off-white powder with a slight, aromatic odor. It is used as an insecticide, as a pesticide, and to control vectors of disease. It is used in veterinary medicine as an insecticide and pediculicide. It is used to kill head lice and disinfect clothing. It is also used as an ectoparasiticide. The use of this compound was prohibited in the United States in 1973. Food and Drug Administration (FDA) tolerance in foods is 5 ppm. It is not biodegradable.

RISK ASSESSMENT: HEALTH**General Assessment**

DDT is a confirmed carcinogen in animals and is highly suspected to cause cancer in humans. Experimental neoplastigenic, tumorigenic, carcinogenic, and teratogenic data have been reported in numerous studies. Human mutation data have also been recorded. It is a human poison primarily by *ingestion*, but can also enter the body through *inhalation* and skin *absorption*.

Ingestion of large doses will result in a broad spectrum of toxic systemic effects as well as local gastric irritation. These include anesthesia, headache, analgesia, cardiac arrhythmia, nausea or vomiting, sweating, delayed emesis or diarrhea, and unspecified pulmonary changes. Other symptoms may appear 2-3 hours after small doses. These include tingling of the lips, tongue, and face. There may be malaise, headache, sore throat, fatigue, coarse tremors of the neck, head, and eyelids, apprehension, ataxia, and confusion. Convulsions may alternate with periods of coma and partial paralysis. Vital signs may appear as normal, but in severe poisonings, the pulse may be irregular or abnormally slow. Ventricular fibrillation and sudden death may occur.

Inhalation will irritate the eyes, nose, and upper respiratory tract. It can also produce many of the toxic systemic effects noted for ingestion. Pulmonary edema

(fluid buildup in the lungs) does not normally occur. If it does, it may indicate solvent intoxication.

Skin contact produces mild irritation. If allowed to remain in contact for prolonged periods of time, may cause smarting and reddening of the skin. Absorption of the solid crystals is not likely. However, when DDT is mixed in solution, absorption through unbroken skin may occur on prolonged contact causing toxic systemic effects.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to DDT:

Skin: Dermatitis associated with DDT is unusual. Most effects from skin contact are internal due to absorption of liquid solutions containing DDT. Symptoms include vomiting, nausea, malaise, and muscular twitching at high doses (above the PEL).

Eye: Possible irritation.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems.

CNS: Dizziness, headaches, nausea, vomiting, muscle jerks, severe seizures, and death.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to DDT and can last for months or even years:

Cancer Hazards: DDT is a confirmed carcinogen in test animals and has been shown to effect animals in the wild as well. It is highly suspected to cause cancers in humans. It is a known human mutagen (causes genetic changes). The data on human carcinogenicity are conflicting and inconclusive.

Reproductive Hazard: DDT may be a teratogen in humans since it has been shown to be a teratogen in some test animals.

Other Chronic Effects: Prolonged exposures may damage the liver or kidney. In animals, chronic exposures have caused liver, lung, and lymphatic tumors. It is not known whether long-term human exposure will have the same effects.

☛ **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with DDT. Even though it has not been permitted for use in the United States since 1973, it is still manufactured for export to other countries. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. This may not be feasible during use as a pesticide outdoors, but it may be possible during manufacture of DDT. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around DDT. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever DDT is being mixed with liquids, a chemical splash hazard exists and a face shield and rubber apron should be worn. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with DDT.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where DDT is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests.
- ☑ Liver and kidney function tests.

- ☑ Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to DDT and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of DDT should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of DDT. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

DDT is considered a combustible solid. While it is a minor fire hazard in and of itself, it is often mixed with liquids which are either flammable or combustible. These characteristics require special consideration during any emergency situation involving a leak or spill of DDT or DDT mixtures. Should DDT ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine) or alkali materials either during use, transportation, or storage, violent reaction can occur.

The proper disposal/destruction method for DDT is to burn it in a chemical incinerator equipped with an afterburner and air scrubber.

DDT can enter the environment through its normal, intended use as a pesticide and through industrial discharges, urban runoff, and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to DDT. This chemical has high acute toxicity to aquatic life and to birds. Insufficient data are available to evaluate or predict the short-term effects of DDT to plants or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

DDT has high chronic toxicity to aquatic life and to birds. Insufficient data are available to evaluate or predict the long-term effects of DDT to plants or land animals.

💧 *Water Solubility*

DDT is very slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

🕒 *Persistence in the Environment*

DDT is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of DDT found in fish tissues is expected to be much higher than the average concentration of DDT found in the water from which the fish was taken.

🔒 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of DDT should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If DDT should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of DDT. If DDT is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered material in the most convenient (safe) manner possible and deposit in sealed containers. If liquid solutions are spilled, use vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of DDT as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving DDT can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environ-

mental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. The public is particularly aware of chemicals such as DDT because of the years of publicity concerning this chemical's hazardous nature. Risk managers should be aware of this when formulating any public relations policies.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

|--|--|--|---|--|
| Decaborane (derivation: A by-product of the pyrolysis of diborane). 1 ppm = 5.08 mg/m³ | PEL (skin): 0.05 ppm 0.3 mg/m³ STEL: 0.15 ppm 0.9 mg/m³ | REL (skin): 0.05 ppm 0.3 mg/m³ STEL: 0.15 ppm 0.9 mg/m³ | 3 ppm (15 mg/m³) | TLV (skin): 0.05 ppm 0.3 mg/m³ STEL: 0.15 ppm 0.9 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 210°F (99°C) Decomposes | Specific Gravity (H ₂ O = 1) 0.94 |
| Vapor Pressure (mm Hg) 0.2 at 69°F (20°C) | Molecular Weight 122.2 |
| Vapor Density (Air = 1) 4.2 | Melting Point 210°F (99°C) |

Solubility

Slightly soluble in cold water, decomposes in hot water. Dissolves in carbon disulfide, alcohol, benzene, ethyl acetate, and acetic acid.

Appearance and Odor

Colorless to white crystalline solid with an intense, bitter, chocolate-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) 176°F (80°C) closed cup | Explosive Limits in Air % by Volume LEL: N/A UEL: N/A |
| NFPA Classification Combustible Solid | Autoignition Temperature 300°F (149°C) |

Extinguishing Media

Use dry chemical, carbon dioxide, or water spray. Do not use halogenated extinguishing agents.

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). May give-off toxic fumes of unburned material. Move containers from fire area if it can be done without risk.

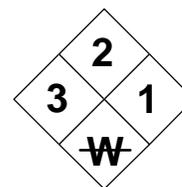

Unusual Fire and Explosion Hazards

Reacts slowly with water to form flammable hydrogen gas. Decaborane ignites spontaneously in oxygen. Reactions with halogen compounds yield products that may explode on impact. May explode when hot (burns with a green colored flame).

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------|---|--|---|
| Stability | | Conditions to Avoid Avoid contact with incompatible materials. Decaborane forms impact-sensitive explosive mixtures with ethers (e.g., dioxane) and halocarbons (carbon tetrachloride). | | |
| Stable | Unstable | Incompatibility (<i>materials to avoid</i>) Oxidizers, water, halogenated compounds, dimethyl sulfoxide. Ignites spontaneously in oxygen and may ignite in air. It produces hydrogen when it hydrolyzes with water or on decomposition at 572°F (300°C). | | |
| X | | | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of decaborane is not expected to occur. | | |
| May Occur | Will Not Occur | Hazardous Decomposition or By-products When heated to decomposition, decaborane emits toxic fumes of boron oxides. Also produces flammable hydrogen gas at decomposition. | | |

DECABORANEB₁₀H₁₄

CAS: 17702-41-9

**IDENTIFICATION AND TYPICAL USES**

Decaborane appears as a colorless to white, orthorhombic, crystalline solid with an intense, bitter, chocolate-like odor. It is used in rocket propellants, as a catalyst in olefin polymerization, as a fuel additive, a corrosion inhibitor, and as a stabilizer. It is also used as a delustrant in the manufacture of rayon, as a moth-proofing agent, a dye-stripping agent, a reducing agent, a fluxing agent, and as an oxygen scavenger.

RISK ASSESSMENT: HEALTH**General Assessment**

Decaborane is a highly toxic compound by all routes of exposure (*inhalation, ingestion, and skin absorption*). It is a systemic poison in humans and acute high exposures or chronic low exposures can lead to death. Its carcinogenicity, teratogenicity, and mutagenicity are unknown in humans.

Inhalation of decaborane vapors or dusts can be irritating to the nose, throat, and upper respiratory tract. Primary effect of inhalation is its apparent action to depress the central nervous system (CNS). Symptoms may include headache, nausea, vomiting, dizziness, drowsiness, and lightheadedness. In severe cases of poisoning, there may be muscle spasm and convulsions. It is important to note that symptoms of exposure may be delayed for 24 to 48 hours following exposure, thereby creating a dangerous and risky false sense of security.

Ingestion can cause spasm, tremor, and convulsion. There may also be fatigue, weakness, muscle spasms, dyspnea, and liver and kidney damage.

Decaborane can be absorbed through unbroken skin to cause toxic systemic effects, including, but not limited to loss of coordination and drowsiness. Toxic systemic effects from absorption, however, are considered to be relatively moderate in comparison to other routes of entry.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to decaborane:

Skin: Irritation and possible rash. If allowed to remain on skin, symptoms of headache, dizziness, nausea, and other systemic effects may occur.

Eye: Dusts will irritate the eyes. Liquid solutions may cause burns and damage.

Lung: Mild irritation of the nose and throat. May cause nausea and vomiting.

CNS: Dizziness, headaches, nausea, vomiting, muscle spasms, tremor, fatigue, convulsions, dyspnea, nervousness, drowsiness, and loss of coordination.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to decaborane and can last for months or even years:

Cancer Hazards: According to the information presented in the references, decaborane has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, decaborane has not been adequately tested for its ability to adversely effect reproduction.

Other Chronic Effects: Prolonged exposures may damage the liver or kidney.

🚫 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with decaborane. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release.

While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around decaborane. This chemical has an extremely low permissible exposure limit (0.05 ppm). Therefore, prudent risk management requires a conservative approach to personal protection. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical/dust goggles should be worn to protect the eyes. Whenever decaborane is being mixed with liquids, a chemical splash hazard exists and a face shield and rubber apron should be worn. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with decaborane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where decaborane is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Liver and kidney function tests.
- Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Physicians are advised to treat symptomatically. Administration of methocarbamol or other muscle relaxant may be helpful immediately following exposure and in the absence of symptoms (note that symptoms may be delayed up to 48 hours in some cases).

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to decaborane and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of decaborane should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of decaborane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Decaborane is considered a combustible solid. While it is a minor fire hazard in and of itself, it is often mixed with liquids which are either flammable or combustible. It ignites spontaneously in oxygen and may ignite in contact with air. In reaction to halogenated compounds, it yields products that may explode on impact. These characteristics require special consideration during any emergency situation involving a leak or spill of decaborane or decaborane mixtures. Should decaborane ever come into contact with incompatible substances such as strong oxidizers, water, halogenated compounds (especially carbon tetrachloride), or dimethyl sulfoxide either during use, transportation, or storage, violent reaction can occur.

Decaborane may be destroyed by carefully dissolving with water followed by treating with 1 M sulfuric acid to a pH of 1. Hydrogen gas will be emitted after addition of acid and should be vented to avoid accumulation of explosive atmospheres. The remaining solution should be allowed to evaporate to dryness. The residue should be buried in an approved landfill site. Decaborane can enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to decaborane.

Insufficient data are available to evaluate or predict the short-term effects of decaborane to aquatic life, plants, birds, or land animals.

💧 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of decaborane to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Decaborane is very slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

🕒 *Persistence in the Environment*

Decaborane is highly persistent in water, with a half-life greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of decaborane found in fish tissues is expected to be much higher than the average concentration of decaborane in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars

will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of decaborane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. A nitrogen purge is recommended inside all storage vessels and bulk storage containers.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If decaborane should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of decaborane. If decaborane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Collect powdered material in the most convenient (safe) manner possible and deposit in sealed containers. If liquid solutions are spilled, use vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of decaborane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving decaborane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an

injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

☉ Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of decahydronaphthalene is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, decahydronaphthalene will emit acrid and irritating smoke and fumes. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin/eye)? | Ingestion? X |
| Health Hazards INHALATION: May cause severe irritation to the respiratory system. There may be conjunctiva irritation and unspecified olfactory and pulmonary changes. There may be numbness, headache, and vomiting. Urine may become blue and there may be kidney damage. SKIN & EYES: Extremely irritating to the skin and eyes. Liquid contact will de-fat the skin. May cause cracking and secondary infection, eczema may also develop. INGESTION: Gastrointestinal irritation. Possible kidney damage. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | No | No | No | Skin, eyes, respiratory system, kidney. |
| Medical Conditions Generally Aggravated by Exposure None reported, however, skin conditions (dermatitis) and respiratory problems may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing, including shoes. Immediately wash area with flooding amounts of soap and water. Seek medical attention immediately. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for shock. If swallowed: Seek medical attention immediately. If conscious, give warm salt water to drink. DOCTOR: Suggest a mild cathartic: Conserve liver and kidney functions. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Wear self-contained breathing apparatus (SCBA) for respiratory protection. Restrict those not wearing not involved in cleanup from entering area. Avoid skin contact. Ventilate area of spill. Decontaminate spill area using soapy water. Take up with sand or vermiculite and deposit in sealed drum. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Avoid contact with heat, sparks, or flame. Can form peroxides on storage or on evaporation/distillation. | | | | |
| Other Precautions and Warnings Use only non-sparking tools and equipment. Do not store in direct sunlight for extended periods of time. Bulk storage of decahydronaphthalene is permissible but not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure levels not established and chemical is moderately toxic by inhalation. Recommend using a supplied-air respirator with full facepiece operated in positive pressure mode or, use a self-contained breathing apparatus (SCBA) with full facepiece operated in positive pressure mode. | | | | |
| Ventilation Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves Rubber Gloves | Eye Protection Chemical Goggles and Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DECAHYDRONAPHTHALENEC₁₀H₁₈

CAS: 91-17-8

**IDENTIFICATION AND TYPICAL USES**

Decahydronaphthalene is a colorless water-white liquid with a strong aromatic odor. It is used as a solvent for oils, fats, waxes, resins, and rubber. It is a substitute for turpentine and is used in cleaning machinery, as a stain remover, in shoe creams, in floor waxes, in other cleaning fluids, in lubricants, and as a motor fuel additive.

RISK ASSESSMENT: HEALTH**General Assessment**

Decahydronaphthalene is moderately toxic to humans by *ingestion* and *inhalation*. It is a questionable carcinogen in humans and in animals. Mutation data have also been reported.

Inhalation and ingestion may cause nose and throat irritation with numbness, headache, and vomiting. There may also be conjunctiva irritation, and other unspecified olfactory and pulmonary system changes. It can cause kidney damage on high or prolonged exposures. Urine may become blue (indicating kidney effects).

The liquid will de-fat the skin and cause dryness, cracking, and secondary infections. Eczema may develop. Eye irritation will also occur on contact with the liquid or vapor, often followed by conjunctivitis.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to decahydronaphthalene:

Skin: Irritation with possible eczema-like rash. There may be cracking of skin and secondary infections.

Eye: Mild to severe irritation with possibility for conjunctivitis.

Lung: Nose, throat, and respiratory irritation causing difficulty in breathing. There may be numbness, headache, vomiting, and possible kidney effects. The urine may become blue.

Other: Ingestion of decahydronaphthalene may cause nausea, vomiting, headaches, dizziness, and gastrointestinal irritation.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to decahydronaphthalene and can last for months or even years:

Cancer Hazards: Decahydronaphthalene may cause mutations (genetic changes) in living cells. There is limited evidence in the references that exposure may cause cancer in animals. There is insufficient data to evaluate its carcinogenic potential in humans.

Reproductive Hazard: There is limited evidence in the references to indicate that decahydronaphthalene may affect the developing fetus.

Other Chronic Effects: Over the long-term, exposure to decahydronaphthalene can lead to skin allergy. If an allergy develops, very low future exposures can cause itching and rash. Very irritating substances such as decahydronaphthalene can affect the lungs. It is not known whether decahydronaphthalene causes lung damage. Chronic exposure may also affect the liver and cause kidney damage.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with decahydronaphthalene. Occupational exposure can occur primarily through inhalation and ingestion. Skin and eye contact also present risks to health. If a less toxic material or compound cannot be substituted for decahydronaphthalene, then *engineering controls* are the most effective method of reducing exposure risk. The

best protection is to enclose operations and/or provide local exhaust ventilation at the site of decahydronaphthalene dust release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still recommended whenever working with or around decahydronaphthalene. No exposure levels have been established for this chemical. However, this does not mean that unprotected exposures are without risk. Decahydronaphthalene has been shown to cause toxic systemic effects by at least two routes of entry (inhalation and ingestion), and skin contact also presents health risks. Therefore, for any exposure levels, a supplied-air respirator with full facepiece or an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the appropriate level of respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes, especially when a splash hazard exists. A face shield should also be considered. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with decahydronaphthalene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication) prior to the first assignment in an area where decahydronaphthalene is used or stored.

Before beginning employment and at regular times thereafter, the following recommended medical tests should be considered for those with frequent or potentially high exposures:

- Lung function tests.

If symptoms develop or overexposure is suspected, the following may be useful:

- Skin testing with dilute decahydronaphthalene may help diagnose allergy, if performed by a qualified allergist.
- Consider chest X-ray following acute exposure.
- Liver and kidney function tests, including urinalysis.

It should be noted that medical tests that simply look for existing damage are not a substitute for controlling

exposures. Medical histories are extremely important when assessing exposure risk.

Other methods to reduce exposure include:

- Decahydronaphthalene should be handled in an enclosed system. There should be local exhaust ventilation at the site of chemical release.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to decahydronaphthalene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of decahydronaphthalene should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to decahydronaphthalene, emergency shower facilities should also be provided.
- Workers whose clothing has been contaminated by decahydronaphthalene should change into clean clothes before leaving work. Contaminated work clothes should be laundered only by individuals who have been informed of the hazards of exposure to decahydronaphthalene.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of decahydronaphthalene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in contamination of the surrounding environmental mediums (water, soil, and air).

Decahydronaphthalene is a combustible liquid. However, caution is always required in handling, storage, transportation, and disposal of decahydronaphthalene. It is flammable and moderately explosive when exposed to heat or flame. It can react vigorously with oxidizing materials (such as perchlorates, peroxides, chlorates, nitrates, and permanganates). Emergency responders should be made aware of the presence of

decahydronaphthalene at any emergency response situation.

Decahydronaphthalene can enter the environment from industrial effluents and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to decahydronaphthalene. Decahydronaphthalene has moderate acute toxicity to aquatic life.

Insufficient data are available to evaluate the acute (short-term) effects of decahydronaphthalene on plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Decahydronaphthalene has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate the chronic (long-term) effects of decahydronaphthalene on plants, birds, or land animals.

💧 *Water Solubility*

Decahydronaphthalene is nearly insoluble in water. Concentrations up to 1 milligram will mix with a liter of water.

🕒 *Persistence in the Environment*

Decahydronaphthalene is slightly persistent in the environment, with a half-life of between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

The chemical properties of decahydronaphthalene indicate that approximately 93% will enter the air with the remaining 7% ending up in water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans exposed to the chemical.

The concentration of decahydronaphthalene found in edible fish tissue is expected to be somewhat higher than the average concentration of decahydronaphthalene found in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill of decahydronaphthalene into the environment. Labels on all containers, trucks, and rail cars must meet DOT requirements and accurately reflect their contents to enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of decahydronaphthalene should be segregated from other chemicals and materials to minimize the risk of cross-contamination and violent reactions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil.

If decahydronaphthalene should contact the water table, aquifer, or navigable waterway, time is of the essence. It is only slightly soluble and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of decahydronaphthalene.

If decahydronaphthalene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete. Avoid skin and eye contact.
- ☑ Absorb liquids in vermiculite or other similar materials and deposit in sealed drum for disposal.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all sources of heat and ignition from the immediate area.
- ☑ It may be necessary to dispose of decahydronaphthalene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving decahydronaphthalene can present a serious threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel illness, injury/death, public exposures, and/or environmental contamination will require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms “carcinogen,” “cancer,” or “reproductive hazard” are used, public emotion and hysteria can run equally high. Risk managers must consider these phenomena when developing company policy.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: If victim is conscious, give milk, water, or salt water solution and induce vomiting repeatedly. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store demeton in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, dark, well-ventilated area. Personnel working with demeton should be trained on its proper handling and storage <i>prior</i> to being assigned to such responsibilities. | | | | |
| Other Precautions and Warnings Bulk storage of demeton is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) PEL is extremely low. At any exposure level: Use a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DEMETON

CAS: 8065-48-3

**IDENTIFICATION AND TYPICAL USES**

Demeton is a pale yellow or amber colored oily liquid with a sulfur-like odor. It is a mixture of demeton-O and demeton-S. It is used as a systemic insecticide. This means that it is absorbed by a plant, which then becomes toxic to sucking and chewing insects.

RISK ASSESSMENT: HEALTH**General Assessment**

Demeton is a deadly human poison by *ingestion*. It is also extremely toxic by *inhalation* and skin contact (*absorption*). Experimental teratogenic data have been reported and human mutagenic data have been confirmed. Its primary systemic effect is to inhibit cholinesterase in humans and animals and, thus, causes a buildup of acetylcholine. Doses are cumulative in humans.

Inhalation appears to cause depression of the central nervous system (CNS) and adverse effects to the cardiovascular system (CVS). Symptoms of headache, vertigo, blurred vision, lachrymation, salivation, sweating, muscular weakness and ataxia, dyspnea, diarrhea, abdominal cramps, vomiting, coma, pulmonary edema, and death. Vapors are irritating to the eyes and skin. Other symptoms of exposure include rhinitis, tightness in chest, wheezing, spasms, giddiness, confusion, convulsions, low blood pressure, and irregular heartbeat.

Ingestion causes nausea, vomiting, muscle twitching, coma, CNS depression, and adverse cardiac effects. Death is likely on acute, high exposures.

Skin or eye contact results in severe irritation and discomfort. Demeton may be absorbed through unbroken skin to cause toxic systemic effects.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to demeton:

Skin: Irritation and possible allergy. Most effects from skin contact are internal due to absorption of demeton. Symptoms include vomiting, nausea, malaise, and muscular twitching at high doses.

Eye: Possible irritation. Possibility of damage if not removed immediately.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs) which is a medical emergency and can be fatal.

CNS: Dizziness, headaches, nausea, vomiting, muscle jerks, convulsions, coma, and death.

CVS: Abnormal cardiac rhythms, changes in blood pressure, and possible increase in blood cholesterol levels.

☪ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to demeton and can last for months or even years:

Cancer Hazards: According to the information presented in the references, demeton has not been adequately tested for its ability to cause cancer in test animals. However, it is a known human mutagen (causes genetic changes) and some scientists believe that mutagenic chemicals may also pose a carcinogenic threat. More research is required on the carcinogenic properties of this chemical.

Reproductive Hazard: Demeton may be a teratogen in humans since it has been shown to be a teratogen in some test animals.

Other Chronic Effects: Demeton will accumulate with each dose. It will inhibit cholinesterase in humans and animals causing a buildup of acetylcholine.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. This may not be feasible during use as a pesticide outdoors, but it may be possible during manufacture of demeton. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around demeton. A self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists a face shield and rubber apron should be worn. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with demeton.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where demeton is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests.
- ☑ Electrocardiogram.
- ☑ Evaluation by a qualified allergist with careful evaluation of exposure history and administration of special tests (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to demeton and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of demeton should be communicated to all exposed or potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of demeton. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Demeton is considered a class II combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of demeton or demeton mixtures. Should demeton ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine), alkali materials, or even water either during use, transportation, or storage, violent reactions can occur.

Demeton can enter the environment through its normal, intended use as a pesticide and through industrial discharges, urban runoff, and spills.

☠ **Acute Ecological Effects**

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after ani-

mals or plants are exposed to demeton. This chemical has not been shown to be acutely toxic to plants. Insufficient data are available to evaluate or predict the short-term effects of demeton to aquatic life, birds, or land animals.

☛ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Demeton has not been shown to present chronic toxicity to plant life. Insufficient data are available to evaluate or predict the long-term effects of demeton to aquatic life, birds, or land animals.

◆ *Water Solubility*

Demeton is very slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

⌚ *Persistence in the Environment*

Demeton is highly persistent in water, with a half-greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded.

🌀 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of demeton found in fish tissues is expected to be much higher than the average concentration of demeton in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of demeton should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If demeton should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of demeton. If demeton is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of demeton as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving demeton can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🚫 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the

development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store diacetone alcohol in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Personnel working with diacetone alcohol should be trained on its proper handling and storage prior to being assigned to such responsibilities. | | | | |
| Other Precautions and Warnings Bulk storage is of diacetone alcohol is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For exposures near or above the PEL (50 ppm), use a full facepiece respirator equipped with an organic vapor cartridge. For greater protection or high exposures, use a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIACETONE ALCOHOL

CAS: 123-42-2

**IDENTIFICATION AND TYPICAL USES**

Diacetone alcohol is a colorless liquid with a faint but pleasant mint-like odor. It is used in the manufacture of nitrocellulose, cellulose acetate, various oils, resins, waxes, fats, dyes, tars, lacquers, dopes, coating compositions, wood preservatives, stains, rayon, and artificial leather. It is also used in the production of imitation gold leaf, in dyeing mixtures, in antifreeze mixtures, in the extraction of resins and waxes, as a preservative for animal tissue, in metal-cleaning compounds, in hydraulic fluids, in stripping agents (textiles), and as a laboratory reagent. The technical grade containing acetone has greater solvent power.

RISK ASSESSMENT: HEALTH**General Assessment**

Diacetone alcohol is a human poison and is toxic by *ingestion, inhalation*, and also poses a risk to health on skin contact (absorption, however, has not been proven). Exposure appears to cause systemic effects by both routes of entry.

Inhalation and ingestion cause headache, nausea or vomiting, eye, and pulmonary changes. Its vapors are extremely irritating to the mucous membranes in the nose and throat. High or prolonged exposures can cause anemia and damage the liver and kidneys. There is also evidence of central nervous system (CNS) effects at high concentrations. These may include narcosis, dizziness, and anesthesia.

Skin contact results in severe irritation and may produce dermatitis with rash and itching. Eye contact can result in corneal damage.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to diacetone alcohol:

Skin: Irritation and possible allergy. May cause dermatitis.

Eye: Severe irritation. Possibility of damage to the cornea.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs) which is a medical emergency and can be fatal.

CNS: Dizziness, headaches, nausea, vomiting, some anesthesia, narcosis (on high concentrations).

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to diacetone alcohol and can last for months or even years:

Cancer Hazards: According to the information presented in the references, diacetone alcohol has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, diacetone alcohol has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Low, chronic exposures to skin may cause allergy or dermatitis. Once an allergy develops, even small future exposures will cause a recurrence of symptoms.

🛡 Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around diacetone alcohol. At exposure levels near or slightly above the PEL (50 ppm), use a full facepiece respirator equipped with an organic vapor cartridge. For high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diacetone alcohol.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diacetone alcohol is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests.
- ☑ Liver and kidney function tests.
- ☑ Evaluation by a qualified allergist with careful evaluation of exposure history and administration of special tests (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to diacetone alcohol and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on

the health and safety hazards of diacetone alcohol should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of diacetone alcohol. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Diacetone alcohol is considered a class II combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of diacetone alcohol or diacetone alcohol mixtures. Should diacetone alcohol ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine) or strong alkali materials either during use, transportation, or storage, violent reactions can occur.

Diacetone alcohol can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diacetone alcohol. Insufficient data are available to evaluate or predict the short-term effects of diacetone alcohol to aquatic life, plants, birds, or land animals.

☪* *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Diacetone alcohol has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of diacetone alcohol to plants, birds, or land animals.

◆ **Water Solubility**

Diacetone alcohol is moderately soluble in water. Concentrations of 100 to 1000 milligrams will mix with a liter of water.

⌚ **Persistence in the Environment**

Diacetone alcohol is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 50% of diacetone alcohol will eventually end up in air; the rest will end up in water.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of diacetone alcohol found in fish tissues is expected to be about the same as the average concentration of diacetone alcohol in the water from which the fish was taken.

🛡️ **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diacetone alcohol should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If diacetone alcohol should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in

place prior to any operations involving the use, transportation, storage, or disposal of diacetone alcohol. If diacetone alcohol is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ If source of leak is a cylinder and it cannot be repaired in place, remove to safe location (e.g., outdoors) and allow to vent until empty.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of diacetone alcohol as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving diacetone alcohol can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🛡️ **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

|---|---|------------------------------------|
| Characteristic Aromatic Amine | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name m-Phenylenediamine, Solid | Chemical Abstract Service (CAS) Number 95-54-5 | |
| DOT Hazard Class and Label Requirements ORM-A; St. Andrew's Cross | DOT Emergency Guide Code 53 | |
| DOT Identification Number UN 1673 | Chemical Formula C₆H₄(NH₂)₂ | |

Synonyms

m-Phenylenediamine; m-aminoaniline; m-benzenediamine; 3-aminoaniline; 1,3-benzendiamine; 1,3-diaminobenzene; 1,3-phenylenediamine.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| m-Diaminobenzene (derivation: By reduction of m-dinitrobenzene or nitroaniline with iron and hydrochloric acid. Purified by crystallization). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 547°F (286°C) | Specific Gravity (H ₂ O = 1) 1.13 |
| Vapor Pressure (mm Hg) 1 mm at 212°F (100°C) | Molecular Weight 108.2 |
| Vapor Density (Air = 1) 3.71 | Melting Point 145°F (63°C) |

Solubility

Soluble in water, methanol, ethanol, chloroform, dimethylformaldehyde, and acetone. Slightly soluble in ether and carbon tetrachloride. Very slightly soluble in toluene and benzene.

Appearance and Odor

Colorless to white crystalline solid. Turns red on exposure to air. Mild phenolic odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 312°F (155°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.4% UEL: Not Found |
| NFPA Classification Combustible Solid | Autoignition Temperature Not Determined |

Extinguishing Media

Use dry chemical, carbon dioxide, foam, or water fog. Water or foam may cause frothing.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Structural protective clothing is permeable and may not provide adequate protection. Wear full protective clothing and self-contained breathing apparatus (SCBA). Move containers from fire area if it can be done safely. Cool exposed container with water.

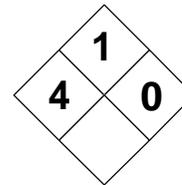

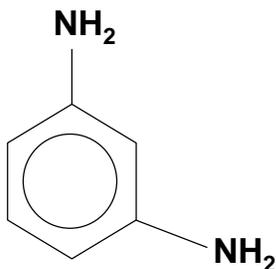

Unusual Fire and Explosion Hazards

Dusts can form explosive mixtures in air. Exercise extreme caution when attempting to move or relocate containers that may have been exposed to high heat.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------|---|--------------------------------|---|
| Stability | | Conditions to Avoid Normally stable chemical. Keep away from heat, sparks, flame, and other ignition sources. May be affected by exposure to light. | | |
| Stable | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (such as chlorine, bromine, fluorine). Reactions can be very violent. | | |
| X | | | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of m-diaminobenzene is not expected to occur. | | |
| May Occur | Will Not Occur | Hazardous Decomposition or By-products When heated to decomposition, m-diaminobenzene will produce toxic and irritating gases and oxides of nitrogen and carbon dioxide and/or carbon monoxide. | | |
| | X | | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? X | Ingestion? X |
| Health Hazards | | | | |
| INHALATION: Irritation of the upper respiratory tract. Causes headache, cough, and may result in the development of allergic hypersensitivity asthma with inflammatory reactions of the larynx and pharynx. Systemic effects include lachrymation, salivation, ataxia, tremor, lower body temperature, increased pulse rate, and respiratory depression. | | | | |
| ABSORPTION: Can cause allergic skin reaction, hives, and dermatitis. Will pass through unbroken skin to cause toxic systemic effects. These include liver and spleen enlargement, vertigo, gastritis, jaundice, atrophy of the liver, and allergic asthma. Severe eye irritant. Can cause corneal ulcer, burning, and redness. Possible presbyopia and conjunctivitis. | | | | |
| INGESTION: Toxic systemic effects similar to those for inhalation and absorption. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | No | Group 3 | No | Respiratory system, skin, eyes, liver, spleen. |
| Medical Conditions Generally Aggravated by Exposure Respiratory conditions and skin disorders may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum) while holding upper and lower eyelids open. Seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Call the poison control center, give water to induce vomiting and seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Powders should be collected in safest manner possible and disposed of in sealed drums. Do NOT dry sweep. Use a high efficiency particulate air (HEPA) vacuum instead. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. | | | | |
| Preferred Waste Disposal Method | | | | |
| Consider reclamation, recycling, or destruction rather than landfill. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store in tightly closed containers in a cool, dark, well-ventilated area. Personnel should be trained on the hazardous properties of m-diaminobenzene <i>prior</i> to working with the material. | | | | |
| Other Precautions and Warnings | | | | |
| Empty containers may still contain product residues and should be handled with caution. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For low exposures, use a full facepiece respirator equipped with HEPA filter and dust pre-filter. For higher exposures, use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Impervious Gloves | | Chemical/Dust Goggles or Face Mask | | Protective Apron |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

m-DIAMINO BENZENE

CAS: 95-54-5

**IDENTIFICATION AND TYPICAL USES**

m-Diaminobenzene is a colorless to white crystalline solid. It will turn red on exposure to air. It has a mild, phenolic odor. It is used in the manufacture of a variety of dyes, in hair dye formulations, as a rubber curing agent, in petroleum additives, as a photographic developing agent, and as an analytical reagent.

RISK ASSESSMENT: HEALTH**General Assessment**

m-Diaminobenzene is a moderate to highly toxic compound in humans. Of the three diamionbenzene isomers, the acute and chronic toxicity of the “m” or *meta*-amine is not as great as that of the “p” or *para*-isomers. It is a poison by *ingestion* and is mildly toxic by skin contact. *Absorption* through unbroken skin is possible. *Inhalation* of fine dusts will also result in toxic systemic effects.

Inhalation and ingestion will cause irritation of the larynx, pharynx, and may cause bronchial asthma. Reports of allergic hypersensitivity have been recorded in the references. Systemic effects may include lachrymation, salivation, ataxia, tremor, decreased body temperature, increased pulse rate, and respiratory depression. It may also cause tremor, excitement, convulsions, cyanosis, and collapse at fatal dose.

Skin contact will cause irritation and possible dermatitis with inflammation and redness. Absorption will result in systemic effects similar to those caused by inhalation and may also result in the enlargement of the liver, kidney, and possibly the spleen, vertigo, gastritis, jaundice, and atrophy of the liver. Eye contact results in burning, redness, corneal ulceration, and a possible presbyopia-like loss of elasticity in the lens of the eye.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to m-diaminobenzene:

Skin: Mild to moderate irritation and possible dermatitis. Skin absorption is likely with subsequent toxic systemic effects.

Eye: Mild to severe irritation with possible damage to the cornea.

Lung: Irritation of the upper respiratory tract causing coughing and/or shortness of breath and may lead to secondary infections. Allergic hypersensitivity, bronchial asthma, and throat problems likely to occur.

CNS: Unconfirmed reaction, but may cause vertigo, ataxia, dizziness, tremor, excitement, convulsions, and other unspecified systemic effects by all routes of entry.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to m-diaminobenzene and can last for months or even years:

Cancer Hazards: According to the information presented in the references, m-diaminobenzene has been shown to cause tumors in test animals. Its carcinogenicity in humans is questioned. However, the data in the references are conflicting and inconclusive in this regard. It is a mutagen. Until further studies are performed, it is suggested that m-diaminobenzene be handled with extreme caution.

Reproductive Hazard: According to the information presented in the references, m-diaminobenzene has not been adequately tested for its ability to adversely affect reproduction.

☉ **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. All metal equipment used with this chemical should be grounded and bonded. Explosion-proof design of equipment is recommended.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around m-diaminobenzene. For low or relatively infrequent exposures, use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust pre-filter. For higher concentrations, use of a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around m-diaminobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where m-diaminobenzene is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Liver function tests.
- Consider chest X-ray after acute overexposure.
- Evaluation by a qualified allergist with careful consideration of exposure history and special tests (may help diagnose allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart diseases, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to m-diaminobenzene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of m-diaminobenzene should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of m-diaminobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

m-Diaminobenzene should always be handled with extreme caution. It is incompatible with strong oxidizers and its dusts can form explosive mixtures in air. These characteristics require special consideration during any emergency situation involving a leak or spill of m-diaminobenzene.

m-Diaminobenzene can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to m-diaminobenzene. Insufficient data are available to evaluate or predict the short-term effects of m-diaminobenzene to aquatic life, plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of m-diaminobenzene to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

m-Diaminobenzene is moderately soluble in water. Concentrations of 100 to 1000 milligrams will mix with a liter of water.

⌚ *Persistence in the Environment*

m-Diaminobenzene is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of m-diaminobenzene found in fish tissues is expected to be somewhat higher than the average concentration of m-diaminobenzene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill

to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of m-diaminobenzene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers should be protected from physical damage. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If m-diaminobenzene should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of m-diaminobenzene. If m-diaminobenzene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.
- Remove all ignition sources.
- Collect powders in safest manner possible and dispose of in sealed drums. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter cartridge or attachment.
- It may be necessary to dispose of m-diaminobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS *General Assessment*

Accidents or mishaps involving m-diaminobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term “carcinogen” or “cancer” are used, public emotion, hysteria, and ignorance can run equally high. This should be considered during the development of any public relations policies.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

MATERIAL SAFETY DATA SHEET

CHEMICAL NAME

o-DIAMINO BENZENE

CRC PRESS/LEWIS PUBLISHERS DISCLAIMER: THE INFORMATION AND RECOMMENDATIONS PRESENTED HEREIN ARE BASED ON SOURCES BELIEVED TO BE RELIABLE. CRC MAKES NO REPRESENTATION ON ITS COMPLETENESS OR ACCURACY. IT IS THE RESPONSIBILITY OF THE USER TO DETERMINE THE CHEMICAL'S SUITABILITY FOR ITS INTENDED USE, THE CHEMICAL'S SAFE USE, AND THE CHEMICAL'S PROPER DISPOSAL. NO REPRESENTATIONS AND/OR WARRANTIES, EITHER EXPRESSED OR IMPLIED, OF THE MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, OR OF ANY OTHER NATURE, ARE MADE WITH RESPECT TO THE INFORMATION PROVIDED IN THIS MSDS OR TO THE CHEMICAL TO WHICH INFORMATION MAY REFER. CRC NEITHER ASSUMES NOR AUTHORIZES ANY OTHER PERSON TO ASSUME FOR IT, ANY OTHER ADDITIONAL RESPONSIBILITY OR LIABILITY FOR THE USE OF, OR RELIANCE UPON, THIS INFORMATION.

HAZARD WARNING INFORMATION

| HEALTH | FIRE | REACTIVE | OTHER | DEGREE OF HAZARD | COLOR CODING | OTHER CODES |
|----------|----------|----------|-------|--|---|--|
| 4 | 1 | 0 | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|---|---|------------------------------------|
| Characterization Aromatic Amine | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name o-Phenylenediamine, Solid | Chemical Abstract Service (CAS) Number 95-54-5 | |
| DOT Hazard Class and Label Requirements ORM-A; St. Andrew's Cross | DOT Emergency Guide Code 53 | |
| DOT Identification Number UN 1673 | Chemical Formula C₆H₄(NH₂)₂ | |

Synonyms

o-Phenylenediamine; o-aminoaniline; o-benzenediamine; 2-aminoaniline; 1,2-benzendiamine; 1,2-diaminobenzene; 1,2-phenylenediamine.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|--|
| o-Diaminobenzene (derivation: By reduction of o-dinitrobenzene or nitroaniline with iron and hydrochloric acid. Purified by crystallization). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV (skin): 0.1 mg/m³ Suspected Human Carcinogen |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 495°F (257°C) | Specific Gravity (H ₂ O = 1) >1 |
| Vapor Pressure (mm Hg) < 1 mm at 69°F (20°C) | Molecular Weight 108.2 |
| Vapor Density (Air = 1) 3.71 | Melting Point 217°F (103°C) |

Solubility

Slightly soluble in water. Very soluble in alcohol, chloroform, ether, and most organic solvents.

Appearance and Odor

Colorless, needle-like crystals that turn brownish-yellow or tan on exposure to air. Mild phenolic odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 312°F (155°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.4% UEL: Not Found |
| NFPA Classification Combustible Solid | Autoignition Temperature Not Determined |

Extinguishing Media

Use dry chemical, carbon dioxide, foam, or water fog. Water or foam may cause frothing.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Structural protective clothing is permeable and may not provide adequate protection. Wear full protective clothing and self-contained breathing apparatus (SCBA). Move containers from fire area if it can be done safely. Cool exposed container with water.

Unusual Fire and Explosion Hazards

Dusts can form explosive mixtures in air. Exercise extreme caution when attempting to move or relocate containers that may have been exposed to high heat.

SECTION V - REACTIVITY DATA

| | | |
|---------------------------------|----------------------------|---|
| Stability | | Conditions to Avoid Normally stable chemical. Keep away from heat, sparks, flame, and other ignition sources. May be affected by exposure to light. |
| Stable X | Unstable | Incompatibility (materials to avoid) Strong oxidizers (such as chlorine, bromine, fluorine). |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of o-diaminobenzene is not expected to occur. |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, o-diaminobenzene will produce toxic and irritating gases and oxides of nitrogen and carbon dioxide and/or carbon monoxide. |

SECTION VI - HEALTH HAZARD DATA

| | | | |
|-----------------------------------|-------------------------|--------------------------------|------------------------|
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X |
|-----------------------------------|-------------------------|--------------------------------|------------------------|

Health Hazards

INHALATION: Irritation of the upper respiratory tract. Causes headache, cough, and may result in the development of allergic hypersensitivity asthma with inflammatory reactions of the larynx and pharynx. Systemic effects include lachrymation, salivation, ataxia, tremor, lower body temperature, increased pulse rate, and respiratory depression.

ABSORPTION: Can cause allergic skin reaction, hives, and dermatitis. Will pass through unbroken skin to cause toxic systemic effects. These include liver and spleen enlargement, vertigo, gastritis, jaundice, atrophy of the liver, and allergic asthma. Severe eye irritant. Can cause corneal ulcer, burning, and redness. Possible presbyopia and conjunctivitis.

INGESTION: Toxic systemic effects similar to those for inhalation and absorption.

| | | | | |
|---|--------------------------|--|------------------------------|---|
| Carcinogenicity Suspected Human Questioned Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? Respiratory system, skin, eyes, liver, spleen. |
|---|--------------------------|--|------------------------------|---|

Medical Conditions Generally Aggravated by Exposure

Respiratory conditions and skin disorders may be aggravated by exposure.

Emergency and First-aid Procedures

Eye contact: Flush immediately with water for 15 minutes (minimum) while holding upper and lower eyelids open. Seek medical attention. **Skin contact:** Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For **inhalation:** Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If **swallowed:** Call the poison control center, give water to induce vomiting and seek medical attention immediately.

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled

Powders should be collected in safest manner possible and disposed of in sealed drums. Do NOT dry sweep. Use a high efficiency particulate air (HEPA) vacuum instead. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities.

Preferred Waste Disposal Method

Consider reclamation, recycling, or destruction rather than landfill.

Precautions to be Taken in Handling and Storage

Store in tightly closed containers in a cool, dark, well-ventilated area. Personnel should be trained on the hazardous properties of o-diaminobenzene prior to working with the material.

Other Precautions and Warnings

Empty containers may still contain product residues and should be handled with caution.

SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT

Respiratory Protection (specify type)

For low exposures, use a full facepiece respirator equipped with HEPA filter and dust pre-filter. For higher exposures, use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode.

Ventilation

Local exhaust or general mechanical systems recommended.

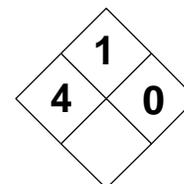

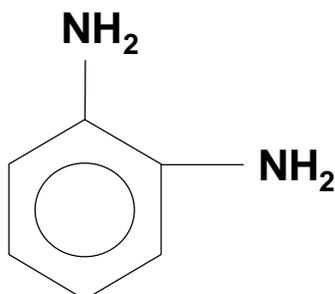

| | | |
|---|---|--|
| Protective Gloves Impervious Gloves | Eye Protection Chemical/Dust Goggles or Face Mask | Other Protective Clothing Protective Apron |
|---|---|--|

Work/Hygiene Practices

Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals.

o-DIAMINO BENZENE

CAS: 95-54-5

**IDENTIFICATION AND TYPICAL USES**

o-Diaminobenzene is a colorless to white crystalline, needle-like solid. It will turn brownish-yellow or tan on exposure to air. It has a mild, phenolic odor. It is used in the manufacture of dyes, as a photographic developing agent, in organic synthesis, and as a laboratory reagent.

RISK ASSESSMENT: HEALTH**General Assessment**

o-Diaminobenzene is a moderate to highly toxic compound in humans. Of the three diamionbenzene isomers, the acute and chronic toxicity of the “o” or *ortho*-amine and the “m” or *meta*-amine is not as great as that of the “p” or *para*-isomer. However, it has been classified by the ACGIH as a suspected human carcinogen. It is a poison by *ingestion* and is mildly toxic by skin contact. *Absorption* through unbroken skin is possible. *Inhalation* of fine dusts will also result in toxic systemic effects.

Inhalation and ingestion will cause irritation of the throat and upper respiratory tract. Systemic effects may include lachrymation, salivation, ataxia, tremor, decreased body temperature, increased pulse rate, and respiratory depression. Ingestion will additionally result in irritation of the stomach.

Skin contact will cause irritation and possible dermatitis with inflammation and redness. Absorption will result in systemic effects similar to those caused by inhalation.

Eye contact results in burning, redness, corneal ulceration, and a possible presbyopia-like loss of elasticity in the crystalline lens of the eye.

In test animals (male rats and male and female mice), exposure produced liver tumors. Evidence of human carcinogenicity, however, is lacking.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to o-diaminobenzene:

Skin: Mild to moderate irritation and possible dermatitis. Skin absorption is likely with subsequent toxic systemic effects.

Eye: Mild to severe irritation with possible damage to the cornea.

Lung: Irritation of the upper respiratory tract causing coughing and/or shortness of breath and may lead to secondary infections. There may be salivation and respiratory depression.

CNS: Unconfirmed reaction, but may cause excitement, tremor, convulsions, and other unspecified systemic effects by all routes of entry.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to o-diaminobenzene and can last for months or even years:

Cancer Hazards: According to the information presented in the references, o-diaminobenzene has been shown to cause tumors in test animals. Its carcinogenicity in humans is questioned. Mutation data have been reported for this compound. Until further studies are performed, it is suggested that o-diaminobenzene be handled with extreme caution.

Reproductive Hazard: According to the information presented in the references, o-diaminobenzene has not

been adequately tested for its ability to adversely affect reproduction.

🔊 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. All metal equipment used with this chemical should be grounded and bonded. Explosion-proof design of equipment is recommended.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around o-diaminobenzene. For low or relatively infrequent exposures, use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust pre-filter. For higher concentrations, use of a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selection are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around o-diaminobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where o-diaminobenzene is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Liver function tests.

- Consider chest X-ray after acute overexposure.
- Evaluation by a qualified allergist with careful consideration of exposure history and special tests (may help diagnose allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart diseases, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to o-diaminobenzene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of o-diaminobenzene should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of o-diaminobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

o-Diaminobenzene should always be handled with extreme caution. It is incompatible with strong oxidizers and its dusts can form explosive mixtures in air. These characteristics require special consideration during any emergency situation involving a leak or spill of o-diaminobenzene.

o-Diaminobenzene can enter the environment through its use as a fungicide, as well as through industrial discharges and spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to o-diaminobenzene. Insufficient data are available to evaluate or predict the short-term effects of o-diaminobenzene to aquatic life, plants, birds, or land animals.

Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of o-diaminobenzene to aquatic life, plants, birds, or land animals.

Water Solubility

o-Diaminobenzene is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

Persistence in the Environment

o-Diaminobenzene is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and organs of animals as well as humans.

The concentration of o-diaminobenzene found in fish tissues is expected to be about the same as the av-

erage concentration of o-diaminobenzene in the water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of o-diaminobenzene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers should be protected from physical damage. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If o-diaminobenzene should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of o-diaminobenzene. If o-diaminobenzene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup of the area is complete.
- Ventilate area and remove all ignition sources.
- Collect powders in safest manner possible and dispose of in sealed drums. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter attachment.
- It may be necessary to dispose of o-diaminobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving o-diaminobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term “carcinogen” or “cancer” are used, public emotion, hysteria, and ignorance can run equally high. This should be considered during the development of any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|---|---|------------------------------------|
| Characterization Aromatic Amine | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name p-Phenylenediamine, Solid | Chemical Abstract Service (CAS) Number 106-50-3 | |
| DOT Hazard Class and Label Requirements ORM-A; St. Andrew's Cross | DOT Emergency Guide Code 53 | |
| DOT Identification Number UN 1673 | Chemical Formula C₆H₄(NH₂)₂ | |
| Synonyms p-Phenylenediamine; p-aminoaniline; p-benzenediamine; 4-aminoaniline; 1,4-benzendiamine; 1,4-diaminobenzene; 1,4-phenylenediamine. | | |

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| p-Diaminobenzene (derivation: By reduction of p-dinitrobenzene or nitroaniline with iron and hydrochloric acid. Purified by crystallization). | PEL (skin): 0.1 mg/m³ STEL: Not Established | REL (skin): 0.1 mg/m³ STEL: Not Established | 25 mg/m³ | TLV (skin): 0.1 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|---|
| Boiling Point 512°F (267°C) | Specific Gravity (H ₂ O = 1) >1 |
| Vapor Pressure (mm Hg) < 1 mm at 69°F (20°C) | Molecular Weight 108.2 |
| Vapor Density (Air = 1) 3.71 | Melting Point 268°F (141°C) |

Solubility

Soluble in water (4.7% at 75°F). Soluble in alcohol, ether and chloroform.

Appearance and Odor

Colorless to white crystalline (sand-like) solid. Turns red, brown, or faintly black on exposure to air. Mild phenolic odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) 312°F (155°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.4% UEL: Not Found |
| NFPA Classification Combustible Solid | Autoignition Temperature Not Determined |

Extinguishing Media

Use dry chemical, carbon dioxide, foam, or water fog. Water or foam may cause frothing.

Special Fire Fighting Procedures

Poisonous gases are produced in fire. Structural protective clothing is permeable and may not provide adequate protection. Wear full protective clothing and self-contained breathing apparatus (SCBA). Move containers from fire area if it can be done safely. Cool exposed container with water.

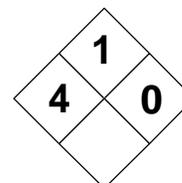

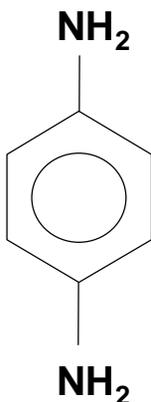

Unusual Fire and Explosion Hazards

Dusts can form explosive mixtures in air. Exercise extreme caution when attempting to move or relocate containers that may have been exposed to high heat.

| SECTION V - REACTIVITY DATA | | | | |
|---|---|---|---------------------------------------|---|
| Stability | | Conditions to Avoid Normally stable chemical. Keep away from heat, sparks, flame, and other ignition sources. May be affected by exposure to light. | | |

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? | Absorption (skin)? | Ingestion? |
| | | X | X | X |
| Health Hazards | | | | |
| INHALATION: Irritation of the upper respiratory tract. Causes headache, cough, and may result in the development of allergic hypersensitivity asthma with inflammatory reactions of the larynx and pharynx. Systemic effects include lachrymation, salivation, ataxia, tremor, lower body temperature, increased pulse rate, and respiratory depression. | | | | |
| ABSORPTION: Can cause allergic skin reaction, hives, and dermatitis. Will pass through unbroken skin to cause toxic systemic effects. These include liver and spleen enlargement, vertigo, gastritis, jaundice, atrophy of the liver, and allergic asthma. Severe eye irritant. Can cause corneal ulcer, burning, and redness. Possible presbyopia and conjunctivitis. | | | | |
| INGESTION: Toxic systemic effects similar to those for inhalation and absorption. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | 5th Annual Report | Group 3 | 29 CFR 1910.1000 Table Z-1 | Respiratory system, skin, eyes, liver, spleen. |
| Medical Conditions Generally Aggravated by Exposure Respiratory conditions and skin disorders may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum) while holding upper and lower eyelids open. Seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Call the poison control center, give water to induce vomiting and seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Powders should be collected in safest manner possible and disposed of in sealed drums. Do NOT dry sweep. Use a high efficiency particulate air (HEPA) vacuum instead. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. | | | | |
| Preferred Waste Disposal Method | | | | |
| Consider reclamation, recycling, or destruction rather than landfill. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store in tightly closed containers in a cool, dark, well-ventilated area. Personnel should be trained on the hazardous properties of p-diaminobenzene <i>prior</i> to working with the material. | | | | |
| Other Precautions and Warnings | | | | |
| Empty containers may still contain product residues and should be handled with caution. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| For low exposures, use a full facepiece respirator equipped with HEPA filter and dust pre-filter. For higher exposures, use a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Impervious Gloves | Chemical/Dust Goggles or Face Mask | Protective Apron | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

p-DIAMINO BENZENE

CAS: 106-50-3

**IDENTIFICATION AND TYPICAL USES**

p-Diaminobenzene is a colorless to white crystalline solid. It will turn red, brown, or faintly black on exposure to air. It has a mild, phenolic odor. It is used in the dyeing of hair and fur, in the manufacture of azo dyes, in accelerating vulcanization of rubber, and in antioxidants.

RISK ASSESSMENT: HEALTH**General Assessment**

p-Diaminobenzene is a moderate to highly toxic compound in humans. Of the three diamionbenzene isomers, the acute and chronic toxicity of the “p” or *para*-amine is greater than that of the *ortho*- or *meta*-isomers. It is a poison by *ingestion* and is mildly toxic by skin contact. *Absorption* through unbroken skin is possible. *Inhalation* of fine dusts will also result in toxic systemic effects.

Inhalation and ingestion will cause irritation of the larynx, pharynx, and may cause bronchial asthma. Reports of allergic hypersensitivity have been recorded in the references. Systemic effects may include lachrymation, salivation, ataxia, tremor, decreased body temperature, increased pulse rate, and respiratory depression.

Skin contact will cause irritation and possible dermatitis with inflammation and redness. Dermal absorption will result in systemic effects similar to those caused by inhalation and may also result in the enlargement of the liver and spleen, vertigo, gastritis, jaundice, and atrophy of the liver. Eye contact results

in burning, redness, corneal ulceration, and a possible presbyopia-like loss of elasticity in the crystalline lens of the eye.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to p-diaminobenzene:

Skin: Mild to moderate irritation and possible dermatitis. Skin absorption is likely with subsequent toxic systemic effects.

Eye: Mild to severe irritation with possible damage to the cornea.

Lung: Irritation of the upper respiratory tract causing coughing and/or shortness of breath and may lead to secondary infections. Allergic hypersensitivity, bronchial asthma, and throat problems likely to occur.

CNS: Unconfirmed reaction, but may cause vertigo, ataxia, dizziness, and other unspecified systemic effects by all routes of entry.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to p-diaminobenzene and can last for months or even years:

Cancer Hazards: According to the information presented in the references, p-diaminobenzene has been

shown to cause tumors in test animals. Its carcinogenicity in humans is questioned. However, the data in the references are conflicting and inconclusive in this regard. It is a mutagen. Until further studies are performed, it is suggested that p-diaminobenzene be handled with extreme caution.

Reproductive Hazard: According to the information presented in the references, p-diaminobenzene has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Repeated low level exposures may damage the liver and can be fatal.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. All metal equipment used with this chemical should be grounded and bonded. Explosion-proof design of equipment is recommended.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around p-diaminobenzene. For low or relatively infrequent exposures, use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust pre-filter. For higher concentrations, use of a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around p-diaminobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where p-diaminobenzene is used or stored. Before beginning employment and at regular intervals thereaf-

ter (e.g. annually), the following medical tests are recommended:

Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

Lung function tests.

Liver function tests.

Consider chest X-ray after acute overexposure.

Evaluation by a qualified allergist with careful consideration of exposure history and special tests (may help diagnose allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.

Always ensure that proper protective clothing is worn when using chemical substances.

Wash thoroughly immediately after exposure to p-diaminobenzene and at the end of the work shift or before eating, drinking, or smoking.

Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of p-diaminobenzene should be communicated to all exposed workers.

Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT *General Assessment*

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of

p-diaminobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

p-Diaminobenzene should always be handled with extreme caution. It is incompatible with strong oxidizers and its dusts can form explosive mixtures in air. These characteristics require special consideration during any emergency situation involving a leak or spill of p-diaminobenzene.

p-Diaminobenzene can enter the environment through industrial discharges and spills.

Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to p-diaminobenzene. Insufficient data are available to evaluate or predict the short-term effects of p-diaminobenzene to aquatic life, plants, birds, or land animals.

Chronic Ecological Effects

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of p-diaminobenzene to aquatic life, plants, birds, or land animals.

Water Solubility

p-Diaminobenzene is slightly soluble in water. Concentrations of 1 to 100 milligrams will mix with a liter of water.

Persistence in the Environment

p-Diaminobenzene is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contami-

nated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of p-diaminobenzene found in fish tissues is expected to be about the same as the average concentration of p-diaminobenzene in the water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of p-diaminobenzene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers should be protected from physical damage. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If p-diaminobenzene should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of p-diaminobenzene. If p-diaminobenzene is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Ventilate area of spill or leak.
- Remove all ignition sources.
- Collect powders in safest manner possible and dispose of in sealed drums. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter cartridge or attachment.

- ☑ It may be necessary to dispose of p-diaminobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving p-diaminobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term “carcinogen” or “cancer” are used, public emotion, hysteria, and ignorance can run equally high. This should be considered during the development of any public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: If victim is conscious, give wet slurry of charcoal. Do NOT give milk or alcohol. Seek medical attention immediately. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Collect any powdered materials in safest manner possible for reuse or disposal in sealed drums. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store Diazinon in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated, moisture-free area. Personnel working with Diazinon should be trained on its proper handling and storage prior to being assigned to such responsibilities. | | | | |
| Other Precautions and Warnings Do not mix with other insecticides or pesticides, unless recommended by the manufacturer. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For relatively low or infrequent exposure to powders, use a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and dust/mist pre-filter. For greater protection, use a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIAZINON[C(CH₃)₂CHC₄N₂H(CH₃)O]PS(OC₂H₅)₂

CAS: 333-41-5

**IDENTIFICATION AND TYPICAL USES**

Diazinon is a colorless liquid with a faint ester-like odor. Its technical grade may appear as a pale to dark brown liquid and its commercial grade is often a dark brown liquid, tan to dark brown solid crystals, or a powder. It is used primarily and principally as a non-systemic insecticide and acaricide. It is used on a wide variety of agricultural crops, ornamentals, domestic animals, lawns, gardens, and to control household pests. It is permitted by the U.S. Environmental Protection Agency (EPA) for use against fire ants.

RISK ASSESSMENT: HEALTH**General Assessment**

Diazinon is primarily toxic to humans by *ingestion*. However, its vapors can also cause adverse systemic effects by *inhalation*, and skin contact may result in *absorption* which will also cause adverse systemic effects. Contact with the eyes or skin will result in irritation. Human mutation data have been reported and it is an experimental teratogen with positive evidence of reproductive effects in animals. There are no reports of carcinogenic reactions subsequent to long-term exposure to Diazinon. However, the fact that mutation data have been reported requires some consideration.

Ingestion and inhalation of Diazinon will result in systemic effects with symptoms of headache, giddiness, blurred vision, nervousness, weakness, cramps, diarrhea, discomfort in the chest, sweating, miosis, lachrymation, salivation and other excessive respiratory tract secretions, vomiting, cyanosis, papilledema, uncontrollable muscle twitching, convulsions, loss of reflexes and motor functions, and loss of sphincter

control. This compound is also an inhibitor of cholinesterase, an enzyme that is essential to the proper functioning of the muscles.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to Diazinon:

- Skin:** Irritation and possible inflammation. May absorb through unbroken skin to cause toxic systemic effects.
- Eye:** Severe irritation with redness, lachrymation, and possible conjunctivitis.
- Lung:** Irritation of the mucosa of the nose, throat, and upper respiratory tract. Effects are more systemic than localized, with action on the blood, central nervous system, and (possibly) the cardiovascular system.
- CNS:** A depressant, causing headache, blurred vision, giddiness, nervousness, and other systemic effects.
- Other:** Ingestion of Diazinon will result in essentially the same symptoms as those reported for inhalation in terms of its action to depress the central nervous system.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to Diazinon and can last for months or even years:

Cancer Hazards: According to the information presented in the references, Diazinon has not been ade-

quately tested for its ability to cause cancer in test animals. It has been shown to cause mutations (genetic changes) and may pose a cancer risk as well.

Reproductive Hazard: According to the information presented in the references, Diazinon may damage the developing fetus in humans since it has been shown to be fetotoxic in animals.

Other Chronic Effects: Chronic exposure to Diazinon has not been sufficiently studied. However, there is some indication that long-term exposure or frequent high exposures may inhibit the essential enzyme cholinesterase.

🔊 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. These controls certainly may not be practical or applicable when using Diazinon as an insecticide, especially outdoors. However, during manufacture, transportation, or storage, certain engineering controls may be effective in reducing exposure risk.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around Diazinon. The exposure level for this compound is extremely low and may be difficult to measure and even more difficult to protect against. At low or infrequent exposures, a full facepiece respirator equipped with a high efficiency particulate air (HEPA) filter and a dust/mist pre-filter may suffice. However, for maximum exposure risk reduction or for exposures to high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with Diazinon.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and

other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where Diazinon is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Complete blood count (CBC).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to Diazinon and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of Diazinon should be communicated to all exposed and potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during the intended use as an insecticide, as well as during transportation, storage, disposal, or destruction of Diazinon. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and, to a lesser extent, air).

Diazinon is considered a Class IIIA combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of Diazinon. Should Diazinon ever come into contact with

incompatible substances such as strong acids (hydrofluoric, sulfuric, nitric, hydrochloric), strong alkali materials (sodium hydroxide, potassium hydroxide, and lithium hydroxide), and/or any copper-containing compounds either during use, transportation, or storage, violent reaction can occur. Diazinon will slowly hydrolyze in water and dilute acid. If insufficient water is mixed, it will form highly toxic tetraethyl monothiopyrophosphate.

Diazinon can enter the environment through its intended use as an insecticide, through industrial discharges, and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to Diazinon.

This chemical has high acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of Diazinon to plants, birds, or land animals.

☞ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Diazinon has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of Diazinon to plants, birds, or land animals.

💧 *Water Solubility*

Diazinon is very slightly soluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

⌚ *Persistence in the Environment*

Diazinon is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become con-

centrated in the tissues and internal organs of animals as well as humans.

The concentration of Diazinon found in fish tissues is expected to be much higher than the average concentration of Diazinon in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of Diazinon should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If Diazinon should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of Diazinon. If Diazinon is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area and remove ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal. Collect any powder materials for reuse or dispose of in an approved, sealed drum.
- ☑ It may be necessary to dispose of Diazinon as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving Diazinon can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | | | | |
|---|---------------------|--|-------------|-----------|-----------------------|
| Characterization | Gas | RCRA Number | None | EPA Class | Not Applicable |
| DOT Proper Shipping Name | Diazomethane | Chemical Abstract Service (CAS) Number | | | |
| | | 334-88-3 | | | |
| DOT Hazard Class and Label Requirements | No Citation | DOT Emergency Guide Code | | | |
| | | No Citation | | | |
| DOT Identification Number | None | Chemical Formula | | | |
| | | CH₂N₂ | | | |

Synonyms
Azimuthylene; azomethylene; Diazirine.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|--|---|--|
| Diazomethane 1 ppm = 1.75 mg/m³ | PEL: 0.2 ppm 0.4 mg/m³ STEL: Not Established | REL: 0.2 ppm 0.4 mg/m³ STEL: Not Established | 2 ppm | TLV: 0.2 ppm 0.4 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | | | |
|------------------------------|-----------------------------|---|------------------------|
| Boiling Point | -9°F (-23°C) | Specific Gravity (H ₂ O = 1) | 1.45 |
| Vapor Pressure (atmospheres) | >1 at 69°F (20°C) | Molecular Weight | 42.05 |
| Vapor Density (Air = 1) | Not Found | Freezing Point | -229°F (-145°C) |

Solubility
Reacts in water.
Appearance and Odor
Yellow gas with a musty odor. Normally shipped as a liquefied compressed gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

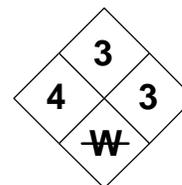

| | | | | |
|---------------------------|----------------------------------|-------------------------------------|----------------------------|--|
| Flash Point (method used) | Not Applicable (gas) | Explosive Limits in Air % by Volume | | |
| | | LEL: Not Determined | UEL: Not Determined | |
| NFPA Classification | Flammable Gas (Explosive) | Autoignition Temperature | | |
| | | Not Applicable | | |

Extinguishing Media
Diazomethane will explode in fire.
Special Fire Fighting Procedures
Diazomethane gas presents a serious explosion hazard when exposed to flame or involved in fire. Gas is extremely irritating: wear full protective clothing and self-contained breathing apparatus (SCBA). In the event of a fire, immediately evacuate the area.
Unusual Fire and Explosion Hazards
Emits toxic fumes of NO_x when exposed to heat. To stop fire, stop the flow of gas. Heat, sunlight, or other bright lights can cause it to explode. Extremely reactive, shock sensitive, and impact sensitive. Explosions likely when exposed to rough surfaces.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|-------------------------------------|--|
| Stability | | Conditions to Avoid Diazomethane is extremely reactive in the presence of heat, sunlight, bright lights, rough surfaces (such as ground glass), and incompatible materials. Explosions are likely to be violent and severe. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Diazomethane is incompatible with numerous commodities, including alkali metals, acid, acid fumes, water, drying agents (such as calcium arsenate) and calcium sulfate. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of diazomethane may occur. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products Diazomethane decomposes upon heating or in the presence of acid or acid fumes to emit highly toxic fumes of Nox. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards | | | | |
| INHALATION: Extremely irritating. Exposure can cause severe lung damage with symptoms of coughing, chest pain, shortness of breath, fever and fatigue. Symptoms may not be felt until hours or days after exposure and this can cause death (pulmonary edema). | | | | |
| SKIN & EYES: Liquid or gas exposure to skin and eyes may cause severe burning and frostbite. | | | | |
| INGESTION: Not likely since diazomethane is a gas. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Suspected Human Confirmed Animal | No | No | 29 CFR 1910.1000 (Table Z-1) | Respiratory system; skin; eyes. |
| Medical Conditions Generally Aggravated by Exposure Respiratory function impairments (bronchitis, asthma, etc.). | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Immediately flush with large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. Observation for 24 - 48 hours since pulmonary edema is possible. If swallowed: Not likely since this product is a gas. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Remove all ignition sources. Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. It may be necessary to evacuate area and wait for cylinder to empty. | | | | |
| Preferred Waste Disposal Method | | | | |
| No Citation. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from sunlight, heat, and bright lights. Keep away from ignition sources such as fire, sparks, and flame. | | | | |
| Other Precautions and Warnings | | | | |
| Bulk storage of diazomethane is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| At any exposure level, use a powered supplied-air respirator set in positive pressure mode or use an MSHA/NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | Eye Protection | Other Protective Clothing | | |
| Butyl Rubber | Chemical Goggles and/or Face Mask | Rubber Apron | | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIAZOMETHANE

CAS: 334-88-3

**IDENTIFICATION AND TYPICAL USES**

Diazomethane is a yellow gas with a musty odor at room temperatures. It can also exist as a liquid under pressure. It is used as a methylating agent for acidic compounds such as carboxylic acids, phenols, and enols.

RISK ASSESSMENT: HEALTH***General Assessment***

Diazomethane is a severe pulmonary irritant and a powerful allergen. As a gas, primary entry is by *inhalation*. It is a confirmed animal carcinogen, creating lung tumors in rats and mice. Human mutagenic data have also been reported.

Inhalation of diazomethane gas is extremely dangerous, causing irritation of the eyes, chest pain, cough, fever, and severe asthmatic attacks. It will cause immediate respiratory distress leading to pneumonitis and death. The warning properties of diazomethane are poor and symptoms may be delayed for several hours or even days after exposure. This presents a serious health risk. Other symptoms may include severe headache, generalized aching of muscles, a sensation of overwhelming tiredness, stupor, fatigue, flushed skin, and shortness of breath.

Skin or eye contact may cause severe damage to tissue. Liquid may cause frostbite, scaling, and burns.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to diazomethane:

Skin: Irritation, burning, scaling, or frostbite on contact with liquid and possibly the gas.

Eye: Burns which can lead to permanent damage.

Lung: Severe lung damage. Symptoms include coughing, wheezing, shortness of breath, chest

pain, dizziness, fatigue, headache, and irritation of the mouth, nose, and throat. Nausea, vomiting, and fever may also occur. Higher exposures can lead to pulmonary edema, a medical emergency which can be fatal.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to diazomethane and can last for months or even years:

Cancer Hazards: Diazomethane has been shown to cause cancer (lung tumors) in test animals and its carcinogenic properties in humans is currently suspect. It has caused mutations (genetic changes) in humans and, therefore, should be treated with extreme caution.

Reproductive Hazards: According to information presented in the references, diazomethane has not been tested for its ability to affect reproduction.

Other Chronic Effects: Repeated exposure to diazomethane can cause an asthma-like lung allergy. Symptoms may include coughing, wheezing, and fatigue. The symptoms may become progressively worse with repeated attacks, and permanent lung damage (emphysema) may result.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with diazomethane. It is extremely toxic and exposures can cause death or serious physical injury or illness. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with diazomethane. A NIOSH-approved self-contained breathing apparatus

(SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diazomethane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diazomethane is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- ☑ Lung function tests. These may be normal at first if the person is not having an attack at the time.

If symptoms develop or overexposure is suspected, the following may be useful:

- ☑ Consider chest X-ray after acute overexposure (may be negative if taken immediately after exposure due to delayed onset of pulmonary edema).
- ☑ Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose allergy).

Other methods to reduce exposure to chemicals include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to diazomethane and at the end of the work shift or before eating, drinking, or smoking. Work clothing contaminated with diazomethane should never be taken home for laundering. Only personnel trained in the hazards of exposure should launder contaminated clothing.
- ☑ Safety shower and eyewash stations should be readily available in work areas where diazomethane is used or stored.

- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of diazomethane should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of diazomethane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Diazomethane is considered to be a flammable gas. It is explosive by itself and, because it is incompatible with many other commodities, contact with any of them can result in violent explosion and fire. It is highly explosive when shocked, exposed to heat, or by chemical reaction. Undiluted liquid or gas may explode on contact with alkali metals, rough surfaces, heat, and high intensity light (especially sunlight). Therefore, diazomethane requires special consideration during any emergency involving a leak or release of diazomethane gas or liquid.

Diazomethane can enter the environment through industrial discharges, unchecked venting, or through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diazomethane.

Insufficient data are available to evaluate or predict the short-term effects of diazomethane on aquatic life, plants, birds, or land animals.

☪* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to

evaluate the long-term effects of diazomethane on aquatic life, plants, birds, or land animals.

◆ **Water Solubility**

Diazomethane decomposes in water.

⌚ **Persistence in the Environment**

Diazomethane will react rapidly with water and therefore will not accumulate in the environment.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Diazomethane will react rapidly with water and therefore is not expected to accumulate in the tissues of fish.

🔒 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diazomethane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Under all circumstances, it should be protected from exposure to light, heat, and impacts. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If diazomethane should contact the water table, aquifer, or navigable waterway, remediation may not be possible. It will readily react with water and decompose and, therefore, total containment will not be possible. When such spills occur, the local and/or state emergency response authorities

must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of diazomethane. If diazomethane is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Remove all ignition sources.
- ☑ Ventilate area of spill or leak.
- ☑ If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, carefully remove leaking cylinder to a safe place in the open air, and allow cylinder to empty. Repair when completely empty. Attempting to repair while venting can be extremely dangerous (explosions from shock or impact likely).
- ☑ Keep diazomethane out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- ☑ It may be necessary to dispose of diazomethane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving diazomethane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🔒 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific

training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|------------------------------------|
| Characterization Hydride Gas | RCRA Number None | EPA Class Not Applicable |
| DOT Proper Shipping Name Diborane | Chemical Abstract Service (CAS) Number 19287-45-7 | |
| DOT Hazard Class and Label Requirements Flammable Gas and Poison | DOT Emergency Guide Code 18 | |
| DOT Identification Number UN 1911 | Chemical Formula B₂H₆ | |

Synonyms

Boroethane; boron hydride; diboron hexahydride.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|--|--|---|--|
| Diborane (derivation: Reaction of lithium hydride and boron trifluoride catalyzed by ether at 25°C). 1 ppm = 1.15 mg/m³ | PEL: 0.1 ppm 0.1 mg/m³ STEL: Not Established | REL: 0.1 ppm 0.1 mg/m³ STEL: Not Established | 15 ppm | TLV: 0.1 ppm 0.1 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point -135°F (-93°C) | Specific Gravity (H ₂ O = 1) 0.97 |
| Vapor Pressure (atmospheres) 39.9 at 62°F (16°C) | Molecular Weight 27.7 |
| Vapor Density (Air = 1) 0.95 | Freezing Point -267°F (-166°C) |

Solubility

Reacts and decomposes in water. Soluble in carbon disulfide.

Appearance and Odor

Colorless gas with a repulsive, sweet odor. Usually shipped in pressurized cylinders diluted with hydrogen, argon, nitrogen, or helium. Odor Threshold = 3.3 ppm.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) -90°F (-68°C) | Explosive Limits in Air % by Volume LEL: 0.8% UEL: 88% |
| NFPA Classification Flammable Gas | Autoignition Temperature 104°F (40°C) |

Extinguishing Media

Stop flow of gas. Use water spray to keep fire-exposed containers cool. Do NOT use Halon.

Special Fire Fighting Procedures

Diborane gas presents a serious explosion hazard when exposed to flame or involved in fire. Gas is poisonous: wear full protective clothing and self-contained breathing apparatus (SCBA).

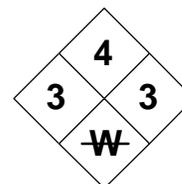

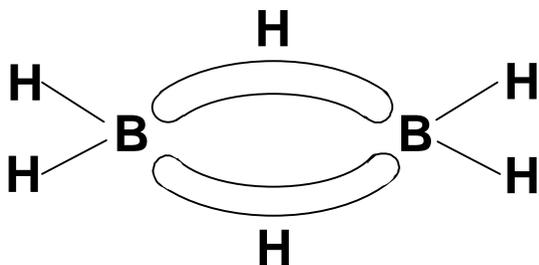

Unusual Fire and Explosion Hazards

To stop fire, stop the flow of gas. Extremely reactive substance. Can react explosive in air. In contact with water or when heated, will form explosive hydrogen gas. May re-ignite explosively after fire has been extinguished.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------|--|---|---|
| Stability | | Conditions to Avoid Diborane is extremely reactive and highly explosive in the presence of heat or flame. It is unstable under normal conditions of temperature and pressure. Explosions are likely to be violent and severe. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Diborane is incompatible with hydrocarbons, amines, aluminum, neoprene rubber, air, water, oxidizing agents, halogens, halogenated compounds, nitric acid, and liquefied nitrogen trifluoride. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of diborane may occur. Avoid elevated temperatures. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products Diborane decomposes upon heating or when exposed to water to evolve highly explosive hydrogen gas and boric acid. Combustion yields boron dust. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? |
| Health Hazards INHALATION: Extremely irritating, may cause infection in the respiratory passages. May deaden the sense of smell, cause headache, cough, nausea, tightness in chest, shortness of breath, chills, fever, weakness, and pulmonary edema (fluid in lungs), which can cause death. SKIN & EYES: Liquid or gas exposure to skin and eyes may cause severe burning and frostbite. INGESTION: Not likely since diborane is a gas. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 (Table Z-1) | Respiratory system; skin; eyes, CNS, liver, kidneys. |
| Medical Conditions Generally Aggravated by Exposure Respiratory function impairments (bronchitis, asthma, etc.). | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Immediately flush with large amounts of water for 15 minutes (minimum), occasionally lifting eyelids, seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. Observation for 24 - 48 hours since pulmonary edema is possible. If <u>swallowed:</u> Not likely since this product is a gas. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Ventilate area. Stop flow of gas. If the source of leak is a cylinder and cannot be stopped, remove to safe place in open air; repair leak or let cylinder empty. It may be necessary to evacuate area and wait for cylinder to empty. | | | | |
| Preferred Waste Disposal Method Burn by any suitable method, under controlled conditions. | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from heat and moisture. Suggest a nitrogen purge inside storage containers. Keep away from ignition sources such as fire, sparks, and flame. | | | | |
| Other Precautions and Warnings Bulk storage of diborane is not recommended. Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) At any exposure level, use a powered supplied-air respirator set in positive pressure mode or use an MSHA/NIOSH approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Synthetic Impervious Material | | Eye Protection Chemical Goggles and/or Face Mask | | Other Protective Clothing Protective Suit |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIBORANE

CAS: 19287-45-7

**IDENTIFICATION AND TYPICAL USES**

Diborane is a colorless gas with a repulsive, sweet odor. It is normally shipped in pressurized cylinders diluted with hydrogen, argon, nitrogen, or helium. It is used in the synthesis of organic boron compounds and metal borohydrides, as a polymerization catalyst for ethylene, a fuel for air-breathing engines and rockets, as a reducing agent, a doping agent for p-type semiconductors, and in the vulcanization of rubber.

RISK ASSESSMENT: HEALTH**General Assessment**

Diborane is a severe pulmonary irritant that can cause secondary infections in the respiratory passageways (may precipitate bronchial pneumonia). As a gas, primary entry is by *inhalation*. Its toxicity is comparable to that of chlorine, fluorine, phosgene, and arsine. Its carcinogenic properties are unknown.

Inhalation of diborane gas is extremely dangerous, causing irritation of the eyes, and symptoms similar to that of metal fume fever. These include headache, nausea, tremors, convulsions, dyspnea, chest pain and tightness, shortness of breath, cough, chills, fever and weakness, delayed pulmonary edema and hemorrhage, loss of consciousness and death. It will deaden the sense of smell on short exposures. It may also cause immediate respiratory distress leading to pneumonitis and death. The warning properties of diborane are poor and symptoms may be delayed for several hours or even days after exposure. This presents a serious health risk. There may also be central nervous system effects (intoxication), liver, and kidney damage.

The liquid causes local inflammation, irritation, and burn. There may be blisters, redness, and painful

swelling. Frostbite may also occur. Eye contact will result in similar effects, with redness, irritation, and swelling of the conjunctiva.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to diborane:

Skin: Irritation, burning, scaling, redness, blistering, swelling, or frostbite on contact with liquid and possibly the gas.

Eye: Burns which can lead to permanent damage. Inflammation and swelling of the conjunctiva and surrounding tissue.

Lung: Severe lung damage with symptoms of coughing, wheezing, shortness of breath, chest pain, dizziness, fatigue, headache, and irritation of the mouth, nose, and throat. Nausea, vomiting, and fever may also occur. Higher exposures can lead to pulmonary edema, a medical emergency which can be fatal.

CNS: High exposures may cause severe CNS irritation such as drowsiness, dizziness, visual disturbances, muscle twitching, and, in severe cases, painful muscle spasm.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to diborane and can last for months or even years:

Cancer Hazards: According to information presented in the references, diborane has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazards: According to information presented in the references, diborane has not been tested for its ability to affect reproduction.

Other Chronic Effects: Prolonged exposures may cause pulmonary irritation, headache, dizziness, muscle fatigue, and occasional transient tremors. Secondary infection may precipitate bronchial pneumonia. May also cause injuries to the central nervous system, liver, and kidneys.

🕒 **Recommended Risk-Reduction Measures**

Personnel should avoid direct contact with diborane. It is extremely toxic and exposures can cause death or serious physical injury or illness. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is always advisable whenever working with diborane. A NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diborane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diborane is used or stored. Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical tests are recommended:

- Lung function tests. These may be normal at first if the person is not having an attack at the time.

If symptoms develop or overexposure is suspected, the following may be useful:

- Consider chest X-ray after acute overexposure.

- Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose allergy).

- Liver and kidney function tests.

Other methods to reduce exposure to chemicals include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to diborane and at the end of the work shift or before eating, drinking, or smoking. Work clothing contaminated with diborane should never be taken home for laundering. Only personnel trained in the hazards of exposure should launder contaminated clothing.
- Safety shower and eyewash stations should be readily available in work areas where diborane is used or stored.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of diborane should be communicated to all exposed and potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of diborane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental releases, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Diborane is considered to be a flammable gas. It is explosive by itself and, because it is incompatible with many other commodities, contact with any of them can result in violent explosion and fire. It is highly reactive and will ignite with moist air at room temperature. Diborane forms explosive mixtures in air over a wide range (0.8% - 88%) which makes it a serious fire and explosion risk. It will explode in contact with many oxidizing agents (especially fluorine, bromine, and

chlorine). It is highly reactive in the presence of halogens and halogenated hydrocarbons. Therefore, diborane requires special consideration during any emergency involving a leak or release of diborane gas or liquid.

Diborane can enter the environment through industrial discharges, unchecked venting, or through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diborane.

Insufficient data are available to evaluate or predict the short-term effects of diborane on aquatic life, plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate the long-term effects of diborane on aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Diborane decomposes in water.

🕒 *Persistence in the Environment*

Diborane will react rapidly with water and therefore will not accumulate in the environment.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Diborane will react rapidly with water and therefore is not expected to accumulate in the tissues of fish.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or release to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and

rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diborane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Under all circumstances, it should be protected from exposure to moisture. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or release to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If diborane should contact the water table, aquifer, or navigable waterway, remediation may not be possible. It will readily react with water and decompose and, therefore, total containment will not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of diborane. If diborane is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, carefully remove leaking cylinder to a safe place in the open air, and allow cylinder to empty. Repair when completely empty. Attempting to repair while venting can be extremely dangerous.
- Keep diborane out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the buildup of explosive concentrations).
- It may be necessary to dispose of diborane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving diborane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

DIBROMOCHLOROPROPANE

CAS: 96-12-8

**IDENTIFICATION AND TYPICAL USES**

Dibromochloropropane (DBCP) is a dense yellow or amber liquid with a pungent odor at high concentrations. It will appear as a solid at temperatures below 43°F (6°C). It is primarily used as an insecticide, nematocide, and soil fumigant.

RISK ASSESSMENT: HEALTH**General Assessment**

DBCP is a human poison and is toxic by *ingestion*, *inhalation*, and skin contact (*absorption*). Exposure appears to cause systemic effects by all routes of entry. It will irritate the nose and throat (mucous membranes) and is a severe eye and skin irritant. It also appears to have a narcotic effect at high concentrations and has also been implicated in male sterility. It is highly suspected as a human carcinogen. Human mutation data have also been reported. It may cause diminished renal function and degeneration and cirrhosis of the liver.

Inhalation will cause nausea, vomiting, conjunctivitis, respiratory irritation and distress, pulmonary congestion, pulmonary edema, testicular atrophy, spleen necrosis, liver and kidney damage, and sperm count depression. May also cause central nervous system (CNS) depression and subsequent symptoms of apathy, drowsiness, sluggishness, and ataxia.

Ingestion will result in digestive system irritation, unspecified but adverse gastrointestinal effects, nausea, vomiting, cramps, headache, and many of the same symptoms associated with inhalation exposures, including CNS depression.

Skin contact results in severe irritation and may produce dermatitis with rash, erythema, inflammation, and itching. Eye contact can result in severe irritation and possible corneal damage.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to DBCP:

Skin: Irritation, inflammation, redness, itching, erythema, and possible dermatitis. May absorb through unbroken skin to cause toxic systemic effects.

Eye: Severe irritation, conjunctivitis, and possible damage to the cornea.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs) which is a medical emergency and can be fatal.

CNS: Dizziness, headaches, nausea, vomiting, some anesthesia, narcosis (on high concentrations).

Other: High concentrations may cause sperm count depression and changes in the liver, kidneys, and/or spleen.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to DBCP and can last for months or even years:

Cancer Hazards: According to the information presented in the references, DBCP has been shown to cause cancer in test animals. Reports of human carcinogenicity in the references are inconclusive and conflicting. Extreme caution is warranted. Human mutation data have been confirmed.

Reproductive Hazard: According to the information presented in the references, DBCP may have the ability to adversely affect the male reproductive system and cause sperm count depression and testicular atrophy.

Other Chronic Effects: Low, chronic exposures to skin may cause allergy or dermatitis. Once an allergy develops, even small future exposures will cause a

recurrence of symptoms. Repeated low exposures can also lead to liver, kidney, and spleen dysfunction.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around DBCP. At any exposure to a suspected human carcinogen, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. Rubber materials should be avoided since this chemical has been known to react with some types of natural and synthetic rubbers. To prevent hand and skin exposures, impervious gloves, such as polyvinyl chloride, should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with DBCP.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per OSHA 29 CFR 1910.1044 (DBCP) and 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where DBCP is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- ☑ Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests.
- ☑ Liver and kidney function tests.
- ☑ Evaluation by a qualified allergist with careful evaluation of exposure history and administration of special tests (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examina-

tion. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to DBCP and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of DBCP should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of DBCP. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

DBCP is considered a Class IIIA combustible liquid (per OSHA 29 CFR 1910.106). It can react with common metals such as aluminum, magnesium, and tin

alloys to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of DBCP or DBCP mixtures. Should DBCP ever come into contact with incompatible substances either during use, transportation, or storage, violent reactions can occur.

DBCP can enter the environment through its intended use as a soil fumigant and pesticide. However, its use in the United States has been severely curtailed and, in some instances, prohibited and, therefore, little release of DBCP presently occurs. It can reach the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to DBCP.

Insufficient data are available to evaluate or predict the short-term effects of DBCP to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

DBCP has slight chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of DBCP to plants, birds, or land animals.

💧 *Water Solubility*

DBCP is nearly insoluble in water. Concentrations of less than 1 milligram will mix with a liter of water.

🕒 *Persistence in the Environment*

DBCP is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals

as well as humans who have been exposed to the chemical.

The concentration of DBCP found in fish tissues is expected to be somewhat higher than the average concentration of DBCP in the water from which the fish was taken.

🔧 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of DBCP should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. This chemical will remain in soil for extended periods and may leach to underground aquifers. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If DBCP should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of DBCP. If DBCP is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of DBCP as a hazardous waste. The responsible state agency or the regional office of the federal Environmental

Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving DBCP can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms “carcinogen,” “cancer,” and “reproductive hazard” are used, public emotion and ignorance can run equally high. This should be a consideration in any policy planning activities.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

DIBUTYLAMINE $(C_4H_9)_2NH$

CAS: 111-92-2

**IDENTIFICATION AND TYPICAL USES**

Dibutylamine is a colorless or clear liquid with an amine-like odor. It is used primarily as a corrosion inhibitor but is also used as an intermediate for emulsifiers, in rubber accelerators, in dyes, insecticides, and flotation agents. It is also used as an inhibitor for butadiene.

RISK ASSESSMENT: HEALTH**General Assessment**

Dibutylamine is a human poison and is toxic by *ingestion* and *inhalation*. It is also moderately toxic by skin contact (corrosive). It will irritate the nose and throat (mucous membranes) and is a severe eye and skin irritant. Human mutation data have also been reported.

Inhalation will cause irritation to the nose, throat, and especially the lungs. It will cause cough, nausea, and headache. Its respiratory toxicity is primarily due to pulmonary effects. On high exposures, it may cause a fluid buildup in the lungs (pulmonary edema) which is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours, thereby creating a false sense of security relative to exposure risk.

Ingestion will result in digestive system irritation, unspecified but adverse gastrointestinal effects with irritation of the mouth and stomach. There may be nausea, vomiting, cramps, and headache.

Skin contact results in severe irritation and may produce dermatitis with rash and itching. Eye contact can result in severe irritation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur either immediately or shortly after (within hours or days) exposure to dibutylamine:

Skin: Irritation, inflammation, redness, itching, and possible dermatitis.

Eye: Severe irritation, inflammation, and possible damage to the cornea.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs) which is a medical emergency and can be fatal.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to dibutylamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, dibutylamine has been shown to cause structural changes in the cells of test animals. It is a mutagen. There is insufficient evidence, however, to support or substantiate any claims of carcinogenicity in humans or animals.

Reproductive Hazard: According to the information presented in the references, dibutylamine has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Low, chronic exposures to skin may cause allergy or dermatitis. Once an allergy develops, even small future exposures will cause a recurrence of symptoms.

🛡 Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dibutylamine. No exposure levels have been established for this chemical. This does not mean, however, that human exposures present no health risks. For relatively low, infrequent, or transient exposures, an organic vapor respirator may suffice. For higher or prolonged exposure, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious nitrile, polyvinyl alcohol (PVA) or Viton gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dibutylamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where dibutylamine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Consider chest X-ray after acute overexposure (may be negative if performed immediately after exposure or if symptoms have not yet appeared).
- Evaluation by a qualified allergist with careful evaluation of exposure history and administration of special tests (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful con-

sideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to dibutylamine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of dibutylamine should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of dibutylamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Dibutylamine is considered a Class II combustible liquid (per OSHA 29 CFR 1910.106). It can react with many common oxidizing materials to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of dibutylamine. Should dibutylamine ever come into contact with incompatible substances either during use, transportation, or storage, violent reactions can occur.

Dibutylamine can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dibutylamine. Insufficient data are available to evaluate or predict the short-term effects of dibutylamine to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of dibutylamine to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Dibutylamine is nearly insoluble in water. Concentrations of less than 1 milligram will mix with a liter of water.

⌚ *Persistence in the Environment*

Dibutylamine is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of dibutylamine found in fish tissues is expected to be somewhat higher than the average concentration of dibutylamine in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react

properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dibutylamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. This chemical will remain in soil for extended periods and may leach to underground aquifers. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If dibutylamine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dibutylamine. If dibutylamine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of dibutylamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dibutylamine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a seri-

ous expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| 2 | 4 | 4 | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|---|--|--|
| Characterization Chlorinated Hydrocarbon | RCRA Number D001, D003 | EPA Class Characteristic Waste (I) and (R) |
| DOT Proper Shipping Name Dichloroacetylene | Chemical Abstract Service (CAS) Number 7572-29-4 | |
| DOT Hazard Class and Label Requirements Forbidden | DOT Emergency Guide Code No Citation | |
| DOT Identification Number None | Chemical Formula C₂Cl₂ | |

Synonyms

Dichloroethyne; DCA.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|--|--|---|---|
| Dichloroacetylene (derivation: An undesired decomposition product of trichloroethylene or trichloroethane; dehydrochlorination; or obtained by degradation of trichloroethylene, vinylidene chloride, and other chlorinated hydrocarbons by pyrolysis above 158°F, photolysis, or contact with alkaline materials). 1 ppm = 3.95 mg/m³ | PEL (ceiling): 0.1 ppm 0.4 mg/m³ STEL: Not Established | REL (ceiling): 0.1 ppm 0.4 mg/m³ Possible Cancer Agent | Not Determined | TLV (ceiling): 0.1 ppm 0.39 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 90°F (32°C) Explodes | Specific Gravity (H ₂ O = 1) 1.26 |
| Vapor Pressure (mm Hg) Not Determined | Molecular Weight 94.9 |
| Vapor Density (Air = 1) Not Determined | Melting Point -86.8 to -83.6°F (-66 to - 64.2°C) |

Solubility

Insoluble in water, soluble in alcohol, acetone, and ether.

Appearance and Odor

Can exist as a volatile oily liquid with a disagreeable, sweetish odor. Normally found in the workplace as a vapor or gas by-product of heated trichloroethylene (above 90°F). Not produced commercially.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Spontaneously Combustible | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Combustible Liquid | Autoignition Temperature Not Determined |

Extinguishing Media

For small fires, use carbon dioxide, water spray, or foam. On large fires, use water spray, foam, or fog.

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Move containers from fire area if it can be done safely. Cool fire-exposed containers using water spray long after fire has been extinguished. Do not release to sewers or waterways.

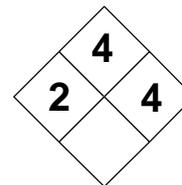

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Vapors may explode when they reach or exceed 90°F (32.2°C). Do NOT use dry chemical on fires (may react explosively).

| SECTION V - REACTIVITY DATA | | | | |
|---|--------------------------|--|------------------------------|---|
| Stability | | Conditions to Avoid Dichloroacetylene is unstable, self-reactive, and shock-sensitive. In its gaseous state, it will spontaneously ignite on exposure to air. Avoid contact with incompatible materials. Keep away from heat and flame. | | |
| Stable | Unstable X | Incompatibility (<i>materials to avoid</i>) Dichloroacetylene will form toxic chloride fumes upon exposure to acids or acid fumes. It will react violently with strong oxidizers (such as chlorine, bromine, fluorine). Also incompatible with heat and shock. | | |
| Hazardous Polymerization | | Conditions to Avoid Avoid contact with acids and oxidizing materials. Do not allow exposure of vapors to air. Avoid situations where friction or shock might occur. | | |
| May Occur X | Will Not Occur | Hazardous Decomposition or By-products Toxic and irritating fumes of carbon dioxide and chloride are produced when dichloroacetylene is involved in fire. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Headache, facial herpes, loss of appetite, intense jaw pain, vomiting, cranial nerve palsy causing uncontrollable tremor of the facial nerves, and nausea that can be extreme and disabling. High concentration can cause pulmonary or brain edema (a fluid buildup), which is a medical emergency and can be fatal. Long-term exposures can lead to CNS damage and behavioral changes, as well as kidney and liver injury. SKIN & EYES: May cause reddened and blistered skin and injury or burning to the eyes. INGESTION: Ingestion not likely. Insufficient data on results of ingesting liquid. | | | | |
| Carcinogenicity Questioned Human Confirmed Animal | NTP Listed? No | IARC Cancer Review Group? Group 3 | OSHA Regulated? No | Target Organs? Respiratory system, CNS, kidneys, liver. |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Call the poison control center and seek medical attention immediately. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Evacuate area, deny entry, stay upwind. Dichloroacetylene is explosive as a liquid or gas. Cleanup personnel should wear fully encapsulated protective suit. If it can be done without risk, shut-off leak. For small spills, use absorbent material to collect liquids. For large spills, dike area far ahead and await for disposal or emergency response team. Follow OSHA, EPA, or other applicable guidelines. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store dichloroacetylene in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. | | | | |
| Other Precautions and Warnings Bulk storage of dichloroacetylene is not recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure level is low (0.01 ppm). Best protection is provided by a supplied-air respirator with full face-piece operated in pressure demand mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Chemically Impervious | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Apron and Gauntlets |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DICHLOROACETYLENEC₂Cl₂

CAS: 7572-29-4

**IDENTIFICATION AND TYPICAL USES**

Dichloroacetylene is a volatile, oily liquid with a disagreeable, sweetish odor. It is usually found in the work environment as a vapor or gas by-product of heated trichloroethylene or, possibly, trichloroethane. It is not produced commercially for any known purpose.

(fluid buildup in lungs) which is a medical emergency and can be fatal.

CNS: Symptoms of dizziness, headache, loss of appetite, jaw pain, cranial nerve palsy (may be permanent), and possible damage to the nervous system.

RISK ASSESSMENT: HEALTH**General Assessment**

Dichloroacetylene is a human poison and is toxic primarily by *inhalation*, and also poses a risk to health on skin contact (absorption, however, is not likely).

Inhalation of the normally heated vapors of dichloroacetylene can cause a wide range of health effects with symptoms such as headache, facial herpes, loss of appetite, intense jaw pain, vomiting, cranial nerve palsy with uncontrollable tremors of the facial nerves, and extreme nausea that may be disabling on prolonged exposures. Exposure to high concentrations may cause pulmonary (lung) or brain edema, which is a dangerous buildup of fluids in the respective organs, and can be fatal.

Skin contact may cause irritation and may produce redness and even blistering (prolonged contact). Eye contact can result in mild to severe irritation.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to dichloroacetylene:

Skin: Irritation and possible redness and blistering.

Eye: Mild to severe irritation.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema

☠ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to dichloroacetylene and can last for months or even years:

Cancer Hazards: According to the information presented in the references, dichloroacetylene has been shown to cause cancer in test animals. Human data are insufficient to support any claims of human carcinogenicity. Extreme caution is warranted.

Reproductive Hazard: According to the information presented in the references, dichloroacetylene has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Low, chronic exposures may lead to liver and kidney damage and possible injury to the central nervous system. There may be symptoms of behavioral changes and general weakness.

🛡 Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dichloroacetylene. The exposure level for this chemical is extremely low (0.01 ppm), and difficult to measure accurately. There-

fore, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dichloroacetylene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where dichloroacetylene is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests.
- ☑ Liver and kidney function tests.
- ☑ Nervous system function tests, including interviews by a qualified neurologist to evaluate any changes in personality or behavior.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Automatic transfer of liquids from storage containers to process containers is recommended wherever possible.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to dichloroacetylene and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of dichloroacetylene

should be communicated to all potentially exposed workers.

- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of dichloroacetylene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Dichloroacetylene is considered a combustible liquid. However, it is self-reactive, extremely sensitive to shock and impact, and can explode violently in contact with air at temperatures above 90°F (32.2°C). These characteristics require special consideration during any emergency situation involving a leak or spill of dichloroacetylene. Should dichloroacetylene ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine), acids, acid fumes, or even air either during use, transportation, or storage, violent and explosive reactions can occur.

Dichloroacetylene can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dichloroacetylene. Insufficient data are available to evaluate or predict the short-term effects of dichloroacetylene to aquatic life, plants, birds, or land animals.

☠* *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of dichloroacetylene to aquatic life, plants, birds, or land animals.

◆ **Water Solubility**

Dichloroacetylene is insoluble in water. Even concentrations of less than 1 milligram may not mix with a liter of water.

⌚ **Persistence in the Environment**

Dichloroacetylene is highly persistent in water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 50% of dichloroacetylene will eventually end up in air; the rest will end up in water.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of dichloroacetylene found in fish tissues is expected to be somewhat higher than the average concentration of dichloroacetylene in the water from which the fish was taken.

🔒 **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dichloroacetylene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from shock and damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If dichloroacetylene should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response

or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dichloroacetylene. If dichloroacetylene is spilled or leaked, the following specific steps are recommended:

- ☑ Evacuate area and deny entry until cleanup is completed. Restrict persons not wearing protective clothing from hazard area.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ If source of leak is a cylinder and it cannot be repaired in place, remove to safe location (e.g., outdoors) and allow to vent until empty. Exercise extreme caution. Chemical is shock and impact sensitive.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of dichloroacetylene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dichloroacetylene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms “carcinogen,” or “cancer” are used, public emotion, hysteria, and ignorance can run equally high. This should be considered during development of any public relations policies.

🔒 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific

training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Damage to the lungs, liver, and kidneys. Coughing, central nervous system depression with transient anesthesia. Also causes lachrymation, irritation of the nose and throat, spasm of glottis and possible suffocation. Pulmonary edema and/or pneumonitis likely. SKIN & EYES: Irritating to the skin, eyes, and membrane tissue. May cause dermatitis and blisters. INGESTION: Poison by ingestion. Gastrointestinal irritation and irritation of the mouth and stomach. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | 5th Annual Report | Group 3 | 29 CFR 1910.1000 Table Z-1 | Eyes, skin, respiratory system, liver, kidneys. |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If swallowed: Call the poison control center and seek medical attention immediately. If conscious, induce vomiting. Never attempt to give an unconscious or convulsing person anything by mouth. DOCTOR: There is no known antidote. Treat symptomatically. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method Burn in a chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Do not store o-dichlorobenzene in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Do NOT store o-dichlorobenzene in aluminum containers (slow reaction may lead to explosion during storage). | | | | |
| Other Precautions and Warnings Automatic transfer of liquids from storage to process containers is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low or infrequent exposures, use an organic vapor respirator. Greater protection at higher exposures is provided with an MSHA/NIOSH-approved supplied-air respirator with full facepiece operated in continuous flow or other positive pressure mode (pressure demand), or, a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber Gloves | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

O-DICHLOROBENZENE

CAS: 95-50-1

**IDENTIFICATION AND TYPICAL USES**

o-Dichlorobenzene is a colorless to pale yellow liquid with a faint, pleasant, aromatic odor. It is used in the manufacture of 3,4-dichloroaniline, as a solvent for a wide range of organic materials, and for oxides of nonferrous metals. It is a solvent carrier in the production of toluene diisocyanate. It is also used in dye manufacturing; as an insecticide, herbicide, and fumigant; for degreasing hides and wool; in metal polishes; for industrial odor control; and as a heat transfer medium.

RISK ASSESSMENT: HEALTH**General Assessment**

o-Dichlorobenzene is a poison and is primarily toxic by *ingestion*. It is also moderately toxic by *inhalation* and will irritate the nose and throat (mucous membranes). It is a severe eye and skin irritant. It may cause liver and kidney injury and is also a questioned carcinogen and teratogen in animals. Human mutation data have also been reported.

Inhalation will cause irritation to the nose, throat, and especially the lungs. Symptoms range from cough and lachrymation to central nervous system depression and transient anesthesia. Its acute respiratory toxicity is primarily due to pulmonary effects. On high exposures, it may cause a fluid buildup in the lungs (pulmonary edema) which is a medical emergency and can be fatal. Symptoms may be delayed up to 48 hours, thereby creating a false sense of security relative to exposure risk.

Ingestion will result in digestive system irritation, unspecified but adverse gastrointestinal effects with irritation of the mouth and stomach. There may be nausea, vomiting, cramps, and headache.

Skin contact results in severe irritation and may produce dermatitis with rash and itching with blisters. Eye contact can result in severe irritation, inflammation, and possible damage to vision.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to o-dichlorobenzene:

Skin: Irritation, inflammation, redness, itching, blistering, smarting, and possible dermatitis.

Eye: Severe irritation, inflammation, and possible damage to vision.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs) which is a medical emergency and can be fatal.

CNS: A central nervous system depressant causing narcotic effects with transient anesthesia.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to o-dichlorobenzene and can last for months or even years:

Cancer Hazards: According to the information presented in the references, o-dichlorobenzene has been shown to cause liver and kidney changes in animals. Its carcinogenicity in humans is questioned. It is a mutagen. There is insufficient evidence, however, to support or substantiate any claims of carcinogenicity in humans or animals.

Reproductive Hazard: According to the information presented in the references, o-dichlorobenzene is suspected to adversely affect reproduction.

Other Chronic Effects: Low, chronic exposures to skin may cause allergy or dermatitis. Once an allergy develops, even small future exposures will cause a recurrence of symptoms. This chemical may cause damage to the liver or kidneys.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around o-dichlorobenzene. For relatively low, infrequent, or transient exposures, an organic vapor respirator may suffice. For higher or prolonged, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around o-dichlorobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where o-dichlorobenzene is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Liver and kidney function tests.

- Consider chest X-ray after acute overexposure (may be negative if performed immediately after exposure or if symptoms have not yet appeared).

- Evaluation by a qualified allergist with careful evaluation of exposure history and administration of special tests (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to o-dichlorobenzene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of o-dichlorobenzene should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of o-dichlorobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in

fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

o-Dichlorobenzene is considered a Class IIIA combustible liquid (per OSHA 29 CFR 1910.106). It can react with many strong oxidizers to cause a fire or explosion. In contact with aluminum, especially in heated conditions, it may react slowly and explode. Storage containers should not be made of aluminum. These characteristics require special consideration during any emergency situation involving a leak or spill of o-dichlorobenzene. Should o-dichlorobenzene ever come into contact with incompatible substances either during use, transportation, or storage, violent reactions can occur.

o-Dichlorobenzene can enter the environment through its intended use as an insecticide, herbicide, and fumigant or through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to o-dichlorobenzene.

As an herbicide, it does not appear that this chemical will cause damage to plants. However, insufficient data are available to evaluate or predict the short-term effects of o-dichlorobenzene to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

As an herbicide, it does not appear that this chemical will cause damage to plants. However, insufficient data are available to evaluate or predict the long-term effects of o-dichlorobenzene to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

o-Dichlorobenzene is nearly insoluble in water (0.01%). Concentrations of less than 1 milligram will mix with a liter of water.

🕒 *Persistence in the Environment*

o-Dichlorobenzene is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of o-dichlorobenzene found in fish tissues is expected to be somewhat higher than the average concentration of o-dichlorobenzene in the water from which the fish was taken.

🛑 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of o-dichlorobenzene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. This chemical will remain in soil for extended periods and may leach to underground aquifers. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If o-dichlorobenzene should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of o-dichlorobenzene. If o-dichlorobenzene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of o-dichlorobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving o-dichlorobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

p-DICHLOROBENZENE

CAS: 106-46-7

**IDENTIFICATION AND TYPICAL USES**

p-Dichlorobenzene is a colorless or white crystalline solid with a characteristic mothball-like odor. It is used as a moth repellent, a general insecticide, a germicide, a space odorant, in the manufacture of 2,5-dichloro-aniline, in the manufacture of dyes, intermediates, in pharmaceuticals, and in the agricultural industry (soil fumigant).

RISK ASSESSMENT: HEALTH***General Assessment***

p-Dichlorobenzene is moderately toxic to humans by *ingestion*. It is also moderately toxic by *inhalation* and will irritate the nose and throat (mucous membranes). It may cause liver and kidney injury and is also a confirmed carcinogen and suspected teratogen in animals. Human mutation data have also been reported.

Inhalation and ingestion will cause toxic symptoms of cough, headache, weakness, dizziness, nausea, vomiting, loss of weight, and injury to the liver and kidney. These symptoms occur from repeated inhalation of high concentrations of vapors or from ingestion. In addition, human systemic effects by ingestion also include unspecified changes in the eyes, lungs, thorax, and in respiration, and decreased motility or constipation. Chronic exposure may cause jaundice and cirrhosis. The vapors may also irritate the skin.

Skin and eye contact results in pain and mild irritation. Absorption is not likely.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to p-dichlorobenzene:

Skin: Mild irritation that may be painful on long exposures.

Eye: Mild to severe irritation with possible inflammation and conjunctivitis.

Lung: Irritation of the upper respiratory tract causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs) which is a medical emergency and can be fatal.

Other: Ingestion can cause symptoms ranging from no effect to headache, vomiting, weakness, loss of weight, and injury to the liver and kidneys.

☘ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to p-dichlorobenzene and can last for months or even years:

Cancer Hazards: According to the information presented in the references, p-dichlorobenzene has been shown to cause liver and kidney changes in animals. Its carcinogenicity in humans is questioned. However, the data in the references are conflicting and inconclusive in this regard. It is a mutagen. Until further

studies are performed, it is suggested that p-dichlorobenzene be handled with extreme caution.

Reproductive Hazard: According to the information presented in the references, p-dichlorobenzene is suspected to adversely affect reproduction in animals.

Other Chronic Effects: This chemical may cause unspecified damage to the eyes, lungs, thorax, liver, and kidneys. Repeated exposures may result in jaundice and cirrhosis.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around p-dichlorobenzene. For any exposure to a suspected human carcinogen, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be worn. Rubber materials should be avoided since this chemical may attack some forms of rubber (as well as some plastics and coatings).

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around p-dichlorobenzene.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where p-dichlorobenzene is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.

- Liver and kidney function tests.
- Consider chest X-ray after acute overexposure (may be negative if performed immediately after exposure or if symptoms have not yet appeared).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to p-dichlorobenzene and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of p-dichlorobenzene should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of p-dichlorobenzene. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the sur-

rounding environmental mediums (water, soil, and air).

p-Dichlorobenzene is considered a combustible solid. It is often mixed in solutions with flammable materials. It can also react with many strong oxidizers to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of p-dichlorobenzene. Should p-dichlorobenzene ever come into contact with incompatible substances either during use, transportation, or storage, violent reactions can occur.

p-Dichlorobenzene can enter the environment through its intended use as an insecticide and fumigant or through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to p-dichlorobenzene. Insufficient data are available to evaluate or predict the short-term effects of p-dichlorobenzene to aquatic life, plants, birds, or land animals.

🕒 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of p-dichlorobenzene to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

p-Dichlorobenzene is nearly insoluble in water (0.008%). Concentrations of less than 1 milligram will mix with a liter of water.

🕒 *Persistence in the Environment*

p-Dichlorobenzene is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat con-

taminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of p-dichlorobenzene found in fish tissues is expected to be somewhat higher than the average concentration of p-dichlorobenzene in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of p-dichlorobenzene should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. This chemical will remain in soil for extended periods and may leach to underground aquifers. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If p-dichlorobenzene should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of p-dichlorobenzene. If p-dichlorobenzene is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal. Collect powders in safest manner possible and dispose of in sealed drums. Do NOT

dry sweep (creates dusts). Use a vacuum with a high efficiency particulate air (HEPA) filter.

- ☑ It may be necessary to dispose of p-dichlorobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving p-dichlorobenzene can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember, anytime the terms “carcinogen,” “cancer,” or “reproductive” hazard is used, public emotion, hysteria, and ignorance can run equally high. This should be a consideration during the development of any corporate policies regarding public relations.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

3,3'-DICHLOROBENZIDINE

CAS: 91-94-1

**IDENTIFICATION AND TYPICAL USES**

3,3'-Dichlorobenzidine is a gray to purple crystalline solid. It is used as an intermediate for dyes and pigments, and as a curing agent for isocyanate-terminated resins for urethane plastics.

RISK ASSESSMENT: HEALTH**General Assessment**

3,3'-Dichlorobenzidine is mildly toxic to humans by *ingestion*. It is also toxic by *inhalation* and will irritate the nose and throat (mucous membranes). It has been shown to cause bladder cancer in test animals. Human mutation data have also been reported.

Inhalation can cause irritation of the upper respiratory tract with a potential for secondary infections. Inhalation and ingestion will cause toxic symptoms of cough, headache, and dizziness. Exposure can also cause blood in the urine and painful, difficult, or frequent urination. It is known to cause bladder cancer in test animals and its carcinogenic properties in humans are highly suspect. There may also be injuries to the liver. These symptoms occur from repeated inhalation of high concentrations of vapors or from ingestion.

This chemical can cause allergic skin reaction, dermatitis, and caustic burns. It can absorb through unbroken skin and cause toxic systemic effects, including a possibility of bladder cancer.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to 3,3'-dichlorobenzidine:

Skin: Mild to moderate irritation and possible caustic burns. Skin absorption is likely.

Eye: Mild to severe irritation and inflammation.

Lung: Irritation of the upper respiratory tract causing coughing and/or shortness of breath and may lead to secondary infections. Can cause blood to appear in the urine. Urination may be painful, difficult, and frequent.

Other: Ingestion can cause symptoms ranging from no effect to headache, dizziness, and painful bloody urination.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to 3,3'-dichlorobenzidine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, 3,3'-dichlorobenzidine has been shown to cause liver, breast, bladder, intestine, and skin cancer in test animals. Its carcinogenicity in humans is questioned. However, the data in the references are conflicting and inconclusive in this regard. It is a mutagen. Until further studies are performed, it is suggested that 3,3'-dichlorobenzidine be handled with extreme caution.

Reproductive Hazard: According to the information presented in the references, 3,3'-dichlorobenzidine is suspected to adversely affect reproduction in animals. It has caused cancer in the offspring of test animals.

Other Chronic Effects: Repeated low-level exposures may cause dermatitis.

🛡 Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around 3,3'-dichlorobenzidine. For any exposure to a suspected human carcinogen, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final gloves selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with or around 3,3'-dichlorobenzidine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where 3,3'-dichlorobenzidine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Examination of the liver, breast, bladder, intestine, and skin.
- Evaluation by a qualified allergist, including careful exposure history and special testing (may help diagnose skin allergy).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to 3,3'-dichlorobenzidine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of 3,3'-dichlorobenzidine should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.
- Specific engineering controls are recommended for this chemical by NIOSH. Refer to NIOSH Criteria Document: Special Occupational Hazard Review for Benzidine Based Dyes (publication Number 80-109).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of 3,3'-dichlorobenzidine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

3,3'-Dichlorobenzidine should always be handled with extreme caution. While it is not reported to be incompatible with other materials, by itself it presents serious health exposure risk. These characteristics require special consideration during any emergency situation involving a leak or spill of 3,3'-dichlorobenzidine.

3,3'-Dichlorobenzidine can enter the environment through industrial discharges and spills.

☠ Acute Ecological Effects

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to 3,3'-dichlorobenzidine.

This chemical has high acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of 3,3'-dichlorobenzidine on plants, birds, or land animals.

☛ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

3,3'-Dichlorobenzidine has high chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of 3,3'-dichlorobenzidine on plants, birds, or land animals.

💧 *Water Solubility*

3,3'-Dichlorobenzidine is nearly insoluble in water (0.07%). Concentrations of less than 1 milligram will mix with a liter of water.

⌚ *Persistence in the Environment*

3,3'-Dichlorobenzidine is moderately persistent in water, with a half-life of between 20 to 200 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 60% will eventually end up in water, the rest will be divided about equally between terrestrial soils and aquatic sediments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of 3,3'-dichlorobenzidine found in fish tissues is expected to be somewhat higher than the average concentration of 3,3'-dichlorobenzidine in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or

spill to the environment. The correct use of labeling on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of 3,3'-dichlorobenzidine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If 3,3'-dichlorobenzidine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of 3,3'-dichlorobenzidine. If 3,3'-dichlorobenzidine is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Collect powders in safest manner possible and dispose of in sealed drums. Do NOT dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter.
- ☑ It may be necessary to dispose of p-dichlorobenzene as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving 3,3'-dichlorobenzidine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember, anytime the terms "carcinogen," "cancer," or "reproductive" hazard is used, public emotion, hysteria, and ignorance can run equally high. This should be a consideration during the development of any corporate policies regarding public relations.

🔗 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|--|---------------------------------|
| Characterization Halogenated Hydrocarbon | RCRA Number U075 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Dichlorodifluoromethane | Chemical Abstract Service (CAS) Number 75-71-8 | |
| DOT Hazard Class and Label Requirements Non Flammable; Non Flammable Gas | DOT Emergency Guide Code 12 | |
| DOT Identification Number UN 1028 | Chemical Formula CCl₂F₂ | |

Synonyms

Difluorodichloromethane; fluorocarbon 12; Freon® 12; Genetron® 12; Halon® 122; Isotron® 12; propellant 12; refrigerant 12; Algofrene® type 2; Eskimon® 12; Ucon® 12.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|--|---|---|
| Dichlorodifluoromethane (derivation: By reaction of carbon tetrachloride and anhydrous hydrogen fluoride, in the presence of an antimony halide catalyst; high-temperature chlorination of vinylidene fluoride, which is made by adding hydrogen fluoride to acetylene). 1 ppm = 5.03 mg/m³ | PEL (8-hour): 1000 ppm 4950 mg/m³ STEL: Not Established | REL (10 hour): 1000 ppm 4950 mg/m³ Possible Cancer Agent | 50,000 ppm | TLV (8-hour): 1000 ppm 4950 mg/m³ STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point -22°F (-30°C) | Specific Gravity (H ₂ O = 1) 1.35 |
| Vapor Pressure (mm Hg) 5.7 at 69°F (20°C) | Molecular Weight 120.9 |
| Vapor Density (Air = 1) 4.16 | Freezing Point -252°F (-158°C) |

Solubility

Insoluble (0.03% at 77°F) in water. Soluble in most organic solvents (alcohol, ether, benzene, amyl chloride, bromobenzene, bromoform, *n*-butyl alcohol, butyl butyrate, carbon tetrachloride, and chloroform).

Appearance and Odor

Colorless gas with an ether-like odor at extremely high concentrations. Shipped as compressed gas.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|--|
| Flash Point (method used) Non Flammable | Explosive Limits in Air % by Volume LEL: Not Determined UEL: Not Determined |
| NFPA Classification Non Flammable Gas | Autoignition Temperature Not Determined |

Extinguishing Media

Use extinguishing media suitable for surrounding fire. Dichlorodifluoromethane does not burn.

Special Fire Fighting Procedures

Poisonous gases are produced in fire, wear full protective clothing and self-contained breathing apparatus. Move containers from fire area if it can be done safely. Cool fire-exposed containers using water spray long after fire has been extinguished. May attack some rubbers, plastics, and coatings.

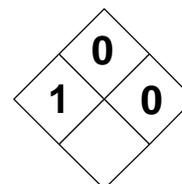

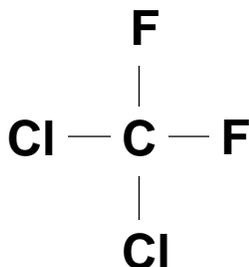

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Evacuate immediately if rising sound is heard from venting device or if there is any noticeable discoloration of tank or vessel.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------|---|-------------------------------|------------------------------------|
| Stability | | Conditions to Avoid Dichlorodifluoromethane is stable up to 1022°F (550°C), above which it will begin to decompose. Avoid exposures to excessive heat and contact with incompatible materials. | | |
| Stable | Unstable | Incompatibility (materials to avoid) Dichlorodifluoromethane will react in the presence of chemically active metals, such as potassium, sodium, calcium, powdered aluminum, magnesium, or zinc. | | |
| X | | | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of dichlorodifluoromethane can not occur. | | |
| May Occur | Will Not Occur | Hazardous Decomposition or By-products Toxic and irritating fumes and gases are produced when dichlorodifluoromethane is involved in fire, including carbon dioxide, phosgene, chlorine, hydrogen chloride, hydrogen fluoride, and fluorine. | | |

| Primary Route(s) of Entry: | | Inhalation? | Absorption (skin)? | Ingestion? |
| | | X | | |
| Health Hazards | | | | |
| <p>INHALATION: Low-level toxicity. A simple asphyxiant when oxygen levels are 15 to 16%. Produces unconsciousness at 6 to 8% oxygen. High concentrations may cause conjunctiva irritation, fibrosing alveolitis, and liver changes. Narcotic at high concentrations.</p> <p>SKIN & EYES: Eye irritation at high concentrations. The liquid can cause frostbite burns to tissues.</p> <p>INGESTION: Ingestion not likely.</p> | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| No Citation (Human) No Citation (Animal) | No | No | 29 CFR 1910.1000 Table Z-1 | Cardiovascular system, CNS, PNS |
| Medical Conditions Generally Aggravated by Exposure Pre-existing ventricular ectopy (an abnormal displacement or situation in the ventricles of the heart). | | | | |
| Emergency and First-aid Procedures | | | | |
| <p>Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: For frostbite, rapidly re-warm using water at 107°F (42°C) until flush returns. Do NOT use dry heat! Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Not likely. Liquid state only below temperatures of -22°F (-30°C). DOCTOR: Monitor for ventricular ectopy according to ACLS guidelines.</p> | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Evacuate area, deny entry, stay upwind. If it can be done without risk, shut off leak. There may be a visible vapor cloud. If leak cannot be repaired, empty into a combustion chamber with a combustible fuel and burn (ensure complete combustion to prevent formation of phosgene). | | | | |
| Preferred Waste Disposal Method | | | | |
| Rotary kiln incineration at 1508 to 2912°F or fluidized bed incineration at 842 to 1796°F. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store dichlorodifluoromethane in the presence of incompatible materials. Store in tightly closed containers in a cool (below 125°F), dry, well-ventilated area. Ship as a liquefied compressed gas. | | | | |
| Other Precautions and Warnings | | | | |
| Prevent physical damage to compressed gas storage cylinders. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) | | | | |
| Best protection is provided by a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Neoprene Rubber | | Chemical Goggles or Face Mask | | Neoprene Rubber Apron |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DICHLORODIFLUOROMETHANE

CAS: 75-71-8

**IDENTIFICATION AND TYPICAL USES**

Dichlorodifluoromethane is colorless gas with an ether-like odor at extremely high concentrations. It is normally shipped as a liquefied compressed gas. It has been used primarily as a refrigerant in air conditioners. It has also been used in the manufacture of plastics, as a blowing agent (a propellant), as a low-temperature solvent, as a leak-detecting agent, and for freezing foods (by direct contact) and for chilling cocktail glasses.

RISK ASSESSMENT: HEALTH**General Assessment**

Dichlorodifluoromethane is considered to have low toxicity by the *inhalation* route. It is a simple asphyxiant and can produce some irritation and mild narcotic effects in high concentrations. Its greatest risk to health is its ability to induce serious cardiac arrhythmia at high concentrations or in personnel with pre-existing ventricular ectopy (abnormalities).

Inhalation produces conjunctiva irritation, fibrosing alveolitis, and possible liver changes. It can also produce narcotic effects at high concentrations with primary action on the central nervous system (CNS) and the peripheral nervous system (PNS). Indications of asphyxia include an overwhelming feeling of "air starvation" or air hunger, and rapid, irregular breathing. There may be headache, fatigue, mental confusion, nausea and vomiting, giddiness and poor judgment, exhaustion, numbness in the legs and arms, convulsions, and death. Prolonged concentrations can lead to generalized paresthesia, ringing in the ears, apprehension, and slurred speech. These may be followed by a

marked decrease in consciousness, amnesia, and cardiac arrhythmia.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to dichlorodifluoromethane:

Skin: Irritation and possible frostbite (liquid contact).

Eye: Mild irritation and conjunctivitis. Liquid will burn tissue.

Lung: Irritation of the mucosa. Will cause asphyxiation and associated symptoms (up to and including death) at high concentrations.

Other: A narcotic at high concentrations. Will effect the central nervous system (CNS) and the peripheral nervous system (PNS). Also, can induce irregular or abnormal heart arrhythmia.

☛ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to dichlorodifluoromethane and can last for months or even years:

Cancer Hazards: According to the information presented in the references, dichlorodifluoromethane has not been shown to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, dichlorodifluoromethane has not been shown to adversely affect reproduction in test animals.

Other Chronic Effects: Low, chronic exposures may lead to liver and kidney damage and possible injury to the central nervous system. There may be symptoms of

behavioral changes and general weakness. Ventricular ectopy may also be induced on high or prolonged exposures.

🕒 **Recommended Risk-Reduction Measures**

While dichlorodifluoromethane is considered to be of a low-order toxicity by inhalation, it can still pose some degree of health hazard risk. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dichlorodifluoromethane. The exposure level for this chemical is extremely high (1000 ppm), and, therefore, respiratory protection may not always be necessary in well-ventilated work areas. However, when high exposure levels are predicted or prolonged exposures are anticipated, a supplied air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, neoprene rubber gloves should be worn. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dichlorodifluoromethane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where dichlorodifluoromethane is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical protocol is suggested for those assigned to work with dichlorodifluoromethane:

- ☑ Electrocardiogram (EKG), to test for pre-existing ventricular ectopy and establish baseline.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Electrocardiogram (EKG), to compare with baseline.
- ☑ Liver function tests.
- ☑ Nervous system function tests, including interviews by a qualified neurologist to evaluate any changes in personality or behavior.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to dichlorodifluoromethane and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of dichlorodifluoromethane should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of dichlorodifluoromethane. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Dichlorodifluoromethane is considered a non-flammable gas. However, it is incompatible with a number of common, chemically active metals and caution is required to ensure contact is prevented. It is also a chlorofluorocarbon (CFC) which is a group of halogenated hydrocarbons alleged to cause damage to the earth's protective ozone layer. Therefore, accidental release to the environment must not occur. These characteristics require special consideration during any emergency situation involving a leak or spill of dichlorodifluoromethane. Should dichlorodifluoromethane ever come into contact with incompatible substances either during use, transportation, or storage, violent and explosive reactions can occur.

Dichlorodifluoromethane is normally a gas. But it is shipped as a liquefied compressed gas. It can enter the environment through industrial discharges and spills.

☠ **Acute Ecological Effects**

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dichlorodifluoromethane.

This chemical is not expected to cause adverse short-term effects on aquatic life, plants, birds, or terrestrial animals.

☪ **Chronic Ecological Effects**

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Insufficient data are available to evaluate or predict the long-term effects of dichlorodifluoromethane to aquatic life, plants, birds, or land animals.

💧 **Water Solubility**

Dichlorodifluoromethane is nearly insoluble in water (0.03% at 77°F). It is normally a gas.

🕒 **Persistence in the Environment**

Dichlorodifluoromethane is virtually non-persistent in water, with a half-life of less than 2 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 100% of dichlorodifluoromethane will end up in air.

🐟 **Bioaccumulation in Aquatic Organisms**

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of dichlorodifluoromethane found in fish tissues is expected to be much lower than the average concentration of dichlorodifluoromethane in the water from which the fish was taken.

🛡️ **Recommended Risk-Reduction Measures**

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of dichlorodifluoromethane should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Containers must be protected from shock, excessive heat (including the sun's rays), and damage.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If any liquid has spilled, contaminated soils may need to be removed for incineration and replaced with clean soil. If dichlorodifluoromethane should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of the aquatic environment. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dichlorodifluoromethane. If dichlorodifluoromethane is spilled or leaked, the following specific steps are recommended:

- Evacuate area and deny entry until cleanup is completed. Restrict persons not wearing protective clothing from hazard area.
- Ventilate area of spill or leak.
- Remove all ignition sources.

- ☑ If source of leak is a cylinder and it cannot be repaired in place, remove to safe location (e.g., outdoors).
- ☑ Absorb liquid spills using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of dichlorodifluoromethane as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dichlorodifluoromethane can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? | Absorption (skin/eye)? | Ingestion? |
| | | X | X | X |
| Health Hazards | | | | |
| INHALATION: Breathing dusts can cause irritation of the nose and throat. Repeated contact will lead to toxic systemic effects. These include headache, dizziness, nausea, vomiting, malaise, profuse sweating, fatigue, clonic or tonic convulsions, myoclonic limb jerks, coma, and respiratory failure. May cause tremors, fainting, muscle spasms, weight loss, and damage to the liver and kidneys. | | | | |
| ABSORPTION: Irritation. Solution can pass through intact skin causing serious systemic effects. | | | | |
| INGESTION: Nausea, vomiting, diarrhea, and systemic effects (see inhalation). | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Questioned Human Questioned Animal | 5th Annual Report | Group 3 | 29 CFR 1910.1000 Table Z-1 | Central nervous system (CNS), liver, kidneys, skin. |
| Medical Conditions Generally Aggravated by Exposure Central nervous system disorders and kidney or liver diseases may be aggravated by exposure. | | | | |
| Emergency and First-aid Procedures | | | | |
| Eye contact: Do not allow victim to keep eyes tightly shut. Flush immediately with water for 15 minutes, seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with flooding amounts of water followed by an alcohol wash and then a second wash with soap and water. If red skin or blisters appear, seek medical assistance. Inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Contact poison control center. Unless advised otherwise, do NOT induce vomiting. Seek medical attention immediately. Never give anything by mouth to an unconscious or convulsing person. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Remove all sources of ignition. Ventilate area of spill. Restrict those not involved in cleanup from entering area. Notify appropriate authorities. Carefully scoop or collect powdered materials with a vacuum equipped with HEPA filter (do NOT generate dusts). Dispose of in sealed drums. | | | | |
| Preferred Waste Disposal Method | | | | |
| Rotary kiln incineration is recommended. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Store in tightly closed containers in cool, well-ventilated area away from heat and incompatibilities. | | | | |
| Other Precautions and Warnings | | | | |
| Since use of dieldrin is prohibited in the U.S., storage should only occur while awaiting disposal. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| Odor threshold is low and difficult to monitor. For exposures above 0.25 mg/m³, use a NIOSH-approved supplied air respirator or a SCBA with full facepiece operated in positive pressure mode. | | | | |
| Ventilation | | | | |
| Local exhaust (preferred) at site of chemical work or general ventilation. | | | | |
| Protective Gloves | | Eye Protection | | Other Protective Clothing |
| Rubber | | Chemical/Dust Goggles or Face Mask | | Protective Apron, Boots (avoid skin contact) |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIELDRINC₁₂H₈Cl₆O

CAS: 60-57-1

**IDENTIFICATION AND TYPICAL USES**

Dieldrin is a colorless to white crystalline solid in its pure form. The technical grade appears as a tan crystalline solid or powder. It has a mild chemical odor. It was formerly used widely as an insecticide until agricultural use was banned in 1974. Its use to control moth proliferation in woolen goods and for termite control continued until 1992. It is no longer produced or used in the United States. It is still used in other countries for the control of malaria mosquitoes and other related vector-borne diseases.

RISK ASSESSMENT: HEALTH**General Assessment**

Dieldrin is highly toxic to humans by all routes of exposure (*inhalation, ingestion, and skin absorption*). It is a questionable carcinogen in animals and in humans, with experimental teratogenic and mutagenic data also reported. This chemical is no longer manufactured in the United States and, therefore, exposure risk is thought to be relatively low. However, because of the chemical's long persistence in the environment, exposure can still occur through contact with contaminated soils, water, and vegetation, at hazardous waste sites, or contaminated manufacturing sites. Should human exposure ever occur, dieldrin can cause serious toxic and poisonous systemic effects up to and including death.

Dieldrin is a central nervous system stimulant. Symptoms of exposure by both inhalation and skin contact (absorption) include respiratory depression with convulsions, hypersalivation, hyperirritability, profuse sweating, myoclonic limb jerks, clonic/tonic convulsions, and coma. There may also be headache, dizzi-

ness, fatigue, blurred vision, tremors, and respiratory failure. Inhalation also causes irritation of the eyes, nose, and throat. Skin absorption may produce greater toxicity than inhalation. Combined exposures (e.g., inhalation *and* absorption) are extremely dangerous and can lead to death in some cases. Caution is therefore warranted when inhalation and skin contact exposures are possible. Even though air levels may be within limits, personnel may be overexposed if dieldrin should contact the skin.

In addition to absorption and subsequent systemic effects, skin contact will result in moderate to severe irritation. Eye contact may also result in irritation. The chemical may even be absorbed through direct eye contact. Ingestion causes nausea, vomiting, diarrhea, and systemic effects of inhalation and skin absorption.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to dieldrin:

Skin: Liquid can pass through unbroken skin. Contact may cause irritation and rash. Symptoms of exposure include headache, nausea, abdominal pain, vomiting, and CNS stimulation.

Eye: Mild to severe irritation. Absorption through direct eye contact is possible.

Lung: Irritation of the nose and throat. Breathing vapors can cause cough, convulsions, and adverse effects on the liver.

CNS: A central nervous system stimulant. Symptoms include, irritability, blurred vision, tremors, convulsions, and mental confusion.

☠* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to dieldrin and can last for months or even years:

Cancer Hazards: Dieldrin may be a carcinogen in humans since it has been shown to cause liver cancer in animals.

Reproductive Hazard: There is some evidence that exposure to dieldrin causes damage to the developing fetus in test animals. Dieldrin may decrease fertility in males and females.

Other Chronic Effects: Repeated exposures may lead to chronic fainting, muscle spasms, tremors, and weight loss. Dieldrin is stored primarily in the fatty tissues and remains relatively unchanged.

🕒 **Recommended Risk-Reduction Measures**

Dieldrin is no longer manufactured in the United States. Its use is no longer permitted. However, in the unlikely event that personnel should be occupationally exposed to dieldrin, the risks to human health can be severe. Personnel should avoid direct contact with dieldrin. If a less toxic material or compound cannot be substituted for dieldrin, then *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of dieldrin dust release. This may be practical in manufacturing operations, but is not feasible in application since it is used outdoors. While not always operationally possible, isolating operations involving dieldrin manufacturing can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dieldrin. The PEL is extremely low (0.25 mg/m³) and difficult to accurately monitor. At exposures above the PEL, an MSHA or NIOSH-approved self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is recommended for the greatest possible respiratory protection. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. A face shield and protective apron should also be worn. To prevent hand and skin exposures, impervious gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with dieldrin.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where dieldrin is used or stored.

If symptoms develop or overexposure is suspected, the following medical testing may be useful:

- ☑ Liver and kidney function tests.
- ☑ Urinalysis for halogenated compounds.
- ☑ Neurological evaluation of central nervous system.
- ☑ Gastric lavage may be indicated if substantial ingestion has occurred. Activated charcoal and sodium sulfate may be beneficial.

Any evaluation should include a careful history of past and present symptoms with an examination. Medical tests that simply look for existing damage are not a substitute for controlling exposures.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to dieldrin and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of dieldrin should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in the immediate work area for emergency use. If there is a possibility of skin exposure to dieldrin, emergency shower facilities should also be provided.
- ☑ Workers whose clothing has been contaminated by dieldrin should change into clean clothes before leaving work. Contaminated work clothing should be laundered only by individuals who have been informed of the hazards of exposure to dieldrin.
- ☑ Specific engineering controls are recommended by NIOSH. Refer to NIOSH Criteria Document: Occupational Exposure During the Manufacture and Formulation of Pesticides (Publication Number 78-174).

RISK ASSESSMENT: ENVIRONMENT

General Assessment

Because of its former use as an insecticide and pesticide, dieldrin may be present in the environment. The environment is also at risk of exposure during transportation, storage, disposal, or destruction of dieldrin. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, where dieldrin contacts incompatible commodities can result in violent and even explosive reactions (depending upon conditions of spill), and possible contamination of the surrounding environmental mediums (water, soil, and air).

Dieldrin is considered a non-combustible solid. However, it is common practice to mix it with some flammable liquids such as benzene or xylene. Also, because it is incompatible with many common oxidizers, such as chlorine, extreme caution is required in handling, storage, transportation, and disposal of dieldrin. These characteristics also require special consideration during any emergency situation involving a leak or spill of dieldrin powder or dust.

Dieldrin use in the U.S. is no longer permitted. However, because of its once widespread, general use in the past and its persistence, dieldrin can enter the environment in agricultural run-off.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to dieldrin. Dieldrin has high acute toxicity to aquatic life, land animals, and to birds. Insufficient data are available on the short-term effects of dieldrin to plants.

🕒 *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Dieldrin has high chronic toxicity to aquatic life, birds, and land animals. Insufficient data are available to evaluate or predict the long-term effects of dieldrin to plants.

💧 *Water Solubility*

Dieldrin is nearly insoluble in water (0.02%). Concentrations of less than 1 milligram may not mix with a liter of water.

🕒 *Persistence in the Environment*

Dieldrin is highly persistent in the water, with a half-life of greater than 200 days. The half-life of a pollutant is the amount of time it takes for one-half of the chemical to be degraded. It will persist in soil for extremely long periods (7 years or more). It can leach to ground water and absorb in terrestrial and aquatic sediments. About 80% of dieldrin will eventually end up in terrestrial soil; approximately 19% will end up in aquatic sediments; the remainder will end up in water or air.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of dieldrin found in fish tissues is expected to be considerably higher than the average concentration of dieldrin in the water from which the fish was taken.

🛡️ *Recommended Risk-Reduction Measures*

Although dieldrin is no longer manufactured or used in the United States and it is unlikely that it will be transported, stored, handled, or destroyed, environmental contamination is still possible. This is based upon its extremely long persistence in the environment and the fact that it can be present in contaminated soils, at hazardous waste sites, and in some stockpiles awaiting destruction.

Storage of dieldrin should be segregated from incompatible materials to minimize the risk of cross-contamination or contact. Buildings or storage areas should be equipped with appropriate fire protection systems (alarms, sprinklers). Proper ventilation and protective equipment should be used while handling the powders or while preparing aqueous solutions.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. If dieldrin should contact the water table, aquifer, or navigable waterway, reclamation procedures should be initiated as soon as practical. It is nearly insoluble in water and total remediation may be possible. The local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of dieldrin. If dieldrin is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Remove all ignition sources.
- Collect solids using a HEPA vacuum to avoid the generation of dusts.
- It may be necessary to dispose of dieldrin as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving dieldrin can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the terms "cancer," "carcinogen," or "reproductive hazard" are used, public emotion, hysteria, and ignorance can run equally high. This must be a consideration when developing public relations policies.

🔊 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures for responding to chemical incidents. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

Medical Conditions Generally Aggravated by Exposure
None Reported.

Emergency and First-aid Procedures

Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. **Skin contact:** Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For **inhalation:** Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If **swallowed:** Call the poison control center and seek medical attention immediately. Unless advised otherwise, give 1-2 glasses of water to dilute. Do NOT induce vomiting. Never attempt to give an unconscious or convulsing person anything by mouth. **DOCTOR:** Treatment is symptomatic and supportive.

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled
Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Do NOT dry sweep solids. Use HEPA vacuum instead. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable.

Preferred Waste Disposal Method
No Citation.

Precautions to be Taken in Handling and Storage
Do not store diethanolamine in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, dry well-ventilated area. Protect from light. If stored for prolonged periods, keep in stainless steel containers with nitrogen purge to prevent absorption of moisture.

Other Precautions and Warnings
None

SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT

Respiratory Protection (*specify type*)
For low exposures, use a respirator equipped with HEPA filter and dust pre-filter. Otherwise, use a supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode.

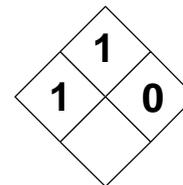

Ventilation
Local exhaust or general mechanical systems recommended.

Work/Hygiene Practices
Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals.

DIETHANOLAMINE(HOCH₂CH₂)₂NH

CAS: 111-42-2

**IDENTIFICATION AND TYPICAL USES**

Diethanolamine is a colorless or clear crystalline solid or may appear as a syrupy, white, hygroscopic liquid with a mild, ammonia-like odor. It is used in the production of surface-active agents and lubricants for the textile industry. It is also used as an intermediate for rubber chemicals, as an emulsifier, as a humectant and softening agent, as a detergent in paints, shampoos, and other cleaners, and as an intermediate in resins and plasticizers.

RISK ASSESSMENT: HEALTH***General Assessment***

Diethanolamine is a severe irritant and corrosive on contact with human tissue. Primary route of exposure is *inhalation* of the dusts or powders. It can also cause serious health effects on *ingestion* and by skin contact (although absorption has not been confirmed as a route of entry). There is no information in the references to indicate any carcinogenic, mutagenic, or teratogenic properties.

Inhalation will result in irritation of the mucosa, especially in the nose, throat, and upper respiratory tract. Symptoms may include coughing, sneezing, and tearing. There may also be nausea and headache. Inhalation of vapors or mists may be fatal due to the potential for spasm of the glottis which can lead to suffocation.

Skin contact with the liquid can cause mild to moderate irritation. Eye contact can result in corneal injury and permanent damage or loss of vision.

Ingestion of an alkaline material, such as diethanolamine, will cause irritation of the gastrointestinal tract with nausea, vomiting, and abdominal pain. Some animal studies have shown liver and kidney damage on ingestion. Human data are not conclusive in this area of study and more research is required.

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to diethanolamine:

Skin: Mild to moderate irritation. May cause allergy to develop.

Eye: Severe irritation, inflammation, with possible damage to the cornea and loss of vision.

Lung: Inhalation of the dusts or heated mists causes coughing, sneezing, and tearing. May cause spasm of the glottis and death by suffocation.

Other: Ingestion causes severe irritation of the digestive tract with nausea, vomiting, possible somnolence, excitement, and muscular contractions and abdominal pains.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to diethanolamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, diethanolamine has not been adequately tested for its ability to cause cancer in test animals. More research is required.

Reproductive Hazard: According to the information presented in the references, diethanolamine has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged exposures may lead to liver damage and possible allergy.

🛡 *Recommended Risk-Reduction Measures*

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment

should be electrically grounded and bonded. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around diethanolamine. For relatively low, infrequent, or transient exposures, an organic vapor respirator equipped with a high efficiency particulate air (HEPA) filter and dust pre-filter may suffice. For higher or prolonged exposure, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious chemical gloves should be worn. Butyl, Neoprene, and nitrile rubber, as well as polyvinyl chloride and Viton are all recommended glove materials. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections have been made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diethanolamine. Diethanolamine should not be used or mixed with N-nitrosating agents since it may form N-nitrosodiethanolamine, which is a liver and nasal cavity carcinogen.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diethanolamine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function tests.
- Liver function tests.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to diethanolamine and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of diethanolamine should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of diethanolamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Diethanolamine is considered a Class IIIB combustible liquid (per OSHA 29 CFR 1910.106). While this means it poses a minimum fire risk by itself, mixture or contact with incompatible materials can cause fire or explosion. It can react with many common oxidizing materials and strong acids. It is corrosive to copper, zinc, and galvanized iron. These characteristics require special consideration during any emergency situation involving a leak or spill of diethanolamine. Should diethanolamine ever come into contact with incompatible substances either during use, transportation, or storage, violent reactions can occur.

Diethanolamine can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diethanolamine.

This chemical has low to moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of diethanolamine to plants, birds, or land animals.

💧 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Diethanolamine has low chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of diethanolamine to plants, birds, or land animals.

💧 *Water Solubility*

Diethanolamine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Diethanolamine is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Diethanolamine is not expected to accumulate in fish tissue.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and

quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diethanolamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If diethanolamine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. Time is of the essence since it is highly soluble and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of diethanolamine.

If diethanolamine is spilled or leaked, the following specific steps are recommended:

- Evacuate area and deny entry to those not involved in cleanup activities. Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Ventilate area of spill or leak.
- Remove all ignition sources.
- Collect dusts in safest and most convenient manner possible and dispose in sealed drums. Do not dry sweep (creates airborne dusts). Use a vacuum equipped with a high efficiency particulate air (HEPA) filter instead. Use a damp mop to collect residue and perform final cleanup of area.
- If liquids are spilled, absorb using vermiculite, dry earth, or sand and place in a sealed drum for disposal.
- It may be necessary to dispose of diethanolamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving diethanolamine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🕒 **Recommended Risk-Reduction Measures**

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

SECTION I - GENERAL INFORMATION

| | | |
|--|---|--|
| Characterization Aliphatic Amine | RCRA Number D001 | EPA Class Characteristic (I) |
| DOT Proper Shipping Name Diethylamine | Chemical Abstract Service (CAS) Number 109-89-7 | |
| DOT Hazard Class and Label Requirements Flammable Liquid | DOT Emergency Guide Code 68 | |
| DOT Identification Number UN 1154 | Chemical Formula (C₂H₅)₂NH | |

Synonyms

Diethylamine; N,N-diethylamine; N-ethylethanamine.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| Diethylamine (derivation: From ethyl chloride and ammonia under high heat and pressure; by continuously passing ammonia, aldehyde or ketone, and hydrogen over a catalyst under careful monitoring). 1 ppm = 3.04 mg/m³ | PEL (8-hour): 25 ppm 75 mg/m³ STEL: Not Established | REL (10-hour): 10 ppm 30 mg/m³ STEL: 25 ppm 75 mg/m³ | 200 ppm | TLV (8-hour): 5 ppm 15 mg/m³ STEL: 15 ppm 45 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 132°F (55°C) | Specific Gravity (H ₂ O = 1) 0.71 |
| Vapor Pressure (mm Hg) 194 at 69°F (20°C) | Molecular Weight 73.1 |
| Vapor Density (Air = 1) 2.5 | Melting Point -58°F (-50°C) |

Solubility

Soluble in water, alcohol, ether, chloroform, paraffin, hydrocarbons, aromatic and aliphatic hydrocarbons, fixed oils, mineral oils, oleic and stearic acids.

Appearance and Odor

Colorless liquid with a fishy, ammonia-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|--|
| Flash Point (method used) -18°F (-28°C) closed cup | Explosive Limits in Air % by Volume LEL: 1.8% UEL: 10.1% |
| NFPA Classification Class IB Flammable Liquid | Autoignition Temperature 594°F (312°C) |

Extinguishing Media

Use dry chemical, carbon dioxide, foam, water spray, or fog. Cool exposed container with water.

Special Fire Fighting Procedures

Use full protective clothing and self-contained breathing apparatus (SCBA). Vapors are heavier than air and may travel for some distance to ignition source and flashback.

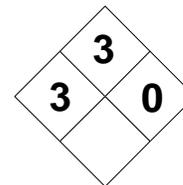

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Do not attempt to extinguish fire unless liquid flow can be stopped first. Aqueous solutions are flammable unless diluted extensively. This chemical presents a vapor explosion hazard indoors, outdoors, and in sewers.

| SECTION V - REACTIVITY DATA | | | | |
|---|----------------------------|---|--|---|
| Stability | | Conditions to Avoid Diethylamine is normally stable at room temperature in closed containers under normal conditions of storage and handling. Avoid contact with incompatible materials. Keep away from heat and flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Oxidizing materials, strong acids, halogens, cellulose nitrate, reactive organic compounds, and some metals. Also, diethylamine will attack some forms of rubber, plastics, and coatings. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of diethylamine is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Toxic and irritating fumes and vapors are produced when diethylamine is heated to decomposition. These include carbon monoxide, carbon dioxide, hydrocarbons, nitrogen oxides, and amine vapors. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Symptoms of nausea, coughing, shortness of breath and difficulty breathing, severe irritation of the nose, throat, and lungs. May cause pulmonary edema (fluid buildup in the lungs), which can be fatal. May also cause degenerative changes in the heart. SKIN & EYES: A corrosive. Severe burns to the eye with corneal damage and permanent vision impairment. Vapor may cause fogging of vision. Liquid will burn the skin and damage tissue. INGESTION: Severe pain with vomiting, diarrhea, collapse, breathing difficulties, and chest pain. | | | | |
| Carcinogenicity Unknown Human Unknown Animal | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? 29 CFR 1910.1000 Table Z-1 | Target Organs? Eyes, skin, respiratory system, CVS. |
| Medical Conditions Generally Aggravated by Exposure Chronic skin, eye, or respiratory diseases may be aggravated. Heart patients may also be affected. | | | | |
| Emergency and First-aid Procedures <u>Eye contact:</u> Flush immediately with water for 15 minutes (minimum), seek medical attention. <u>Skin contact:</u> Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For <u>inhalation:</u> Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24-48 hours for lung effects. If <u>swallowed:</u> Call the poison control center and seek medical attention immediately. Unless advised otherwise, give 8 ounces of milk. Do NOT induce vomiting. Never attempt to give an unconscious or convulsing person anything by mouth. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Neutralize with sodium bisulfate and small amounts of water. Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store diethylamine in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Personnel working with diethylamine should be trained on its proper handling and storage <i>prior</i> to being assigned to such responsibilities. | | | | |
| Other Precautions and Warnings Recommend storage in external (detached) facility away from main work areas. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) For low exposures, use an organic vapor respirator. Otherwise, use an MSHA/NIOSH-approved supplied-air respirator with full facepiece operated in positive pressure mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious Gloves | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Protective Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIETHYLAMINE $(C_2H_5)_2NH$

CAS: 109-89-7

**IDENTIFICATION AND TYPICAL USES**

Diethylamine is a colorless or clear liquid with a strong, fishy, ammonia-like odor. It is used as a flotation agent, in the manufacture of dyes and pharmaceuticals, and in resins. It also finds applications in the rubber and petroleum industries, in the manufacture of textile specialties, in electroplating, as a corrosion inhibitor, and is used as a solvent.

RISK ASSESSMENT: HEALTH***General Assessment***

Diethylamine is a severe irritant and corrosive on contact with human tissue. Primary route of exposure is *inhalation*. It can also cause serious health effects on *ingestion* and by skin contact (although absorption has not been confirmed as a route of entry). There is no information in the references to indicate any carcinogenic, mutagenic, or teratogenic properties.

Inhalation will result in irritation of the mucous membranes, especially in the nose, throat, and upper respiratory tract. Symptoms may include coughing, nausea, severe chest pains, difficult or labored breathing, and pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can be fatal. There is also some evidence to indicate that high exposures may cause severe tissue degeneration of the heart (animal experiments only).

Skin contact with the liquid can cause severe irritation with necrosis and vesiculation (the appearance of tiny, fluid-filled lesions on the skin surface called vesicles). Eye contact can result in corneal injury and permanent damage or loss of vision. The vapor can cause foggy vision and tissue irritation.

Ingestion causes severe pain, vomiting, diarrhea, collapse, labored breathing, and chest pains. It may lead to liver or heart injuries (confirmed in animal studies only).

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to diethylamine:

Skin: Irritation, inflammation, redness, possible blistering, and tissue damage. May cause necrosis and vesiculation.

Eye: Severe irritation, inflammation, with possible damage to the cornea and loss of vision. Vapor can cause foggy vision, the appearance of halos around lights, and inflammation of tissues.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can lead to respiratory problems, including pulmonary edema (fluid buildup in lungs) which is a medical emergency and can be fatal.

Other: Animal studies have shown a degeneration of heart tissue and liver damage on high exposures. It is not known if these effects will occur in humans.

☠ *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to diethylamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, diethylamine has not been adequately tested for its ability to cause cancer in test animals. More research is required.

Reproductive Hazard: According to the information presented in the references, diethylamine has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Low, chronic exposures may cause corneal damage, foggy vision, halos around lights, and irritation of the lungs, bronchi, and throat. There is also a possibility that chronic exposures may

cause injury to the heart and liver. However, the data are inconclusive in this regard.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around diethylamine. For relatively low, infrequent, or transient exposures, an organic vapor respirator may suffice. For higher or prolonged exposure, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious chemical gloves should be worn. Butyl, natural, and nitrile rubber, as well as polyvinylchloride and Neoprene are not recommended.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diethylamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diethylamine is used or stored.

Before beginning employment and at regular intervals thereafter (e.g. annually), the following medical tests are recommended:

- ☑ Lung function tests (establish a baseline).

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Lung function tests. (Doctor: If pulmonary edema is present, consider PEEP. Steroids may be effective, but antibiotics are useful only if there is evidence of infection).
- ☑ Consider chest X-ray after acute overexposure.

- ☑ Complete blood count and blood gases.
- ☑ For oral exposures, evaluate for esophageal burns.
- ☑ For alkali burns, consider irrigating skin frequently for 24 hours with normal saline. (Note: Hydrotherapy may not be effective if not begun within 1 hour of the burn).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and numerous other respiratory disorders, smokers may be affected more rapidly than non-smokers to the same exposure conditions. Prudent risk assessment and management requires careful consideration of *all* possible risk factors that may be causing the appearance of symptoms in exposed workers.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to diethylamine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of diethylamine should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of diethylamine. In almost every scenario,

the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Diethylamine is considered a Class IB flammable liquid (per OSHA 29 CFR 1910.106). Its extremely low flash point and its relatively low boiling point make it a serious and dangerous fire and explosion risk. It can react with many common oxidizing materials to cause a fire or explosion. These characteristics require special consideration during any emergency situation involving a leak or spill of diethylamine. Should diethylamine ever come into contact with incompatible substances, such as oxidizers or acids, either during use, transportation, or storage, violent reactions can occur.

Diethylamine can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diethylamine. This chemical has low to moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of diethylamine to plants, birds, or land animals.

🌱 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of diethylamine to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Diethylamine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

Diethylamine is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It is not expected to accumulate in aquatic sediments or terrestrial soils.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Diethylamine is not expected to accumulate in fish tissue.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diethylamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. This chemical will remain in soil for extended periods and may leach to underground aquifers. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If diethylamine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of diethylamine. If diethylamine is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.
- Remove all ignition sources.
- Absorb liquid spills using vermiculite, dry earth, or sand and place in a sealed drum for disposal.

- ☑ Use water spray to disperse vapors and dilute to non-flammable mixtures. Dispose of accordingly.
- ☑ It may be necessary to dispose of diethylamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving diethylamine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Hazard Class and Label Requirements Combustible Liquid; Label: None | DOT Emergency Guide Code 29 | |
| DOT Identification Number NA 1993 | Chemical Formula C₈H₁₈O₃ | |

Synonyms

Butyl carbitol; butoxy diglycol; butoxy diethylene glycol; 2-(2-butoxyethoxy) ethanol; butyl digol; diglycol monobutyl ether; Ektasolve DB; Jeffersol DB; Poly-Solve DB.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|---|---|---|---|---|
| Diethylene glycol monobutyl ether (derivation: By reaction of ethylene oxide and <i>n</i> -butyl alcohol). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|---|
| Boiling Point 448°F (231°C) | Specific Gravity (H ₂ O = 1) 0.945 |
| Vapor Pressure (mm Hg) 0.02 at 69°F (20°C) | Molecular Weight 162.26 |
| Vapor Density (Air = 1) 5.58 | Melting Point -90.6°F (-68°C) |

Solubility

Completely soluble in water, oils, alcohol, acetone, benzene, and ether.

Appearance and Odor

Colorless liquid with a faint, pleasant odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|---|---|
| Flash Point (method used) 172°F (78°C) closed cup | Explosive Limits in Air % by Volume LEL: 0.85% UEL: 24.6% |
| NFPA Classification Class IIIB Combustible Liquid | Autoignition Temperature 400°F (204°C) |

Extinguishing Media

Use water, dry chemical, carbon dioxide, or alcohol resistant foam. Water may cause frothing.

Special Fire Fighting Procedures

Acrid and irritating fumes and smoke are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Vapors are heavier than air and may travel for some distance to ignition source and flashback. Fight fire from distance if possible. Move containers from fire area if it can be done safely. Exercise extreme caution when moving containers.

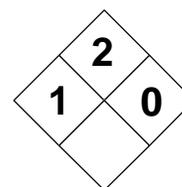

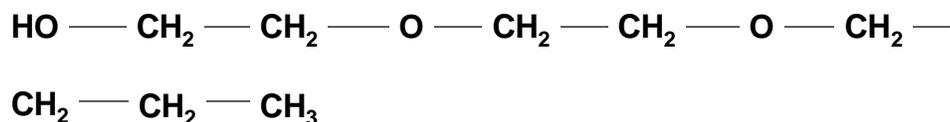

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Apply cooling water to sides of container until long after fire has been extinguished.

| SECTION V - REACTIVITY DATA | | | | |
|---|--|---|------------------------------|---|
| Stability | | Conditions to Avoid Under normal conditions of temperature and pressure, diethylene glycol monobutyl ether is stable. Avoid contact with incompatible materials. Keep away from heat and flame. | | |
| Stable X | Unstable | Incompatibility (materials to avoid) Strong oxidizers, such as chlorine, bromine, fluorine, and peroxides. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of diethylene glycol monobutyl ether is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Acrid and irritated gases and fumes are produced when diethylene glycol monobutyl ether is involved in fire, including carbon dioxide. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | Inhalation? X | Absorption (skin)? X | Ingestion? X | |
| Health Hazards INHALATION: Essentially non-toxic on single exposures. Repeated exposures produce toxic effects with action on the CNS and the kidneys. May cause irritation to the eyes, nose, throat, and upper respiratory tract. Repeated exposures can cause cyanosis, acidosis, and tachypnea. Kidney function may be reduced. Tissue damage to the liver, kidney, spleen. ABSORPTION: Low to no toxicity on single exposure. Repeated or heavy contact will pass through unbroken skin to cause toxic systemic effects. Eye contact with liquid can cause burns. INGESTION: Moderately toxic with systemic effects as those noted for inhalation. | | | | |
| Carcinogenicity | NTP Listed? No | IARC Cancer Review Group? No | OSHA Regulated? No | Target Organs? CNS, kidneys, liver, eyes, skin. |
| Unknown Human Unknown Animal | | | | |
| Medical Conditions Generally Aggravated by Exposure None reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Administer 100% supplemental, humidified oxygen, as needed. If swallowed: Call the poison control center and seek medical attention immediately. Unless advised otherwise, give 1 - 2 glasses of water and induce vomiting. Never give an unconscious or convulsing person anything by mouth and never try to make such a person vomit. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Do not allow flow into sewers or waterways. Ventilate area. Restrict those not involved in cleanup from entering area. | | | | |
| Preferred Waste Disposal Method Mix with a combustible solvent, burn in a chemical incinerator equipped with afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Do not store diethylene glycol monobutyl ether in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, dry, well-ventilated area away from ignition sources. | | | | |
| Other Precautions and Warnings Use non-sparking tools for all operations involving this chemical compound. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (specify type) No exposure levels have been established. This does not mean exposure is without risk. For the best protection, use a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Butyl Rubber | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Protective Clothing or Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIETHYLENE GLYCOL MONOBUTYL ETHERC₈H₁₈O₃

CAS: 112-34-5

**IDENTIFICATION AND TYPICAL USES**

Diethylene glycol monobutyl ether (DGBE) is a colorless liquid with a faint, pleasant odor. It is used as a solvent for cellulose ester, oils, gums, soaps, polymers, lacquers, varnishes, and dyes. It is a plasticizer intermediate, a melting-out solution in the textile industry, and a diluting agent for hydraulic brake fluids. It is also used as a primary component of the aqueous film-forming foam that is used by the U.S. Navy in shipboard fire fighting systems.

RISK ASSESSMENT: HEALTH**General Assessment**

DGBE is considered to be of low-order toxicity on single exposures. However, prolonged low exposures or acute high exposures, primarily by *ingestion* or *inhalation*, can cause serious risks to human health. It is also known for its ability to pass through unbroken skin (*absorption*) to cause toxic systemic effects. There is no evidence to indicate that it is carcinogenic or mutagenic in humans or test animals. There is some data to show it can damage the male reproductive organs in test animals. Human data in this regard are inconclusive.

In high concentrations, vapor inhalation may cause smarting of the eyes and respiratory tract. Ingestion and inhalation, as well as skin absorption, of repeated small exposures can cause cyanosis (bluish discoloration of the skin due to reduced hemoglobin in the blood), acidosis (accumulation of acid or depletion of the alkaline reserve in the blood and body tissue), and tachypnea (a respiratory neurosis marked by rapid respiration). Kidney function may be reduced with subsequent uremia (accumulation in the blood of constituents that are normally excreted in the urine), presenting a potential for severe systemic toxicity. Tissue damage

to the liver, kidney, spleen, and testes were seen in test animals.

Skin contact is irritating and may cause rash to develop. Liquid contact with the eyes can result in severe irritation and possible damage to the cornea.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to DGBE:

Skin: Low, single exposures are not likely to cause any toxic effects. Higher exposures can result in irritation, burns, inflammation, and possible absorption causing toxic systemic effects.

Eye: Severe irritation with burns, redness, and damage to the corneal tissues.

Lung: Single exposures are not likely to be toxic. High concentrations can cause irritation of the mucosa of the nose, throat, and upper respiratory tract. Can cause a number of toxic systemic effects, including cyanosis, acidosis, tachypnea, and uremia.

Other: Ingestion can cause the same symptoms as inhalation. Adverse action on the central nervous system is likely on high acute exposures.

●* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to DGBE and can last for months or even years:

Cancer Hazards: According to the information presented in the references, DGBE has not been shown to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, DGBE may have teratogenic effects in test animals. It may cause tissue damage

age to the testes. Human studies in this regard are inconclusive.

Other Chronic Effects: There is some indication that long-term exposure or frequent high exposures may cause tissue damage in the liver, kidney, and spleen. Kidney function may be reduced resulting in a toxic buildup of constituents normally excreted in urine (uremia).

🔗 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure, especially if DGBE is to be agitated or heated.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around DGBE. No exposure levels have been established for this compound. However, this does not mean there is no health hazard risk. For the best protection, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or a supplied-air respirator operated in pressure demand or continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with DGBE.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where DGBE is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Kidney and liver function tests.
- Urinalysis and blood gas tests.

Any evaluation should include a careful medical history of past and present symptoms with an examination.

However, medical tests that evaluate existing damage are not a substitute for controlling exposure. Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, exposure to DGBE can have a more pronounced effect on smokers than on non-smokers exposed to the same levels. Prudent risk assessment and management requires consideration of *all* possible risk factors when exposure symptoms appear in the workforce.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of liquids from storage containers to process containers is recommended.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to DGBE and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of DGBE should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during use, transportation, storage, disposal, or destruction of DGBE. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

DGBE is considered a Class IIIB combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of DGBE. Should DGBE ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine, chlorine dioxide, and peroxides) either

during use, transportation, or storage, violent reaction can occur.

The acceptable disposal method for DCBE is to mix it with a combustible solvent (higher alcohol, benzene, or petroleum ether) and burn in a chemical incinerator equipped with an afterburner and scrubber.

DGBE can enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to DGBE. This chemical is expected to have low to moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of DGBE to plants, birds, or land animals.

☼ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. DGBE is not expected to have chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of DGBE to plants, birds, or land animals.

💧 *Water Solubility*

DGBE is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

🕒 *Persistence in the Environment*

DGBE is highly persistent in the aquatic environment with a half-life of 200 days and more. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. It is highly mobile in both water and soil and undergoes aerobic biodegeneration.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans who have been exposed.

The concentration of DGBE found in fish tissues is expected to be about the same as that found in the water from which the fish was taken.

🔧 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of DGBE should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings should be properly constructed for storage of hazardous chemicals (fire suppression equipment, alarms, separation, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If DGBE should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. It is highly soluble in water and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of DGBE. If DGBE is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.
- Remove all ignition sources.
- Collect liquid using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal. Damp mop residue and collect. Contain any water from cleanup efforts and do NOT let it reach sewers or open waterways.
- It may be necessary to dispose of DGBE as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving DGBE can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business. Always remember that anytime the term "reproductive hazard" is used, public emotion, hysteria, and ignorance can run equally high. This should be properly considered during the development of public relations policies.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any such procedures. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

DIETHYLENETRIAMINE

CAS: 111-40-0

**IDENTIFICATION AND TYPICAL USES**

Diethylenetriamine is a colorless to yellow liquid with a strong, ammonia-like odor. It is hygroscopic (absorbs moisture from the air). It is used as a solvent for sulfur, acid gases, various resins, and dyes. Also used as a saponification agent for acidic materials, as a fuel component, and in zylene or toluene as a hardener for epoxy resins.

RISK ASSESSMENT: HEALTH**General Assessment**

Diethylenetriamine is a severe irritant and corrosive on contact with human tissue. Primary route of exposure is *inhalation* of its vapors. It can also cause serious health effects on *ingestion* and by skin contact (although absorption has not been confirmed as a route of entry). There is no information in the references to indicate any carcinogenic, mutagenic, or teratogenic properties.

Inhalation will result in irritation of the mucosa, especially in the nose, throat, and upper respiratory tract. Symptoms may include coughing, dyspnea, nausea, and vomiting.

Skin contact with the liquid can cause mild to severe irritation. Dermatitis may develop with rash and painful itching and possible necrosis. Skin sensitization is also likely to occur over a period of prolonged or repeated contact. Eye contact can result in corneal injury and permanent damage or loss of vision. Tissue necrosis of the eye is also possible.

Ingestion can cause painful burning and corrosion of the mouth, lips, and esophagus.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to diethylenetriamine:

Skin: Mild to severe irritation. May cause dermatitis and/or sensitization of the skin. Necrosis of skin tissue is possible.

Eye: Severe irritation, inflammation, with possible necrosis of eye tissue, damage to the cornea and loss of vision.

Lung: Coughing, nausea, and vomiting. May cause asthma-like symptoms and hypersensitivity.

Other: Ingestion causes severe irritation and corrosion of the mouth, lips, and esophagus.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to diethylenetriamine and can last for months or even years:

Cancer Hazards: According to the information presented in the references, diethylenetriamine has not been adequately tested for its ability to cause cancer in test animals. More research is required.

Reproductive Hazard: According to the information presented in the references, diethylenetriamine has not been adequately tested for its ability to adversely affect reproduction.

Other Chronic Effects: Prolonged exposures may cause dermatitis and skin sensitization. Once allergy develops, even slight future exposures will cause a recurrence of the symptoms.

🛡 Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. To prevent static sparks, all containers and equipment should be electrically grounded and bonded. While not

always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around diethylenetriamine. The exposure level is extremely low (1 ppm) and difficult to monitor. An organic vapor respirator may suffice for low or transient exposures. However, greater protection is provided by a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and apron should be worn. To prevent hand and skin exposures, impervious chemical gloves should be used. Glove manufacturers should be contacted and permeation studies obtained *before* final glove selections are made.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diethylenetriamine.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diethylenetriamine is used or stored.

Physicians should treat early for esophageal burns with IV therapy, broad spectrum antibiotics, sedation, parenteral hydrocortisone, and, most importantly, prevention of esophageal obstruction, followed by dilation.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, if possible, automatically transfer liquids from storage containers to process containers using non-sparking tools.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.

- ☑ Wash thoroughly immediately after exposure to diethylenetriamine and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of diethylenetriamine should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during intended use, transportation, storage, disposal, or destruction of diethylenetriamine. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Diethylenetriamine is considered a Class IIIB combustible liquid (per OSHA 29 CFR 1910.106). While this means it poses a minimum fire risk by itself, mixture or contact with incompatible materials can cause fire or explosion. It can react with many common oxidizing materials, cellulose nitrate, and strong acids. It is corrosive to copper and its alloys. These characteristics require special consideration during any emergency situation involving a leak or spill of diethylenetriamine. Should diethylenetriamine ever come into contact with incompatible substances either during use, transportation, or storage, violent reactions can occur.

Diethylenetriamine can enter the environment through industrial discharges and spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diethylenetriamine. Insufficient data are available to evaluate or predict the short-term effects of diethylenetriamine to aquatic life, plants, birds, or land animals.

☛ *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Insufficient data are available to evaluate or predict the long-term effects of diethylenetriamine to aquatic life, plants, birds, or land animals.

💧 *Water Solubility*

Diethylenetriamine is highly soluble in water. Concentrations of 1000 milligrams and more will mix with a liter of water.

⌚ *Persistence in the Environment*

Diethylenetriamine is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded.

🌊 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of diethylenetriamine found in fish tissues is expected to be lower than the levels found in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diethylenetriamine should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Storage buildings should be equipped with the proper fire protection equipment (alarms, sprinklers, extinguishers, etc.).

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those

trained in proper spill containment procedures. Contaminated soils should therefore be removed for incineration and replaced with clean soil. If diethylenetriamine should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. Time is of the essence since it is highly soluble and total containment and remediation may not be possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of diethylenetriamine. If diethylenetriamine is spilled or leaked, the following specific steps are recommended:

- ☑ Evacuate area and deny entry to those not involved in cleanup activities. Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Absorb liquids using vermiculite, dry earth, or sand and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of diethylenetriamine as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving diethylenetriamine can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

🚫 *Recommended Risk-Reduction Measures*

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response.

A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Vapor Density (Air = 1) | 3 | Melting Point | -44°F (-42°C) |

Solubility

Slightly soluble (5%) in water. Soluble in alcohol and acetone.

Appearance and Odor

Colorless liquid with a characteristic, acetone-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | | | |
|---------------------------|----------------------------------|-------------------------------------|----------------------------|
| Flash Point (method used) | 55°F (13°C) opened cup | Explosive Limits in Air % by Volume | LEL: 1.6% UEL: 6.4% |
| NFPA Classification | Class 1B Flammable Liquid | Autoignition Temperature | 846°F (453°C) |

Extinguishing Media

Carbon dioxide, dry chemical, alcohol foam.

Special Fire Fighting Procedures

Wear full protective clothing and self-contained breathing apparatus (SCBA). Heat will build pressure and may rupture closed storage containers. Fight fire from a distance if possible. Because of low flash point, water may be ineffective on fire. Keep fire-exposed containers cool with water spray. If it can be done safely, move fire-exposed containers from fire area. Exercise extreme caution.

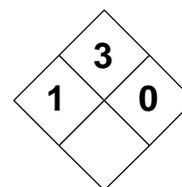

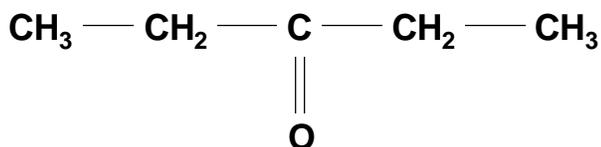

Unusual Fire and Explosion Hazards

Vapors are heavier than air; they may travel a distance to flashback and cause fire. Poisonous gases are produced in fire.

| SECTION V - REACTIVITY DATA | | | | |
|--|--|---|---------------------------------------|---|
| Stability | | Conditions to Avoid Normally stable. Do not allow diethyl ketone to come into contact with incompatible materials. Avoid contact with fire or high heat sources. Diethyl ketone is highly volatile. Do not use in confined spaces. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers (chlorine, fluorine, bromine), alkalis, and mineral acids. Diethyl ketone reacts with hydrogen peroxide and nitric acid to form a heat-sensitive explosive peroxide. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of diethyl ketone is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products When heated to decomposition, diethyl ketone emits acrid, irritating smoke and fumes, including oxides of carbon. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Irritation of the conjunctiva of the eyes and mucosa of the nose and throat. Symptoms include dizziness, headache, nausea, vomiting, ataxia, and unconsciousness. May also cause potentially fatal heart rhythm disturbances. Narcotic effects also possible. SKIN & EYES: Skin contact can result in irritation and may cause dermatitis. Severe eye irritation likely. INGESTION: Symptoms of nausea and vomiting. Abdominal cramps. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | 29 CFR 1910.1000 Table Z-1 | Respiratory system; skin; eyes; CNS. |
| Medical Conditions Generally Aggravated by Exposure None Reported. However, respiratory impairments, skin conditions (dermatitis) may be aggravated. | | | | |
| Emergency and First-aid Procedures Eye contact: Immediately flush with large amounts of water for 15 minutes (minimum), occasionally lifting eyelids. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer promptly to medical facility. If swallowed: Seek medical attention immediately. Never try to give an unconscious person anything by mouth. Do NOT induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Remove all ignition sources. Restrict persons not wearing protective equipment from entering area of spill or leak until cleanup is complete. Ventilate area. Absorb liquid in dry sand or other material and deposit in sealed containers. Alert appropriate state or federal response agencies. | | | | |
| Preferred Waste Disposal Method Incineration (with afterburner and scrubber). | | | | |
| Precautions to be Taken in Handling and Storage Do not store with incompatible chemicals since violent reactions can occur. Store in tightly closed containers in a cool, dark, well-ventilated area away from fire, sparks, and flame. Use non-sparking tools on containers. Ground and bond metal containers during transfer operations. | | | | |
| Other Precautions and Warnings Containers may explode in fire or under conditions of extreme heat (do not store outdoors or in direct sunlight). Protect containers from physical damage. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposures above 200ppm: MSHA/NIOSH-approved full facepiece respirator with organic vapor cartridge. Greater protection is obtained from a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Solvent Resistant Butyl Rubber | Eye Protection Chemical Goggles and/or Face Mask | Other Protective Clothing Rubber Apron | | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIETHYL KETONE

CAS: 96-22-0

**IDENTIFICATION AND TYPICAL USES**

Diethyl ketone is a colorless liquid with a characteristic, acetone-like odor. It is used as a solvent. Also used in the manufacture of medicines and in organic synthesis.

RISK ASSESSMENT: HEALTH**General Assessment**

Mutagenic effects in animals have been reported for diethyl ketone. However, there are no reports of carcinogenic or mutagenic effects in human. Exposure to diethyl ketone can result in harmful effects. Such exposures can occur primarily by *inhalation* of its vapors. Direct *ingestion* will also cause harmful effects. There are no reports in the references that indicate absorption is a risk factor. However, skin or eye contact can cause damage.

Inhalation of diethyl ketone vapors in high concentrations produces dryness of the mouth and throat, dizziness, headache, nausea, vomiting, ataxia, and unconsciousness. Inhalation may also produce mild narcotic effects. Inhalation of other organic solvents of similar structure are known to cause potentially fatal heart rhythm disturbances. It is not known if exposure to diethyl ketone will have this effect.

Ingestion can result in nausea and vomiting. Skin contact will defat the surface of the skin and may lead to dermatitis. Eye contact produces severe irritation and possible damage.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to diethyl ketone:

Skin: Irritation/rash and possible dermatitis.

Eye: Irritation which can lead to permanent damage.

Lung: Irritation causing coughing and/or shortness of breath. Higher exposures can cause dizziness, headache, and possibly, coma.

CNS: A mild narcotic compound. Inhalation of high concentrations of the vapor may cause dizziness, lightheadedness, and possible loss of consciousness.

☞ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to diethyl ketone and can last for months or even years:

Cancer Hazards: According to information presented in the references, exposure to diethyl ketone has not been shown to cause carcinogenic effects. Animal mutation data have been reported.

Reproduction: There are no reports to support any claims of reproductive hazards in humans or animals.

Sensitivity: Exposure to the skin may result in allergy (sensitization). If allergy develops, very low future exposure can result in skin irritation and rash. Repeated exposure can cause chronic irritation of the eyes and lungs.

Other Chronic Effects: Long-term exposures can also cause chronic nose and throat irritation.

🛡 Recommended Risk-Reduction Measures

Personnel should avoid direct contact with diethyl ketone. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure. Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with

diethyl ketone. For exposures to the PEL (200 ppm), use a NIOSH-approved, full facepiece organic vapor respirator. For higher or prolonged exposures, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand is the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and a rubber apron should be worn. To prevent hand and skin exposures, butyl rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diethyl ketone.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diethyl ketone is used or stored.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances. Clothing should be properly cared for and maintained by the responsible employee.
- ☑ Wash thoroughly immediately after exposure to diethyl ketone and at the end of the work shift or before eating, drinking, or smoking. Never wear clothes contaminated with diethyl ketone home. Family members can be exposed.
- ☑ Hazard warning information should be posted in the work area. As part of an on-going education and training program, all information on the health and safety hazards of diethyl ketone should be communicated to all potentially exposed workers.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during transportation, storage, disposal, or destruction of diethyl ketone. In almost every scenario, the threat of environmental exposure is contingent upon the proper han-

dling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Diethyl ketone is considered a highly flammable liquid. Because of its low flash point and relatively high boiling point, it is classified as a Class 1B flammable liquid (per OSHA 29 CFR 1910.106). Its low auto-ignition temperature and low flash point, together with its high vapor pressure make it a dangerous fire and explosion hazard. It is also incompatible with a number of commodities. Potentially explosive reactions can occur if diethyl ketone is mixed or comes into contact with oxidizers and/or mineral acids. These characteristics require special consideration during any emergency involving a leak or spill of diethyl ketone.

The proper disposal/destruction method for diethyl ketone is to burn it in a chemical incinerator (with molten salt treatment) equipped with an afterburner and air scrubber.

Diethyl ketone can enter the environment through manufacturing, unchecked discharge into effluents from industrial or municipal waste treatment plants, and through spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish, and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diethyl ketone.

This chemical has a slight acute toxicity to aquatic life. No data are available on the short-term effects of diethyl ketone on plants, birds, or land animals.

☠* *Chronic Ecological Effects*

Chronic (long-term) toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals.

Diethyl ketone has slight chronic toxicity in aquatic life. No data are available to evaluate the long-term effects of diethyl ketone to plants, birds, or land animals.

💧 *Water Solubility*

Diethyl ketone is slightly soluble in water. Concentrations between 1 to 100 milligrams will mix with a liter of water.

Persistence in the Environment

Diethyl ketone is slightly persistent in water, with a half-life of between 2 to 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. Approximately 50% of diethyl ketone will eventually end up in air; the rest will end up in water.

Bioaccumulation in Aquatic Organisms

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of diethyl ketone found in fish tissues is expected to be about the same as the average concentration of diethyl ketone in water from which the fish was taken.

Recommended Risk-Reduction Measures

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diethyl ketone should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. Buildings designated for storage should be equipped with appropriate fire protection systems (alarms, sprinklers, emergency lighting, portable extinguishers).

If a spill or leak to the environment has occurred, fire department, emergency response, and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If diethyl ketone should contact the water table, aquifer, or navigable waterway, time is of the essence. It is slightly soluble in water and, therefore, total containment and remediation may not be entirely possible. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transporta-

tion, storage, or disposal of diethyl ketone. If diethyl ketone is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete.
- Remove all ignition sources.
- Ventilate area of spill or leak.
- Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers.
- If applicable, stop flow of leaking liquid or gas. If leak source is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair or allow cylinder to empty.
- Keep diethyl ketone out of a confined space, such as a sewer, because of the possibility of explosion (unless the sewer is designed to prevent the build-up of explosive concentrations).
- It may be necessary to dispose of diethyl ketone as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving diethyl ketone can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, illness, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| 0 | 1 | 0 | | 0 = Minimum Hazard 1 = Slight Hazard 2 = Moderate Hazard 3 = Serious Hazard 4 = Severe Hazard | HEALTH = BLUE FIRE = RED REACTIVITY = YELLOW OTHER = WHITE | OX = Oxidizer ACID = Acid ALK = Alkali COR = Corrosive W = Use No Water |

SECTION I - GENERAL INFORMATION

| | | |
|--|--|---------------------------------|
| Characterization Phthalate Ester | RCRA Number U088 | EPA Class Toxic Waste |
| DOT Proper Shipping Name Diethyl Ketone | Chemical Abstract Service (CAS) Number 84-66-2 | |
| DOT Hazard Class and Label Requirements Not Listed | DOT Emergency Guide Code No Citation | |
| DOT Identification Number Not Listed | Chemical Formula C₆H₄(COOC₂H₆)₂ | |

Synonyms

DEP; Diethyl ester of phthalic acid; ethyl phthalate; 1,2-benzenedicarboxylic acid, diethyl ester; diethyl-o-phthalate; phthalic acid, diethyl ester.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|--|---|---|
| Diethyl phthalate (derivation: By reacting phthalic anhydride with ethanol followed by careful purification). 1 ppm = 9.24 mg/m³ | PEL: Not Established STEL: Not Established | REL: 0.5 ppm 5 mg/m³ STEL: Not Established | Not Determined | TLV: 0.5 ppm 5 mg/m³ STEL: 1.08 ppm 10 mg/m³ |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|---|--|
| Boiling Point 563°F (298°C) | Specific Gravity (H ₂ O = 1) 1.12 |
| Vapor Pressure (mm Hg) 0.002 at 77°F (25°C) | Molecular Weight 222.3 |
| Vapor Density (Air = 1) 7.66 | Freezing Point -40°F (-40°C) |

Solubility

Insoluble in water. Miscible in alcohols, ketones, esters, aromatic hydrocarbons. Partly miscible with aliphatic solvents.

Appearance and Odor

Colorless to water-white, stable, oily liquid with a very slight, aromatic odor and a bitter taste.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) 325°F (163°C) closed cup | Explosive Limits in Air % by Volume LEL: 0.75% (at 368°F) UEL: Not Determined |
| NFPA Classification Class IIIB Combustible Liquid | Autoignition Temperature 855°F (458°C) |

Extinguishing Media

Use water spray, dry chemical, carbon dioxide, or foam. Water may cause frothing.

Special Fire Fighting Procedures

Acrid and irritating fumes and smoke are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Vapors are heavier than air and may travel for some distance to ignition source and flashback. Move containers from fire area if it can be done safely.

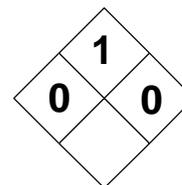

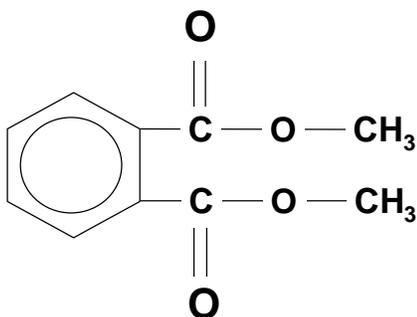

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Exercise extreme caution when attempting to move or relocate containers that may have been exposed to high heat.

| SECTION V - REACTIVITY DATA | | | | |
|--|----------------------------|---|--------------------|---|
| Stability | | Conditions to Avoid Under normal conditions of temperature and pressure, diethyl phthalate is stable. Avoid contact with incompatible materials. Keep away from heat and flame. | | |
| Stable X | Unstable | Incompatibility (<i>materials to avoid</i>) Strong oxidizers, such as chlorine, bromine, and fluorine, strong acids (sulfuric, nitric, hydrochloric), permanganates, and water. | | |
| Hazardous Polymerization | | Conditions to Avoid Under normal conditions of temperature and pressure, hazardous polymerization of diethyl phthalate is not expected to occur. | | |
| May Occur | Will Not Occur X | Hazardous Decomposition or By-products Acrid and irritated gases and fumes are produced when diethyl phthalate is involved in fire. | | |
| SECTION VI - HEALTH HAZARD DATA | | | | |
| Primary Route(s) of Entry: | | Inhalation? X | Absorption (skin)? | Ingestion? X |
| Health Hazards INHALATION: Symptoms include irritation to the eyes, nose, and throat. Causes headache, dizziness, nausea, lachrymation, pain, numbness, weakness, spasms in the arms and legs. Also, possible polyneuritis (inflammation of peripheral nerves) and respiratory obstruction. Narcotic at high concentrations. SKIN & EYES: Contact may irritate the skin and eyes. May cause conjunctivitis. INGESTION: Burning irritation of the mucous membranes. Gastrointestinal irritation. | | | | |
| Carcinogenicity | NTP Listed? | IARC Cancer Review Group? | OSHA Regulated? | Target Organs? |
| Unknown Human Unknown Animal | No | No | No | Eyes, skin, resp. system, CNS, PNS, repro. system. |
| Medical Conditions Generally Aggravated by Exposure None Reported. | | | | |
| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. If swallowed: Call the poison control center and seek medical attention immediately. Give 2-3 glasses of water and induce vomiting. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Small spills can be collected using a paper towel or other absorbent for disposal. For larger spills, dike area ahead of spill and absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Do not allow flow into sewers or waterways. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method Burn in chemical incinerator equipped with an afterburner and scrubber. | | | | |
| Precautions to be Taken in Handling and Storage Do not store diethyl phthalate in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, well-ventilated area. Personnel working with diethyl phthalate should be trained on its proper handling and storage prior to being assigned to such responsibilities. | | | | |
| Other Precautions and Warnings Bulk storage of diethyl phthalate should be avoided. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) Exposure level is extremely low and may be difficult to monitor. For the best protection, use a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Rubber | | Eye Protection Chemical Goggles or Face Mask | | Other Protective Clothing Apron |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIETHYL PHTHALATE

CAS: 84-66-2

**IDENTIFICATION AND TYPICAL USES**

Diethyl phthalate is a colorless to water-white, oily liquid with a very slight, aromatic odor and a bitter taste. It is used as a solvent for nitrocellulose and cellulose acetate, as a plasticizer, a wetting agent, in the manufacture of insecticide sprays, as a camphor substitute, in plastics, in perfumery (as a fixative and solvent), as an alcohol denaturant, in mosquito repellents, and as a plasticizer in solid rocket propellants.

RISK ASSESSMENT: HEALTH***General Assessment***

Diethyl phthalate is of low-order toxicity in animal studies. It is toxic in humans primarily through *inhalation* and can also cause adverse health effects on *ingestion*. Eye and skin contact also pose some degree of health hazard risk to humans. While it has not been shown to cause carcinogenic effects in humans, there are reports of teratogenicity in animals studies.

Inhalation causes toxic systemic effects, including lachrymation, respiratory obstruction, and other unspecified respiratory system effects. Also causes irritation of the eyes, nose, and throat. It is a narcotic on high concentrations. May also cause polyneuritis (inflammation of the peripheral nervous system) with symptoms of dizziness, nausea, pain, weakness, and spasms in the arms and legs.

Ingestion causes irritation and burning of the mucosa of the digestive tract. Causes somnolence, hypotension, and coma.

Skin and eye contact result in irritation, burning, and possible painful rash (on prolonged contact).

☠ *Acute Health Effects*

The following acute (short-term) health effects may occur immediately or shortly after exposure to diethyl phthalate:

Skin: Irritation and possible inflammation.

Eye: Severe irritation with redness, lachrymation, and possible conjunctivitis.

Lung: Irritation of the mucosa of the nose, throat, and upper respiratory tract. Causes toxic systemic effects with action on the peripheral and central nervous systems.

Other: Narcotic effects, with a potential for inflammation of many of the peripheral nerves. Ingestion can cause gastritis, somnolence, hypotension, and coma.

☠* *Chronic Health Effects*

The following chronic (long-term) health effects may occur at some time after exposure to diethyl phthalate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, diethyl phthalate has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, diethyl phthalate may damage the developing fetus in humans since it has been shown to be fetotoxic in animals. It may also damage fertility.

Other Chronic Effects: Chronic exposure to diethyl phthalate has not been sufficiently studied. However,

there is some indication that long-term exposure or frequent high exposures may cause changes in the function of the nervous system, causing pain or numbness in the legs and arms. A mild decrease in white blood cells and platelets may occur.

🕒 **Recommended Risk-Reduction Measures**

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around diethyl phthalate. The exposure level for this compound is extremely low and may be difficult to monitor. Cartridge-type respirators may not suffice, especially at high concentrations. For the best protection, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or a supplied-air respirator operated in pressure demand or continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diethyl phthalate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diethyl phthalate is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- ☑ Nervous system examination with special testing by a qualified neurologist.
- ☑ Complete blood count and differential.

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Other methods to reduce exposure include:

- ☑ Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of liquids from storage containers to process containers is recommended.
- ☑ Always ensure that proper protective clothing is worn when using chemical substances.
- ☑ Wash thoroughly immediately after exposure to diethyl phthalate and at the end of the work shift or before eating, drinking, or smoking.
- ☑ Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of diethyl phthalate should be communicated to all potentially exposed workers.
- ☑ Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during use, transportation, storage, disposal, or destruction of diethyl phthalate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Diethyl phthalate is considered a Class IIIB combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of diethyl phthalate. Should diethyl phthalate ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine, and chlorine dioxide), strong acids (sulfuric acid, hydrochloric acid, and nitric acid), permanganates, and water either during use, transportation, or storage, violent reaction can occur. Diethyl phthalate is especially reactive in contact with liquid chlorine.

Diethyl phthalate can enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diethyl phthalate. This chemical has moderate acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of diethyl phthalate to plants, birds, or land animals.

💧 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Diethyl phthalate has moderate chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of diethyl phthalate to plants, birds, or land animals.

💧 *Water Solubility*

Diethyl phthalate is nearly insoluble in water. Concentrations of 1 milligram or less will mix with a liter of water.

⌚ *Persistence in the Environment*

Diethyl phthalate is slightly persistent in water, with a half-life between 2 and 20 days. The half-life of a pollutant is the amount of time it takes for one half of the chemical to be degraded. About 83% of diethyl phthalate will eventually end up in water. Approximately 11.6% will end up in the air, and the rest will end up equally divided in terrestrial soils and aquatic sediments.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

The concentration of diethyl phthalate found in fish tissues is expected to be somewhat higher than the average concentration of diethyl phthalate in the water from which the fish was taken.

🚫 *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diethyl phthalate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact.

Diethyl phthalate is destroyed by burning in a chemical incinerator equipped with an afterburner and scrubber.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If diethyl phthalate should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt to ensure protection of aquatic sediments. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of diethyl phthalate. If diethyl phthalate is spilled or leaked, the following specific steps are recommended:

- ☑ Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- ☑ Ventilate area of spill or leak.
- ☑ Remove all ignition sources.
- ☑ Absorb small spills with paper towel or other absorbent material and dispose of as hazardous waste. For larger spills, collect liquid using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- ☑ It may be necessary to dispose of diethyl phthalate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS**General Assessment**

Accidents or mishaps involving diethyl phthalate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also result in a loss of profits and loss of current as well as future business.

Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| DOT Hazard Class and Label Requirements Poison B | DOT Emergency Guide Code 15 | |
| DOT Identification Number UN 1594 | Chemical Formula (CH₃CH₂)₂SO₄ | |

Synonyms

Diethyl monosulfate; diethyl sulphate; DS; ethyl sulfate; sulfuric acid diethyl ester.

SECTION II - HAZARDOUS INGREDIENTS AND IDENTITY INFORMATION

| Hazardous Components (specific identity) | OSHA Exposure Criteria | NIOSH Exposure Criteria | Immediately Dangerous to Life and Health (IDLH) | ACGIH Exposure Criteria |
|--|---|---|---|---|
| Diethyl sulfate (derivation: From ethanol and fuming sulfuric acid or directly from ethanol and ethylhydrosulfuric acid). | PEL: Not Established STEL: Not Established | REL: Not Established STEL: Not Established | Not Determined | TLV: Not Established STEL: Not Established |

SECTION III - PHYSICAL AND CHEMICAL CHARACTERISTICS

| | |
|--|--|
| Boiling Point 205°F (96°C) | Specific Gravity (H ₂ O = 1) 1.17 |
| Vapor Pressure (mm Hg) 0.19 at 77°F (25°C) | Molecular Weight 154.2 |
| Vapor Density (Air = 1) 5.31 | Melting Point -25°F (-13°C) |

Solubility

Insoluble in water (decomposes to form sulfuric acid. Rapidly decomposed by hot water into monoethyl sulfate and alcohol. Soluble in alcohol and ether.

Appearance and Odor

Colorless, oily liquid, darkens with age. Has a faint, ethereal or peppermint-like odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

| | |
|--|---|
| Flash Point (method used) 220°F (104°C) closed cup | Explosive Limits in Air % by Volume LEL: 4.1% UEL: Not Determined |
| NFPA Classification Class IIIB Combustible Liquid | Autoignition Temperature 817°F (436°C) |

Extinguishing Media

Use water spray, dry chemical, carbon dioxide, or foam. Water may cause frothing.

Special Fire Fighting Procedures

Acrid and irritating fumes and smoke are produced in fire, wear full protective clothing and self-contained breathing apparatus (SCBA). Vapors are heavier than air and may travel for some distance to ignition source and flashback. Fight fire from distance if possible. Move containers from fire area if it can be done safely. Exercise extreme caution when moving containers.

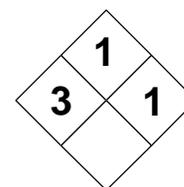

Unusual Fire and Explosion Hazards

Containers may explode in fire due to buildup of excessive internal pressures. Decomposes to ethyl ether in fire which is more flammable than diethyl sulfate.

| Emergency and First-aid Procedures | | | | |
| Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: Remove all contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe 24 - 48 hours for lung effects (pulmonary edema). If swallowed: Call the poison control center and seek medical attention immediately. Unless advised otherwise, do NOT induce vomiting due to the corrosive nature of diethyl sulfate. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled | | | | |
| Absorb liquids in vermiculite or other absorbent and deposit in DOT-approved drum. Do not allow flow into sewers or waterways. Ventilate area and remove ignition sources. Restrict those not involved in cleanup from entering area. Notify appropriate authorities, if applicable. | | | | |
| Preferred Waste Disposal Method | | | | |
| No Citation. | | | | |
| Precautions to be Taken in Handling and Storage | | | | |
| Do not store diethyl sulfate in the presence of incompatible chemicals or materials. Store in tightly closed containers in a cool, dry, well-ventilated area away from ignition sources. Do not allow moisture to accumulate inside metal containers (hydrogen gas may build up and cause explosion). | | | | |
| Other Precautions and Warnings | | | | |
| Bulk storage should be avoided. Outside or external facility storage is recommended. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) | | | | |
| No exposure levels have been established. This does not mean exposure is without risk. For the best protection, use a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus (SCBA) with full facepiece operated in pressure demand mode. | | | | |
| Ventilation | | | | |
| Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Rubber | | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Apron | |
| Work/Hygiene Practices | | | | |
| Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIETHYL SULFATE

CAS: 64-67-5

**IDENTIFICATION AND TYPICAL USES**

Diethyl sulfate is a colorless, oily liquid that darkens with age. It has a faint, ethereal or peppermint-like odor. It is primarily used as an ethylating agent in organic synthesis, as an alkylating agent, an accelerator in sulfation of ethylene, a chemical intermediate for ethyl derivatives of phenols, amines, and thiols, and in some sulfonations.

RISK ASSESSMENT: HEALTH**General Assessment**

Diethyl sulfate is a confirmed animal carcinogen and is highly suspected to cause cancer in humans as well. It has been shown to cause reproductive problems in animals. It is a human poison by *inhalation*, *ingestion*, and skin *absorption*. Mutation data have also been recorded.

Inhalation results in headache, coughing, wheezing, inflammation of the upper respiratory system, nausea, and vomiting. Exposure may also result in severe chemical pneumonitis or pulmonary edema (fluid buildup in the lungs), which is a medical emergency and can lead to death. Symptoms may be delayed up to 48 hours creating a false sense of security with regard to exposure risk. Spasm of the glottis may occur causing death by suffocation.

Ingestion causes nausea, vomiting, abdominal pain, and collapse. Gastritis and other systemic effects are also possible.

Skin contact will cause burns and irritation. Absorption through unbroken skin is likely resulting in toxic systemic effects. Eye contact with the vapor causes irritation. The liquid will produce burns to the tissue on contact and subsequent inflammation of the surrounding area. If not removed immediately, there is a chance that permanent damage (up to and including blindness) may occur.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to diethyl sulfate:

Skin: Irritation, burns, inflammation, and possible absorption causing toxic systemic effects.

Eye: Severe irritation with burns, redness, lachrymation, and possible conjunctivitis.

Lung: Irritation of the mucosa of the nose, throat, and upper respiratory tract. Can cause pulmonary edema (fluid buildup in the lungs) which can be fatal.

Other: Ingestion causes nausea, vomiting, abdominal pain, and possible collapse.

☘* Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to diethyl sulfate and can last for months or even years:

Cancer Hazards: According to the information presented in the references, diethyl sulfate has been shown to cause cancer in test animals and its carcinogenicity in humans is highly suspect.

Reproductive Hazard: According to the information presented in the references, diethyl sulfate may have teratogenic effects in test animals. It has caused cancer of the nervous system in the offspring of test animals.

Other Chronic Effects: There is some indication that long-term exposure or frequent high exposures may cause changes in cell structure (mutations) and damage the lungs.

🛡 Recommended Risk-Reduction Measures

Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most

effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around diethyl sulfate. No exposure levels have been established for this compound. However, this does not mean there is no health hazard risk. For the best protection, a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand or a supplied-air respirator operated in pressure demand or continuous flow mode are the recommended respiratory protection methods of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with diethyl sulfate.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where diethyl sulfate is used or stored.

If symptoms develop or overexposure is suspected, the following medical tests may be useful:

- Lung function test.
- Consider chest X-ray after acute overexposure (may be negative if done within the first 24 to 48 hours following exposure due to delayed onset of pulmonary edema).

Any evaluation should include a careful medical history of past and present symptoms with an examination. However, medical tests that evaluate existing damage are not a substitute for controlling exposure.

Also, since smoking can cause heart disease, emphysema, and other respiratory disorders, exposure to diethyl sulfate can have a more pronounced effect on smokers than on non-smokers exposed to the same levels. Prudent risk assessment and management requires consideration of *all* possible risk factors when exposure symptoms appear in the workforce.

Other methods to reduce exposure include:

- Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respiratory protection should be mandatory. Also, automatic transfer of liquids from storage containers to process containers is recommended.
- Always ensure that proper protective clothing is worn when using chemical substances.
- Wash thoroughly immediately after exposure to diethyl sulfate and at the end of the work shift or before eating, drinking, or smoking.
- Hazard warning information should be posted in the work area. In addition, as part of an on-going education and training program, all information on the health and safety hazards of diethyl sulfate should be communicated to all potentially exposed workers.
- Eye wash stations should be provided in work areas. If the potential for whole body exposure exists, then safety showers should also be provided.

RISK ASSESSMENT: ENVIRONMENT

General Assessment

The environment is at risk of exposure during use, transportation, storage, disposal, or destruction of diethyl sulfate. In almost every scenario, the threat of environmental exposure is contingent upon the proper handling of the chemical substance. Accidental spills, large or small, can result in fire, explosion, and possible contamination of the surrounding environmental mediums (water, soil, and air).

Diethyl sulfate is considered a Class IIIB combustible liquid (per OSHA 29 CFR 1910.106). These characteristics require special consideration during any emergency situation involving a leak or spill of diethyl sulfate. Should diethyl sulfate ever come into contact with incompatible substances such as strong oxidizers (chlorine, bromine, fluorine, chlorine dioxide, and peroxides), strong acids (sulfuric acid, hydrochloric acid, and nitric acid), either during use, transportation, or storage, violent reaction can occur. Diethyl sulfate is especially reactive in contact with nitric acid. Diethyl sulfate may also react with moisture to yield sulfuric acid and subsequently react with metal to liberate flammable hydrogen gas.

Diethyl sulfate can enter the environment through industrial discharges and from spills.

☠ *Acute Ecological Effects*

Acute (short-term) toxic effects may include the death of animals, birds, or fish and death or low growth rate in plants. Acute effects are seen 2 to 4 days after animals or plants are exposed to diethyl sulfate. This chemical is not expected to have acute toxicity to aquatic life. Insufficient data are available to evaluate or predict the short-term effects of diethyl sulfate to plants, birds, or land animals.

💧 *Chronic Ecological Effects*

Chronic toxic effects may include shortened life span, reproductive problems, lower fertility, and changes in appearance or behavior in exposed animals. These effects can be seen long after first exposure(s) to toxic chemicals. Diethyl sulfate is not expected to have chronic toxicity to aquatic life. Insufficient data are available to evaluate or predict the long-term effects of diethyl sulfate to plants, birds, or land animals.

💧 *Water Solubility*

Diethyl sulfate is known to rapidly hydrolyze in water to decompose and form sulfuric acid. The rate of hydrolysis will increase in both acidic and basic waters.

🕒 *Persistence in the Environment*

Diethyl sulfate is probably slightly persistent in the aquatic environment. It is not expected to adsorb to sediment and suspended organic matter. Approximately 93% will eventually end up in the water.

🐟 *Bioaccumulation in Aquatic Organisms*

Some substances increase in concentration, or *bioaccumulate*, in living organisms as they breathe contaminated air, drink contaminated water, or eat contaminated food. These chemicals can become concentrated in the tissues and internal organs of animals as well as humans.

Diethyl sulfate is not expected to accumulate in fish tissue or aquatic organisms.

🛡️ *Recommended Risk-Reduction Measures*

Proper training of all transporters will reduce the likelihood of a mishap or accident resulting in a leak or spill to the environment. The correct use of DOT labeling (per the MSDS) on all containers, trucks, and rail cars will enable emergency responders to react properly and

quickly to any disaster thereby reducing the potential risk to the environment and to personnel.

Storage of diethyl sulfate should be segregated from incompatible chemicals to minimize the risk of cross-contamination or contact. A blanket purge of inert gas inside containers is recommended to keep moisture from condensing since hydrogen gas may be formed presenting a dangerous explosion hazard.

If a spill or leak to the environment has occurred, fire department, emergency response and/or hazardous materials spill personnel should be notified immediately. Cleanup should be attempted only by those trained in proper spill containment procedures. Contaminated soils should be removed for incineration and replaced with clean soil. If diethyl sulfate should contact the water table, aquifer, or navigable waterway, remediation activities should be prompt. When such spills occur, the local and/or state emergency response authorities must be notified. A comprehensive emergency response or disaster preparedness/recovery plan should be in place prior to any operations involving the use, transportation, storage, or disposal of diethyl sulfate. If diethyl sulfate is spilled or leaked, the following specific steps are recommended:

- Restrict persons not wearing protective clothing from area of spill or leak until cleanup is complete and area can be opened for normal work.
- Ventilate area of spill or leak.
- Remove all ignition sources.
- Collect liquid using vermiculite, dry earth, or sand to absorb and place in a sealed drum for disposal.
- It may be necessary to dispose of diethyl sulfate as a hazardous waste. The responsible state agency or the regional office of the federal Environmental Protection Agency (EPA) should be contacted for specific recommendations.

RISK ASSESSMENT: BUSINESS

General Assessment

Accidents or mishaps involving diethyl sulfate can present a significant threat to business operations. The loss or damage of equipment or facilities can significantly affect fiscal viability. Lawsuits that may result from personnel injury/death, public exposures, and/or environmental contamination will also require a serious expenditure of resources. Media attention surrounding an injury, death, or environmental damage can also re-

sult in a loss of profits and loss of current as well as future business. Always remember that anytime the terms “cancer,” “carcinogen,” or “reproductive hazard” are used, public emotion, hysteria, and ignorance can run equally high. This should be properly considered during the development of public relations policies.

🕒 Recommended Risk-Reduction Measures

Company attorneys, safety and health professionals, and environmental specialists should be involved in the development of any procedures dealing with safety or emergency response. A company official should be pre-designated as a public relations officer with specific training in dealing with the press. Corporate plans and policies should be developed, approved, and implemented long before any need for such arises.

| Emergency and First-aid Procedures Eye contact: Flush immediately with water for 15 minutes (minimum), seek medical attention. Skin contact: For frostbite, rapidly re-warm using water at 107°F (42°C) until flush returns. Do NOT use dry heat! Seek medical assistance. For inhalation: Remove the person from exposure. Provide respiratory assistance and CPR. Transfer to medical facility. Observe for 24 - 48 hours for lung effects. If swallowed: Not likely. If large amount is ingested, consider emesis and/or activated charcoal solution. | | | | |
| SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE | | | | |
| Steps to be Taken in Case Material is Released or Spilled Evacuate area, deny entry, stay upwind. If it can be done without risk, shut off leak. Vapor can accumulate in low areas. If possible, stop leak. If not, remove leaking cylinder to an open or safe area (fume hood) and allow to vent. Position so gas, not liquid, escapes. | | | | |
| Preferred Waste Disposal Method No Citation. | | | | |
| Precautions to be Taken in Handling and Storage Do not store difluorodibromomethane in the presence of incompatible materials. Store in tightly closed containers in a cool, well-ventilated area away from heat and the sun's rays. | | | | |
| Other Precautions and Warnings Prevent physical damage to storage cylinders. | | | | |
| SECTION VIII - CONTROL MEASURES AND PERSONAL PROTECTIVE EQUIPMENT | | | | |
| Respiratory Protection (<i>specify type</i>) A NIOSH-approved respirator will suffice for exposures to the PEL. Best protection is provided by a supplied-air respirator with full facepiece operated in pressure demand mode or a self-contained breathing apparatus with full facepiece operated in pressure demand or other positive pressure mode. | | | | |
| Ventilation Local exhaust or general mechanical systems recommended. | | | | |
| Protective Gloves Impervious, Insulated Rubber | | Eye Protection Chemical Goggles or Face Mask | Other Protective Clothing Apron | |
| Work/Hygiene Practices Always wash hands thoroughly after using chemical; never bring food, drink, or smoking materials into vicinity of chemicals. | | | | |

DIFLUORODIBROMOMETHANE

CAS: 75-61-6

**IDENTIFICATION AND TYPICAL USES**

Difluorodibromomethane is colorless, heavy liquid or gas (above 76°F) with a characteristic odor. It is used as a fire extinguishing agent, in the synthesis of dyes, in the manufacture of pharmaceuticals, and as an intermediate in quaternary ammonium compounds.

RISK ASSESSMENT: HEALTH**General Assessment**

Difluorodibromomethane is considered to be moderately toxic by *inhalation*. Skin contact also presents some level of health risk, although absorption is not likely to occur. Ingestion is also not likely in the industrial setting. Fluorinated hydrocarbons present their greatest toxicity when inhaled at high concentrations. This occurs most often as a result of intentional abuse rather than occupational exposure. There is no evidence in the references regarding the real or potential carcinogenicity, mutagenicity, or teratogenicity of this chemical in humans or test animals.

Inhalation can cause transient irritation of the eyes, nose, and throat. Can cause fluid to build up in the lungs (pulmonary edema), which is a medical emergency and can be fatal. Symptoms of cough, congestion, and tightness in chest may be delayed up to 48 hours, thereby creating a false sense of security with regard to health risk. There may also be palpitations of the heart and lightheadedness. It may also act on the central nervous system as a depressant, although the references are not clear on the precise action. At high concentrations, muscle cells of the heart may become sensitized to essential chemicals normally produced by the body, such as adrenaline. This can lead to potentially fatal disturbances in the natural rhythm of the heart. Long-term exposures can also adversely affect the liver and cause damage.

Skin contact with the liquid can cause frostbite and irritation. It will defat the skin and may result in chronic contact dermatitis and erythema.

☠ Acute Health Effects

The following acute (short-term) health effects may occur immediately or shortly after exposure to difluorodibromomethane:

Skin: Irritation, contact dermatitis, and possible frostbite (liquid contact).

Eye: Mild irritation. Liquid will burn tissue.

Lung: Irritation of the eyes, nose, and throat. Possible fatal disturbance in heart rhythm (palpitations), and lightheadedness. May cause pulmonary edema (fluid in the lungs), which can be fatal. Can cause lung irritation and bronchial constriction.

Other: Difluorodibromomethane is a narcotic at high concentrations with unspecified effect on the CNS.

☘ Chronic Health Effects

The following chronic (long-term) health effects may occur at some time after exposure to dichlorodifluoromethane and can last for months or even years:

Cancer Hazards: According to the information presented in the references, difluorodibromomethane has not been adequately tested for its ability to cause cancer in test animals.

Reproductive Hazard: According to the information presented in the references, difluorodibromomethane has not been adequately tested for its ability to adversely affect reproduction in test animals.

Other Chronic Effects: Low, chronic exposures may lead to liver damage and possible adverse effect on the central nervous system. Chronic exposures can also lead to heart palpitations and lightheadedness.

🕒 **Recommended Risk-Reduction Measures**

While difluorodibromomethane is considered to be of a low-order toxicity by inhalation, it can still pose some degree of health hazard risk. Unless a less toxic chemical can be substituted for a hazardous substance, *engineering controls* are the most effective method of reducing exposures. The best protection is to enclose operations and/or provide local exhaust ventilation at the site of chemical release. While not always operationally feasible, isolating operations can also reduce exposure.

Using respiratory protection is less effective than the controls mentioned above, but is still advisable whenever working with or around dichlorodifluoromethane. For exposures to the PEL (100 ppm), a full facepiece respirator may suffice. However, when high exposure levels are predicted or prolonged exposures are anticipated, a supplied air respirator or a self-contained breathing apparatus (SCBA) with full facepiece and pressure demand are the recommended respiratory protection of choice. If a full facepiece is not available, then chemical goggles should be worn to protect the eyes. Whenever a chemical splash hazard exists, a face shield and rubber apron should be worn. To prevent hand and skin exposures, impervious and insulated rubber gloves should be worn.

Administrative controls should also be in place to minimize the potential for human exposures. These may include written procedures or policies which specify the methods and techniques that will be practiced whenever personnel are to work with difluorodibromomethane.

All personnel should receive *training* on the use, hazards, protective measures, emergency actions, and other precautions per 29 CFR 1910.1200 (Hazard Communication), prior to the first assignment in an area where difluorodibromomethane is used or stored.

Before beginning employment and at regular intervals thereafter (e.g., annually), the following medical protocol is suggested for those assigned to work with difluorodibromomethane:
